

NCT6776F / NCT6776D

Nuvoton LPC I/O

Date: July 12th, 2011 Revision 1.2

Table of Contents –

1.	GENERAL DESCRIPTION	1
2.	FEATURES	2
3.	BLOCK DIAGRAM	6
4.	PIN LAYOUT	7
5.	PIN DESCRIPTION.....	9
5.1	LPC Interface	10
5.2	FDC Interface.....	10
5.3	Multi-Mode Parallel Port.....	11
5.4	Serial Port Interface	13
5.5	KBC Interface	14
5.6	CIR Interface	14
5.7	Hardware Monitor Interface.....	15
5.8	VID Input/Output	16
5.9	Intel® PECI Interface	16
5.10	Advanced Configuration & Power Interface	17
5.11	Advanced Sleep State Control	17
5.12	Port 80 Message Display & LED Control	18
5.13	SMBus Interface.....	18
5.14	Hard Disk Message Display & LED Control.....	19
5.15	Power Pins	19
5.16	AMD Power-On Sequence.....	19
5.17	Intel Serial VID	19
5.18	AMD Serial VID	20
5.19	AMD SB-TSI Interface.....	20
5.20	Dual Voltage Control	20
5.21	DSW	20
5.22	IR.....	21
5.23	General Purpose I/O Port.....	21
5.23.1	GPIO-0 Interface.....	21
5.23.2	GPIO-1 Interface.....	22
5.23.3	GPIO-2 Interface.....	23
5.23.4	GPIO-3 Interface.....	23
5.23.5	GPIO-4 Interface.....	24
5.23.6	GPIO-5 Interface.....	25
5.23.7	GPIO-6 Interface.....	26
5.23.8	GPIO-7 Interface.....	26
5.23.9	GPIO-8 Interface.....	27
5.23.10	GPIO-9 Interface.....	28
5.23.11	GPIO-A Interface	28
5.24	Strapping Pins.....	29
5.25	Internal pull-up, pull-down pins	30
6.	GLUE LOGIC	31
6.1	ACPI Glue Logic.....	31
6.2	BKFD_CUT & LATCH_BKFD_CUT	34
6.3	3VSBSW#	35

6.4	PSON# Block Diagram.....	36
6.5	PWROK.....	37
6.6	Front Panel LEDs.....	38
6.6.1	Automatic Mode.....	38
6.6.2	Manual Mode.....	39
6.6.3	S0~S5 LED Blink Block Diagram.....	39
6.6.4	LED Pole (LED_POL).....	40
6.6.5	Deeper Sleeping State Detect Function.....	41
6.7	HDD LED.....	43
6.8	Advanced Sleep State Control (ASSC) Function.....	44
6.8.1	When ASSC is disabled.....	44
6.8.2	When ASSC is enabled (Enter into Deeper Sleeping State).....	45
6.8.3	When ASSC is enabled (Exit Deeper Sleeping State).....	45
6.8.4	SLP_S5#_LATCH Control Function.....	46
6.9	Intel DSW Function	47
6.9.1	Enter DSW State timing diagram	47
6.9.2	Exit DSW State timing diagram.....	48
6.9.3	Application Circuit.....	48
6.10	AMD Power-On Sequence.....	49
7.	CONFIGURATION REGISTER ACCESS PROTOCOL	52
7.1	Configuration Sequence.....	54
7.1.1	Enter the Extended Function Mode	54
7.1.2	Configure the Configuration Registers.....	54
7.1.3	Exit the Extended Function Mode.....	55
7.1.4	Software Programming Example	55
8.	HARDWARE MONITOR	56
8.1	General Description	56
8.2	Access Interfaces.....	56
8.3	LPC Interface	56
8.4	I ² C interface.....	58
8.5	Analog Inputs	59
8.5.1	Voltages Over 2.048 V or Less Than 0 V	60
8.5.2	Voltage Data Format.....	60
8.5.2.1.	Voltage Reading	60
8.5.3	Temperature Data Format	61
8.5.3.1.	Monitor Temperature from Thermistor.....	61
8.5.3.2.	Monitor Temperature from Thermal Diode (Voltage Mode).....	61
8.5.3.3.	Monitor Temperature from Thermal Diode (Current Mode)	62
8.5.3.4.	Temperature Reading.....	62
8.6	PECI.....	63
8.7	Fan Speed Measurement and Control.....	65
8.7.1	Fan Speed Reading.....	65
8.7.2	Fan Speed Calculation by Fan Count Reading.....	65
8.7.3	Fan Speed Calculation by Fan RPM Reading	65
8.7.4	Fan Speed Control.....	65
8.7.5	SMART FAN™ Control.....	66
8.7.6	Temperature Source & Reading for Fan Control	67
8.8	SMART FAN™ I	68

8.8.1	Thermal Cruise Mode	68
8.8.2	Speed Cruise Mode	69
8.9	SMART FAN™ IV & Close Loop Fan Control Mode	71
8.9.1	Step Up Time / Step Down Time	74
8.9.2	Fan Output Start-up Value	74
8.9.3	Fan Output Stop Value	74
8.9.4	Fan Output Stop Time	75
8.9.5	Fan Output Step	75
8.9.6	Revolution Pulse Selection	75
8.9.7	Weight Value Control	76
8.10	Alert and Interrupt	78
8.10.1	SMI# Interrupt Mode	78
8.10.2	Voltage SMI# Mode	78
8.10.3	Fan SMI# Mode	79
8.10.4	Temperature SMI# Mode	79
8.10.4.1.	Temperature Sensor 1 SMI# Interrupt (Default: SYSTIN).....	79
8.10.4.2.	SMI# Interrupt of Temperature Sensor 2 (Default: CPUTIN) and Temperature Sensor 3 (Default: AUXTIN) and Temperature Sensor 4 (Default: SYSTIN) and Temperature Sensor 5 (Default: SYSTIN) and Temperature Sensor 6 (Default: SYSTIN)	81
8.10.5	OVT# Interrupt Mode	84
8.10.6	Caseopen Detection	85
8.11	Power Measurement	86
9.	HARDWARE MONITOR REGISTER SET	87
9.1	Address Port (Port x5h).....	87
9.2	Data Port (Port x6h)	87
9.3	SYSFANOUT PWM Output Frequency Configuration Register – Index 00h (Bank 0).....	87
9.4	SYSFANOUT Output Value Select Register – Index 01h (Bank 0)	88
9.5	CPUFANOUT PWM Output Frequency Configuration Register – Index 02h (Bank 0)	89
9.6	CPUFANOUT Output Value Select Register – Index 03h (Bank 0).....	90
9.7	SYSFANOUT Configuration Register I – Index 04h (Bank 0).....	90
9.8	Reserved Register – Index 05h ~ 0Fh (Bank 0)	90
9.9	AUXFANOUT PWM Output Frequency Configuration Register – Index 10h (Bank 0).....	91
9.10	AUXFANOUT Output Value Select Register – Index 11h (Bank 0).....	91
9.11	Reserved Register – Index 12-17h (Bank 0).....	92
9.12	OVT# Configuration Register – Index 18h (Bank 0)	92
9.13	Reserved Registers – Index 19h ~ 1Fh (Bank 0).....	92
9.14	Value RAM — Index 20h ~ 3Fh (Bank 0).....	92
9.15	Configuration Register – Index 40h (Bank 0)	93
9.16	Interrupt Status Register 1 – Index 41h (Bank 0).....	94
9.17	Interrupt Status Register 2 – Index 42h (Bank 0).....	94
9.18	SMI# Mask Register 1 – Index 43h (Bank 0)	95
9.19	SMI# Mask Register 2 – Index 44h (Bank 0)	95
9.20	Interrupt Status Register 4 – Index 45h (Bank 0).....	96
9.21	SMI# Mask Register 3 – Index 46h (Bank 0)	96
9.22	Reserved Register – Index 47h (Bank 0).....	97
9.23	Serial Bus Address Register – Index 48h (Bank 0)	97
9.24	Reserved Register – Index 49h ~ 4Bh (Bank 0)	97
9.25	SMI/OVT Control Register1 – Index 4Ch (Bank 0)	97

9.26	FAN IN/OUT Control Register – Index 4Dh (Bank 0)	98
9.27	Bank Select Register – Index 4Eh (Bank 0).....	99
9.28	Nuvoton Vendor ID Register – Index 4Fh (Bank 0)	99
9.29	Reserved Register – Index 50h ~ 57h (Bank 0).....	99
9.30	Chip ID – Index 58h (Bank 0).....	99
9.31	Reserved Register – Index 59h ~ 5Ch (Bank 0).....	100
9.32	VBAT Monitor Control Register – Index 5Dh (Bank 0)	100
9.33	Current Mode Enable Register – Index 5Eh (Bank 0)	100
9.34	Reserved Register – Index 5F (Bank 0).....	101
9.35	PORT 80 DATA INPUT Register – Index 60 (Bank 0).....	101
9.36	Reserved Register – Index 61F ~ 62F (Bank 0)	101
9.37	Reserved Register – Index 65 (Bank 0).....	101
9.38	Reserved Register – Index 66 (Bank 0).....	101
9.39	Reserved register – Index 67h ~ 72h (Bank 0).....	101
9.40	MONITOR TEMPERATURE 1 Register (Integer Value)- Index 73h (Bank 0).....	101
9.41	MONITOR TEMPERATURE 1 Register (Fractional Value)- Index 74h (Bank 0).....	102
9.42	MONITOR TEMPERATURE 2 Register (Integer Value)- Index 75h (Bank 0).....	102
9.43	MONITOR TEMPERATURE 2 Register (Fractional Value)- Index 76h (Bank 0).....	102
9.44	MONITOR TEMPERATURE 3 Register (Integer Value)- Index 77h (Bank 0).....	103
9.45	MONITOR TEMPERATURE 3 Register (Fractional Value)- Index 78h (Bank 0).....	103
9.46	Reserved Register – Index 79h~ADh (Bank 0).....	103
9.47	PECI Temperature Reading Enable for SMIOVT and SMART FAN Control Register – Index AEh (Bank 0).....	103
9.48	BEEP Control Register 1 – Index B2h (Bank0).....	104
9.49	BEEP Control Register 2 – Index B3h (Bank0).....	104
9.50	BEEP Control Register 3 – Index B4h (Bank0).....	105
9.51	BEEP Control Register 4 – Index B5h (Bank0).....	106
9.52	SYSFAN Monitor Temperature Source Select Register/ STOPDUTY Enable Register – Index 00h (Bank 1).....	106
9.53	SYSFAN Target Temperature Register / SYSFANIN Target Speed_L Register – Index 01h (Bank 1).....	107
9.54	SYSFAN MODE Register / SYSFAN TOLERRANCE Register – Index 02h (Bank 1)	108
9.55	SYSFANOUT Step Up Time Register – Index 03h (Bank 1)	108
9.56	SYSFANOUT Step Down Time Register – Index 04h (Bank 1)	108
9.57	SYSFANOUT Stop Value Register – Index 05h (Bank 1)	109
9.58	SYSFANOUT Start-up Value Register – Index 06h (Bank 1).....	109
9.59	SYSFANOUT Stop Time Register – Index 07h (Bank 1).....	109
9.60	Reserved Register – Index 08h (Bank 1).....	110
9.61	SYSFANOUT Output Value Select Register – Index 09h (Bank 1).....	110
9.62	SYSFANIN Tolerance_H / Target Speed_H Register – Index 0Ch (Bank 1)	110
9.63	Reserved Register – Index 0Dh (Bank 1)	110
9.64	SMART FAN IV SYSFANOUT STEP Register – Index 20h (Bank 1)	110
9.65	SYSFAN (SMART FAN TM IV) Temperature 1 Register(T1) – Index 21h (Bank 1)	111
9.66	SYSFAN (SMART FAN TM IV) Temperature 2 Register(T2) – Index 22h (Bank 1)	111
9.67	SYSFAN (SMART FAN TM IV) Temperature 3 Register(T3) – Index 23h (Bank 1)	111
9.68	SYSFAN (SMART FAN TM IV) Temperature 4 Register(T4) – Index 24h (Bank 1)	112
9.69	SYSFAN (SMART FAN TM IV) DC/PWM 1 Register – Index 27h (Bank 1)	112

9.70	SYSFAN (SMART FAN™ IV) DC/PWM 2 Register – Index 28h (Bank 1)	112
9.71	SYSFAN (SMART FAN™ IV) DC/PWM 3 Register – Index 29h (Bank 1)	112
9.72	SYSFAN (SMART FAN™ IV) DC/PWM 4 Register – Index 2Ah (Bank 1)	113
9.73	Reserved Register – Index 2Bh~30h (Bank 1)	113
9.74	SYSFAN 3-Wire Enable Register – Index 31h (Bank 1)	113
9.75	Reserved Register – Index 32h ~ 34h (Bank 1)	113
9.76	SYSFAN (SMART FAN™ IV) Critical Temperature Register – Index 35h (Bank 1)	113
9.77	Reserved Register – Index 36h ~ 37h (Bank 1)	114
9.78	SYSFANOUT Critical Temperature Tolerance Register – Index 38h (Bank 1)	114
9.79	Weight value Configuration Register – Index 39h (Bank 1)	114
9.80	SYSFANOUT Temperature Step Register – Index 3Ah (Bank 1)	115
9.81	SYSFANOUT Temperature Step Tolerance Register – Index 3Bh (Bank 1)	115
9.82	SYSFANOUT Weight Step Register – Index 3Ch (Bank 1)	115
9.83	SYSFANOUT Temperature Base Register – Index 3Dh (Bank 1)	115
9.84	SYSFANOUT Temperature Fan Duty Base Register – index 3Eh (Bank 1)	116
9.85	Reserved Register – Index 3Fh (Bank 1)	116
9.86	Reserved Register – Index 40h (Bank 1)	116
9.87	Reserved Register – Index 41h (Bank 1)	116
9.88	Reserved Register – Index 42h ~ 44h (Bank 1)	116
9.89	Reserved Register – Index 45h (Bank 1)	116
9.90	Reserved Register – Index 46h (Bank 1)	116
9.91	Reserved Register – Index 49h ~ 4Fh (Bank1)	116
9.92	SMIOVT2 Temperature Source (High Byte) Register – Index 50h (Bank 1)	116
9.93	SMIOVT2 Temperature Source (Low Byte) Register – Index 51h (Bank 1)	117
9.94	SMIOVT2 Temperature Source Configuration Register – Index 52h (Bank 1)	117
9.95	SMIOVT2 Temperature Source Hysteresis (High Byte) Register – Index 53h (Bank 1)	117
9.96	SMIOVT2 Temperature Source Hysteresis (Low Byte) Register – Index 54h (Bank 1)	118
9.97	SMIOVT2 Temperature Source Over-temperature (High Byte) Register – Index 55h (Bank1)	118
9.98	SMIOVT2 Temperature Source Over-temperature (Low Byte) Register – Index 56h (Bank 1)	118
9.99	Reserved Register – Index 57h ~ 7Fh (Bank 1)	118
9.100	CPUFAN Monitor Temperature Source Select Register/ STOPDUTY Enable Register – Index 00h (Bank 2)	119
9.101	CPUFAN Target Temperature Register / CPUFANIN Target Speed_L Register – Index 01h (Bank 2)	119
9.102	CPUFAN MODE Register / CPUFAN TOLERRANCE Register – Index 02h (Bank 2)	120
9.103	CPUFANOUT Step Up Time Register – Index 03h (Bank 2)	120
9.104	CPUFANOUT Step Down Time Register – Index 04h (Bank 2)	120
9.105	CPUFANOUT Stop Value Register – Index 05h (Bank 2)	121
9.106	CPUFANOUT Start-up Value Register – Index 06h (Bank 2)	121
9.107	CPUFANOUT Stop Time Register – Index 07h (Bank 2)	121
9.108	Reserved Register – Index 08h (Bank 2)	122
9.109	CPUFANOUT Output Value Select Register – Index 09h (Bank 2)	122
9.110	CPUFANIN Tolerance_H / Target Speed_H Register – Index 0Ch (Bank 2)	122
9.111	Reserved Register – Index 0Dh (Bank 2)	122
9.112	SMART FAN IV CPUFANOUT STEP Register – Index 20h (Bank 2)	122

9.113	CPUFAN (SMART FAN™ IV) Temperature 1 Register(T1) – Index 21h (Bank 2).....	123
9.114	CPUFAN (SMART FAN™ IV) Temperature 2 Register(T2) – Index 22h (Bank 2).....	123
9.115	CPUFAN (SMART FAN™ IV) Temperature 3 Register(T3) – Index 23h (Bank 2).....	123
9.116	CPUFAN (SMART FAN™ IV) Temperature 4 Register(T4) – Index 24h (Bank 2).....	123
9.117	CPUFAN (SMART FAN™ IV) DC or DUTY_SMF4 PWM1 Register – Index 27h (Bank 2)	124
9.118	CPUFAN (SMART FAN™ IV) DC or DUTY_SMF4 PWM2 Register – Index 28h (Bank 2)	124
9.119	CPUFAN (SMART FAN™ IV) DC or DUTY_SMF4 PWM3 Register – Index 29h (Bank 2)	124
9.120	CPUFAN (SMART FAN™ IV) DC or DUTY_SMF4 PWM4 Register – Index 2Ah (Bank 2)	124
9.121	Reserved Register – Index 2Dh~ 30h (Bank 2).....	125
9.122	CPUFAN 3-Wire FAN Enable Register – Index 31h (Bank 2)	125
9.123	Reserved Register – Index 32h ~ 34h(Bank 2).....	125
9.124	CPUFAN (SMART FAN™ IV) Critical Temperature Register – Index 35h (Bank 2)	125
9.125	Reserved Register – Index 36h ~ 37h (Bank 2).....	125
9.126	CPUFANOUT Critical Temperature Tolerance Register – Index 38h (Bank 2).....	125
9.127	Weight value Configuration Register – Index 39h (Bank 2).....	126
9.128	CPUFANOUT Temperature Step Register – Index 3Ah (Bank 2)	127
9.129	CPUFANOUT Temperature Step Tolerance Register – Index 3Bh (Bank 2)	127
9.130	CPUFANOUT Weight Step Register – Index 3Ch (Bank 2)	127
9.131	CPUFANOUT Temperature Base Register – Index 3Dh (Bank 2)	127
9.132	CPUFANOUT Temperature Fan Duty Base Register – Index 3Eh (Bank 2).....	128
9.133	Reserved Register – Index 3Fh (Bank 2).....	128
9.134	Reserved Register – Index 40h (Bank 2).....	128
9.135	Reserved Register – Index 41h (Bank 2).....	128
9.136	Reserved Register – Index 42h ~ 44h (Bank 2).....	128
9.137	Reserved Register – Index 45h (Bank 2).....	128
9.138	Reserved Register – Index 46h (Bank 2).....	128
9.139	Reserved Register – Index 49h ~ 4Fh (Bank2)	128
9.140	SMIOVT3 Temperature Source (High Byte) Register – Index 50h (Bank 2)	128
9.141	SMIOVT3 Temperature Source (Low Byte) Register – Index 51h (Bank 2).....	128
9.142	SMIOVT3 Temperature Source Configuration Register – Index 52h (Bank 2).....	129
9.143	SMIOVT3 Temperature Source Hysteresis (High Byte) Register – Index 53h (Bank 2)	129
9.144	SMIOVT3 Temperature Source Hysteresis (Low Byte) Register – Index 54h (Bank 2)	129
9.145	SMIOVT3 Temperature Source Over-temperature (High Byte) Register – Index 55h (Bank 2)	130
9.146	SMIOVT3 Temperature Source Over-temperature (Low Byte) Register – Index 56h (Bank 2)	130
9.147	Reserved Register – Index 57h ~ 7Fh (Bank 2)	130
9.148	AUXFAN Monitor Temperature Source Select Register/ STOPDUTY Enable Register – Index 00h (Bank 3).....	130
9.149	AUXFAN Target Temperature Register / AUXFANIN Target Speed_L Register – Index 01h (Bank 3).....	131
9.150	AUXFAN MODE Register / AUXFAN TOLERRANCE Register – Index 02h (Bank 3).....	132
9.151	AUXFANOUT Step Up Time Register – Index 03h (Bank 3).....	132
9.152	AUXFANOUT Step Down Time Register – Index 04h (Bank 3).....	132
9.153	AUXFANOUT Stop Value Register – Index 05h (Bank 3)	133
9.154	AUXFANOUT Start-up Value Register – Index 06h (Bank 3).....	133
9.155	AUXFANOUT Stop Time Register – Index 07h (Bank 3)	133

9.156	Reserved Register – Index 08h (Bank 3).....	133
9.157	AUXFANOUT Output Value Select Register – Index 09h (Bank 3).....	134
9.158	AUXFANIN Tolerance_H / Target Speed_H Register – Index 0Ch (Bank 3).....	134
9.159	Reserved Register – Index 0Dh (Bank 3).....	134
9.160	SMART FAN IV AUXFANOUT STEP Register – Index 20h (Bank 3).....	134
9.161	AUXFAN (SMART FAN TM IV) Temperature 1 Register(T1) – Index 21h (Bank 3).....	135
9.162	AUXFAN (SMART FAN TM IV) Temperature 2 Register(T2) – Index 22h (Bank 3).....	135
9.163	AUXFAN (SMART FAN TM IV) Temperature 3 Register(T3) – Index 23h (Bank 3).....	135
9.164	AUXFAN (SMART FAN TM IV) Temperature 4 Register(T4) – Index 24h (Bank 3).....	135
9.165	AUXFAN (SMART FAN TM IV) DC/PWM 1 Register – Index 27h (Bank 3).....	136
9.166	AUXFAN (SMART FAN TM IV) DC/PWM 2 Register – Index 28h (Bank 3).....	136
9.167	AUXFAN (SMART FAN TM IV) DC/PWM 3 Register – Index 29h (Bank 3).....	136
9.168	AUXFAN (SMART FAN TM IV) DC/PWM 4 Register – Index 2Ah (Bank 3).....	136
9.169	Reserved Register – Index Index 2Dh~ 30h (Bank 3).....	137
9.170	AUXFAN 3-Wire Enable Register – Index 31h (Bank 3).....	137
9.171	Reserved Register – Index 32h ~ 34h(Bank 3).....	137
9.172	AUXFAN (SMART FAN TM IV) Critical Temperature Register – Index 35h (Bank 3).....	137
9.173	Reserved Register – Index 36h ~ 37h (Bank 3).....	137
9.174	AUXFANOUT Critical Temperature Tolerance Register – Index 38h (Bank 3).....	137
9.175	Weight value Configuration Register – Index 39h (Bank 3).....	138
9.176	AUXFANOUT Temperature Step Register – Index 3Ah (Bank 3).....	139
9.177	AUXFANOUT Temperature Step Tolerance Register – Index 3Bh (Bank 3).....	139
9.178	AUXFANOUT Weight Step Register – Index 3Ch (Bank 3).....	139
9.179	AUXFANOUT Temperature Base Register – Index 3Dh (Bank 3).....	139
9.180	AUXFANOUT Temperature Fan Duty Base Register – Index 3Eh (Bank 3).....	140
9.181	Reserved Register – Index 3Fh (Bank 3).....	140
9.182	Reserved Register – Index 40h (Bank 3).....	140
9.183	Reserved Register – Index 41h (Bank 3).....	140
9.184	Reserved Register – Index 42h ~ 44h (Bank 3).....	140
9.185	Reserved Register – Index 45h (Bank 3).....	140
9.186	Reserved Register – Index 46h (Bank 3).....	140
9.187	Reserved Register – Index 47h ~ 7Fh (Bank3).....	140
9.188	PCH_CHIP_CPU_MAX_TEMP Register – Index 00h (Bank 4).....	140
9.189	PCH_CHIP_TEMP Register – Index 01h (Bank 4).....	140
9.190	PCH_CPU_TEMP_H Register – Index 02h (Bank 4).....	141
9.191	PCH_CPU_TEMP_L Register – Index 03h (Bank 4).....	141
9.192	PCH_MCH_TEMP Register – Index 04h (Bank 4).....	141
9.193	PCH_DIM0_TEMP Register – Index 05h (Bank 4).....	142
9.194	PCH_DIM1_TEMP Register – Index 06h (Bank 4).....	142
9.195	PCH_DIM2_TEMP Register – Index 07h (Bank 4).....	142
9.196	PCH_DIM3_TEMP Register – Index 08h (Bank 4).....	142
9.197	PCH_TSI0_TEMP_H Register – Index 09h (Bank 4).....	143
9.198	PCH_TSI0_TEMP_L Register – Index 0Ah (Bank 4).....	143
9.199	PCH_TSI1_TEMP_H Register – Index 0Bh (Bank 4).....	143

1. GENERAL DESCRIPTION

The NCT6776F / NCT6776D is a member of Nuvoton's Super I/O product line. The NCT6776F / NCT6776D monitors several critical parameters in PC hardware, including power supply voltages, fan speeds, and temperatures. In terms of temperature monitoring, the NCT6776F / NCT6776D adopts the Current Mode (dual current source) and thermistor sensor approach. The NCT6776F / NCT6776D also supports the Smart Fan control system, including "SMART FAN™ I and SMART FAN™ IV, which makes the system more stable and user-friendly.

