Jameco Part Number 1727818

# Dual, Matched Picoampere, Microvolt Input, Low Noise Op Amp

### **FEATURES**

■ Guaranteed Offset Voltage: 50µV Max

Guaranteed Bias Current: 25°C: 120pA Max

-55°C to 125°C: 700pA Max

Guaranteed Drift: 1.5μV/°C Max
 Low Noise, 0.1Hz to 10Hz: 0.5μV<sub>P-P</sub>

■ Guaranteed Supply Current: 600µA Max

Guaranteed CMRR: 112dB MinGuaranteed PSRR: 112dB Min

Guaranteed Voltage Gain with 5mA Load Current

Guaranteed Matching Characteristics

### **APPLICATIONS**

Strain Gauge Signal Conditioner

Dual Limit Precision Threshold Detection

Charge Integrators

Wide Dynamic Range Logarithmic Amplifiers

Light Meters

Low Frequency Active Filters

Standard Cell Buffers

Thermocouple Amplifiers

17, LTC and LT are registered trademarks of Linear Technology Corporation.

### DESCRIPTION

The LT®1024 dual, matched internally compensated universal precision operational amplifier can be used in practically all precision applications requiring multiple op amps. The LT1024 combines picoampere bias currents (which are maintained over the full -55°C to 125°C temperature range), microvolt offset voltage (and low drift with time and temperature), low voltage and current noise and low power dissipation. Extremely high common mode and power supply rejection ratios, practically immeasurable warm-up drift, and the ability to deliver 5mA load current with a voltage gain of a million, round out the LT1024's superb precision specifications.

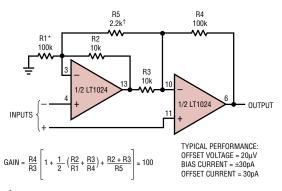

Tight matching is guaranteed on offset voltage, noninverting bias currents and common mode and power supply rejections.

The all-around excellence of the LT1024 eliminates the necessity of the time-consuming error analysis procedure of precision system design in many dual applications; the LT1024 can be stocked as the universal dual op amp in the 14-pin DIP configuration.

For a single op amp with similar specifications, see the LT1012 data sheet; for a single supply dual precision op amp in the 8-pin configuration, see the LT1013 data sheet.

**Note 1:** Absolute Maximum Ratings are those values beyond which the life of a device may be impaired.

**Note 2:** Differential input voltages greater than 1V will cause excessive current to flow through the input protection diodes unless limiting resistance is used.

**Note 3:** The V<sup>+</sup> supply terminals are completely independent and may be powered by separate supplies if desired (this approach, however, would sacrifice the advantages of the power supply rejection ratio matching). The V<sup>-</sup> supply terminals are both connected to the common substrate and must be tied to the same voltage. Both V<sup>-</sup> pins should be used.

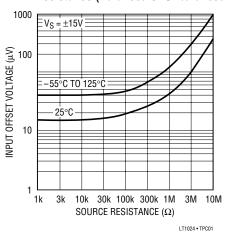

Note 4: This parameter is tested on a sample basis only.

### APPLICATIONS INFORMATION

The LT1024 may be inserted directly into OP-10, OP-207 or OP227 sockets with or without removal of external nulling components.

The LT1024 is specified over a wide range of power supply voltages from  $\pm 2V$  to  $\pm 18V$ . Operation with lower supplies is possible down to  $\pm 1.2V$  (two NiCad batteries).

#### **Advantages of Matched Dual Op Amps**

In many applications, the performance of a system depends on the matching between two operational amplifiers rather than the individual characteristics of the two op amps. Two or three op amp instrumentation amplifiers, tracking voltage references, and low drift active filters are some of the circuits requiring matching between two op amps.

The well-known triple op amp configuration illustrates these concepts. Output offset is a function of the difference between the offsets of the two halves of the LT1024. This error cancellation principle holds for a considerable number of input-referred parameters in addition to offset voltage and its drift with temperature. Input bias current will be the average of the two noninverting input currents  $(I_B^+)$ . The difference between

these two currents  $(I_{OS}^+)$  is the offset current of the instrumentation amplifier. Common mode and power supply rejections will be dependent only on the match between the two amplifiers (assuming perfect resistor matching).

