

CMOS 4-BIT MICROCONTROLLER

TMP47C451BN

The 47C451B is a high performance 4-bit single chip microcomputer based on the TLC5-47 CMOS series with a DTMF generator and a large-capacity RAM for repertory dialing applications, and which is highly suitable for utilization in telephones. The 47C451B is also capable of operation with low voltages such as those supplied by telephone line.

FEATURES

- ◆ 4-bit single chip microcomputer
- ◆ Instruction execution time : 16.7 μ s (at 480kHz)
- ◆ Low voltage operation : 2.2V min.
- ◆ 90 basic instructions
- ◆ Table look-up instructions
- ◆ Subroutine nesting : 15 levels max.
- ◆ 5 interrupt sources (External : 2, Internal : 3)
All sources have independent latches each, and multiple interrupt control is available.
- ◆ I/O port (23 pins)
 - Input 2ports 5pins
 - Output 1port 2pins
 - I/O 4ports 16pins
- ◆ Interval Timer
- ◆ Two 12-bit Timer/Counters
Timer, event counter, and pulse width measurement mode
- ◆ DTMF (Dual Tone Multi Frequency) Output
 - DTMF output with one instruction
 - Single tone output function
- ◆ RAM for repertory dial : 768 × 4 bit max.
- ◆ BEEP output function
- ◆ Hold function
 - Battery/Capacitor back-up
 - Hold function controlled by port K0 .
- ◆ Real Time Emulator : BM47215B + BM1104

OPERATIONAL DESCRIPTION

Concerning the 47C454A the configuration and functions of hardwares are described. As the description has been provided with priority on those parts differing from the 47C452B, the technical data sheets for the 47C452B shall also be referred to.

Further, the 47C451B can use to the piggyback with 47C452A by to use the ADAPTER SOCKET (BM1104) . Refer to the piggyback section of the technical data sheets for the 47C452B/952B.

1. SYSTEM CONFIGURATION

(1) CPU Core Function

The functions are the same as those of the 47C452B.

(2) Peripheral Hardware Functions

① I/O Port

② Interval Timer

③ Timer/Counter

④ DTMF Generator

⑤ BEEP Output Circuit

The following are explanations of functions ① which have been added to the 47C454A or which are different from those of the 47C452B, and DTMF Generator, BEEP Output Circuit.

The 47C451A does not have the Serial Interface.

2. CPU CORE FUNCTIONS

2.1 DATA MEMORY

The 47C451B has a total of 768×4 bits of data memory. This memory is same as the data memory built into the 47C452B, so refer to the technical data sheets for the 47C452B for an explanation of the operation.

2.2 Hold Operating Mode

The 47C451B has a $\overline{\text{HOLD}}$ pin and K0 port as hold control pins. Therefore, in the case of K0 port for Key inputs, the hold mode can be released by key inputs. Figure 4-1 shows the hold control circuit of the 47C451B. Hold operating mode of the 47C451B is same as the 47C452B, excepting those aforementioned. For details, refer to the technical data sheets for the 47C452B.

3. PERIPHERAL HARDWARE FUNCTION

3.1 I/O Ports

The 47C451B has 7 I/O ports (23 pins) each as follows:

- ① K0 ; 4-bit input (shared with hold request/release signal input)
- ② R3 ; 4-bit input/output
- ③ R6, R7 ; 4-bit input/output
- ④ R8 ; 4-bit input/output (shared with external interrupt input and timer/counter input)
- ⑤ P14 ; 2-bit output (P140 is shared with BEEP output)
- ⑥ KE ; 1-bit sense input (shared with hold request/release signal input)

The 47C451B does not have the port P1, P2 and R4, R5, R9.

Table 3-1 lists the port address assignments and the I/O instructions that can access the ports.