The NCT6776F / NCT6776D supports four – 360K, 720K, 1.2M, 1.44M, or 2.88M – disk drive types and data transfer rates of 250 Kb/s, 300 Kb/s, 500 Kb/s, 1 Mb/s, and 2 Mb/s. The disk drive adapter supports the functions of floppy disk drive controller (compatible with the industry standard 82077/ 765), data separator, write pre-compensation circuit, decode logic, data rate selection, clock generator, drive interface control logic, and interrupt and DMA logic. Such a wide range of functions integrated into one NCT6776F / NCT6776D greatly reduce the number of required components to interface with floppy disk drives.

The NCT6776F / NCT6776D provides two high-speed serial communication port (UART), which includes a 16-byte send/receive FIFO, a programmable baud rate generator, complete modem-control capability, and a processor interrupt system. The UART supports legacy speeds up to 115.2K bps as well as even higher baud rates of 230K, 460K, or 921K bps to support higher speed modems.

The NCT6776F / NCT6776D supports the PC-compatible printer port (SPP), the bi-directional printer port (BPP), the enhanced parallel port (EPP) and the extended capabilities port (ECP). The NCT6776F / NCT6776D supports keyboard and mouse interface which is 8042-based keyboard controller.

The NCT6776F / NCT6776D provides flexible I/O control functions through a set of general purpose I/O (GPIO) ports. These GPIO ports may serve as simple I/O ports or may be individually configured to provide alternative functions.

The NCT6776F / NCT6776D supports the Intel® PECI (Platform Environment Control Interface) and AMD® SB-TSI interface. The NCT6776F / NCT6776D supports separated VID input and output pins for Vcore voltage adjustment. It also supports AMD® CPU power on sequence, and it also supports Intel® Deep Sleep Well glue logic to help customers to reduce the external circuits needed while using Deep Sleep Well function.

The NCT6776F / NCT6776D supports to decode port 80 diagnostic messages on the LPC bus. This could help on system power on debugging. It also supports two-color LED control to indicate system power states. The NCT6776F / NCT6776D supports Consumer IR function for remote control purpose. It also supports Advanced Power Saving function to further reduce the power consumption while the system is at S5 state.

The configuration registers inside the NCT6776F / NCT6776D support mode selection, function enable and disable, and power-down selection. Furthermore, the configurable PnP features are compatible with the plug-and-play feature in Windows, making the allocation of the system resources more efficient than ever.

2. FEATURES

General

- Meet LPC Specification 1.1
- Support AMD power on sequence
- Support LDRQ# (LPC DMA), SERIRQ (Serialized IRQ)
- Integrated hardware monitor functions
- Support DPM (Device Power Management), ACPI (Advanced Configuration and Power Interface)
- Programmable configuration settings
- Single 24-MHz or 48-MHz clock input
- Support selective pins of 5 V tolerance

FDC

- Variable write pre-compensation with track-selection capability
- Support vertical recording format
- DMA-enable logic
- 16-byte data FIFO
- Support floppy disk drives and tape drives
- Detect all overrun and underrun conditions
- Built-in address mark detection circuit to simplify the read electronics
- FDD anti-virus functions with software write protect and FDD-write enable signal (write data signal forced to be inactive)
- Support 3.5-inch or 5.25-inch floppy disk drives
- Compatible with industry standard 82077
- 360K / 720K / 1.2M / 1.44M / 2.88M formats
- 250K, 300K, 500K, 1M, 2M bps data transfer rate
- Support 3-mode FDD and its Windows driver

UART

- Two high-speed, 16550-compatible UART with 16-byte send / receive FIFO
- Support RS485
 - Supports auto flow control
- Fully programmable serial-interface characteristics:
 - 5, 6, 7 or 8-bit characters
 - Even, odd or no parity bit generation / detection
 - 1, 1.5 or 2 stop-bit generation
- Internal diagnostic capabilities:
 - Loop-back controls for communications link fault isolation
 - Break, parity, overrun, framing error simulation
- Programmable baud rate generator allows division of clock source by any value from 1 to $(2^{16} - 1)$
- Maximum baud rate for clock source 14.769 MHz is up to 921K bps. The baud rate at 24 MHz is 1.5 M bps.

Parallel Port

Compatible with IBM® parallel port
 Support PS/2-compatible bi-directional parallel port
 Support Enhanced Parallel Port (EPP) – Compatible with IEEE 1284 specification
 Support Extended Capabilities Port (ECP) – Compatible with IEEE 1284 specification
 Enhanced printer port back-drive current protection

Keyboard Controller

8042-based keyboard controller
 Asynchronous access to two data registers and one status register
 Software-compatible with 8042
 Support PS/2 mouse
 Support Port 92
 Support both interrupt and polling modes
 Fast Gate A20 and Hardware Keyboard Reset
 12MHz operating frequency

Hardware Monitor Functions

Smart Fan control system
 Programmable threshold temperature to speed fan fully while current temperature exceeds this threshold in the Thermal Cruise™ mode
 Support Current Mode (dual current source) temperature sensing method
 Nine voltage inputs (CPUVCORE, VIN[0..3], 3VCC, AVCC, 3VSB and VBAT)
 Five fan-speed monitoring inputs
 Three fan-speed controls
 Dual mode for fan control (PWM and DC) for SYSFANOUT
 Built-in case-open and CPU socket occupied detection circuit
 Programmable hysteresis and setting points for all monitored items
 Issue SMI#, OVT# (Over-temperature) to activate system protection
 Nuvoton Health Manager support
 Provide I²C master / slave interface to read / write registers

CIR and IR (Infrared)

- Support IrDA version 1.0 SIR protocol with maximum baud rate up to 115.2K bps
- Support SHARP ASK-IR protocol with maximum baud rate up to 57,600 bps
- Support Consumer IR, including CIRTx, CIRRx, CIRRxWB, CIR LED, CIR SENSE

VCORE Voltage Adjustment

Support INTEL® VRM11.1 VID input to VID output
 Watch Dog Timer for VID over-voltage failure recovery
 Support AMD® Parallel VID input to VID output
 Support Intel® VR12 SVID
 Support AMD® Serial VID input to Serial VID output

General Purpose I/O Ports

GPIO0 ~ GPIOA programmable general purpose I/O ports
Two access channels, indirect (via 2E/2F or 4E/4F) and direct (Base Address) access.

ACPI Configuration

Support Glue Logic functions
Support general purpose Watch Dog Timer functions

OnNow Functions

Keyboard Wake-Up by programmable keys
Mouse Wake-Up by programmable buttons
OnNow Wake-Up from all of the ACPI sleeping states (S1-S5)

PECI Interface

Support PECI 1.1, 2.0 and 3.0 specification
Support 2 CPU addresses and 2 domains per CPU address

AMD SB-TSI Interface

Support AMD® SB-TSI specification

SMBus Interface

Support SMBus Slave interface to report Hardware Monitor device data
Support SMBus Master interface to get thermal data from PCH
Support SMBus Master interface to get thermal data from MXM module

Power Measurement

Support Power Consumption measurement
Fading LED driver control for power status and diagnostic indications

Intel Deep Sleep Well (DSW) Glue Logic

Support Deep Sleep Well (DSW) Glue Logic

AMD® CPU Power on Sequence

Support AMD® CPU power on sequence

Advanced Power Saving

Advanced Sleep State Control to save motherboard Stand-by power consumption

Operation voltage

- 3.3 voltage

Package

NCT6776F 128-pin QFP

NCT6776D 128-pin LQFP

Figure 4-1 NCT6776F Pin Layout

Figure 4-2 NCT6776D Pin Layout

5. PIN DESCRIPTION

Note: Please refer to 25.2 DC CHARACTERISTICS for details.

AOUT	- Analog output pin
AIN	- Analog input pin
IN _{tp3}	- 3.3V TTL-level input pin
IN _{tsp3}	- 3.3V TTL-level, Schmitt-trigger input pin
IN _{gp5}	- 5V GTL-level input pin
IN _{tp5}	- 5V TTL-level input pin
IN _{tscup5}	- 5V TTL-level, Schmitt-trigger, input buffer with controllable pull-up
IN _{tsp5}	- 5V TTL-level, Schmitt-trigger input pin
IN _{tdp5}	- 5V TTL-level input pin with internal pull-down resistor
O ₈	- output pin with 8-mA source-sink capability
OD ₈	- open-drain output pin with 8-mA sink capability
O ₁₂	- output pin with 12-mA source-sink capability
OD ₁₂	- open-drain output pin with 12-mA sink capability
O ₂₄	- output pin with 24-mA source-sink capability
OD ₂₄	- open-drain output pin with 24-mA sink capability
O ₄₈	- output pin with 48-mA source-sink capability
OD ₄₈	- open-drain output pin with 48-mA sink capability
I/O _{v3}	- Bi-direction pin with source capability of 6 mA and sink capability of 1 mA
I/O _{v4}	- Bi-direction pin with source capability of 6 mA
O _{12cu}	- output pin 12-mA source-sink capability with controllable pull-up
OD _{12cu}	- open-drain 12-mA sink capability output pin with controllable pull-up

5.1 LPC Interface

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
15	IOCLK	I	IN _{tp5}	VCC	System clock input, either 24MHz or 48MHz. The actual frequency must be specified by 24M_48M_SEL strapping.
65	PME#	O	OD ₁₂	VSB	Generated PME event.
17	PCICLK	I	IN _{tp3}	VCC	PCI-clock 33-MHz input.
18	LDRQ#	O	O ₁₂	VCC	Encoded DMA Request signal.
19	SERIRQ	I/O	IN _{tp3} O ₁₂ OD ₁₂	VCC	Serialized IRQ input / output.
20-23	LAD[3:0]	I/O	IN _{tp3} OD ₁₂	VCC	These signal lines communicate address, control, and data information over the LPC bus between a host and a peripheral.
25	LFRAME#	I	IN _{tp3}	VCC	Indicates the start of a new cycle or the termination of a broken cycle.
26	LRESET#	I	IN _{tp3}	VCC	Reset signal. It can be connected to the PCIRST# signal on the host.

5.2 FDC Interface

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
2	DRV DEN0	O	OD ₂₄	VCC	Drive Density Select bit 0.
3	INDEX#	I	IN _{tscup5}	VCC	This Schmitt-trigger input from the disk drive is active-low when the head is positioned over the beginning of a track marked by an index hole. This input pin needs to connect a pulled-up 1-KΩ resistor to 5V for Floppy Drive compatibility.
4	MOA#	O	OD ₂₄	VCC	Motor A On. When set to 0, this pin activates disk drive A. This is an open-drain output.
5	DSA#	O	OD ₂₄	VCC	Drive Select A. When set to 0, this pin activates disk drive A. This is an open-drain output.
6	DIR#	O	OD ₂₄	VCC	Direction of the head step motor. An open-drain output. Logic 1 = outward motion Logic 0 = inward motion
7	STEP#	O	OD ₂₄	VCC	Step output pulses. This active-low open-drain output produces a pulse to move the head to another track.
8	WD#	O	OD ₂₄	VCC	Write data. This logic-low open-drain writes pre-compensation serial data to the selected FDD. An open-drain output.
9	WE#	O	OD ₂₄	VCC	Write enable. An open-drain output.

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
10	TRAK0#	I	IN _{tscup5}	VCC	Track 0. This Schmitt-trigger input from the disk drive is active-low when the head is positioned over the outermost track. This input pin needs to connect a pulled-up 1-K Ω resistor to 5V for Floppy Drive compatibility.
11	WP#	I	IN _{tscup5}	VCC	Write protected. This active-low Schmitt input from the disk drive indicates that the diskette is write-protected. This input pin needs to connect a pulled-up 1-K Ω resistor to 5V for Floppy Drive compatibility.
12	RDATA#	I	IN _{tscup5}	VCC	The read-data input signal from the FDD. This input pin needs to connect a pulled-up 1-K Ω resistor to 5V for Floppy Drive compatibility.
13	HEAD#	O	OD ₂₄	VCC	Head selection. This open-rain output determines which disk drive head is active. Logic 1 = side 0 Logic 0 = side 1
14	DSKCHG#	I	IN _{tscup5}	VCC	Diskette change. This signal is active-low at power-on and whenever the diskette is removed. This input pin needs to connect a pulled-up 1-K Ω resistor to 5V for Floppy Drive compatibility.

5.3 Multi-Mode Parallel Port

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
38	SLCT	I	IN _{tsp5}	VSB	PRINTER MODE: An active-high input on this pin indicates that the printer is selected. See the description of the parallel port for the definition of this pin in ECP and EPP modes.
39	PE	I	IN _{tsp5}	VSB	PRINTER MODE: An active-high input on this pin indicates that the printer has detected the end of the paper. See the description of the parallel port for the definitions of this pin in ECP and EPP modes.
40	BUSY	I	IN _{tsp5}	VSB	PRINTER MODE: An active-high input indicates that the printer is not ready to receive data. See the description of the parallel port for the definitions of this pin in ECP and EPP modes.
41	ACK#	I	IN _{tsp5}	VSB	PRINTER MODE: ACK# An active-low input on this pin indicates that the printer has received data and is ready to accept more data. See the descriptions of the parallel port for the definition of this pin in ECP and EPP modes.
53	ERR#	I	IN _{tsp5}	VSB	PRINTER MODE: ERR# An active-low input on this pin indicates that the printer has encountered an error condition. See the description of the parallel port for the definitions of this pin in ECP and EPP modes.

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
51	SLIN#	O	O ₁₂	VSB	PRINTER MODE: SLIN# Output line for detection of printer selection. See the description of the parallel port for the definitions of this pin in ECP and EPP modes.
52	INIT#	O	O ₁₂	VSB	PRINTER MODE: INIT# Output line for the printer initialization. See the description of the parallel port for the definitions of this pin in ECP and EPP modes.
54	AFD#	O	O ₁₂	VSB	PRINTER MODE: AFD# An active-low output from this pin causes the printer to auto feed a line after a line is printed. See the description of the parallel port for the definitions of this pin in ECP and EPP modes.
55	STB#	O	O ₁₂	VSB	PRINTER MODE: STB# An active-low output is used to latch the parallel data into the printer. See the description of the parallel port for the definitions of this pin in ECP and EPP modes.
50	PD0	I/O	IN _{tsp5} O ₁₂	VSB	PRINTER MODE: PD0 Parallel port data bus bit 0. See the description of the parallel port for the definitions of this pin in ECP and EPP modes.
49	PD1	I/O	IN _{tsp5} O ₁₂	VSB	PRINTER MODE: PD1 Parallel port data bus bit 1. See the description of the parallel port for the definitions of this pin in ECP and EPP modes.
48	PD2	I/O	IN _{tsp5} O ₁₂	VSB	PRINTER MODE: PD2 Parallel port data bus bit 2. See the description of the parallel port for the definitions of this pin in ECP and EPP modes.
47	PD3	I/O	IN _{tsp5} O ₁₂	VSB	PRINTER MODE: PD3 Parallel port data bus bit 3. See the description of the parallel port for the definitions of this pin in ECP and EPP modes.
45	PD4	I/O	IN _{tsp5} O ₁₂	VSB	PRINTER MODE: PD4 Parallel port data bus bit 4. See the description of the parallel port for the definition of this pin in ECP and EPP modes.
44	PD5	I/O	IN _{tsp5} O ₁₂	VSB	PRINTER MODE: PD5 Parallel port data bus bit 5. See the description of the parallel port for the definitions of this pin in ECP and EPP modes.
43	PD6	I/O	IN _{tsp5} O ₁₂	VSB	PRINTER MODE: PD6 Parallel port data bus bit 6. See the description of the parallel port for the definitions of this pin in ECP and EPP modes.

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
42	PD7	I/O	IN _{tp5} O ₂₄	VSB	PRINTER MODE: PD7 Parallel port data bus bit 7. See the description of the parallel port for the definitions of this pin in ECP and EPP modes.

5.4 Serial Port Interface

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
36	RIA#	I	IN _{tp5}	VSB	Ring Indicator. An active-low signal indicates that a ring signal is being received from the modem or the data set.
35	DCDA#	I	IN _{tp5}	VSB	Data Carrier Detection. An active-low signal indicates the modem or data set has detected a data carrier.
34	SOUTA	O	O ₁₂	VSB	UART A Serial Output. This pin is used to transmit serial data out to the communication link.
33	SINA	I	IN _{tp5}	VSB	Serial Input. This pin is used to receive serial data through the communication link.
32	DTRA#	O	O ₁₂	VSB	UART A Data Terminal Ready. An active-low signal informs the modem or data set that the controller is ready to communicate.
31	RTSA#	O	O ₁₂	VSB	UART A Request To Send. An active-low signal informs the modem or data set that the controller is ready to send data.
30	DSRA#	I	IN _{tp5}	VSB	Data Set Ready. An active-low signal indicates the modem or data set is ready to establish a communication link and transfer data to the UART.
29	CTSA#	I	IN _{tp5}	VSB	Clear To Send. This is the modem-control input. The function of these pins can be tested by reading bit 4 of the handshake status register.
123	RIB#	I	IN _{tp5}	VSB	Ring Indicator. An active-low signal indicates that a ring signal is being received from the modem or the data set.
122	DCDB#	I	IN _{tp5}	VSB	Data Carrier Detection. An active-low signal indicates the modem or data set has detected a data carrier.
121	SOUTB	O	O ₁₂	VSB	UART B Serial Output. This pin is used to transmit serial data out to the communication link.
120	SINB	I	IN _{tp5}	VSB	Serial Input. This pin is used to receive serial data through the communication link.
119	DTRB#	O	O ₁₂	VSB	UART B Data Terminal Ready. An active-low signal informs the modem or data set that the controller is ready to communicate.
118	RTSB#	O	O ₁₂	VSB	UART B Request To Send. An active-low signal informs the modem or data set that the controller is ready to send data.

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
117	DSRB#	I	IN _{tp5}	VSB	Data Set Ready. An active-low signal indicates the modem or data set is ready to establish a communication link and transfer data to the UART.
116	CTSB#	I	IN _{tp5}	VSB	Clear To Send. This is the modem-control input. The function of these pins can be tested by reading bit 4 of the handshake status register.

5.5 KBC Interface

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
27	GA20M	O	O ₁₂	VCC	Gate A20 output. This pin is high after system reset. (KBC P21)
28	KBRST#	O	O ₁₂	VCC	Keyboard reset. This pin is high after system reset. (KBC P20)
58	KCLK	I/O	IN _{tsp5} OD ₁₂	VSB	Keyboard Clock.
59	KDAT	I/O	IN _{tsp5} OD ₁₂	VSB	Keyboard Data.
56	MCLK	I/O	IN _{tsp5} OD ₁₂	VSB	PS2 Mouse Clock.
57	MDAT	I/O	IN _{tsp5} OD ₁₂	VSB	PS2 Mouse Data.

