1. OUTLINE AND DEVICE CHARACTERISTICS

The TMP93PS40 is OTP type MCU which includes 64K byte One-time PROM. Using the adapter-socket (BM11109 or BM11129), you can write and verify the data for the TMP93PS40.

TMP93PS40 has the same pin-assignment with TMP93CM40 / CS40 (Mask ROM type).

Writing the program to Built-in PROM, the TMP93PS40 operates as the same way as the TMP93CS40.

There is a difference in ROM capacity between TMP93PS40 (64K-byte) and the TMP93CM40 (32K-byte). Please pay attention to the difference of memory maps.

3. OPERATION

This section describes the functions and basic operational blocks of the TMP93PS40.

The TMP93PS40 has ROM in place of the mask ROM which is included in the TMP93CS40. The other configuration and functions are the same as the TMP93CS40. Regarding the function of the TMP93PS40, which is not described herein, see the TMP93CS40.

The TMP93PS40 has two operational modes: MCU mode and PROM mode.

3.1 MCU mode

(1) Mode-setting and function

The MCU mode is set by opening the CLK pin (Output status). In the MCU mode, the operation is same as TMP93CS40.

3.2 Memory Map

Figure 3.1 is a memory map of the TMP93PS40.

Figure 3.1 (1) Memory map in MCU mode

Figure 3.1 (2) Memory map in PROM mode

3.3 PROM Mode

(1) Mode setting and Function

PROM mode is set by setting the RESET and CLK pins to the “L” level. The programming and verification for the internal PROM is achieved by using a general PROM programmer with the adaptor socket.

① OTP adaptor

BM11109 : TMP93PS40F, TMP93PW40F adaptors

BM11129 : TMP93PS40DF, TMP93PW40DF adaptors

② Setting OTP adaptor

Set the switch (SW1) to N side.

③ Setting PROM programmer

i) Set PROM type to TC571000D.

Size : 1 M bit (128K×8 bit)

VPP : 12.75 V

tpw : 100 μ s

The electric signature mode (hereinafter referred to as “signature”.) is not supported. Therefore if signature is used, the device is damaged because 12.75 V is applied to A9 of address. Do not use signature.

ii) Transferring the data (copy)

In TMP93PS40, PROM is placed on addresses 00000 to 0FFFFH in PROM mode, and addresses 08000H to 17FFFH in MCU mode. Therefore data should be transferred to addresses 00000 to 0FFFFH in PROM mode using the object converter (tuconv) or the block transfer mode (see instruction manual of PROM programmer.) or making the object data.

iii) Setting the programming address

Start address : 00000H

End address : 0FFFFH

Using PROM programmer which can not set the programming address, set FFH at addresses 10000H to 1FFFFH.

④ Programming

Program/verify according to the procedures of PROM programmer.

Figure 3.2 PROM Mode Pin Setting

(2) Programming Flow Chart

The programming mode is set by applying 12.75 V (programming voltage) to the VPP pin when the following pins are set as follows, (VCC : 6.25 V, **RESET** : "L" level, CLK : "L" level).

While address and data are fixed and **CE** pin is set to "L" level, 0.1 ms of "L" level pulse is applied to **PGM** pin to program the data.

Then the data in the address is verified.

If the programmed data is incorrect, another 0.1 ms pulse is applied to **PGM** pin.

This programming procedure is repeated until correct data is read from the address. (25 times maximum)

Subsequently, all data are programmed in all addresses.

The verification for all data is done under the condition of $V_{pp} = V_{cc} = 5$ V after all data were written.

Figure 3.2 (2) shows the programming flow chart.

High Speed Program Writing.

Flow chart

Figure 3.3 Flow chart

(3) Security Bit

The TMP93PS40 has a Security Bit.

If the Security Bit is programmed to “0”, the content of the PROM can not be read in PROM mode. (outputs data FFH)

How to program the Security Bit.

The difference from the programming procedures described in section 3.3 (1) are follows.

① Setting OTP adapter

Set the switch (SW1) to S side.

② Setting PROM programmer

ii) Transferring the data

iii) Setting programming address

The security bit is in bit 0 of address 00000H.

Set the start address 00000H and the end address 00000H.

Set the data FEH at the address 00000H.

4. ELECTRICAL CHARACTERISTICS

4.9 Timing Chart for Bus Request ($\overline{\text{BUSRQ}}$) / Bus Acknowledge ($\overline{\text{BUSAK}}$)

Symbol	Parameter	Variable		12.5 MHz		20 MHz		Unit
		Min	Max	Min	Max	Min	Max	
t _{BRC}	$\overline{\text{BUSRQ}}$ Set-up Time to CLK	120		120		120		ns
t _{CBAL}	CLK → $\overline{\text{BUSAK}}$ Falling Edge		1.5X + 120		270		195	ns

t _{ABA}	Output Buffer off to $\overline{\text{BUSAK}}$	0	80	0	80	0	80	ns
t _{BAA}	$\overline{\text{BUSAK}}$ to Output Buffer on	0	80	0	80	0	80	ns

Note 1 : The Bus will be released after the $\overline{\text{WAIT}}$ request is inactive, when the $\overline{\text{BUSRQ}}$ is set to "0" during "Wait" cycle.

Note 2 : This line only shows the output buffer is off-state.

It doesn't indicate the signal level is fixed.

Just after the bus is released, the signal level which is set before the bus is released is kept dynamically by the external capacitance. Therefore, to fix the signal level by an external resistor during bus releasing, designing is executed carefully because the level-fix will be delayed.

The internal programmable pull-up/pull-down resistor is switched active/non-active by an internal signal.

NOTE

1. The power supply of V_{PP} (12.75 V) must be turned on at the same time or the later time for a power supply of V_{CC} and must be turned off at the same time or early time for a power supply of V_{CC} .
2. The device suffers a damage taking out and putting in on the condition of $V_{PP} = 12.75$ V.
3. The maximum spec of V_{PP} pin is 14.0 V. Be carefull a overshoot at the programming.

4.14 Recommended Oscillator

The TMP93PS40 is evaluated with the resonators. The evaluation results are referred to your usable application.

Note: The load capacitance of the resonator consists of the load capacitance C1, C2 to be connected and the floating capacitance on the target board.

Even if the specified values of C1 and C2 are used, there is a possibility that the oscillator malfunctions due to different load capacitance of the target boards. Therefore the peripheral patterns of the oscillator should be designed to take the shortest course on the board.

It is recommended that the evaluation of the resonators is executed on the target board.