(1) Port K0 (K03 to K00)

3.2 DTMF Generator

The 47C451B has built-in DTMF generator which generates dialing signals for tone dialing type telephones. There are two groups of tone dial signals, one group of 4 sine wave low frequencies and another group of 4 sine wave high frequencies. All of these frequencies can be selected individually and combined with a frequency from the other group for a total of 16 different DTMF composite waves.

(DTMF ; Dual Tone Multi Frequency)

3.2.1 Configuration of DTMF Generator

Figure 3-4 shows configuration of the DTMF generator The 47C451B generates two stepped, quasi sine waves for tone dial signals which can be combined and output. The high or low group of frequencies is selected by setting frequency selection codes into the ROW and COLUMN registers.

Figure 3-4. Configuration of DTMF Generator

3.2.2 Control of DTMF Generator

Tone output is controlled by ROW register(OP01/IP01) and COLUMN register(OP02/IP02). And single tone is controlled by TONE command register(OP0D/IP0D).

TONE command register (Port address OP0D/IP0D)

3	2	1	0	
STE		(R / W)	(CE)	(Initial value 0*00)

STE	Controls single tone output

1	Enable mode of single tone output

Note 1. * ; don't care

Note 2. When read STE bit, "1" is always read.

Figure 3-5. TONE Command Register

Figure 3-6. ROW, COLUMN Register

Tones are outputted by loading the frequency selection codes shown in Figure 3-6 into the ROW and COLUMN registers. In the enable mode of single tone output, either ROW or COLUMN register is disabled, another register remains to be enabled, and so single tone can be outputted, by loading an ineffective code into the register. When both the registers are enabled, dual tone can be outputted. In the disable mode of single tone output, effective codes are loaded into both ROW and COLUMN registers and then dual tone can be outputted. At this time, an ineffective code is loaded into ROW or COLUMN register and then the 47C451B has no tone output signal.

The [OUTB @HL] instruction can set 8-bit data into both registers (the upper 4 bits of the ROM data go to the COLUMN register and the lower 4 bits go to the ROW register) at the same time, and DTMF signal is outputted without single tone output.

Example 1: To output 1481.5Hz single tone

```
OUT    #8, %OP0D    ; Sets the enable mode of single tone output
OUT    #0, %OP01    ; Sets an ineffective code into ROW register
OUT    #4, %OP02    ; Sets data "4" into COLUMN register
```

Example 2: 8 bits of data corresponding to the 5 bits of data linking the content of carry flag and the contents of data memory RAM address 90_H are read from the ROM, frequency selection codes are loaded into ROW and COLUMN registers, and dual tone is outputted.

```
LD      HL, #90H    ; HL←90H(Sets the address of the data memory)
OUTB    @HL          ; Sets the ROM data into the ROW and COLUMN
                      ; register
```

Table 3-2 shows the corresponding frequency selection codes of the ROW and COLUMN registers for the telephone dial keys. Table 3-3 shows the deviation between the 47C451B tone output frequency and standard frequency.

3.2.3 Test mode for tone output

The 47C451B includes a test mode for checking tone output waveforms. Tones can be outputted by the circuit shown in figure 3-7. ROW data are inputted from the R6 port and COLUMN data are inputted from the R3 port, and any desired single or dual tones can be outputted by setting the frequency selection codes shown in Figure 3-6. Figure 3-8 shows a single tone waveform and Figure 3-9 shows a dual tone waveform.

3.3 BEEP Output Circuit

BEEP output circuit generates square wave in the audible frequency range. This circuit can drive the key input confirmation tone generator circuit for telephone applications.

BEEP output is from the P140 (BEEP) pin. This pin is for both P140 output and BEEP output. Set the P140 output latch to "1" for BEEP output.

3.3.1 Configuration of BEEP Output Circuit

Figure 3-10 shows configuration of the BEEP output circuit. The clock pulse of BEEP output circuit is supplied by an interval timer. BEEP output is controlled by frequency selection and output enable/disable setting.

3.3.2 Control of BEEP Output

BEEP output is controlled with the BEEP output control command register (OP13) .