5.6 CIR Interface

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
95	CIRRX	I	IN _{tsp5}	VSB	CIR input for long length
96	CIRTX1	O	O ₁₂	VSB	CIR transmission output
6	CIRTX2	O	O ₂₄	VCC	CIR transmission output
55	CIRTX3	O	O ₁₂	VSB	CIR transmission output
38	CIRRXWB	I	IN _{tsp5}	VSB	CIR input for wide band.
11	CIR_SENSE1	I	IN _{tsp5}	VCC	It could be CIR function by Nuvoton CIR driver.
12	CIR_SENSE2	I	IN _{tsp5}	VCC	It could be CIR function by Nuvoton CIR driver.
13	CIRLED	O	OD ₂₄	VCC	It could be CIR function by Nuvoton CIR driver.

5.7 Hardware Monitor Interface

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
102	SKTOCC#	I	IN _{tp5}	VRTC	CPU socket occupied detection
100	CASEOPEN0#	I	IN _{tp5}	VRTC	CASE OPEN 0 detection. An active-low input from an external device when the case is open. This signal can be latched if pin VBAT is connected to the battery, even if the system is in G3 state. Pulling up a 2-MΩ resistor to VBAT is recommended if not in use.
72	CASEOPEN1#	I	IN _{tp5}	VRTC	CASE OPEN 1 detection. An active-low input from an external device when the case is open. This signal can be latched if pin VBAT is connected to the battery, even if the system is in G3 state. Pulling up a 2-MΩ resistor to VBAT is recommended if not in use.
103	VIN2	I	AIN	AVCC	Analog input for voltage measurement (Range: 0 to 2.048 V)
104	VIN1	I	AIN	AVCC	Analog input for voltage measurement (Range: 0 to 2.048 V)
105	VIN0	I	AIN	AVCC	Analog input for voltage measurement (Range: 0 to 2.048 V)
107	CPUVCORE	I	AIN	AVCC	Analog input for voltage measurement (Range: 0 to 2.048 V)
108	VREF	O	AOUT	AVCC	Reference Voltage (around 2.048 V).
109	VIN3 / AUXTIN	I	AIN	AVCC	Analog input for voltage measurement (Range: 0 to 2.048V)
110	CPUTIN	I	AIN	AVCC	The input of temperature sensor 2. It is used for CPU temperature sensing.
111	SYSTIN	I	AIN	AVCC	The input of temperature sensor 1. It is used for system temperature sensing.
128	OVT#	O	OD ₁₂	VCC	The output of over temperature Shutdown. This pin indicates the temperature is over the temperature limit. (Default after LRESET#)
	SMI#	O	OD ₁₂	VCC	System Management Interrupt channel output.
83	OVT#	O	OD ₁₂	VSB	The output of over temperature Shutdown. This pin indicates the temperature is over the temperature limit. (Default after LRESET#)
3	AUXFANIN0	I	IN _{tp5}	VCC	0 to +5 V amplitude fan tachometer input.
4	AUXFANIN1	I	IN _{tp5}	VCC	0 to +5 V amplitude fan tachometer input.
5	AUXFANIN2	I	IN _{tp5}	VCC	0 to +5 V amplitude fan tachometer input.
98	AUXFANOUT	O	O ₁₂ OD ₁₂	VSB	PWM duty-cycle signal for fan speed control.

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
124	CPUFANIN	I	IN _{tsp5}	VCC	0 to +5 V amplitude fan tachometer input.
125	CPUFANOUT	O	O ₁₂ OD ₁₂	VCC	PWM duty-cycle signal for fan speed control.
126	SYSFANIN	I	IN _{tsp5}	VCC	0 to +5 V amplitude fan tachometer input.
127	SYSFANOUT	O	O ₁₂ OD ₁₂ AOUT	VCC	PWM duty-cycle signal for fan speed control. DC voltage output for fan speed control.
51	BEEP	O	OD ₁₂	VSB	Beep function for hardware monitor.

5.8 VID Input/Output

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
116 117 118 119 120 121 122 123	VIDI7 VIDI6 VIDI5 VIDI4 VIDI3 VIDI2 VIDI1 VIDI0	I	IN _{gp5}	VSB	VID input detection, also with output control.
86 87 88 89 90 91 92 93	VIDO7 VIDO6 VIDO5 VIDO4 VIDO3 VIDO2 VIDO1 VIDO0	O	OD ₁₂	VSB	VID Output. These pins could be connected to VCORE voltage regulator's VID input pins.
53	VID_RST#	I	IN _{gp5}	VSB	VID external reset.

5.9 Intel® PECI Interface

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
115	PECI	I/O	I/O _{V3}	Vtt	INTEL® CPU PECI interface. Connect to CPU.
114	Vtt	I	Power	Vtt	INTEL® CPU Vtt Power.

5.10 Advanced Configuration & Power Interface

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
61	PSIN#	I	IN _{tp5}	VSBS	Panel Switch Input. This pin is active-low with an internal pulled-up resistor.
60	PSOUT#	O	OD ₁₂	VSBS	Panel Switch Output. This signal is used to wake-up the system from S3/S5 state.
101	RSMRST#	O	OD ₁₂	VRTC	Resume reset signal output.
64	SLP_S3#	I	IN _{tp5}	VSBS	SLP_S3# input.
84	SLP_S5#	I	IN _{tp5}	VSBS	SLP_S5# input.
80	ATXPGD	I	IN _{tp5}	VSBS	ATX power good signal.
63	PSON#	O	OD ₁₂	VSBS	Power supply on-off output.
82	PWROK	O	O ₁₂ OD ₁₂	VRTC	3VCC PWROK signal.
81	CPUPWRGD	O	O ₁₂ OD ₁₂	VRTC	3VCC PWROK signal.
83	RESETCONI#	I	IN _{tp5}	VSBS	Connect to the reset button. This pin has internal de-bounce circuit whose de-bounce time is at least 16 mS.
37	RESETCONO#	O	OD ₁₂	VSBS	RESETCON output.
70	3VSBSW	O	OD ₁₂	VRTC	Switch 3VSBS power to memory when in S3 state.
71	3VSBSW#	O	O ₂₄	VSBS	Switch 3VSBS power to memory when in S3 state.
79	RSTOUT0#	O	OD ₂₄	VSBS	PCI Reset Buffer 0. (from pin26)
78	RSTOUT1#	O	O ₂₄ OD ₂₄	VSBS	PCI Reset Buffer 1. (from pin26) This pin default is push-pull output and could be programmed to open-drain output by register Logic Device A, CRF7 bit6.
77	RSTOUT2#	O	O ₂₄ OD ₂₄	VSBS	PCI Reset Buffer 2. (from pin26) This pin default is push-pull output and could be programmed to open-drain output by register Logic Device A, CRF7 bit7.

5.11 Advanced Sleep State Control Control

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
62	SLP_S5#_LATCH	O	O ₁₂	VSBS	This pin has the same signal output as SLP_S5#, but keeps the output signal high while in deep S3
70	DEEP_S5	O	OD ₁₂	VSBS	This pin is to control system power for entering "more power saving mode".

5.12 Port 80 Message Display & LED Control

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
42	DGH#	O	O ₂₄	VS _B	Common cathode output of high nibble display on decoded Port 0x80h message. Switching frequency is about 4 KHz.
41	DGL#	O	O ₂₄	VS _B	Common cathode output of low nibble display on decoded Port 0x80h message. Switching frequency is about 4 KHz.
50 49 48 47 45 44 43	LED_A LED_B LED_C LED_D LED_E LED_F LED_G	O	O ₁₂	VS _B	Anode outputs for 7-Segment LED.
39	YLW_LED	O	O ₁₂	VS _B	Yellow LED output control. This pin could indicate the power status.
40	GRN_LED	O	O ₁₂	VS _B	Green LED output control. This pin could indicate the power status.

5.13 SMBus Interface

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
75	SCL	I/O	IN _{tsp5} OD ₁₂	VS _B	SMBus slave clock.
76	SDA	I/O	IN _{tsp5} OD ₁₂	VS _B	SMBus slave bi-directional Data.
52	SCL	I/O	IN _{tsp5} OD ₁₂	VS _B	SMBus slave clock.
51	SDA	I/O	IN _{tsp5} OD ₁₂	VS _B	SMBus slave bi-directional Data.
75	MSCL	I/O	IN _{tsp5} OD ₁₂	VS _B	SMBus master clock. The SMBus master function could be performed through either pin#51, pin#52 or pin#75, pin#76.
76	MSDA	I/O	IN _{tsp5} OD ₁₂	VS _B	SMBus master bi-directional Data. The SMBus master function could be performed through either pin#51, pin#52 or pin#75, pin#76.
52	MSCL	I/O	IN _{tsp5} OD ₁₂	VS _B	SMBus master clock. The SMBus master function could be performed through either pin#51, pin#52 or pin#75, pin#76.
51	MSDA	I/O	IN _{tsp5} OD ₁₂	VS _B	SMBus master bi-directional Data. The SMBus master function could be performed through either pin#51, pin#52 or pin#75, pin#76.

5.14 Hard Disk Message Display & LED Control

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
7	HD_LED#	O	O ₂₄	VCC	Hard disk operation message output for LED.
10	PRIMARY_HD#	I	IN _{tsp5}	VCC	LED control. The primary HD control the LED.
14	SECONDARY_HD#	I	IN _{tsp5}	VCC	LED control. The secondary HD control the LED.

5.15 Power Pins

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
46, 85	3VSB	I		3VSB	+3.3 V stand-by power supply for the digital circuits.
99	VBAT	I		VBAT	+3 V on-board battery for the digital circuits.
1,24	VCC	I		VCC	+3.3 V power supply for driving 3 V on host interface.
106	AVCC	I		AVCC3	Analog +3.3 V power input. Internally supply power to all analog circuits.
112	CPUD- / AGND	I		CPUD- / AGND	Analog ground. The ground reference for all analog input. Internally connected to all analog circuits. This pin should be connected to ground.
16, 94	VSS	I		VSS	Ground.
114	VTT	I		VTT	INTEL® CPU Vtt power.

5.16 AMD Power-On Sequence

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
107	CPUVCORE	I	AIN	AVCC	Power sequence group B signal
104	VLDT	I	AIN	AVCC	Power sequence group C signal
105	VDIMM	I	AIN	AVCC	Memory power enable
87	VCORE_EN	O	OD ₁₂	VSB	CPU Vcore power enable
86	VLDT_EN	O	OD ₁₂	VSB	Hyper transport I/O power enable
81	CPUPWRGD	O	OD ₁₂	VSB	AMD power on sequence ok signal
63	AMD_PSON#	O	OD ₁₂	VSB	Power supply on/off output to enable ATX

5.17 Intel Serial VID

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
68	VCLKI	I	IN _{gp5}	VSB	Intel Serial VID input clock signal from CPU
69	VDIOI	I	IN _{gp5}	VSB	Intel Serial VID input data signal from CPU

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
54	ALERTI#	I	IN _{gp5}	VSB	Intel Serial VID input alert signal from Regulator
66	VCLKO	O	OD ₁₂	VSB	Intel Serial VID output clock signal to Regulator
67	VDIOO	O	OD ₁₂	VSB	Intel Serial VID output data signal to Regulator
55	ALERTO#	O	OD ₁₂	VSB	Intel Serial VID output alert signal to CPU

5.18 AMD Serial VID

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
74	VRM_EN	I	IN _{tp5}	VSB	Active high signal generated by system to enable Regulator
68	VCLKI	I	IN _{gp5}	VSB	AMD Serial VID input clock signal from CPU
69	VDIOI	I	IN _{gp5}	VSB	AMD Serial VID input data signal from CPU
66	VCLKO	O	OD ₁₂	VSB	AMD Serial VID output clock signal to Regulator
67	VDIOO	O	OD ₁₂	VSB	AMD Serial VID output data signal to Regulator

5.19 AMD SB-TSI Interface

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
113	TSIC	O	OD ₁₂	VCC	AMD SB-TSI clock output.
115	TSID	I/O	IN _{tsp3} OD ₁₂	VCC	AMD SB-TSI data input / output.

5.20 Dual Voltage Control

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
73	BKFD_CUT	O	OD ₁₂	VSB	Power distribution control (When switching between main and standby regulators) for system transition into and out of the S3 sleep state.
71	LATCH_BK FD_CUT#	O	O ₂₄	VSB	Power distribution control (When switching between main and standby regulators) for system transition into and out of the S5 sleep state.
70	LATCH_BK FD_CUT	O	O ₁₂	VRTC	Power distribution control (When switching between main and standby regulators) for system transition into and out of the S5 sleep state.

5.21 DSW

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
54	SLP_SUS#	I	IN _{tp5}	VSB	This pin connects to SLP_SUS# in CPT PCH

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
66	SUS_WARN_5 V DUAL	O	OD ₁₂	VS B	This pin links to external 5V DUAL control circuits
67	SUSACK#	O	OD ₁₂	VS B	This pin connects to SUSACK# in CPT PCH
68	5V DUAL	I	AIN	VS B	Analog input to monitor 5V DUAL voltage
74	SUSWARN#	I	IN _{tp5}	VS B	This pin connects to SUSWARN# in CPT PCH
77	SLP_SUS_FET	O	OD ₁₂	VS B	This pin connects to VS B power switch
89	SLP_SUS#	I	IN _{tp5}	VS B	This pin connects to SLP_SUS# in CPT PCH
90	SUS_WARN_5 V DUAL	O	OD ₁₂	VS B	This pin links to external 5V DUAL control circuits
91	SUSACK#	O	OD ₁₂	VS B	This pin connects to SUSACK# in CPT PCH
92	5V DUAL	I	AIN	VS B	Analog input to monitor 5V DUAL voltage
93	SUSWARN#	I	IN _{tp5}	VS B	This pin connects to SUSWARN# in CPT PCH
88	SLP_SUS_FET	O	OD ₁₂	VS B	This pin connects to VS B power switch
97	PCHVS B	I	AIN	VS B	PCHVS B function

5.22 IR

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
95	IRRX1	I	IN _{tp5}	VS B	IR Receiver input.
96	IRTX1	O	O ₁₂	VS B	IR Transmitter output.
120	IRRX2	I	IN _{tp5}	VS B	IR Receiver input.
121	IRTX2	O	O ₁₂	VS B	IR Transmitter output.

5.23 General Purpose I/O Port

5.23.1 GPIO-0 Interface

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
2	GP00	I/O	IN _{tp5} O ₂₄ OD ₂₄	VCC	General-purpose I/O port 0 bit 0.
4	GP01	I/O	IN _{tp5} O ₂₄ OD ₂₄	VCC	General-purpose I/O port 0 bit 1.
5	GP02	I/O	IN _{tp5} O ₂₄ OD ₂₄	VCC	General-purpose I/O port 0 bit 2.

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
8	GP03	I/O	IN _{tp5} O ₂₄ OD ₂₄	VCC	General-purpose I/O port 0 bit 3.
9	GP04	I/O	IN _{tp5} O ₂₄ OD ₂₄	VCC	General-purpose I/O port 0 bit 4.
11	GP05	I/O	IN _{tsp5} O ₁₂ OD ₁₂	VCC	General-purpose I/O port 0 bit 5.
12	GP06	I/O	IN _{tsp5} O ₁₂ OD ₁₂	VCC	General-purpose I/O port 0 bit 6.
13	GP07	I/O	IN _{tp5} O ₂₄ OD ₂₄	VCC	General-purpose I/O port 0 bit 7.

5.23.2 GPIO-1 Interface

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
123	GP10	I/O	IN _{tp5} O ₁₂ OD ₁₂	VSB	General-purpose I/O port 1 bit 0.
122	GP11	I/O	IN _{tp5} O ₁₂ OD ₁₂	VSB	General-purpose I/O port 1 bit 1.
121	GP12	I/O	IN _{tp5} O ₁₂ OD ₁₂	VSB	General-purpose I/O port 1 bit 2.
120	GP13	I/O	IN _{tp5} O ₁₂ OD ₁₂	VSB	General-purpose I/O port 1 bit 3.
119	GP14	I/O	IN _{tp5} O ₁₂ OD ₁₂	VSB	General-purpose I/O port 1 bit 4.
118	GP15	I/O	IN _{tp5} O ₁₂ OD ₁₂	VSB	General-purpose I/O port 1 bit 5.

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
117	GP16	I/O	IN _{tp5} O ₁₂ OD ₁₂	VSB	General-purpose I/O port 1 bit 6.
116	GP17	I/O	IN _{tp5} O ₁₂ OD ₁₂	VSB	General-purpose I/O port 1 bit 7.

5.23.3 GPIO-2 Interface

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
59	GP20	I/O	IN _{tsp5} O ₁₂ OD ₁₂	VSB	General-purpose I/O port 2 bit 0.
58	GP21	I/O	IN _{tsp5} O ₁₂ OD ₁₂	VSB	General-purpose I/O port 2 bit 1.
57	GP22	I/O	IN _{tsp5} O ₁₂ OD ₁₂	VSB	General-purpose I/O port 2 bit 2.
56	GP23	I/O	IN _{tsp5} O ₁₂ OD ₁₂	VSB	General-purpose I/O port 2 bit 3.
95	GP24	I/O	IN _{tsp5} O ₁₂ OD ₁₂	VSB	General-purpose I/O port 2 bit 4.
96	GP25	I/O	IN _{tp5} O ₁₂ OD ₁₂	VSB	General-purpose I/O port 2 bit 5.
98	GP27	I/O	IN _{tp5} O ₁₂ OD ₁₂	VSB	General-purpose I/O port 2 bit 7.

5.23.4 GPIO-3 Interface

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
84	GP30	I/O	IN _{tp5} O ₁₂ OD ₁₂	VSB	General-purpose I/O port 3 bit 0.

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
83	GP31	I/O	IN _{tp5} O ₁₂ OD ₁₂	VSB	General-purpose I/O port 3 bit 1.
82	GP32	I/O	IN _{tp5} O ₁₂ OD ₁₂	VRTC	General-purpose I/O port 3 bit 2.
81	GP33	I/O	IN _{tp5} O ₁₂ OD ₁₂	VRTC	General-purpose I/O port 3 bit 3.
80	GP34	I/O	IN _{tp5} O ₁₂ OD ₁₂	VSB	General-purpose I/O port 3 bit 4.
79	GP35	I/O	IN _{tp5} O ₂₄ OD ₂₄	VSB	General-purpose I/O port 3 bit 5.
78	GP36	I/O	IN _{tp5} O ₂₄ OD ₂₄	VSB	General-purpose I/O port 3 bit 6.
77	GP37	I/O	IN _{tp5} O ₂₄ OD ₂₄	VSB	General-purpose I/O port 3 bit 7.

5.23.5 GPIO-4 Interface

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION
62	GP40	I/O	IN _{tp5} O ₁₂ OD ₁₂	VSB	General-purpose I/O port 4 bit 0.
52	GP41	I/O	IN _{tsp5} O ₁₂ OD ₁₂	VSB	General-purpose I/O port 4 bit 1.
51	GP42	I/O	IN _{tsp5} O ₁₂ OD ₁₂	VSB	General-purpose I/O port 4 bit 2.
41	GP43	I/O	IN _{tsp5} O ₂₄ OD ₂₄	VSB	General-purpose I/O port 4 bit 3.

PIN	SYMBOL	I/O	BUFFER TYPE	POWER WELL	DESCRIPTION

Advanced Configuration & Power Interface					
PSIN#	61	3VSB	Pull-up	47.03K	

Note1. FDC internal pull-up resistors could be controlled by Logic Device 0, CRF0 bit7. (=1, has pull-up; =0, no pull-up (default))

Note2. Active only during VCC Power-up reset

Note3. Active only during VSB Power-up reset

6. GLUE LOGIC

6.1 ACPI Glue Logic

Table 6-1 Pin Description

SYMBOL	PIN	DESCRIPTION
SLP_S5#	84	SLP_S5# input.
RESETCNI#	83	RESETCN# input signal. This pin has internal de-bounce circuit whose de-bounce time is at least 16 mS.
RESETCNO#	37	RESETCN# output signal.
PWROK	82	This pin generates the PWROK signals while 3VCC is present.
ATXPGD	80	ATX power good input signal. It is connected to the PWROK signal from the power supply for PWROK/PWRGD generation. The default is enabled.
RSMRST#	101	The RSMRST# signal is a reset output and is used as the VSB power on reset signal for the South Bridge. When the NCT6776F / NCT6776D detects the 3VSB voltage rises to "V1", it then starts a delay – "t1" before the rising edge of RSMRST# asserting. If the 3VSB voltage falls below "V2", the RSMRST# de-asserts immediately. When the 3VSB voltage falls below "Vg", it then starts a delay – "tg" before the falling edge of RSMRST# de-asserting. If the 3VSB voltage rises above "V2", the RSMRST# asserts immediately.

Figure 6-1 RSMRST#

Figure 6-2 PWROK

Figure 6-3 RESETCONI# and PWROK

Figure 6-4 RSTOUTX# and LRESET#

TIMING	PARAMETER	MIN	MAX	UNIT
t1	Valid 3VSB to RSMRST# inactive	200	300	mS
tg	3VSB Glitch allowance		1	uS
td	Falling 3VSB supply Delay		1	uS
t2	Valid 3VCC to PWROK active	300	500	mS

TIMING	PARAMETER	MIN	MAX	UNIT
t3	RESETCONI# de-bounce	15	20	mS
t4	RESETCONO# and PWROK active	See LDB CRFA		
t5	RESETCONO# active to PWROK active	1	2	uS
t6	RESETCONO# inactive to RESETCONI# detect	2	3	S
t7	LRESET# active to RSTOUTx# active	0	80	nS
t8	LRESET# inactive to RSTOUTx# inactive	0	80	nS

DC	PARAMETER	MIN	MAX	UNIT
V1	3VSB Valid Voltage	-	3.033	Volt
V2	3VSB Ineffective Voltage	2.882	-	Volt
V3	3VCC Valid Voltage	-	2.83	Volt
V4	3VCC Ineffective Voltage	2.68	-	Volt
Vg	3VSB drops by Power noise	2	-	Volt

Note : 1. The values above are the worst-case results of R&D simulation.

