

Complete, 12-Bit Multiplying DAC

MX7845

General Description

The MX7845 is a 12-bit, voltage-output, 4-quadrant, multiplying digital-to-analog converter (DAC). A precision internal output amplifier and thin-film resistors, laser-trimmed at the wafer level, maintain accuracy over the full operating temperature range. The output amplifier is internally compensated and drives $\pm 10V$ into a $2k\Omega$ load.

The MX7845 has buffered latches that are easily interfaced with microprocessors. Data is transferred into the input register from a 12-bit-wide data path. The input registers are controlled by standard $\overline{CS}$ (CHIP SELECT) and $\overline{WR}$ (WRITE) signals. For stand-alone operation, the $\overline{CS}$ and $\overline{WR}$ inputs are grounded, making all latches transparent. All logic inputs are level-triggered and compatible with TTL and +5V CMOS logic levels. For a detailed description of MX7845 operation, refer to the MAX501/MAX502 data sheet.
