# TLP2095

Programmable logic controllers

High-speed line receivers

Microprocessor system interfaces

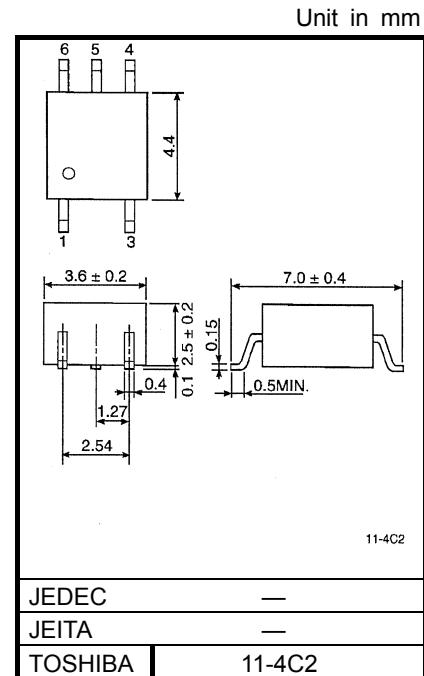

The Toshiba TLP2095 consists of two GaAlAs light emitting diodes optically coupled to a high-gain, high-speed photodetector.

The TLP2095 is housed in a 6-pin MFSOP.

With a totem-pole output, the TLP2095 is capable of both sinking and sourcing current.

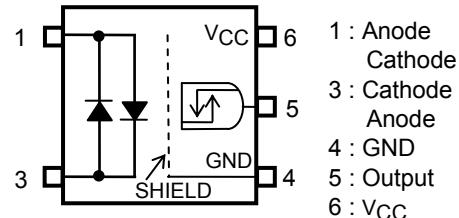

The TLP2095 has an internal Faraday shield, which provides a guaranteed common-mode transient immunity of  $\pm 10 \text{ kV}/\mu\text{s}$ .

The TLP2095 has a noninverting output. An inverting-output version, the TLP2098, is also available.

Weight: 0.09 g (typ.)

## Soldering and Storage

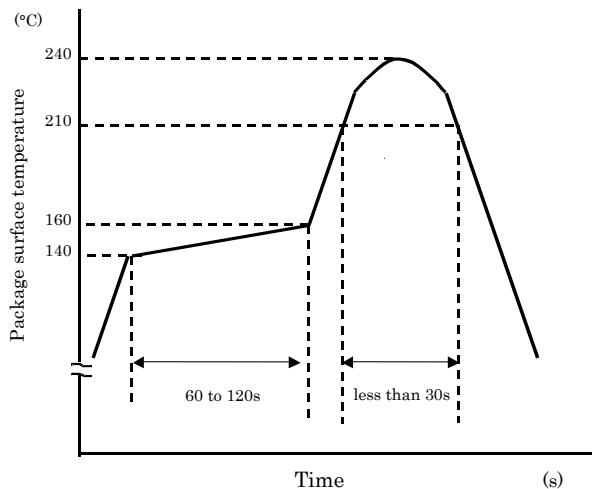

### 1. Soldering

#### 1.1 Soldering

When using a soldering iron or medium infrared ray/hot air reflow, avoid a rise in device temperature as much as possible by observing the following conditions.

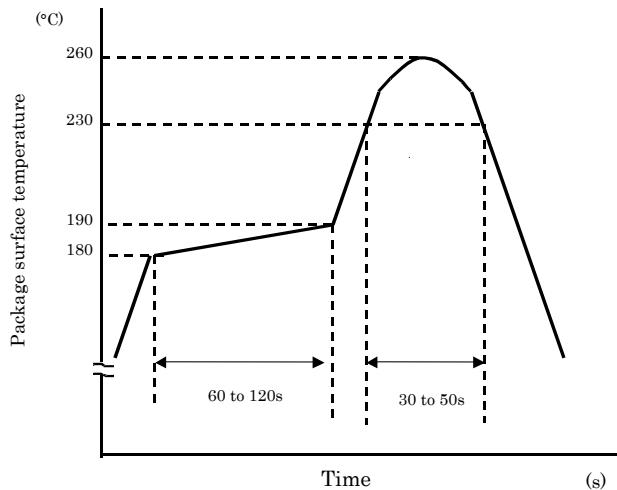

##### 1) Using solder reflow

- Temperature profile example of lead (Pb) solder

This profile is based on the device's maximum heat resistance guaranteed value. Set the preheat temperature/heating temperature to the optimum temperature corresponding to the solder paste type used by the customer within the described profile.

- Temperature profile example of using lead (Pb)-free solder

This profile is based on the device's maximum heat resistance guaranteed value. Set the preheat temperature/heating temperature to the optimum temperature corresponding to the solder paste type used by the customer within the described profile.

##### 2) Using solder flow (for lead (Pb) solder, or lead (Pb)-free solder)

- Please preheat it at 150°C between 60 and 120 seconds.
- Complete soldering within 10 seconds below 260°C. Each pin may be heated at most once.

##### 3) Using a soldering iron

Complete soldering within 10 seconds below 260°C, or within 3 seconds at 350°C. Each pin may be heated at most once.

## 2. Storage

- 1) Avoid storage locations where devices may be exposed to moisture or direct sunlight.
- 2) Follow the precautions printed on the packing label of the device for transportation and storage.
- 3) Keep the storage location temperature and humidity within a range of 5°C to 35°C and 45% to 75% respectively.
- 4) Do not store the products in locations with poisonous gases (especially corrosive gases) or in dusty conditions.
- 5) Store the products in locations with minimal temperature fluctuations. Rapid temperature changes during storage can cause condensation, resulting in lead oxidation or corrosion, which will deteriorate the solderability of the leads.
- 6) When restoring devices after removal from their packing, use anti-static containers.
- 7) Do not allow loads to be applied directly to devices while they are in storage.
- 8) If devices have been stored for more than two years under normal storage conditions, it is recommended that you check the leads for ease of soldering prior to use.