6.2 BKFD_CUT & LATCH_BKFD_CUT

NCT6776F / NCT6776D supports BKFD_CUT & LATCH_BKFD_CUT functions, please refer the timing diagram below:

Figure 6-5 BKFD_CUT and LATCH_BKFD_CUT

BKFD_CUT (Backfeed_Cut) – When high, switches dual rails to standby power.

LATCH_BKFD_CUT (Latched_Backfeed_Cut) – When high, switches dual rails to standby power.

6.3 3VSBSW#

Figure 6-6 3VSBSW#

TIMING	PARAMETER	MIN	MAX	UNIT
t9	SLP_S3# active to 3VSBSW# active	0	30	mS
t10	3VCC active to 3VSBSW# inactive	90	142	mS
t11	SLP_S3# inactive to PSON# active	0	80	nS
t12	SLP_S3# active to PSON# inactive	15	45	mS
t13	SLP_S3# minimal Low Time	40	-	mS

6.4 PSIN# Block Diagram

The PSIN# function controls the main power on/off. The main power is turned on when PSIN# is low. Please refer to the figure below.

Figure 6-7 PSIN# Block Diagram

6.5 PWROK

PWROK Signal indicates the main power (VCC Power) is valid. Besides, valid PWROK signal also requires the following conditions, as shown in the figure below.

Figure 6-8 PWROK Block Diagram

6.6 Front Panel LEDs

NCT6776F / NCT6776D supports two LED control pins – GRN_LED and YLW_LED.

For dual-color LED application:

(1)GRN_LED pin is connected to a 470ohm resistor to 5VSB, and the cathode of the green LED and the anode of the yellow LED.

(2)YLW_LED pin is connected to a 470ohm resistor to 5VSB, and the cathode of the yellow LED and the anode of the green LED.

Figure 6-9 Illustration of Dual Color LED application

GRN_LED and YLW_LED pins are designed to show currently power states. There are Manual Mode and Automatic Mode:

6.6.1 Automatic Mode

Power state is S0 or S1: GRN_LED will be asserted by default.

Power state is S3: YLW_LED will be asserted by default.

Power state is S4 or S5: Both GRN_LED and YLW_LED will be de-asserted by default.

AUTO_EN	GRN_LED_RST (YLW_LED_RST)	Pwr State	SLP_S3#	SLP_S5#	GRN_LED	YLW_LED
1	X	S0,S1	1	1	GRN_BLK_FREQ	HIGH-Z
1	X	S3	0	1	HIGH-Z	YLW_BLK_FREQ
1	X	S4,S5	X	0	HIGH-Z	HIGH-Z

6.6.2 Manual Mode

AUTO_EN	GRN_LED_RST# (YLW_LED_RST)	Pwr State	SLP_S3#	SLP_S5#	GRN_LED	YLW_LED
0	0	S0,S1	1	1	GRN_BLK_FREQ	YLW_BLK_FREQ
0	0	S3	0	1	HIGH-Z	HIGH-Z
0	0	S4,S5	X	0	HIGH-Z	HIGH-Z
0	1	S0,S1	1	1	GRN_BLK_FREQ	YLW_BLK_FREQ
0	1	S3	0	1	GRN_BLK_FREQ	YLW_BLK_FREQ
0	1	S4,S5	X	0	GRN_BLK_FREQ	YLW_BLK_FREQ

Register Neme	Register Location
AUTO_EN	Logic Device B, CRF7h, bit7
GRN_BLK_FREQ	Logic Device B, CRF7h, bit3~0
YLW_BLK_FREQ	Logic Device B, CRF8h, bit3~0
GRN_LED_RST#	Logic Device B, CRF7h, bit6
YLW_LED_RST#	Logic Device B, CRF8h, bit6

6.6.3 S0~S5 LED Blink Block Diagram

6.6.4 LED Pole (LED_POL)

Set to 0b, GRN_LED output is active low, as the following Figure(a)

Set to 1b, GRN_LED output is active high, as the following Figure(b)

Figure 6-10 Illustration of LED polarity

6.6.5 Deeper Sleeping State Detect Function

These two LED pins could also be used to indicate if the system is in Deeper Sleeping State. For more detail, please refer to the section of Advanced Sleep State Control Function.

Enable_DEEP_S5	GRN_DEEPS#_Disable (YLW_DEEPS#_Disable)	Pwr State	GRN_LED	YLW_LED
1	0	DEEP_S5	DeepS5_GRN_BLK_FREQ	DeepS5_YLW_BLK_FREQ
1	1	DEEP_S5	HIGH-Z	HIGH-Z
0	X	S0~S5	S0~S5 behavior	S0~S5 behavior

Enable_DEEP_S3	GRN_DEEPS#_Disable (YLW_DEEPS#_Disable)	Pwr State	GRN_LED	YLW_LED
1	0	DEEP_S3	DeepS3_GRN_BLK_FREQ	DeepS3_YLW_BLK_FREQ
1	1	DEEP_S3	HIGH-Z	HIGH-Z
0	X	S0~S5	S0~S5 behavior	S0~S5 behavior

6.7 HDD LED

HDD LED is used for Hard Drive Disk, red LED indicator, and it will drive low when PRIMARY_HDD# = 0 or SECONDARY_HDD# = 0. Below shows the simplified diagram of the circuit that generates the HDD LED signal.

6.8 Advanced Sleep State Control (ASSC) Function

Advanced Sleep State Control (ASSC) Function is used to control the system power at S3 or S5 state. The purpose of this function is to provide a method to reduce power consumption at S3 or S5 state. This function is disabled by default. When VCC power is first supplied, BIOS can program the register to enable ASSC Function. The register is powered by 3VSB_IO and some is powered by VBAT. The related registers are located at Logic Device 16 CRE0h ~ CRE3h.

Figure 6-11 ASSC Application Diagram

6.8.1 When ASSC is disabled

When ASSC is disabled, ACPI function is as same as the normal ACPI behavior.

6.8.2 When ASSC is enabled (Enter into Deeper Sleeping State)

When the first time AC plug in and enter into S0 State, BIOS can enable ASSC Function (DeepS3 or DeepS5), when the system enters S3/S5 state, the pin DEEP_S5 will be asserted after pre configuration delay time (power_off_dly_time, LD16 CRE2) to make the system entering the “Deeper Sleeping State (DSS)” where system’s VSB power is cut off. When pin DEEP_S5 asserts, the pin RSMRST# will de-assert by detecting PSOUT# signal (monitor 3VSB SYS Power).

6.8.3 When ASSC is enabled (Exit Deeper Sleeping State)

When any Wakeup Event (PSIN#, KB MS Wakeup, CIR wakeup, GPIO Wakeup) happened, pin DEEP_S5 will be de-asserted to turn on the VSB power to the system. The pin RSMRST# will de-assert when 3VSB_SYS power reach valid voltage. And then the pin PSOUT# will issue a low pulse (T3) turn on the system after T2 time (wakeup delay time, LD16 CRE0). The PSOUT# low pulse is also programmable (LD16 CRE1). The T4 time is the delay from Deep_S5 ds-assert to Deeo_S5#_DELAY de-assert.

6.8.4 SLP_S5#_LATCH Control Function

SLP_S5#_LATCH control signal is similar to SLPS5# signal. When System is at S0 ~ S5 state, SLP_S5#_LATCH follows the SLPS5# signal. When system is at DeepS5 State, SLP_S5#_LATCH will keep low state till system returns to S0 state. When system is at DeepS3 State, SLP_S5#_LATCH will keep high till system returns to S0 state. Please see the following timing diagram:

6.9.2 Exit DSW State timing diagram

6.9.3 Application Circuit

The NCT6776 can not only provide SIO Deep S5/S3 function, but Intel DSW function. The application circuit should follow the guide below:

6.10 AMD Power-On Sequence

We support new AMD power on sequence base on ACPI power on sequence , therefore , user can choose which architecture by set the strapping pin GP25 . If GP25 is 0, only ACPI power on sequence is set , otherwise, AMD power on sequence is combined with ACPI, user can set CR2F[5] to get the same condition. To make sure CR2B[4]:GP34_SEL and CR2B[0]:GP30_SEL are "0" before running the sequence, because they are ATXPGD and SLP_S5 pin select.

When S0->S3 or S0->S5, we support two kinds of power off sequence. One is non_level detect: it means VCORE_EN will pull low as long as about 10~15ms after VLDT_EN pull low and PS_ON will pull high as long as about 10~15ms after VCORE_EN pull low. Two, level detect, means VCORE_EN will pull low depend on delay time and pre-power group VLDT_IN, and PS_ON will pull high depend on pre-power group (VDIMM_IN, ATXPGD), too. User can set CR27[1] to choose two condition and its default is "0" (level detect).

Timing Parameters

Parameter	Description	Min.	Typ.	Max.	Unit
T2	Period of VDIMM rises to 0.7V to VCORE_EN assertion	10		15	ms
T3	Period of CPUVCORE rises to 0.7V to VLDT_EN assertion	10		15	ms
T4	Period of VLDT_IN rises to 0.7V to CPUPWRGD assertion	10		15	ms
T5	Period of SLP_S3# deassertion to CPUPWRGD deassertion	10		50	ms
T6	Period of CPUPWRGD deassertion to VLDT_EN deassertion	10		15	ms
T7	Period of VLDT_EN deassertion to VCORE_EN deassertion	10		15	ms
T8	Period of VCORE_EN deassertion to PS_ON# deassertion	10		15	ms

VDDA: 2.5V (not controlled by SIO)

VDIMM: DDR 1.8V, DDR3 1.5V (not controlled by SIO)

VLDT: 1.2V

VCORE: 0.8V ~ 1.55V

To support AMD power on sequence , we add some Pinout as VLDT_EN , VCORE_EN , VLDT_12 , VDIMM_18 . The sequence is follow the figure above . CPU and NB must conform to the SPEC or else the SIO will suspend at the sequence .

7. CONFIGURATION REGISTER ACCESS PROTOCOL

The NCT6776F / NCT6776D uses a special protocol to access configuration registers to set up different types of configurations. The NCT6776F / NCT6776D has a total of 17 Logical Devices (from Logical Device 0 to Logical Device 17 with the exception of Logical Device 4, C, 10, 11, 12, 13 & 15 for backward compatibility) corresponding to fourteen individual functions: FDC (Logical Device 0), Parallel Port (Logical Device 1), UART A (Logical Device 2), UART B & IR (Logical Device 3), Keyboard Controller (Logical Device 5), CIR (Logical Device 6), GPIO6, 7, 8 & 9 (Logical Device 7), WDT1 & GPIO0, 1 & A (Logical Device 8), GPIO1, 2, 3, 4, 5, 6 & 7 (Logical Device 9), ACPI (Logical Device A), Hardware Monitor & Front Panel LED (Logical Device B), VID (Logical Device D), CIRWAKEUP (Logical Device E), GPIO (Logical Device F), SVID (Logical Device 14), Deep Sleep (Logical Device 16), and GPIOA (Logical Device 17).

It would require a large address space to access all of the logical device configuration registers if they were mapped into the normal PC address space. The NCT6776F / NCT6776D, then, maps all the configuration registers through two I/O addresses (2Eh/2Fh or 4Eh/4Fh) set at power on by the strap pin 2E_4E_SEL. The two I/O addresses act as an index/data pair to read or write data to the Super I/O. One must write an index to the first I/O address which points to the register and read or write to the second address which acts as a data register.

An extra level of security is added by only allowing data updates when the Super I/O is in a special mode, called the Extended Function Mode. This mode is entered by two successive writes of 87h data to the first I/O address. This special mode ensures no false data can corrupt the Super I/O configuration during a program runaway.

There are a set of global registers located at index 0h – 2Fh, containing information and configuration for the entire chip.

The method to access the control registers of the individual logical devices is straightforward. Simply write the desired logical device number into the global register 07h. Subsequent accesses with indexes of 30h or higher are directly to the logical device registers.

Figure 7-1 Structure of the Configuration Register

Table 7-1 Devices of I/O Base Address

LOGICAL DEVICE NUMBER	FUNCTION	I/O BASE ADDRESS
0	FDC	100h ~ FF8h
1	Parallel Port	100h ~ FF8h
2	UART A	100h ~ FF8h
3	UART B & IR	100h ~ FF8h
4	Reserved	
5	Keyboard Controller	100h ~ FFFh
6	CIR	100h ~ FF8h
7	GPIO 6, 7, 8 & 9	Reserved
8	WDT1 ,GPIO 0, 1 & A	Reserved
9	GPIO 1, 2, 3, 4, 5, 6 & 7	Reserved
A	ACPI	Reserved
B	Hardware Monitor & Front Panel LED	100h ~ FFEh
C	Reserved	
D	VID	Reserved
E	CIRWAKEUP	100h ~ FF8h
F	GPIO	Reserved
10	Reserved	
11	Reserved	
12	Reserved	
13	Reserved	
14	SVID	Reserved
15	Reserved	
16	Deep Sleep	Reserved
17	GPIO A	Reserved

7.1 Configuration Sequence

Figure 7-2 Configuration Register

To program the NCT6776F / NCT6776D configuration registers, the following configuration procedures must be followed in sequence:

- (1). Enter the Extended Function Mode.
- (2). Configure the configuration registers.
- (3). Exit the Extended Function Mode.

7.1.1 Enter the Extended Function Mode

To place the chip into the Extended Function Mode, two successive writes of 0x87 must be applied to Extended Function Enable Registers (EFERs, i.e. 2Eh or 4Eh).

7.1.2 Configure the Configuration Registers

The chip selects the Logical Device and activates the desired Logical Devices through Extended Function Index Register (EFIR) and Extended Function Data Register (EFDR). The EFIR is located at the same address as the EFER, and the EFDR is located at address (EFIR+1).

First, write the Logical Device Number (i.e. 0x07) to the EFIR and then write the number of the desired Logical Device to the EFDR. If accessing the Chip (Global) Control Registers, this step is not required.

Secondly, write the address of the desired configuration register within the Logical Device to the EFIR and then write (or read) the desired configuration register through the EFDR.

7.1.3 Exit the Extended Function Mode

To exit the Extended Function Mode, writing 0xAA to the EFER is required. Once the chip exits the Extended Function Mode, it is in the normal running mode and is ready to enter the configuration mode.

7.1.4 Software Programming Example

The following example is written in Intel 8086 assembly language. It assumes that the EFER is located at 2Eh, so the EFIR is located at 2Eh and the EFDR is located at 2Fh. If the HEFRAS (CR[26h] bit 6 showing the value of the strap pin at power on) is set, 2Eh can be directly replaced by 4Eh and 2Fh replaced by 4Fh.

This example programs the configuration register F0h (clock source) of logical device 1 (UART A) to the value of 3Ch (24MHz). First, one must enter the Extended Function Mode, then setting the Logical Device Number (Index 07h) to 01h. Then program index F0h to 3Ch. Finally, exit the Extended Function Mode.

```

;-----
; Enter the Extended Function Mode
;-----
MOV    DX, 2EH
MOV    AL, 87H
OUT    DX, AL
OUT    DX, AL

;-----
; Configure Logical Device 1, Configuration Register CRF0
;-----
MOV    DX, 2EH
MOV    AL, 07H
OUT    DX, AL      ; point to Logical Device Number Reg.
MOV    DX, 2FH
MOV    AL, 01H
OUT    DX, AL      ; select Logical Device 1
;
MOV    DX, 2EH
MOV    AL, F0H
OUT    DX, AL      ; select CRF0
MOV    DX, 2FH
MOV    AL, 3CH
OUT    DX, AL      ; update CRF0 with value 3CH

;-----
; Exit the Extended Function Mode
;-----
MOV    DX, 2EH
MOV    AL, AAH
OUT    DX, AL

```

8. HARDWARE MONITOR

8.1 General Description

The NCT6776F / NCT6776D monitors several critical parameters in PC hardware, including power supply voltages, fan speeds, and temperatures, all of which are very important for a high-end computer system to work stably and properly. In addition, proprietary hardware reduces the amount of programming and processor intervention to control cooling fan speeds, minimizing ambient noise and maximizing system temperature and reliability.

The NCT6776F / NCT6776D can simultaneously monitor all of the following inputs:

- Nine analog voltage inputs (five internal voltages CPUVCORE, VBAT, 3VSB, 3VCC and AVCC; four external voltage inputs)
- Five fan tachometer inputs
- Three remote temperatures, using either a thermistor or from the CPU thermal diode (voltage or Current Mode measurement method)
- Two case-open detection signal.

These inputs are converted to digital values using the integrated, eight-bit analog-to-digital converter (ADC).

In response to these inputs, the NCT6776F / NCT6776D can generate the following outputs:

- Three PWM (pulse width modulation) and one DC fan outputs for the fan speed control
- SMI#
- OVT# signals for system protection events

The NCT6776F / NCT6776D provides hardware access to all monitored parameters through the LPC or I²C interface and software access through application software, such as Nuvoton's Hardware Doctor™, or BIOS.

The rest of this section introduces the various features of the NCT6776F / NCT6776D hardware-monitor capability. These features are divided into the following sections:

- Access Interfaces
- Analog Inputs
- Fan Speed Measurement and Control
- Smart Fan Control
- SMI# interrupt mode
- OVT# interrupt mode
- Registers and Value RAM

8.2 Access Interfaces

The NCT6776F / NCT6776D provides two interfaces, LPC and I²C, for the microprocessor to read or write the internal registers of the hardware monitor.

8.3 LPC Interface

The internal registers of the hardware monitor block are accessible through two separate methods on the LPC bus. The first set of registers, which primarily enable the block and set its address in the CPU I/O address space are accessed by the Super I/O protocol described in Chapter 7 at address 2Eh/2Fh or 4Eh/4Fh. The bulk of the functionality and internal registers of this block are accessed from an index/data pair of CPU I/O addresses. The

standard locations are usually 295h/296h and are set by CR[60h]&CR[61h] accessed using the Super I/O protocol as described in Chapter 7.

Due to the number of internal register, it is necessary to separate the register sets into “banks” specified by register 4Eh. The structure of the internal registers is shown in the following figure.

Figure 8-1 LPC Bus' Reads from / Write to Internal Registers

8.4 I²C interface

The I²C interface is a second, serial port into the internal registers of the hardware monitor function block. The interface is totally compatible with the industry-standard I²C specification, allowing external components that are also compatible to read the internal registers of the NCT6776F / NCT6776D hardware monitor and control fan speeds. The address of the I²C peripheral is set by the register located at index 48h (which is accessed by the index/data pair at I/O address typically at 295h/296h)

The two timing diagrams below illustrate how to use the I²C interface to write to an internal register and how to read the value in an internal register, respectively.

(a) Serial bus write to internal address register followed by the data byte

Figure 8-2 Serial Bus Write to Internal Address Register Followed by the Data Byte

(b) Serial bus read from a register

Figure 8-3 Serial Bus Read from Internal Address Register

8.5 Analog Inputs

The nine analog inputs of the hardware monitor block connect to an 8-bit Analog to Digital Converter (ADC) and consist of 4 general-purpose inputs connected to external device pins (VIN0 – VIN3) and five internal signals connected to the power supplies (CPUVCORE, AVCC, VBAT, 3VSB and 3VCC). All inputs are limited to a maximum voltage of 2.048V due to an internal setting of 8mV LSB (256 steps x 8mV = 2.048V). All inputs to the ADC must limit the maximum voltage by using a voltage divider. The power supplies have internal resistors, while the external pins require outside limiting resistors as described below.

Figure 8-4 Analog Inputs and Application Circuit of the NCT6776F / NCT6776D

As illustrated in the figure above, other connections may require some external circuits. The rest of this section provides more information about voltages outside the range of the 8-bit ADC, CPU Vcore voltage detection, and temperature sensing.

8.5.1 Voltages Over 2.048 V or Less Than 0 V

Input voltages greater than 2.048 V should be reduced by an external resistor divider to keep the input voltages in the proper range. For example, input voltage V_0 (+12 V) should be reduced before it is connected to VIN0 according to the following equation:

$$VIN0 = V_0 \times \frac{R_2}{R_1 + R_2}$$

R1 and R2 can be set to 56 K Ω and 10 K Ω , respectively, to reduce V_0 from +12 V to less than 2.048 V.

All the internal inputs of the ADC, AVCC, VBAT, 3VSB and 3VCC utilize an integrated voltage divider with both resistors equal to 34K Ω , yielding a voltage one half of the power supply. Since one would expect a worst-case 10% variation or a 3.63V maximum voltage, the input to the ADC will be 1.815V, well within the maximum range.

$$V_{in} = VCC \times \frac{34K\Omega}{34K\Omega + 34K\Omega} \cong 1.65V, \text{ where } VCC \text{ is set to } 3.3V$$

The CPUVCORE pin feeds directly into the ADC with no voltage divider since the nominal voltage on this pin is only 1.2V.

Negative voltages are handled similarly, though the equation looks a little more complicated. For example, negative voltage V_1 (-12V) can be reduced according to the following equation:

$$VIN1 = (V_1 - 2.048) \times \frac{R_4}{R_3 + R_4} + 2.048, \text{ where } V_1 = -12$$

R3 and R4 can be set to 232 K Ω and 10 K Ω , respectively, to reduce negative input voltage V_1 from -12 V to less than 2.048 V. Note that R4 is referenced to VREF, or 2.048V instead of 0V to allow for more dynamic range. This is simply good analog practice to yield the most precise measurements.

Both of these solutions are illustrated in the figure above.

8.5.2 Voltage Data Format

The data format for voltage detection is an eight-bit value, and each unit represents an interval of 8 mV.

$$\text{Detected Voltage} = \text{Reading} * 0.008 \text{ V}$$

If the source voltage was reduced by a voltage divider, the detected voltage value must be scaled accordingly.

8.5.2.1. Voltage Reading

NCT6776F / NCT6776D has 9 voltage reading:

	3VCC	AVCC	3VSB	VBAT	
Voltage reading	Bank0, index23	Bank0, index22	Bank5, Index50	Bank5, Index51	
	CPUVCORE	VIN0	VIN1	VIN2	VIN3
Voltage reading	Bank0, index20	Bank0, index21	Bank0, index24	Bank0, index25	Bank0, index26

8.5.3 Temperature Data Format

The data format for sensors SYSTIN, CPUTIN and AUXTIN is 9-bit, two's-complement. This is illustrated in the table below. There are two sources of temperature data: external thermistors or thermal diodes.