The concepts of common mode and power supply rejection ratio match ( $\Delta$ CMRR and  $\Delta$ PSRR) are best demonstrated with a numerical example:

Assume CMRR<sub>A</sub> =  $+1.0\mu$ V/V or 120dB and CMRR<sub>B</sub> =  $+0.5\mu$ V/V or 126dB, then  $\Delta$ CMRR =  $0.5\mu$ V/V or 126dB if CMRR<sub>B</sub> =  $-0.5\mu$ V/V, which is still 126dB, then  $\Delta$ CMRR =  $1.5\mu$ V/V or 116.5dB.

Typical performance of the instrumentation amplifier: Input offset voltage =  $25\mu V$ .

Input bias current = 30pÅ.

Input resistance =  $10^{12}\Omega$ .

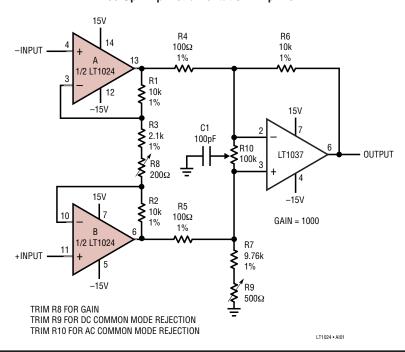

Input offset current = 30pA.

Input noise =  $0.7\mu V_{P-P}$ .

Power bandwidth  $(V_0 = \pm 10V) = 80kHz$ .

Clearly, the LT1024, by specifying and guaranteeing all of these matching parameters, can significantly improve the performance of matching dependent circuits.

#### Three Op Amp Instrumentation Amplifier

### APPLICATIONS INFORMATION

#### Achieving Picoampere/Microvolt Performance

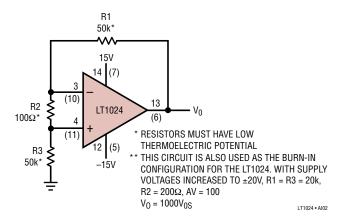

In order to realize the picoampere/microvolt level accuracy of the LT1024, proper care must be exercised. For example, leakage currents in circuitry external to the op amp can significantly degrade performance. High quality insulation should be used (e.g., Teflon™, Kel-F); cleaning of all insulating surfaces to remove fluxes and other residues will probably be required. Surface coating may be necessary to provide a moisture barrier in high humidity environments.

Board leakage can be minimized by encircling the input circuitry with a guard ring operated at a potential close to that of the inputs: in inverting configurations, the guard ring should be tied to ground; in noninverting connections, to the inverting input. Guarding both sides of the printed circuit board is required. Bulk leakage reduction depends on the guard ring width. Nanoampere level leakage into the offset trim terminals can affect offset voltage and drift with temperature.

Teflon is a trademark of Dupont.

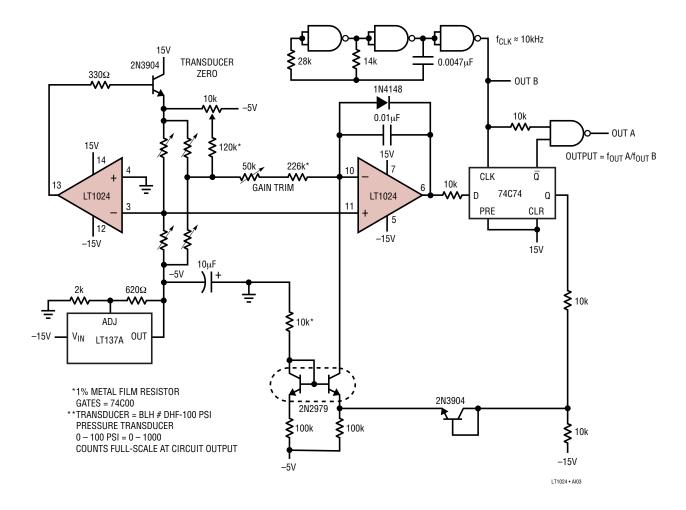

Microvolt level error voltages can also be generated in the external circuitry. Thermocouple effects, caused by temperature gradients across dissimilar metals at the contacts to the input terminals, can exceed the inherent drift of the amplifier. Air currents over device leads should be minimized, package leads should be short, and the two input leads should be as close together as possible and maintained at the same temperature.
