

64K x 1 Static RAM

Features

- High speed
 - 15 ns
- CMOS for optimum speed/power
- Low active power
 - --- 495 mW
- Low standby power
 220 mW
- TTL compatible inputs and outputs
- Automatic power-down when deselected

Functional Description

The CY7C187 is a high-performance CMOS static RAM organized as 65,536 words x 1 bit. Easy memory expansion is provided by an active LOW chip enable (CE) and three-state drivers. The CY7C187 has an automatic power-down feature, reducing the power consumption by 56% when deselected.

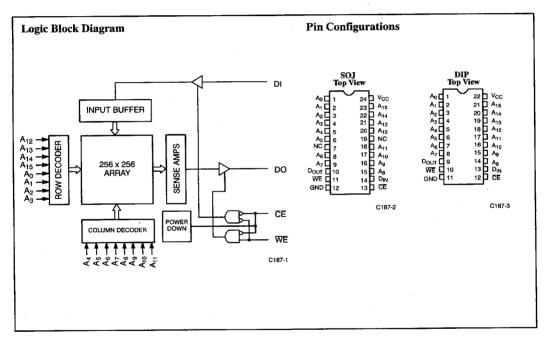

Writing to the device is accomplished when the chip enable (Œ) and write enable (WE) inputs are both LOW. Data on the input pin (DI) is written into the memory

location specified on the address pins (A_0 through A_{15}).

Reading the device is accomplished by taking the chip enable (TE) LOW, while write enable (WE) remains HIGH. Under these conditions, the contents of the memory location specified on the address pins will appear on the data output (DO) pin.

The output pin stays in high-impedance state when chip enable (\overline{CE}) is HIGH or write enable (\overline{WE}) is LOW.

The CY7C187 utilizes a die coat to ensure alpha immunity.

Selection Guide[1]

	7C187-12	7C187-15	7C187-20	7C187-25	7C187-35
Maximum Access Time (ns)	12	15	20	25	35
Maximum Operating Current (mA)	160	90	80	70	70
Maximum Standby Current (mA)	40/20	40/20	40/20	20/20	20/20

Shaded area indicates preliminary information.

Note

1. For military specifications, see the CY7C187A datasheet.

Capacitance^[5]

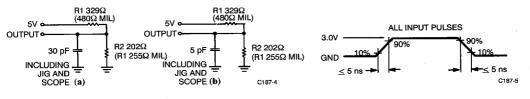

Parameter	Description	Test Conditions	Max.	Unit
C _{IN}	Input Capacitance	$T_A = 25^{\circ}C, f = 1 \text{ MHz},$	10	pF
C_{OUT}	Output Capacitance	$V_{CC} = 5.0V$	10	pF

Notes: 2. V₁

- V_{IL} (min.) = -3.0V for pulse durations less than 30 ns.
- Not more than 1 output should be shorted at one time. Duration of the short circuit should not exceed 30 seconds.
- A pull-up resistor to V_{CC} on the \overline{CE} input is required to keep the device deselected during V_{CC} power-up, otherwise I_{SB} will exceed values given.
- 5. Tested initially and after any design or process changes that may affect these parameters.

Shaded area indicates preliminary information.

Notes:

- Test conditions assume signal transition time of 5 ns or less, timing reference levels of 1.5V, input pulse levels of 0 to 3.0V, and output loading of the specified I_{OL}/I_{OH} and 30-pF load capacitance.
- At any given temperature and voltage condition, tHZCE is less than t_{LZCE} for any given device.
- $_{\rm HZCE}$ and $_{\rm HZWE}$ are specified with $_{\rm CL}$ = 5 pF as in part (b) of AC Test Loads. Transition is measured ± 500 mV from steady-state voltage.
- The internal write time of the memory is defined by the overlap of CE LOW and WE LOW. Both signals must be LOW to initiate a write and either signal can terminate a write by going HIGH. The data input setup and hold timing should be referenced to the rising edge of the signal that terminates the write.
- 10. WE is HIGH for read cycle.

Switching Waveforms

Read Cycle No. 1[10, 11]

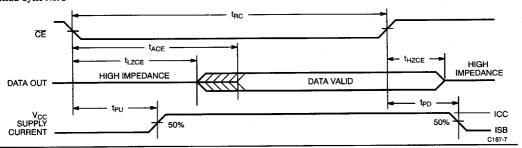

Note: 11. Device is continuously selected, $\overline{CE} = V_{IL}$.

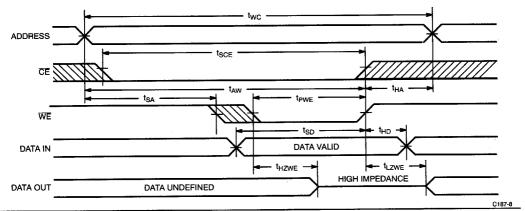

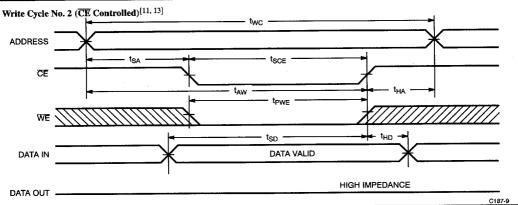

Switching Waveforms (continued)

Read Cycle No. 2[10, 12]

Write Cycle No. 1 (WE Controlled)[11]

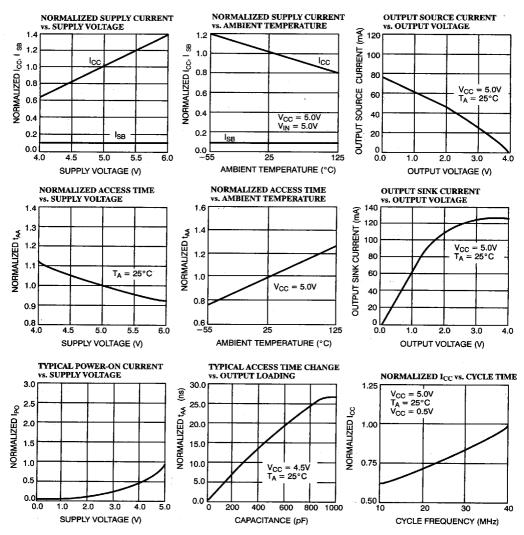

Notes: 12. Address valid prior to or coincident with $\overline{\text{CE}}$ transition LOW.

^{13.} If \overline{CE} goes HIGH simultaneously with \overline{WE} HIGH, the output remains in a high-impedance state.