Table 8-1 Temperature Data Format

TEMPERATURE	8-BIT DIGITAL OUTPUT		9-BIT DIGITAL OUTPUT	
	8-BIT BINARY	8-BIT HEX	9-BIT BINARY	9-BIT HEX
+125°C	0111,1101	7Dh	0,1111,1010	0FAh
+25°C	0001,1001	19h	0,0011,0010	032h
+1°C	0000,0001	01h	0,0000,0010	002h
+0.5°C	-	-	0,0000,0001	001h
+0°C	0000,0000	00h	0,0000,0000	000h
-0.5°C	-	-	1,1111,1111	1FFh
-1°C	1111,1111	FFh	1,1111,1110	1FFh
-25°C	1110,0111	E7h	1,1100,1110	1Ceh
-55°C	1100,1001	C9h	1,1001,0010	192h

8.5.3.1. Monitor Temperature from Thermistor

External thermistors should have a β value of 3435K and a resistance of 10 K Ω at 25°C. As illustrated in the schematic above, the thermistor is connected in series with a 10-K Ω resistor and then connects to VREF (pin 108). The configuration registers to select a thermistor temperature sensor and the measurement method are found at Bank 0, index 59h, 5Dh, and 5Eh.

Figure 8-5 Monitoring Temperature from Thermistor

8.5.3.2. Monitor Temperature from Thermal Diode (Voltage Mode)

The thermal diode D- pin is connected to AGND (pin 112), and the D+ pin is connected to the temperature sensor pin in the NCT6776F / NCT6776D. A 15-K Ω resistor is connected to VREF to supply the bias current for the diode, and the 2200-pF, bypass capacitor is added to filter high-frequency noise. The configuration registers to select a thermal diode temperature sensor and the measurement method are found at Bank 0, index 5Dh, and 5Eh.

Figure 8-6 Monitoring Temperature from Thermal Diode (Voltage Mode)

8.5.3.3. Monitor Temperature from Thermal Diode (Current Mode)

The NCT6776F / NCT6776D can also sense the diode temperature through Current Mode and the circuit is shown in the following figure.

Figure 8-7 Monitoring Temperature from Thermal Diode (Current Mode)

The pin of processor D- is connected to CPUD- (pin 112) and the pin D+ is connected to temperature sensor pin in the NCT6776F / NCT6776D. A bypass capacitor $C=2200\text{pF}$ should be added to filter the high frequency noise. The configuration registers to select a thermal diode temperature sensor and the measurement method are found at Bank 0, index 5Dh and 5Eh.

8.5.3.4. Temperature Reading

NCT6776F / NCT6776D has 6 temperature reading can monitor different temperature sources (ex. SYSTIN, CPUTIN, AUXTIN, PECL...etc).

	SMIOVT1	SMIOVT2	SMIOVT3	SMIOVT4	SMIOVT5	SMIOVT6
Temperature source select	Bank6, index21 bit[4:0]	Bank6, index22 bit[4:0]	Bank6, index23 bit[4:0]	Bank6, index24 bit[4:0]	Bank6, index25 bit[4:0]	Bank6, index26 bit[4:0]
	default:	default:	default:	default:	default:	default:

	SYSTIN	CPUTIN	AUXTIN	SYSTIN	SYSTIN	SYSTIN
Temperature reading (2's complement)	Bank0, index27	Bank1, index50 & index51 bit7	Bank2, index50 & index51 bit7	Bank6, index2B & index2E bit0	Bank6, index2C & index2E bit1	Bank6, index2D & index2E bit2

Note. If the temperature source is selecting to PECI, please set Bank0 Index AEh first for reading correct value.

8.6 PECI

PECI (Platform Environment Control Interface) is a new digital interface to read the CPU temperature of Intel® CPUs. With a bandwidth ranging from 2 Kbps to 2 Mbps, PECI uses a single wire for self-clocking and data transfer. By interfacing to the Digital Thermal Sensor (DTS) in the Intel® CPU, PECI reports a negative temperature (in counts) relative to the processor's temperature at which the thermal control circuit (TCC) is activated. At the TCC Activation temperature, the Intel CPU will operate at reduced performance to prevent the device from thermal damage.

PECI is one of the temperature sensing methods that the NCT6776F / NCT6776D supports. The NCT6776F / NCT6776D contains a PECI master and reads the CPU PECI temperature. The CPU is a PECI client.

The PECI temperature values returning from the CPU are in "counts" which are approximately linear in relation to changes in temperature in degrees centigrade. However, this linearity is approximate and cannot be guaranteed over the entire range of PECI temperatures. For further information, refer to the PECI specification. All references to "temperature" in this section are in "counts" instead of "°C".

Figure 8-8 PECI Temperature shows a typical fan speed (PWM duty cycle) and PECI temperature relationship.

Figure 8-8 PECI Temperature

In this illustration, when PECI temperature is -20, the PWM duty cycle for fan control is at Duty2. When CPU is getting hotter and the PECI temperature is -10, the PWM duty cycle is at Duty1.

At Tcontrol PECI temperature, the recommendation from Intel is to operate the CPU fan at full speed. Therefore Duty1 is 100% if this recommendation is followed. The value of Tcontrol can be obtained by reading the related Machine Specific Register (MSR) in the Intel CPU. The Tcontrol MSR address is usually in the BIOS Writer's guide for the CPU family in question. Refer to the relevant CPU documentation from Intel for more information. In this example, Tcontrol is -10.

When the PECI temperature is below -20, the duty cycle is fixed at Duty2 to maintain a minimum (and constant) RPM for the CPU fan.

The device also provides an offset register to 'shift' the negative PECI readings to positive values. The offset registers are called "Tbase", which are located at Bank7 Index 09h for Agent0 and Bank7 Index 0Ah for Agent1. All default values of these Tbase registers are 8'h00. The unit of the Tbase register contents is "count" to match that of PECI values. The resultant value (Tbase + PECI) should not be interpreted as the "temperature" (whether in count or °C) of the PECI client (CPU).

The Figure 8-9 Temperature and Fan Speed Relation after Tbase Offsets, shows the temperature and fan-speed relationship after Tbase offset is applied (based on Figure 8-8 PECI Temperature). This view is from the perspective of the NCT6776F / NCT6776D fan control circuit.

Figure 8-9 Temperature and Fan Speed Relation after Tbase Offsets

Assuming Tbase is set to 100 and the PECI temperature is -15, the real-time temperature value to the fan control circuit will be 85 (-15 + 100). The value of 55 (hex) will appear in the relevant real-time temperature register.

While using Smart Fan control function of NCT6776F / NCT6776D, BIOS/software can include Tbase in determining the thresholds (limits). In this example, assuming Tcontrol is -10 and Tbase is set to 100⁽¹⁾, the threshold temperature value corresponding to the "100% fan duty-cycle" event is 90 (-10+100). The value of 5A (hex) should be written to the relevant threshold register.

Tcontrol is typically -10 to -20 for PECI-enabled CPUs. Base on that, a value of 85 ~100 for Tbase could be set for proper operation of the fan control circuit. This recommendation is applicable for most designs. In general, the concept presented in this section could be used to determine the optimum value of Tcontrol to match the specific application.

8.7 Fan Speed Measurement and Control

This section is divided into two parts, one to measure the speed and one to control the speed.

8.7.1 Fan Speed Reading

The fan speed reading at:

	FAN COUNT READING		FAN RPM READING ^{NOTE}	
	13-bit		16-bit	
	[12:5]	[4:0]	[15:8]	[7:0]
SYSFANIN	Bank6, index30	Bank6, index31	Bank6, index56	Bank6, index57
CPUFANIN	Bank6, index32	Bank6, index33	Bank6, index58	Bank6, index59
AUXFANIN0	Bank6, index34	Bank6, index35	Bank6, index5A	Bank6, index5B
AUXFANIN1	Bank6, index36	Bank6, index37	Bank6, index5C	Bank6, index5D
AUXFANIN2	Bank6, index38	Bank6, index39	Bank6, index5E	Bank6, index5F

Note. The default value of the “16-bit RPM reading” is 0x00A4h.

8.7.2 Fan Speed Calculation by Fan Count Reading

In 16-bit fan count reading, please read high byte first then low byte.

Fan speed RPM can be evaluated by the following equation, fan count could be 8-bit or 16-bit:

$$RPM = \frac{1.35 \times 10^6}{Count}$$

8.7.3 Fan Speed Calculation by Fan RPM Reading

In 16-bit fan RPM reading, please read high byte first then low byte.

Fan speed RPM can be evaluated by translating 16-bit RPM reading from hexadecimal to decimal.

Register reading 0x09C4h = 2500 RPM

8.7.4 Fan Speed Control

The NCT6776F / NCT6776D has three output pins for fan control, only SYSFANOUT offers PWM duty cycle and DC voltage to control the fan speed. The output type (PWM or DC) of each pin is configured by Bank0 index 04h, bits 0 for SYSFANOUT, bits 1 for CPUFANOUT, and Bank0 index 12h, bit 0 for AUXFANOUT.

		SYSFANOUT	CPUFANOUT	AUXFANOUT
Output Type Select		Bank0, index04 bit0 0: PWM output 1: DC output (default)	Bank0, index04 bit1 Only PWM output	Bank0, index12 bit0 Only PWM output
Output Type Select (in PWM output)		CR24 bit4 0: open-drain (default) 1: push-pull	CR24 bit3 0: open-drain (default) 1: push-pull	CR24 bit5 0: push-pull (default) 1: open-drain
PWM Output Frequency		Bank0, Index00	Bank0, Index02	Bank0, Index10
Fan Control Mode Select		Bank1, index02, bit[7:4] 0h: Manual mode (def.) 1h: Thermal Cruise 2h: Speed Cruise 4h: SMART FAN IV	Bank2, index02, bit[7:4] 0h: Manual mode(def.) 1h: Thermal Cruise 2h: Speed Cruise 4h: SMART FAN IV	Bank3, index02, bit[7:4] 0h: Manual mode (def.) 1h: Thermal Cruise 2h: Speed Cruise 4h: SMART FAN IV
Output Value (write)	PWM output (Duty)	Bank1, index09 bit[7:0]	Bank2, index09 bit[7:0]	Bank3, index09 bit[7:0]
	DC output (Voltage)	Bank1, index09 bit[7:2]		
Current Output Value (read only)		Bank0, index01	Bank0, index03	Bank0, index11

For PWM, the duty cycle is programmed by eight-bit registers at Bank1 Index 09h for SYSFANOUT, Bank2 Index 09h for CPUFANOUT and Bank3 Index 09h for AUXFANOUT. The duty cycle can be calculated using the following equation:

$$\text{Dutycycle(\%)} = \frac{\text{Programmed 8-bit Register Value}}{255} \times 100\%$$

The default duty cycle is FFh, or 100%. The PWM clock frequency is programmed at Bank0 Index 00h, Index 02h, and Index 10h.

For DC, the NCT6776F / NCT6776D has a six bit digital-to-analog converter (DAC) that produces 0 to 2.048 Volts DC. The analog output is programmed at Bank1 Index 09h bit[7:2] for SYSFANOUT. The analog output can be calculated using the following equation:

$$\text{OUTPUT Voltage (V)} = V_{ref} \times \frac{\text{Programmed 6-bit Register Value}}{64}$$

The default value is 111111YY, or nearly 2.048 V, and Y is a reserved bit.

8.7.5 SMART FAN™ Control

The NCT6776F / NCT6776D supports various different fan control features:

- ♦ SMART FAN™ I (Thermal Cruise & Speed Cruise)
- ♦ SMART FAN™ IV
- ♦ Close-Loop Fan Control RPM mode

	SYSFANOUT	CPUFANOUT	AUXFANOUT
Fan Control Mode Select	Bank1, index02, bit[7:4] 0h: Manual mode (def.) 1h: Thermal Cruise 2h: Speed Cruise 4h: SMART FAN IV	Bank2, index02, bit[7:4] 0h: Manual mode(def.) 1h: Thermal Cruise 2h: Speed Cruise 4h: SMART FAN IV	Bank3, index02, bit[7:4] 0h: Manual mode (def.) 1h: Thermal Cruise 2h: Speed Cruise 4h: SMART FAN IV

8.7.6 Temperature Source & Reading for Fan Control

Select temperature source for each fan control output:

	SYSFANOUT	CPUFANOUT	AUXFANOUT
Fan Control Temperature Source Select	Bank1, index00 bit[4:0] Default: SYSTIN	Bank2, index00 bit[4:0] Default: CPUTIN	Bank3, index00 bit[4:0] Default: AUXTIN
Fan Control Temperature Reading	Bank0, index73 & Bank0, index74 bit7	Bank0, index75 & Bank0, index76 bit7	Bank0, index77 & Bank0, index78 bit7

Note. If the temperature source is selecting to PECl, please set Bank0 Index AEh first for reading correct value.

8.8 SMART FAN™ I

8.8.1 Thermal Cruise Mode

Thermal Cruise mode controls the fan speed to keep the temperature in a specified range. First, this range is defined in BIOS by a temperature and the interval (e.g., $55^{\circ}\text{C} \pm 3^{\circ}\text{C}$). As long as the current temperature remains below the low end of this range (i.e., 52°C), the fan is off. Once the temperature exceeds the low end, the fan turns on at a speed defined in BIOS (e.g., 20% output). Thermal Cruise mode then controls the fan output according to the current temperature. Three conditions may occur:

- (1) If the temperature still exceeds the high end, fan output increases slowly. If the fan is operating at full speed but the temperature still exceeds the high end, a warning message is issued to protect the system.
- (2) If the temperature falls below the high end (e.g., 58°C) but remains above the low end (e.g., 52°C), fan output remains the same.
- (3) If the temperature falls below the low end (e.g., 52°C), fan output decreases slowly to zero or to a specified "stop value". This "stop value" is enabled by the Bank1, Index00h, Bit7 for SYSFANOUT; Bank2, Index00h, Bit7 for CPUFANOUT and Bank3, Index00h, Bit7 for AUXFANOUT. The stop value itself is separately specified in Bank1 Index05h, Bank2 Index05h and Bank3 Index05h. The fan remains at the stop value for the period of time also separately defined in Bank1 Index07h, Bank2 Index07h and Bank3 Index07h.

In general, Thermal Cruise mode means

- If the current temperature is higher than the high end, increase the fan speed.
- If the current temperature is lower than the low end, decrease the fan speed.
- Otherwise, keep the fan speed the same.

The following figures illustrate two examples of Thermal Cruise mode.

Figure 8-10 Mechanism of Thermal Cruise™ Mode (PWM Duty Cycle)

Figure 8-11 Mechanism of Thermal Cruise™ Mode (DC Output Voltage)

8.8.2 Speed Cruise Mode

Speed Cruise mode keeps the fan speed in a specified range. First, this range is defined in BIOS by a fan speed count (the amount of time between clock input signals, not the number of clock input signals in a period of time) and an interval (e.g., 160 ± 10). As long as the fan speed count is in the specified range, fan output remains the same. If the fan speed count is higher than the high end (e.g., 170), fan output increases to make the count lower. If the fan speed count is lower than the low end (e.g., 150), fan output decreases to make the count higher. One example is illustrated in this figure.

Figure 8-12 Mechanism of Fan Speed Cruise™ Mode

The following tables show current temperatures, fan output values and the relative control registers at Thermal Cruise and Fan Speed mode.

Table 8-2 Relative Registers – at Thermal Cruise™ Mode

THERMAL CRUISE MODE	TARGET TEMPERATURE	TOLERANCE	START-UP VALUE	STOP VALUE	KEEP MIN. FAN OUTPUT VALUE	STOP TIME	STEP-UP TIME	STEP-DOWN TIME
SYSFANOUT	Bank 1, index 01h bit[7:0]	Bank 1, index 02h Bit[2:0]	Bank 1, index 06h	Bank 1, index 05h	Bank 1, Index 00h, bit7	Bank 1, index 07h	Bank 1, index 03h	Bank 1, index 04h
CPUFANOUT	Bank 2, index 01h bit[7:0]	Bank 2, index 02h Bit[2:0]	Bank 2, index 06h	Bank 2, index 05h	Bank 2, Index 00h, bit7	Bank 2, index 07h	Bank 2, index 03h	Bank 2, index 04h

8.9 SMART FAN™ IV & Close Loop Fan Control Mode

SMART FAN™ IV and Close Loop Fan Control Mode offer 3 slopes to control the fan speed.

Set **Critical Temperature, Bank1 Index 35_{HEX}, Bank2 Index 35_{HEX}, Bank3 Index 35_{HEX}**

- Set the **Relative Register-at SMART FAN™ IV Control Mode Table**
If fan control mode is set as Close Loop Fan Control, the unit step is 50RPM. So the maximum controllable RPM is 50*255=12,750RPM.
- Set **Tolerance of Target Temperature, Bank1 Index 02_{HEX} bit[2:0]. Bank2 Index 02_{HEX} bit[2:0]. Bank3 Index 02_{HEX} bit[2:0].**

The 3 slopes can be obtained by setting FanDuty1/RPM1~FanDuty4/RPM4 and T1~T4 through the registers. When the temperature rises, FAN Output will calculate the target FanDuty/RPM based on the current slope. For example, assuming Tx is the current temperature and Ty is the target, then

The slope:

$$X2 = \frac{(FanDuty3 / RPM3) - (FanDuty2 / RPM2)}{(T3 - T2)}$$

Fan Output:

$$Target\ FanDuty\ or\ RPM = (FanDuty2\ or\ RPM2) + (Tx - T2) \cdot X2$$

Figure 8-14 Fan Control Duty Mode Programming Flow

Figure 8-15 Close-Loop Fan Control RPM mode Programming Flow

8.9.1 Step Up Time / Step Down Time

SMART FAN™ IV is designed for the smooth operation of the fan. The Up Time / Down Time register defines the time interval between successive duty increases or decreases. If this value is set too small, the fan will not have enough time to speed up after tuning the duty and sometimes may result in unstable fan speed. On the other hand, if Up Time / Down Time is set too large, the fan may not work fast enough to dissipate the heat. This register should never be set to 0, otherwise, the fan duty will be abnormal.

8.9.2 Fan Output Start-up Value

From still to rotate, the fan usually needs a higher fan output value to generate enough torque to conquer the restriction force. Thus the Fan Output Start-up Value is used to turn on the fan with the specified output value.

8.9.3 Fan Output Stop Value

It takes some time to bring a fan from still to working state. Therefore, Stop value are designed with a minimum fan output to keep the fan working when the system does not require the fan to help reduce heat but still want to keep the fast response time to speed up the fan.

8.9.4 Fan Output Stop Time

A time interval is specified to turn off the fan if SmartFan continuously requests to slow down the fan which has already reached the Stop time.

Smart Fan Control Parameters Figure

8.9.5 Fan Output Step

8.9.6 Revolution Pulse Selection

The NCT6776F / NCT6776D supports four RPM output of the pulses selection function for different type of FAN which has the character of different pulses per revolution. The others could be set by HM register at Bank6, Index44, Bit1-0 for SYSFANIN; Bank6, Index45, Bit1-0 for CPUFANIN and Bank6, Index46, Bit1-0 for AUXFANIN0. All default value of pulse selection registers are 2 pulses of one revolution.

Setting description for “Pulse Selections Bits”:

00: 4 pulses per revolution

- 01: 1 pulse per revolution
- 10: 2 pulses per revolution (default)
- 11: 3 pulses per revolution

8.9.7 Weight Value Control

The NCT6776F / NCT6776D supports weight value control for fan duty output. By register configuration, the results of weight value circuit can be added to the fan duty of SMART FAN™ I or IV and output to the fan. Take CPUFANOUT for example, if SMART FAN™ IV is selected, CPUTIN is the temperature source, and weight value control is enabled, SMART FAN™ IV will calculate the output duty, and weight value circuit will calculate the corresponding weight value based on SYSTIN. As the SYSTIN temperature rises, its corresponding weight value increases. Then, the two values will be summed up and output to CPU fan. In other words, the CPU fan duty is affected not only by the CPUTIN but also the SYSTIN temperature.

Figure 8-16 SYS TEMP and Weight Value Relations shows the relation between the SYSTIN temperature and the weight value. Tolerance setup is offered on each change point to avoid weight value fluctuation resulted from SYSTIN temperature change. The weight value will increase by one weight value step only when the SYSTIN temperature is higher than the point value plus tolerance. Likewise, the weight value decreases by one weight value step only when the SYSTIN temperature is lower than the point value minus tolerance.

SMIOVT Relative Temperature Registers

8.10.1 SMI# Interrupt Mode

The SMI#/OVT# pin (pin.128) is a multi-function pin. It can be in HM_SMI# mode or in OVT# mode by setting Configuration Register [CR24h, bit 2](#). In HM_SMI# mode, it can monitor voltages, fan counts, or temperatures.

8.10.2 Voltage SMI# Mode

The SMI# pin can create an interrupt if a voltage exceeds a specified high limit or falls below a specified low limit. This interrupt must be reset by reading all the interrupt status registers, or subsequent events do not generate interrupts. This mode is illustrated in the following figure.

*Interrupt Reset when Interrupt Status Registers are read

Figure 8-18 SMI Mode of Voltage and Fan Inputs

8.10.3 Fan SMI# Mode

The SMI# pin can create an interrupt if a fan count crosses a specified fan limit (rises above it or falls below it). This interrupt must be reset by reading all the interrupt status registers, or subsequent events do not generate interrupts. This mode is illustrated in the figure above.

8.10.4 Temperature SMI# Mode

The SMI# pin can create interrupts that depend on the temperatures measured by SYSTIN, CPUTIN, and AUXIN. These interrupts are divided into two parts, one for SYSTIN and the other for CPUTIN / AUXIN.

8.10.4.1. Temperature Sensor 1 SMI# Interrupt (Default: SYSTIN)

The SMI# pin has four interrupt modes with Temperature Sensor 1.

(1) Shut-down Interrupt Mode

This mode is enabled by setting Bank0 Index 40h, bit 4 to one.

In this mode, the SMI# pin can create an interrupt when the current temperature rises above T_{OL} or Shut-down mode high limit temperature, and when the current temperature falls below T_{HYST} or Shut-down mode low limit temperature. Once the temperature rises above T_{OL} , however, and generates an interrupt, this mode does not generate additional interrupts, even if the temperature remains above T_{OL} , until the temperature falls below T_{HYST} . This interrupt must be reset by reading all the interrupt status registers, or subsequent events do not generate interrupts, except the first time current temperature rises above Shut-down mode high limit temperature. This is illustrated in the following figure.

Figure 8-19 Shut-down Interrupt Mode

(2) Comparator Interrupt Mode

This mode is enabled by setting T_{HYST} (Temperature Hysteresis) to 127°C. This mode is enabled by setting Bank0 Index 40h, bit 4 to 0.

In this mode, the SMI# pin can create an interrupt as long as the current temperature exceeds T_O (Over Temperature). This interrupt can be reset by reading all the interrupt status registers, or subsequent events do not generate interrupts. If the interrupt is reset, the SMI# pin continues to create interrupts until the temperature goes below T_O . This is illustrated in the figure below.

Figure 8-20 SMI Mode of SYSTIN I

(3) Two-Times Interrupt Mode

This mode is enabled by setting T_{HYST} (Temperature Hysteresis) lower than T_O and setting Bank0 Index 4Ch, bit 5 to zero. This mode is enabled by setting Bank0 Index 40h, bit 4 to 0.

In this mode, the SMI# pin can create an interrupt when the current temperature rises above T_O or when the current temperature falls below T_{HYST} . Once the temperature rises above T_O , however, and generates an interrupt, this mode does not generate additional interrupts, even if the temperature remains above T_O , until the temperature falls below T_{HYST} . This interrupt must be reset by reading all the interrupt status registers, or subsequent events do not generate interrupts. This is illustrated in the figure above.

(4) One-Time Interrupt Mode

This mode is enabled by setting T_{HYST} (Temperature Hysteresis) lower than T_O and setting Bank0 Index 4Ch, bit 5 to one. This mode is enabled by setting Bank0 Index 40h, bit 4 to 0.

In this mode, the SMI# pin can create an interrupt when the current temperature rises above T_O . Once the temperature rises above T_O , however, and generates an interrupt, this mode does not generate additional interrupts, even if the temperature remains above T_O , until the temperature falls below T_{HYST} . This interrupt must be reset by reading all the interrupt status registers, or subsequent events do not generate interrupts. This is illustrated in the following figure.

One-Time Interrupt Mode

Figure 8-21 SMI Mode of SYSTIN II

8.10.4.2. SMI# Interrupt of Temperature Sensor 2 (Default: CPUTIN) and Temperature Sensor 3 (Default: AUXTIN) and Temperature Sensor 4 (Default: SYSTIN) and Temperature Sensor 5 (Default: SYSTIN) and Temperature Sensor 6 (Default: SYSTIN).

The SMI# pin has 3 interrupt modes with Temperature Sensor 2~6.

(1) Shut-down Interrupt Mode

This mode is enabled by Bank0 Index 40h, bit5 to one for Temperature Sensor 2; Bank0 Index 40h, bit6 to one for Temperature Sensor 3; Bank6 Index 74h, bit1 to one for Temperature Sensor 4; Bank6 Index 79h, bit1 to one for Temperature Sensor 5 and Bank6 Index 7Eh, bit1 to one for Temperature Sensor 6.

In this mode, the SMI# pin can create an interrupt when the current temperature rises above T_{OL} or Shut-down mode high limit temperature, and when the current temperature falls below T_{HYST} or Shut-down mode low limit temperature. Once the temperature rises above T_{OL} , however, and generates an interrupt, this mode does not generate additional interrupts, even if the temperature remains above T_{OL} , until the temperature falls below T_{HYST} . This interrupt must be reset by reading all the interrupt status registers, or subsequent events do not generate interrupts, except the first time current temperature rises above Shut-down mode high limit temperature. This is illustrated in the following figure.

Figure 8-22 Shut-down Interrupt Mode

(2) Comparator Interrupt Mode

This mode is enabled by setting Bank0 Index 4Ch, bit 6, to one.

In this mode, the SMI# pin can create an interrupt when the current temperature exceeds T_O (Over Temperature) and continues to create interrupts until the temperature falls below T_{HYST} . This interrupt can be reset by reading all the interrupt status registers, or subsequent events do not generate interrupts. This is illustrated in the figure below.

Figure 8-23 SMI Mode of CPUTIN

(3) Two-Times Interrupt Mode

This mode is enabled by setting Bank0 Index 4Ch, bit 6, to zero.

In this mode, the SMI# pin can create an interrupt when the current temperature rises above T_O or when the current temperature falls below T_{HYST} . Once the temperature rises above T_O , however, and generates an interrupt, this mode does not generate additional interrupts, even if the temperature remains above T_O , until the temperature falls below T_{HYST} . This interrupt must be reset by reading all the interrupt status registers, or subsequent events do not generate interrupts. This is illustrated in the figure above.

---	---	---

8.10.5 OVT# Interrupt Mode

The SMI#/OVT# pin is a multi-function pin. It can be in SMI# mode or in OVT# mode by setting Configuration Register CR[24h], bit 2 to one or zero, respectively. In OVT# mode, it can monitor temperatures, and OVT pin could be enabled to OVT output by Bank0 Index 18h, bit 6 for Temperature Sensor 1(default: SYSTIN); Bank1 Index 52h, bit 1 for Temperature Sensor 2(default: CPUTIN); Bank2 Index 52h, bit1 for Temperature Sensor 3(default: AUXTIN); Bank6 Index 28h, bit1 for Temperature Sensor 4(default: SYSTIN); Bank6 Index 29h, bit1 for Temperature Sensor 5(default: SYSTIN)and Bank6 Index 2Ah, bit1 for Temperature Sensor 6(default: SYSTIN).

The OVT# pin has two interrupt modes, comparator and interrupt. The modes are illustrated in this figure.

Figure 8-24 OVT# Modes of Temperature Inputs

If Bank0 Index 18h, bit 4, is set to zero, the OVT# pin is in comparator mode. In comparator mode, the OVT# pin can create an interrupt once the current temperature exceeds T_O and continues to create interrupts until the

temperature falls below T_{HYST} . The OVT# pin is asserted once the temperature has exceeded T_O and has not yet fallen below T_{HYST} .

If Bank0 Index 18h, bit 4, is set to one, the OVT# pin is in interrupt mode. In interrupt mode, the OVT# pin can create an interrupt once the current temperature rises above T_O or when the temperature falls below T_{HYST} . Once the temperature rises above T_O , however, and generates an interrupt, this mode does not generate additional interrupts, even if the temperature remains above T_O , until the temperature falls below T_{HYST} . This interrupt must be reset by reading all the interrupt status registers. The OVT# pin is asserted when an interrupt is generated and remains asserted until the interrupt is reset.

8.10.6 Caseopen Detection

The purpose of Caseopen function is used to detect whether the computer case has been opened and possible tampered with. This feature must function even when there is no 3VSB power. Consequently, the power source for the circuit is from either Pin 99 (VBAT) or Pin 85 (3VSB). 3VSB is the default power source. If there is no 3VSB power, the power source is VBAT. This is designed to save power consumption of the battery.

When the case is closed, CASEOPEN0# or CASEOPEN1# (pin 100) must be pulled high by an externally pulled-up $2M\Omega$ resistor that is connected to VBAT (pin 99). When the case is opened, CASEOPEN0# or CASEOPEN1# will be switched from high to low. Meanwhile, the detection circuit inside the IC latches the signal. As a result, the interrupt status and the real-time status can be read at the registers next time when the computer is powered. The CASEOPEN0# status will not be cleared unless CR[46h], bit 7, or CR[E6h] bit 5 at Logical Device A is set to "1" first and then to "0". The CASEOPEN1# status will not be cleared unless CR[46h], bit 6, or CR[E6h] bit 0 at Logical Device A is set to "1" first and then to "0".

Figure 8-25 Caseopen Mechanism

8.11 Power Measurement

Figure 8-26 Power measurement architecture

This function will detect the voltage from current measurement IC on board and calculate the current and power. Fig 8.26 is the architecture. $V_{in3} = Power_V \times \frac{R1}{R1 + R2}$ and $V_{in1} = Is \times Rs \times Gm \times RL2$ could

	HM Register	Note
Is	Bank4 Index 60h & Index 61h	Calculate by IO
POWER	Bank4 Index 62h & Index 63h	Calculate by IO

Vin1	Bank0 Index 24h	Measure by IO

not over 2.048. We suggest the ratio $\frac{R1}{R1 + R2} = \frac{1}{15}$.

9. HARDWARE MONITOR REGISTER SET

The base address of the Address Port and Data Port is specified in registers CR[60h] and CR[61h] of Logical Device B, the hardware monitor device. CR[60h] is the high byte, and CR[61h] is the low byte. The Address Port and Data Port are located at the base address, plus 5h and 6h, respectively. For example, if CR[60h] is 02h and CR[61h] is 90h, the Address Port is at 0x295h, and the Data Port is at 0x296h.

Remember that this access is from the host CPU I/O address range. To conserve space in the crowded CPU I/O addresses, many of the hardware monitor registers are “banked” with the bank number located at Bank0, index 04Eh.

9.1 Address Port (Port x5h)

9.3 SYSFANOUT PWM Output Frequency Configuration Register – Index 00h (Bank 0)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	PWM_CLK_SEL1	PWM_SCALE1						
DEFAULT	0	0	0	0	0	1	0	0

The register is meaningful only when SYSFANOUT is programmed for PWM output (i.e., Bank0, Index 04h, bit 0 is 0).

BIT	DESCRIPTION
7	PWM_CLK_SEL1. SYSFANOUT PWM Input Clock Source Select. This bit selects the clock source for PWM output frequency. Refer the Divisor table.
6-0	PWM_SCALE1. SYSFANOUT PWM Pre-Scale divider. The clock source for PWM output is divided by this seven-bit value to calculate the actual PWM output frequency. Refer the Divisor table.

The clock source selected by CKSEL will be divided by the divisor and used as a fan PWM output frequency.

If CKSEL equals **0**, then the output clock is simply equal to **93.9/ (Divisor[6:0]+1) KHz**

MappedDivisor depends on **Divisor[6:0]** and is described in the table below.

Divisor[6:0]	Mapped Divisor	Output Frequency	Divisor[6:0]	Mapped Divisor	Output Frequency
0000000	1	93.9KHz			
0000001	2	46.95KHz			
0000010	3	31.3KHz			
0000011	4	23.47KHz			
0000100	5	18.78KHz	0001111	16	5.86KHz
0000101	6	15.65KHz	0011111	32	2.93KHz
0000110	7	13.41KHz	0111111	64	1.46KHz
0000111	8	11.73KHz	1111111	128	734Hz

If CKSEL equals **1**, then the output clock is simply equal to **1008/ Mapped Divisor Hz**

MappedDivisor depends on **Divisor[3:0]** and is described in the table below.

Divisor[3:0]	Mapped Divisor	Output Frequency	Divisor[3:0]	Mapped Divisor	Output Frequency
0000	1	1008Hz	1000	12	84Hz
0001	2	504Hz	1001	16	63Hz
0010	3	336Hz	1010	32	31.5Hz
0011	4	252Hz	1011	64	15.75Hz
0100	5	201Hz	1100	128	7.875Hz
0101	6	168Hz	1101	256	3.94Hz
0110	7	144Hz	1110	512	1.97Hz
0111	8	126Hz	1111	1024	0.98Hz

9.4 SYSFANOUT Output Value Select Register – Index 01h (Bank 0)

Attribute: Read Only

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	SYSFANOUT Value							
DEFAULT	FFh							

FUNCTION MODE		7	6	5	4	3	2	1	0
PWM Output (Bank0, Index 04h, bit 0 is 0)	DESCRIPTION	The PWM duty cycle is equal to this eight-bit value, divided by 255, times 100%. FFh creates a duty cycle of 100%, and 00h creates a duty cycle of 0%.							
DC Voltage Output Bank0, Index 04h, bit 0 is 1)	DESCRIPTION	SYSFANOUT voltage control. The output voltage is calculated according to this equation. OUTPUT Voltage = $V_{ref} * \frac{FANOUT}{64}$ Note. VREF is approx 2.048V.						Reserved	
This register could be programmed by Bank1, Index 09									

9.5 CPUFANOUT PWM Output Frequency Configuration Register – Index 02h (Bank 0)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	PWM_CLK_SEL2	PWM_SCALE2						
DEFAULT	0	0	0	0	0	1	0	0

The register is meaningful only when CPUFANOUT is programmed for PWM output.

BIT	DESCRIPTION
7	PWM_CLK_SEL2. CPUFANOUT PWM Input Clock Source Select. This bit selects the clock source for the PWM output. Refer the Divisor table.
6-0	PWM_SCALE2. CPUFANOUT PWM Pre-Scale divider. The clock source for PWM output is divided by this seven-bit value to calculate the actual PWM output frequency. Refer the Divisor table.

The clock source selected by CKSEL will be divided by the divisor and used as a fan PWM output frequency.

If CKSEL equals 0, then the output clock is simply equal to **93.9/ (Divisor[6:0]+1) KHz**

MappedDivisor depends on **Divisor[6:0]** and is described in the table below.

Divisor[6:0]	Mapped Divisor	Output Frequency	Divisor[6:0]	Mapped Divisor	Output Frequency
0000000	1	93.9KHz			
0000001	2	46.95KHz			
0000010	3	31.3KHz			
0000011	4	23.47KHz			
0000100	5	18.78KHz	0001111	16	5.86KHz
0000101	6	15.65KHz	0011111	32	2.93KHz
0000110	7	13.41KHz	0111111	64	1.46KHz

Divisor[6:0]	Mapped Divisor	Output Frequency	Divisor[6:0]	Mapped Divisor	Output Frequency
0000111	8	11.73KHz	1111111	128	734Hz

If CKSEL equals **1**, then the output clock is simply equal to **1008/ Mapped Divisor Hz**

MappedDivisor depends on **Divisor[3:0]** and is described in the table below.

Divisor[3:0]	Mapped Divisor	Output Frequency	Divisor[3:0]	Mapped Divisor	Output Frequency
0000	1	1008Hz	1000	12	84Hz
0001	2	504Hz	1001	16	63Hz
0010	3	336Hz	1010	32	31.5Hz
0011	4	252Hz	1011	64	15.75Hz
0100	5	201Hz	1100	128	7.875Hz
0101	6	168Hz	1101	256	3.94Hz
0110	7	144Hz	1110	512	1.97Hz
0111	8	126Hz	1111	1024	0.98Hz

9.6 CPUFANOUT Output Value Select Register – Index 03h (Bank 0)

Attribute: Read Only

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	CPUFANOUT Value							
DEFAULT	7Fh							

FUNCTION MODE		7	6	5	4	3	2	1	0
PWM Output	DESCRIPTION	CPUFANOUT PWM Duty. The PWM duty cycle is equal to this 8-bit value, divided by 255, times 100%. FFh creates a duty cycle of 100%, and creates a duty cycle of 0%.							
This register could be programmed by Bank2, Index 09									

9.7 SYSFANOUT Configuration Register I – Index 04h (Bank 0)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	RESERVED							SYSFANOUT_SEL
DEFAULT	0	0	0	0	0	0	0	1

BIT	DESCRIPTION
7-1	Reserved.
0	SYSFANOUT Output Mode Selection. 0: SYSFANOUT pin produces a PWM duty cycle output. 1: SYSFANOUT pin produces DC output. (Default)

9.8 Reserved Register – Index 05h ~ 0Fh (Bank 0)

9.9 AUXFANOUT PWM Output Frequency Configuration Register – Index 10h (Bank 0)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	PWM_CLK_SEL3	PWM_SCALE3						
DEFAULT	0	0	0	0	0	1	0	0

This register is only meaningful when AUXFANOUT is programmed for PWM output (i.e. Bank0, Index 12h, bit 0 is 0)

BIT	DESCRIPTION
7	PWM_CLK_SEL3. AUXFANOUT PWM Input Clock Source Select. This bit selects the clock source of PWM output frequency. Refer the Divisor table.
6-0	PWM_CLK_SCALE3. AUXFANOUT PWM Pre-Scale divider. The clock source for PWM output is divided by this seven-bit value to calculate the actual PWM output frequency. Refer the Divisor table.

The clock source selected by CKSEL will be divided by the divisor and used as a fan PWM output frequency.

If CKSEL equals **0**, then the output clock is simply equal to **93.9/ (Divisor[6:0]+1) KHz**

MappedDivisor depends on **Divisor[6:0]** and is described in the table below.

Divisor[6:0]	Mapped Divisor	Output Frequency	Divisor[6:0]	Mapped Divisor	Output Frequency
0000000	1	93.9KHz			
0000001	2	46.95KHz			
0000010	3	31.3KHz			
0000011	4	23.47KHz			
0000100	5	18.78KHz	0001111	16	5.86KHz
0000101	6	15.65KHz	0011111	32	2.93KHz
0000110	7	13.41KHz	0111111	64	1.46KHz
0000111	8	11.73KHz	1111111	128	734Hz

If CKSEL equals **1**, then the output clock is simply equal to **1008/ Mapped Divisor Hz**

MappedDivisor depends on **Divisor[3:0]** and is described in the table below.

Divisor[3:0]	Mapped Divisor	Output Frequency	Divisor[3:0]	Mapped Divisor	Output Frequency
0000	1	1008Hz	1000	12	84Hz
0001	2	504Hz	1001	16	63Hz
0010	3	336Hz	1010	32	31.5Hz
0011	4	252Hz	1011	64	15.75Hz
0100	5	201Hz	1100	128	7.875Hz
0101	6	168Hz	1101	256	3.94Hz
0110	7	144Hz	1110	512	1.97Hz
0111	8	126Hz	1111	1024	0.98Hz

9.10 AUXFANOUT Output Value Select Register – Index 11h (Bank 0)

Attribute: Read Only

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	AUXFANOUT Value							
DEFAULT	FFh							

FUNCTION MODE		7	6	5	4	3	2	1	0
PWM Output	DESCRIPTION	AUXFANOUT PWM Duty Cycle. The PWM duty cycle is equal to this 8-bit value, divided by 255, times 100%. FFh creates a duty cycle of 100%, and 00h creates a duty cycle of 0%.							
This register could be programmed by Bank3, Index 09									

9.11 Reserved Register – Index 12-17h (Bank 0)

9.12 OVT# Configuration Register – Index 18h (Bank 0)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
BIT	RESERVED	DIS_OVT1	RESERVED	OVT1_Mode	RESERVED			STOP
DEFAULT	0	1	0	0	0	0	0	0

BIT	DESCRIPTION
7	Reserved.
6	DIS_OVT1. 0: Enable SMIOVT1 OVT# output. (Default) 1: Disable temperature sensor SMIOVT1 over-temperature (OVT#) output.
5	Reserved.
4	OVT1_Mode. SMIOVT1 Mode Select. 0: Compare Mode. (Default) 1: Interrupt Mode.
3-1	Reserved.
0	STOP. 0: Monitor SMIOVT1 temperature source. 1: Stop monitoring SMIOVT1 temperature source.

9.13 Reserved Registers – Index 19h ~ 1Fh (Bank 0)

9.14 Value RAM — Index 20h ~ 3Fh (Bank 0)

9.15 Configuration Register – Index 40h (Bank 0)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	INITIALIZATION	EN_WS2	EN_WS1	EN_WS	INT_CLEAR	RESERVED	SMI#ENABLE	START
DEFAULT	0	0	0	0	0	0	1	1

BIT	DESCRIPTION
7	Initialization. A one restores the power-on default values to some registers. This bit clears itself since the power-on default of this bit is zero.
6	Output type of SMIOVT3: 1: SMI# output type of SMIOVT Source3 temperature (Default: AUXTIN) is Shut-down Interrupt Mode. 0: Depend on the value of Bank0, Index 4C, bit6.
5	Output type of SMIOVT2: 1: SMI# output type of SMIOVT Source2 temperature (Default: CPUTIN) is Shut-down

BIT	DESCRIPTION
	Interrupt Mode. 0: Depend on the value of Bank0, Index 4C, bit6.
4	Output type of SMIOVT3 1: SMI# output type of SMIOVT Source1 temperature (Default: SYSTIN) is Shut-down Interrupt Mode. 0: Depend on the value of Bank0, Index 4C, bit5.
3	INT_Clear. A one disables the SMI# output without affecting the contents of Interrupt Status Registers. The device will stop monitoring. It will resume upon clearing of this bit.
2	Reserved.
1	SMI# Enable. A one enables the SMI# Interrupt output. 1: Enable SMI# function (Default) 0: Disable SMI# function
0	Start. A one enables startup of monitoring operations. A zero puts the part in standby mode. Note: Unlike the "INT_Clear" bit, the outputs of interrupt pins will not be cleared if the user writes a zero to this location after an interrupt has occurred.

9.16 Interrupt Status Register 1 – Index 41h (Bank 0)

Attribute: [Read Clear](#)

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	CPUFANIN	SYSFANIN	SOURCE2 _ SMI	SOURCE1 _ SMI	3VCC	AVCC	VIN0	CPUVCORE
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7	CPUFANIN. A one indicates the fan count limit of CPUFANIN has been exceeded.
6	SYSFANIN. A one indicates the fan count limit of SYSFANIN has been exceeded.
5	SMIOVT2. A one indicates the high limit of SMIOVT2 temperature has been exceeded. (CPUTIN is default temperature)
4	SMIOVT1. A one indicates the high limit of SMIOVT1 temperature has been exceeded. (SYSTIN is default temperature)
3	3VCC. A one indicates the high or low limit of 3VCC has been exceeded.
2	AVCC (Pin 106). A one indicates the high or low limit of AVCC has been exceeded.
1	VIN0. A one indicates the high or low limit of VIN0 has been exceeded.
0	CPUVCORE. A one indicates the high or low limit of CPUVCORE has been exceeded.

9.17 Interrupt Status Register 2 – Index 42h (Bank 0)

Attribute: [Read Clear](#)

Size: 8 bits

6	SYSFANIN.
5	SMIOVT2.
4	SMIOVT1.
3	3VCC.
2	AVCC (Pin 106).
1	VIN0.
0	CPUVCORE.

A one disables the corresponding interrupt status bit for the SMI interrupt. (See Interrupt Status Register 1 – Index 41h (Bank0))

9.19 SMI# Mask Register 2 – Index 44h (Bank 0)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	TAR2	TAR1	AUXTIN	CASEOPEN0	AUXFANIN0	VIN3	VIN2	VIN1
DEFAULT	1	1	1	1	1	1	1	1

BIT	DESCRIPTION
-----	-------------

BIT	DESCRIPTION	
7	TAR2.	A one disables the corresponding interrupt status bit for the interrupt. (See Interrupt Status Register 2 – Index 42h (Bank 0))
6	TAR1.	
5	SMIOVT3.	
4	CASEOPEN0.	
3	AUXFANIN0.	
2	VIN3.	
1	VIN2.	
0	VIN1.	

9.20 Interrupt Status Register 4 – Index 45h (Bank 0)

Attribute: [Read Clear](#)

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	VID	VID (Auto Clear)	AUX FANOUT	CPU FANOUT	SYS FANOUT	Shut_ SOURCE3_SMI	Shut_ SOURCE2_SMI	Shut_ SOURCE1_SMI
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7	VID. “1” indicates that the VID is on the flying.
6	VID (Auto Clear). “1” indicates that the VID is on the flying.
5	AUXFANOUT. “1” indicates that AUXFANOUT works for three minutes at the full fan speed.
4	CPUFANOUT. “1” indicates that CPUFANOUT works for three minutes at the full fan speed.
3	SYSFANOUT. “1” indicates that SYSFANOUT works for three minutes at the full fan speed.
2	Shut_ SOURCE3_SMI. “1” indicates the high limit of SMIOVT_SOURCE3 temperature of SMI# Shut-down mode has been exceeded. (AUXTIN is default temperature)
1	Shut_ SOURCE2_SMI. “1” indicates the high limit of SMIOVT_SOURCE2 temperature of SMI# Shut-down mode has been exceeded. (CPUTIN is default temperature)
0	Shut_ SOURCE1_SMI. “1” indicates the high limit of SMIOVT_SOURCE1 temperature of SMI# Shut-down mode has been exceeded. (SYSTIN is default temperature)

9.21 SMI# Mask Register 3 – Index 46h (Bank 0)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	CASEOPEN CLEAR0	CASEOPEN CLEAR1	Shut_AUX	Shut_CPU	Shut_SYS	AUXFANIN2	AUXFANIN1	CASEOPEN1
DEFAULT	0	0	1	1	1	1	1	0

BIT	DESCRIPTION	
7	CASEOPEN0 Clear Control. Writing 1 to this bit will clear CASEOPEN status. This bit will be cleared itself. The function is the same as LDA, CR[E6h], bit 5.	
6	CASEOPEN1 Clear Control. Writing 1 to this bit will clear CASEOPEN status. This bit will be cleared itself. The function is the same as LDA, CR[E6h], bit 5..	
5	Shut_SOURCE3_SMI	"1" disables the corresponding interrupt status bit for the SMI interrupt. (See Interrupt Status Register 4 – Index 45h (Bank 0)).
4	Shut_SOURCE2_SMI	
3	Shut_SOURCE1_SMI	
2	AUXFANIN2	"1" disables the corresponding interrupt status bit for the SMI interrupt.
1	AUXFANIN1	"1" disables the corresponding interrupt status bit for the SMI interrupt
0	CASEOPEN1	"1" disables the corresponding interrupt status bit for the SMI interrupt.

9.22 Reserved Register – Index 47h (Bank 0)

9.52 SYSFAN Monitor Temperature Source Select Register/ STOPDUTY Enable Register – Index 00h (Bank 1)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Stopduty_En	Reserved		SYSFAN SOURCE[4:0]				
DEFAULT	0	0	0	0	0	0	0	1

BIT	DESCRIPTION
7	Stopduty_En: 0: FANOUT will decrease to zero value at most if necessary. 1: FANOUT will decrease to SYSFANOUT Stop Value (Bank1, index05h) at most if necessary. (This function is for SMART FAN I and III.)
6-5	Reserved
4-0	SYSFAN Temperature Source Select: Bits 4 3 2 1 0 0 0 0 0 1: Select SYSTIN as SYSFAN monitoring source. (Default) 0 0 0 1 0: Select CPUTIN as SYSFAN monitoring source. 0 0 0 1 1: Select AUXTIN as SYSFAN monitoring source. 0 0 1 0 0: Select SMBUSMASTER 0 as SYSFAN monitoring source. 0 0 1 0 1: Select SMBUSMASTER 1 as SYSFAN monitoring source. 0 0 1 1 0: Select SMBUSMASTER 2 as SYSFAN monitoring source. 0 0 1 1 1: Select SMBUSMASTER 3 as SYSFAN monitoring source. 0 1 0 0 0: Select SMBUSMASTER 4 as SYSFAN monitoring source. 0 1 0 0 1: Select SMBUSMASTER 5 as SYSFAN monitoring source. 0 1 0 1 0: Select SMBUSMASTER 6 as SYSFAN monitoring source. 0 1 0 1 1: Select SMBUSMASTER 7 as SYSFAN monitoring source. 0 1 1 0 0: Select PECI Agent 0 as SYSFAN monitoring source. 0 1 1 0 1: Select PECI Agent 1 as SYSFAN monitoring source. 0 1 1 1 0: Select PCH_CHIP_CPU_MAX_TEMP as SYSFAN monitoring source. 0 1 1 1 1: Select PCH_CHIP_TEMP as SYSFAN monitoring source. 1 0 0 0 0: Select PCH_CPU_TEMP as SYSFAN monitoring source. 1 0 0 0 1: Select PCH_MCH_TEMP as SYSFAN monitoring source. 1 0 0 1 0: Select PCH_DIM0_TEMP as SYSFAN monitoring source. 1 0 0 1 1: Select PCH_DIM1_TEMP as SYSFAN monitoring source. 1 0 1 0 0: Select PCH_DIM2_TEMP as SYSFAN monitoring source. 1 0 1 0 1: Select PCH_DIM3_TEMP as SYSFAN monitoring source. 1 0 1 1 0: Select BYTE_TEMP as SYSFAN monitoring source.

Note. If the temperature source is selecting to PECT, please set Bank0 Index AEh first for reading correct value.

9.53 SYSFAN Target Temperature Register / SYSFANIN Target Speed_L Register – Index 01h (Bank 1)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	SYSTIN Target Temperature / SYSFANIN Target Speed_L							
DEFAULT	0	0	0	0	0	0	0	0

FUNCTION MODE		7	6	5	4	3	2	1	0
Thermal Cruise™	DESCRIPTION	SYSFAN Target Temperature							
Fan Speed Cruise™	DESCRIPTION	SYSFANIN Target Speed [7:0], [11:8] associate index 0C [3:0]							

9.54 SYSFAN MODE Register / SYSFAN TOLERRANCE Register – Index 02h (Bank 1)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	SYSFAN MODE				Reserved	Tolerance of SYSFAN Target Temperature or SYSFANIN Target Speed_L		
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7-4	SYSFANOUT Mode Select. 0000: SYSFANOUT is in Manual Mode. (Default) 0001: SYSFANOUT is in Thermal Cruise Mode. 0010: SYSFANOUT is in Speed Cruise Mode. 0100: SYSFANOUT is in SMART FAN IV Mode.
3	Reserved
2-0	Tolerance of SYSFAN Target Temperature or SYSFANIN Target Speed_L.

9.55 SYSFANOUT Step Up Time Register – Index 03h (Bank 1)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	SYSFANOUT Value Step Up Time							
DEFAULT	0	0	0	0	1	0	1	0

In SMART FAN™ mode, this register determines the amount of time SYSFANOUT takes to increase its value by one step.

(1) For PWM output:

The units are intervals of 0.1 second. The default time is 1 second.

(2) For DC output:

The units are intervals of 0.4 second. The default time is 4 seconds.

9.56 SYSFANOUT Step Down Time Register – Index 04h (Bank 1)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	SYSFANOUT Value Step Down Time							

DEFAULT	0	0	0	0	1	0	1	0
---------	---	---	---	---	---	---	---	---

In SMART FAN™ mode, this register determines the amount of time SYSFANOUT takes to decrease its value by one step.

(1) For PWM output:

The units are intervals of 0.1 second. The default time is 1 second.

(2) For DC output:

The units are intervals of 0.4 second. The default time is 4 seconds.

9.57 SYSFANOUT Stop Value Register – Index 05h (Bank 1)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	SYSFANOUT Stop Value							
DEFAULT	0	0	0	0	0	0	0	1

In Thermal Cruise mode, the SYSFANOUT value decreases to this eight-bit value if the temperature stays below the lowest temperature limit. This value should not be zero.

Please note that Stop Value does not mean that the fan really stops. It means that if the temperature keeps below low temperature limit, then the fan speed keeps on decreasing until reaching a minimum value, and this is Stop Value.

9.58 SYSFANOUT Start-up Value Register – Index 06h (Bank 1)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	SYSFANOUT Start-Up Value							
DEFAULT	0	0	0	0	0	0	0	1

In Thermal Cruise mode, SYSFANOUT value increases from zero to this eight-bit register value to provide a minimum value to turn on the fan.

9.59 SYSFANOUT Stop Time Register – Index 07h (Bank 1)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	SYSFANOUT Value Stop Time							
DEFAULT	0	0	1	1	1	1	0	0

In SMART FAN™ mode, this register determines the amount of time it takes SYSFANOUT value to fall from the stop value to zero.

(1) For PWM output:

The units are intervals of 0.1 second. The default time is 1 second.

(2) For DC output:

The units are intervals of 0.4 second. The default time is 4 seconds.

9.60 Reserved Register – Index 08h (Bank 1)

9.61 SYSFANOUT Output Value Select Register – Index 09h (Bank 1)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	SYSFANOUT Value							
DEFAULT	1	1	1	1	1	1	1	1

FUNCTION MODE		7	6	5	4	3	2	1	0
PWM Output (Bank0, Index 04h, bit 0 is 0)	DESCRIPTION	The PWM duty cycle is equal to this eight-bit value, divided by 255, times 100%. FFh creates a duty cycle of 100%, and 00h creates a duty cycle of 0%.							
DC Voltage Output Bank0, Index 04h, bit 0 is 1)	DESCRIPTION	SYSFANOUT voltage control. The output voltage is calculated according to this equation. $\text{OUTPUT Voltage} = V_{ref} * \frac{FANOUT}{64}$ Note. VREF is approx 2.048V.						Reserved

Note. If the temperature source is selecting to PECI, please set Bank0 Index AEh first for reading correct value.

9.101 CPUFAN Target Temperature Register / CPUFANIN Target Speed_L Register – Index 01h (Bank 2)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	CPUTIN Target Temperature / CPUFANIN Target Speed_L							
DEFAULT	0	0	0	0	0	0	0	0

FUNCTION MODE		7	6	5	4	3	2	1	0
Thermal Cruise™	DESCRIPTION	CPUFAN Target Temperature							
Fan Speed Cruise™	DESCRIPTION	CPUFANIN Target Speed [7:0], [11:8] associate index 0C [3:0]							

9.102 CPUFAN MODE Register / CPUFAN TOLERRANCE Register – Index 02h (Bank 2)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	CPUFAN MODE				Reserved	Tolerance of CPUFAN Target Temperature or CPUFANIN Target Speed_L		
DEFAULT	0	0	0	0	0	0	1	0

BIT	DESCRIPTION
7-4	CPUFANOUT Mode Select. 0000: CPUFANOUT is in Manual Mode. (Default) 0001: CPUFANOUT is in Thermal Cruise Mode. 0010: CPUFANOUT is in Speed Cruise Mode. 0100: CPUFANOUT is in SMART FAN IV Mode.
3	Reserved
2-0	Tolerance of CPUFAN Target Temperature or CPUFANIN Target Speed_L.

9.103 CPUFANOUT Step Up Time Register – Index 03h (Bank 2)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	CPUFANOUT Value Step Up Time							
DEFAULT	0	0	0	0	1	0	1	0

In SMART FAN™ mode, this register determines the amount of time CPUFANOUT takes to increase its value by one step.

(1) For PWM output:

The units are intervals of 0.1 second. The default time is 1 second.

9.104 CPUFANOUT Step Down Time Register – Index 04h (Bank 2)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	CPUFANOUT Value Step Down Time							
DEFAULT	0	0	0	0	1	0	1	0

In SMART FAN™ mode, this register determines the amount of time CPUFANOUT takes to decrease its value by one step.

(1) For PWM output:

The units are intervals of 0.1 second. The default time is 1 second.

9.105 CPUFANOUT Stop Value Register – Index 05h (Bank 2)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	CPUFANOUT Stop Value							
DEFAULT	0	0	0	0	0	0	0	1

In Thermal Cruise mode, the CPUFANOUT value decreases to this eight-bit value if the temperature stays below the lowest temperature limit. This value should not be zero.

Please note that Stop Value does not mean that the fan really stops. It means that if the temperature keeps below low temperature limit, then the fan speed keeps on decreasing until reaching a minimum value, and this is Stop Value.

9.106 CPUFANOUT Start-up Value Register – Index 06h (Bank 2)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	CPUFANOUT Start-Up Value							
DEFAULT	0	0	0	0	0	0	0	1

In Thermal Cruise mode, CPUFANOUT value increases from zero to this eight-bit register value to provide a minimum value to turn on the fan.

9.107 CPUFANOUT Stop Time Register – Index 07h (Bank 2)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	CPUFANOUT Value Stop Time							
DEFAULT	0	0	1	1	1	1	0	0

In SMART FAN™ mode, this register determines the amount of time it takes CPUFANOUT value to fall from the stop value to zero.

(1) For PWM output:

The units are intervals of 0.1 second. The default time is 1 second.

9.108 Reserved Register – Index 08h (Bank 2)

9.109 CPUFANOUT Output Value Select Register – Index 09h (Bank 2)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	CPUFANOUT Value							
DEFAULT	Depends on strapping pin – Pin.34 FAN_SET							

FUNCTION MODE		7	6	5	4	3	2	1	0
PWM Output Only	DESCRIPTION	The PWM duty cycle is equal to this eight-bit value, divided by 255, times 100%. FFh creates a duty cycle of 100%, and 00h creates a duty cycle of 0%.

BIT	DESCRIPTION
7-4	AUXFANOUT Mode Select. 0000: AUXFANOUT is in Manual Mode. (Default) 0001: AUXFANOUT is in Thermal Cruise Mode. 0010: AUXFANOUT is as Fan Speed Cruise Mode. 0100: AUXFANOUT is in SMART FAN IV Mode.
3	Reseved
2-0	Tolerance of AUXFAN Target Temperature or AUXFANIN Target Speed_L.

9.151 AUXFANOUT Step Up Time Register – Index 03h (Bank 3)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	AUXFANOUT Value Step Up Time							
DEFAULT	0	0	0	0	1	0	1	0

In SMART FAN™ mode, this register determines the amount of time AUXFANOUT takes to increase its value by one step.

(1) For PWM output:

The units are intervals of 0.1 second. The default time is 1 second.

9.152 AUXFANOUT Step Down Time Register – Index 04h (Bank 3)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	AUXFANOUT Value Step Down Time							

DEFAULT	0	0	0	0	1	0	1	0
---------	---	---	---	---	---	---	---	---

In SMART FAN™ mode, this register determines the amount of time AUXFANOUT takes to decrease its value by one step.

(1) For PWM output:

The units are intervals of 0.1 second. The default time is 1 second.

9.153 AUXFANOUT Stop Value Register – Index 05h (Bank 3)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	AUXFANOUT Stop Value							
DEFAULT	0	0	0	0	0	0	0	1

In Thermal Cruise mode, the AUXFANOUT value decreases to this eight-bit value if the temperature stays below the lowest temperature limit. This value should not be zero.

Please note that Stop Value does not mean that the fan really stops. It means that if the temperature keeps below low temperature limit, then the fan speed keeps on decreasing until reaching a minimum value, and this is Stop Value.

9.154 AUXFANOUT Start-up Value Register – Index 06h (Bank 3)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	AUXFANOUT Start-Up Value							
DEFAULT	0	0	0	0	0	0	0	1

In Thermal Cruise mode, AUXFANOUT value increases from zero to this eight-bit register value to provide a minimum value to turn on the fan.

9.155 AUXFANOUT Stop Time Register – Index 07h (Bank 3)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	AUXFANOUT Value Stop Time							
DEFAULT	0	0	1	1	1	1	0	0

In SMART FAN™ mode, this register determines the amount of time it takes AUXFANOUT value to fall from the stop value to zero.

(1) For PWM output:

The units are intervals of 0.1 second. The default time is 1 second.

9.156 Reserved Register – Index 08h (Bank 3)

9.157 AUXFANOUT Output Value Select Register – Index 09h (Bank 3)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	AUXFANOUT Value							
DEFAULT	1	1	1	1	1	1	1	1

FUNCTION MODE		7	6	5	4	3	2	1	0
PWM Output	DESCRIPTION	The PWM duty cycle is equal to this eight-bit value, divided by 255, times 100%. FFh creates a duty cycle of 100%, and 00h creates a duty cycle of 0%.							

9.158 AUXFANIN Tolerance_H / Target Speed_H Register – Index 0Ch (Bank 3)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Reserved	AUXFANIN TOL_H			AUXFANIN Target Speed_H			
DEFAULT	0	0			0			

BIT	DESCRIPTION
7	Reserved
6-4	AUXFANIN Tolerance_H [5:3]
3-0	AUXFANIN Target Speed_H [11:8]

9.159 Reserved Register – Index 0Dh (Bank 3)
9.160 SMART FAN IV AUXFANOUT STEP Register – Index 20h (Bank 3)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Reserved							En_AUXFANOUT_STEP
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7-1	Reserved
0	En_AUXFANOUT_STEP 0: Disable SMART FAN IV has Stepping AUXFANOUT. (default) 1: Enable SMART FAN IV has Stepping AUXFANOUT.

9.161 AUXFAN (SMART FAN™ IV) Temperature 1 Register(T1) – Index 21h (Bank 3)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	AUXFAN (SMART FAN™ IV) Temperature 1							
DEFAULT	0	0	0	1	1	0	0	1

BIT	DESCRIPTION
7-0	AUXFAN (SMART FAN™ IV) Temperature 1 Register (T1).

9.162 AUXFAN (SMART FAN™ IV) Temperature 2 Register(T2) – Index 22h (Bank 3)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	AUXFAN (SMART FAN™ IV) Temperature 2							
DEFAULT	0	0	1	0	0	0	1	1

BIT	DESCRIPTION
7-0	AUXFAN (SMART FAN™ IV) Temperature 2 Register (T2).

9.163 AUXFAN (SMART FAN™ IV) Temperature 3 Register(T3) – Index 23h (Bank 3)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	AUXFAN (SMART FAN™ IV) Temperature 3							
DEFAULT	0	0	1	0	1	1	0	1

BIT	DESCRIPTION
7-0	AUXFAN (SMART FAN™ IV) Temperature 3 Register (T3).

9.164 AUXFAN (SMART FAN™ IV) Temperature 4 Register(T4) – Index 24h (Bank 3)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	AUXFAN (SMART FAN™ IV) Temperature 4							
DEFAULT	0	0	1	1	0	1	1	1

BIT	DESCRIPTION
7-0	AUXFAN (SMART FAN™ IV) Temperature 4 Register (T4).

9.165 AUXFAN (SMART FAN™ IV) DC/PWM 1 Register – Index 27h (Bank 3)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	AUXFAN (SMART FAN™ IV) DC/PWM 1							
DEFAULT	1	0	0	0	1	1	0	0

BIT	DESCRIPTION
7-0	AUXFAN (SMART FAN™ IV) DC/PWM 1 Register.

9.166 AUXFAN (SMART FAN™ IV) DC/PWM 2 Register – Index 28h (Bank 3)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	AUXFAN (SMART FAN™ IV) DC/PWM 2							
DEFAULT	1	0	1	0	1	0	1	0

BIT	DESCRIPTION
7-0	AUXFAN (SMART FAN™ IV) DC/PWM 2 Register.

9.167 AUXFAN (SMART FAN™ IV) DC/PWM 3 Register – Index 29h (Bank 3)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	AUXFAN (SMART FAN™ IV) DC/PWM 3							
DEFAULT	1	1	0	0	1	0	0	0

BIT	DESCRIPTION
7-0	AUXFAN (SMART FAN™ IV) DC/PWM 3 Register.

9.168 AUXFAN (SMART FAN™ IV) DC/PWM 4 Register – Index 2Ah (Bank 3)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	AUXFAN (SMART FAN™ IV) DC/PWM 4							
DEFAULT	1	1	1	0	0	1	1	0

BIT	DESCRIPTION
7-0	AUXFAN (SMART FAN™ IV) DC/PWM 4 Register.

9.169 Reserved Register – Index Index 2Dh~ 30h (Bank 3)

9.170 AUXFAN 3-Wire Enable Register – Index 31h (Bank 3)

Attribute: Read Only

-----	-------------

7-0	VIN1 Low Limit Compared Voltage. Default: 0x64h (0.8V)
-----	---

9.220 AVCC High Limit Compared Voltage Register – Index 27h (Bank 4)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	AVCC High Limit Compared Voltage (AVCC_Limth)							
DEFAULT	1	1	1	0	0	0	0	1

BIT	DESCRIPTION
7-0	AVCC High Limit Compared Voltage. Default: 0xE1h (1.8V *2)

9.221 AVCC Low Limit Compared Voltage Register – Index 28h (Bank 4)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	AVCC Low Limit Compared Voltage (AVCC_Limth)							
DEFAULT	1	0	0	1	0	1	1	0

BIT	DESCRIPTION
7-0	AVCC Low Limit Compared Voltage (AVCC_Limth). Default: 0x96h (1.2V *2)

9.222 Reserved Register – Index 29h ~ 3Fh (Bank 4)

9.223 SMI_TEMP4-6 SMI# Mask Register - Index 40h (Bank 4)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Reserved		SMSK TEMP_T6_Shut	SMSK TEMP_T5_Shut	SMSK TEMP_T4_Shut	SMSK TEMP_T6	SMSK TEMP_T5	SMSK TEMP_T4
DEFAULT	0	0	1	1	1	1	1	1

BIT	DESCRIPTION
7-6	Reserved.
5	Shut_SOURCE6_SMI
4	Shut_SOURCE5_SMI
3	Shut_SOURCE4_SMI
2	SMIOVT6
1	SMIOVT5
0	SMIOVT4

“1” disables the corresponding interrupt status bit for the SMI interrupt. (See Interrupt Status Register 4 – Index 45h (Bank 0))

9.224 SMI_TEMP4-6 Interrupt Status Register - Index 41h (Bank 4)

Attribute: Read Clear

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Reserved	STS_TEMP_Shut_T6	STS_TEMP_Shut_T5	STS_TEMP_Shut_T4	Reserved	STS_TEMP_T6	STS_TEMP_T5	STS_TEMP_T4
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7	Reserved.
6	Shut_SOURCE6_SMI A one indicates the high limit of SMI_SOURCE6 temperature of SMI# Shut-down mode has been exceeded. (SYSTIN is default temperature)
5	Shut_SOURCE5_SMI A one indicates the high limit of SMI_SOURCE5 temperature of SMI# Shut-down mode has been exceeded. (SYSTIN is default temperature)
4	Shut_SOURCE4_SMI A one indicates the high limit of SMI_SOURCE4 temperature of SMI# Shut-down mode has been exceeded. (SYSTIN is default temperature)
3	Reserved.
2	SMIOVT6 A one indicates the high limit of SMI_SOURCE6 temperature has been exceeded. (SYSTIN is default temperature)
1	SMIOVT5 A one indicates the high limit of SMI_SOURCE5 temperature has been exceeded. (SYSTIN is default temperature)
0	SMIOVT4 A one indicates the high limit of SMI_SOURCE4 temperature has been exceeded. (SYSTIN is default temperature)

9.225 Voltage Comparison Interrupt Status Register - Index 42h (Bank 4)

Attribute: Read Only

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	RESERVED					AVCC_Warn	VIN1_Warn	VIN0_Warn
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7-3	Reserved.
2	AVCC_Warn. A one indicates the limit of AVCC voltage has been exceeded.
1	VIN1_Warn. A one indicates the limit of VIN1 voltage has been exceeded.

BIT	DESCRIPTION
0	VIN0_Warn A one indicates the limit of VIN0 voltage has been exceeded.

9.226 Interrupt Status Register 3 – Index 50h (Bank 4)

Attribute: **Read Clear**

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	RESERVED		AUXFANIN2	AUXFANIN1	RESERVED		VBAT	3VSB
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7-6	Reserved.
5	AUXFANIN2. A one indicates the fan count limit of AUXFANIN2 has been exceeded.
4	AUXFANIN1. A one indicates the fan count limit of AUXFANIN1 has been exceeded.
2-3	Reserved.
1	VBAT. A one indicates the high or low limit of VBAT has been exceeded.
0	3VSB. A one indicates the high or low limit of 3VSB has been exceeded.

9.227 SMI# Mask Register 4 – Index 51h (Bank 4)

Attribute: **Read/Write**

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	RESERVED			TAR3	RESERVED		SMSKVBAT	SMSKVSB
DEFAULT	0	0	0	1	0	0	1	1

BIT	DESCRIPTION
7-5	Reserved.
4	TAR3. A one disables the corresponding interrupt status bit for the $\overline{\text{SMI}}$ interrupt. (See Interrupt Status Register 3 – Index 50h (Bank 4))
3-2	Reserved.
1	SMSKVBAT. A one disables the corresponding interrupt status bit for the $\overline{\text{SMI}}$ interrupt. (See Interrupt Status Register 3 – Index 50h (Bank 4))
0	SMSKVSB. A one disables the corresponding interrupt status bit for the $\overline{\text{SMI}}$ interrupt. (See Interrupt Status Register 3 – Index 50h (Bank 4))

9.228 Reserved Register – Index 52h ~ 53h (Bank 4)

9.229 SYSTIN Temperature Sensor Offset Register – Index 54h (Bank 4)

Attribute: **Read/Write**

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	OFFSET<7:0>							
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7-0	SYSTIN Temperature Offset Value. The value in this register is added to the monitored value so that the read value will be the sum of the monitored value and this offset value.

9.230 CPUTIN Temperature Sensor Offset Register – Index 55h (Bank 4)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	OFFSET<7:0>							
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7-0	CPUTIN Temperature Offset Value. The value in this register will be added to the monitored value so that the read value is the sum of the monitored value and this offset value.

9.231 AUCTIN Temperature Sensor Offset Register – Index 56h (Bank 4)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	OFFSET<7:0>							
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7-0	AUCTIN Temperature Offset Value. The value in this register is added to the monitored value so that the read value is the sum of the monitored value and this offset value.

9.232 Reserved Register – Index 57h-58h (Bank 4)

9.233 Real Time Hardware Status Register I – Index 59h (Bank 4)

Attribute: Read Only

DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7	CPUFANIN_STS. CPUFANIN Status. 1: Fan speed count is over the threshold value. 0: Fan speed count is in the allowed range.
6	SYSFANIN_STS. SYSFANIN Status. 1: Fan speed count is over the threshold value. 0: Fan speed count is in the allowed range.
5	CPUTIN_STS. CPUTIN Temperature Sensor Status. 1: Temperature exceeds the over-temperature value. 0: Temperature is under the hysteresis value.
4	SYSTIN_STS. SYSTIN Temperature Sensor Status. 1: Temperature exceeds the over-temperature value. 0: Temperature is under the hysteresis value.
3	3VCC_STS. 3VCC Voltage Status. 1: 3VCC voltage is over or under the allowed range. 0: 3VCC voltage is in the allowed range.
2	AVCC_STS. AVCC Voltage Status. 1: AVCC voltage is over or under the allowed range. 0: AVCC voltage is in the allowed range.
1	VIN0_STS. VIN0 Voltage Status. 1: VIN0 voltage is over or under the allowed range. 0: VIN0 voltage is in the allowed range.
0	CPUVCORE_STS. CPUVCORE Voltage Status. 1: CPUVCORE voltage is over or under the allowed range. 0: CPUVCORE voltage is in the allowed range.

9.234 Real Time Hardware Status Register II – Index 5Ah (Bank 4)

Attribute: Read Only

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	TAR2_STS	TAR1_STS	AUXTIN_STS	CASEOPEN0_STS	AUXFANIN0_STS	AUXFANIN1_STS	CASEOPEN1_STS	VIN1_STS
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7	TAR2_STS. Smart Fan of CPUFANIN Warning Status. 1: Selected temperature has been over the target temperature for three minutes at full fan speed in Thermal Cruise Mode. 0: Selected temperature has not reached the warning range.
6	TAR1_STS. Smart Fan of SYSFANIN Warning Status. 1: SYSTIN temperature has been over the target temperature for three minutes at full fan speed in Thermal Cruise Mode. 0: SYSTIN temperature has not reached the warning range.
5	AUXTIN_STS. AUXTIN Temperature Sensor Status. 1: Temperature exceeds the over-temperature value. 0: Temperature is under the hysteresis value.

BIT	DESCRIPTION
4	CASEOPEN0_STS. CaseOpen Status. 1: Caseopen is detected and latched. 0: Caseopen is not latched.
3	AUXFANIN0_STS. AUXFANIN0 Status. 1: Fan speed count is over the threshold value. 0: Fan speed count is in the allowed range.
2	AUXFANIN1_STS. AUXFANIN1 Status. 1: Fan speed count is over the threshold value. 0: Fan speed count is in the allowed range.
1	CASEOPEN1_STS. CaseOpen Status. 1: Caseopen is detected and latched. 0: Caseopen is not latched.
0	VIN1_STS. VIN1 Voltage Status. 1: VIN1 voltage is over or under the allowed range. 0: VIN1 voltage is in the allowed range.

9.235 Real Time Hardware Status Register III – Index 5Bh (Bank 4)

Attribute: Read Only

Size: 8 bits

9.344 PECE Command Write Data 12 Register – Index 16h (Bank 7)

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	PECI Write Data 12							
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7~0	The data would be sent to client. Default value is 00_{HEX}.

9.345 PECI Agent Relative Temperature Register (ARTR) – Index 17h-1Eh (Bank 7)

These registers return the “raw data” retrieved from PECI GetTemp() command. These data could be the error codes (range: 8000H~81FFH) or relative temperatures to process the defined Tbase. The error code will only be update in **ARTR**; while “Temperature Reading Register”, Bank7 Index 20h and 21h, will not be updated when the error code is received. If the **RtHigher** mechanism is activated, the normal temperature will always be returned first. In case both 2 domains return errors, the return priority will be Overflow Error > Underflow Error > Missing Diode > General Error. The reset value is 8001_{HEX}, in that PECI is defaulted to be off. In PECI, 8001_{HEX} means the diode is missing.

Attribute: Read / Write(When Virtual_En enable)

ADDRESS 17-1E	DESCRIPTION
17h[15:8],18h[7:0]	Domain0 Relative Temperature Agent0 [15:0]
19h[15:8],1Ah[7:0]	Domain1 Relative Temperature Agent0 [15:0]
1Bh[15:8],1Ch[7:0]	Domain0 Relative Temperature Agent1 [15:0]
1Dh[15:8],1Eh[7:0]	Domain1 Relative Temperature Agent1 [15:0]

GetTemp() PECI Temperature format:

BIT	DESCRIPTION
15	Sign Bit. (Sign) In PECI Protocol, this bit should always be 1 to represent a negative temperature.
14-6	The integer part of the relative temperature. (Temperature[8:0])
5	TEMP_2. 0.5°C unit.
4	TEMP_4. 0.25°C unit.
3	TEMP_8. 0.125°C unit.
2	TEMP_16. 0.0625°C unit.
1	TEMP_32. 0.03125°C unit.
0	TEMP_64. 0.015625°C unit.

GetTemp() Response Definition:

RESPONSE	MEANING
General Sensor Error (GSE)	Thermal scan did not complete in time. Retry is appropriate.
0x0000	Processor is running at its maximum temperature or is currently being reset.

All other data	Valid temperature reading, reported as a negative offset from the TCC activation temperature. The valide temperature reading is referred to <u>GetTemp() PECL Temperature format</u>
----------------	---

Error Code	Description	Host operation
8000 _{HEX}	General Sensor Error	No further processing.
8001 _{HEX}	Sensing Device Missing	
8002 _{HEX}	Operational, but the temperature is lower than the sensor operation range.	Compulsorily write 0°C back to the temperature readouts.
8003 _{HEX}	Operational, but the temperature is higher than the sensor operation range.	Compulsorily write 127°C back to the temperature readouts.
8004 _{HEX}	Reserved.	No further operation.
81FF _{HEX}		

9.346 PECL Command Read Date Registers – Index 1F ~ 32h (Bank 7)

9.347 PECL Alive Agent Register – Index 1Fh (Bank 7)

Attribute: Read only

Size: 8 bits

Record which agentis able to respond to Ping().**Default value is 00_{HEX}.**

1: agent is able to respond to Ping() command. Agent alive

0: agent isn't able to respond to Ping() command. Agent is not alive

BIT	7	6	5	4	3	2	1	0
NAME	Reserved						PECL Alive Agent	
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION

NAME	PECI Read Data 4							
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7~0	The data would be get from client. Default value is 00_{HEX}.

9.362 Peci Command Read Data 5 Register – Index 2Eh (Bank 7)

Attribute: Read only

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	PECI Read Data 5							
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7~0	The data would be get from client. Default value is 00_{HEX}.

9.363 Peci Command Read Data 6 Register – Index 2Fh (Bank 7)

Attribute: Read only

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	PECI Read Data 6							
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7~0	The data would be get from client. Default value is 00_{HEX}.

9.364 Peci Command Read Data 7 Register – Index 30h (Bank 7)

Attribute: Read only

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	PECI Read Data 7							

DEFAULT	0	0	0	0	0	0	0	0
---------	---	---	---	---	---	---	---	---

BIT	DESCRIPTION
7~0	The data would be get from client. Default value is 00_{HEX}.

9.365 PECI Command Read Data 8 Register – Index 31h (Bank 7)

Attribute: Read only

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	PECI Read Data 8							
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7~0	The data would be get from client. Default value is 00_{HEX}.

9.366 PECI Command Read Data 9 Register – Index 32h (Bank 7)

Attribute: Read only

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	PECI Read Data 9							
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7~0	The data would be get from client. Default value is 00_{HEX}.

10. FLOPPY DISK CONTROLLER

10.1 FDC Functional Description

The floppy disk controller (FDC) of the NCT6776F / NCT6776D integrates all of the logic required for floppy disk control. The FDC implements a FIFO which provides better system performance in multi-master systems, and the digital data separator supports data rates up to 2 M bits/sec.

The FDC includes the following blocks: Precompensation, Data Rate Selection, Digital Data Separator, FIFO, and FDC Core. The rest of this section discusses these blocks through the following topics: FIFO, Data Separator, Write Precompensation, Perpendicular Recording mode, FDC core, FDC commands, and FDC registers.

10.1.1 FIFO (Data)

The FIFO is 16 bytes in size and has programmable threshold values. All command parameter information and disk data transfers go through the FIFO. Data transfers are governed by the RQM (Request fro Master) and DIO (Data Input / Output) bits in the Main Status Register.

The FIFO is defaulted to disabled mode after any form of reset, which maintains PC/AT hardware compatibility. The default values can be changed through the configure command. The advantage of the FIFO is that it lets the system have a larger DMA latency without causing disk errors. The following tables give several examples of the delays with the FIFO. The data are based upon the following formula:

$$\text{DELAY} = \text{THRESHOLD} \# \times (1 / \text{DATA RATE}) * 8 - 1.5 \mu s$$

Table 10-1 The Delays of the FIFO

FIFO THRESHOLD	MAXIMUM DELAY UNTIL SERVICING AT 500K BPS
	Data Rate
1 Byte	$1 \times 16 \mu s - 1.5 \mu s = 14.5 \mu s$
2 Byte	$2 \times 16 \mu s - 1.5 \mu s = 30.5 \mu s$
8 Byte	$8 \times 16 \mu s - 1.5 \mu s = 6.5 \mu s$
15 Byte	$15 \times 16 \mu s - 1.5 \mu s = 238.5 \mu s$
FIFO THRESHOLD	MAXIMUM DELAY UNTIL SERVICING AT 1M BPS
	Data Rate
1 Byte	$1 \times 8 \mu s - 1.5 \mu s = 6.5 \mu s$
2 Byte	$2 \times 8 \mu s - 1.5 \mu s = 14.5 \mu s$
8 Byte	$8 \times 8 \mu s - 1.5 \mu s = 62.5 \mu s$
15 Byte	$15 \times 8 \mu s - 1.5 \mu s = 118.5 \mu s$

At the start of a command, the FIFO is always disabled, and command parameters must be sent based upon the RQM and DIO bit settings in the Main Status Register. When the FDC enters the command execution phase, it clears the FIFO off any data to ensure that invalid data are not transferred.

An overrun or underrun terminates the current command and data transfer. Disk writes complete the current sector by generating a 00 pattern and valid CRC. Reads require the host to remove the remaining data so that the result phase may be entered.

DMA transfers are enabled by the specify command and are initiated by the FDC when the LDRQ pin is activated during a data transfer command.

10.1.2 Data Separator

The function of the data separator is to lock onto incoming serial read data. When a lock is achieved, the serial front-end logic in the chip is provided with a clock that is synchronized with the read data. The synchronized clock, called the Data Window, is used to internally sample the serial data portion of the bit cell, and the alternate state samples the clock portion. Serial-to-parallel conversion logic separates the read data into clock and data bytes.

The Digital Data Separator (DDS) has three parts: control logic, error adjustment, and speed tracking. The control logic generates RDD and RWD for every pulse input, and any data pulse input is synchronized and then adjusted immediately by error adjustment. A digital integrator keeps track of the speed changes in the input data stream.

10.1.3 Write Precompensation

The write precompensation logic minimizes bit shifts in the RDDATA stream from the disk drive. Shifting of bits is a known phenomenon in magnetic media and depends on the disk media and the floppy drive.

The FDC monitors the bit stream that is being sent to the drive. The data patterns that require precompensation are well known, so, depending on the pattern, the bit is shifted either early or late, relative to the surrounding bits.

10.1.4 Perpendicular Recording Mode

The FDC is also capable of interfacing directly to perpendicular recording floppy drives. Perpendicular recording differs from the traditional longitudinal method in that the magnetic bits are oriented vertically. This scheme packs more data bits into the same area.

FDCs with perpendicular recording drives can read standard 3.5" floppy disks and can read and write perpendicular media. Some manufacturers offer drives that can read and write standard and perpendicular media in a perpendicular media drive.

A single command puts the FDC into perpendicular mode. All other commands operate as they normally do. Perpendicular mode requires a 1 Mbps data rate for the FDC, and, at this data rate, the FIFO manages the host interface bottleneck due to the high speed of data transfer to and from the disk.

10.1.5 FDC Core

The NCT6776F / NCT6776D FDC is capable of performing twenty commands. Each command is initiated by a multi-byte transfer from the microprocessor, and the result may be a multi-byte transfer back to the microprocessor. Each command consists of three phases: command, execution, and result.

Command

The microprocessor issues all required information to the controller to perform a specific operation.

Execution

The controller performs the specified operation.

Result

After the operation is completed, status information and other housekeeping information are provided to the microprocessor.

The next section introduces each of the commands.

10.1.6 FDC Commands

Command Symbol Descriptions:

C: Cylinder Number 0 – 256

D:	Data Pattern
DIR:	Step Direction
	DIR = 0: step out
	DIR = 1: step in
DS0:	Disk Drive Select 0
DS1:	Disk Drive Select 1
DTL:	Data Length
EC:	Enable Count
EFIFO:	Enable FIFO
EIS:	Enable Implied Seek
EOT:	End of Track
FIFOTHR:	FIFO Threshold
GAP:	Gap Length Selection
GPL:	Gap Length
H:	Head Number
HDS:	Head Number Select
HLT:	Head Load Time
HUT:	Head Unload Time
LOCK:	Lock EFIFO, FIFOTHR, and PTRTRK bits to prevent being affected by software reset
MFM:	MFM or FM Mode
MT:	Multitrack
N:	The number of data bytes written in a sector
NCN:	New Cylinder Number
ND:	Non-DMA Mode
OW:	Overwritten
PCN:	Present Cylinder Number
POLL:	Polling Disable
PRETRK:	Precompensation Start Track Number
R:	Record
RCN:	Relative Cylinder Number
R/W:	Read/Write
SC:	Sectors per Cylinder
SK:	Skip deleted data address mark
SRT:	Step Rate Time
ST0:	Status Register 0
ST1:	Status Register 1
ST2:	Status Register 2
ST3:	Status Register 3
WG:	Write gate alters timing of WE

(1) Read Data

Execution										No data transfer takes place	
Result	R	----- ST0 -----								Status information after command execution	
	R	----- ST1 -----									
	R	----- ST2 -----									
	R	----- C -----								Sector ID information after command execution	
	R	----- H -----									
	R	----- R -----									
	R	----- N -----									

(6) Version

PHASE	R/W	D7	D6	D5	D4	D3	D2	D1	D0	REMARKS
Command	W	0	0	0	1	0	0	0	0	Command code
Result	R	1	0	0	1	0	0	0	0	Enhanced controller

(7) Write Data

PHASE	R/W	D7	D6	D5	D4	D3	D2	D1	D0	REMARKS	
Command	W	MT	MFM	0	0	0	1	0	1	Command codes Sector ID information prior to Command execution	
	W	0	0	0	0	0	HDS	DS1	DS0		
	W	----- C -----									
	W	----- H -----									
	W	----- R -----									
	W	----- N -----									
	W	----- EOT -----									
	W	----- GPL -----									
	W	----- DTL -----									
Execution										Data transfer between the FDD and the system	
Result	R	----- ST0 -----								Status information after Command execution	
	R	----- ST1 -----									
	R	----- ST2 -----									

	R	----- C -----	Sector ID information after Command execution
	R	----- H -----	
	R	----- R -----	
	R	----- N -----	

(8) Write Deleted Data

PHASE	R/W	D7	D6	D5	D4	D3	D2	D1	D0	REMARKS
Command	W	MT	MFM	0	0	1	0	0	1	Command codes
	W	0	0	0	0	0	HDS	DS1	DS0	
	W	----- C -----								Sector ID information prior to command execution
	W	----- H -----								
	W	----- R -----								
	W	----- N -----								
	W	----- EOT -----								
	W	----- GPL -----								
	W	----- DTL -----								
Execution										Data transfer between the FDD and the system
Result	R	----- ST0 -----								Status information after command execution
	R	----- ST1 -----								
	R	----- ST2 -----								
	R	----- C -----								Sector ID information after command execution
	R	----- H -----								
	R	----- R -----								
	R	----- N -----								

(9) Format A Track

PHASE	R/W	D7	D6	D5	D4	D3	D2	D1	D0	REMARKS
Command	W	0	MFM	0	0	1	1	0	1	Command codes
	W	0	0	0	0	0	HDS	DS1	DS0	
	W	----- N -----								Bytes per Sector Sectors per Cylinder
	W	----- SC -----								
	W	----- GPL -----								Gap 3
	W	----- D -----								Filler Byte
Execution for Each Sector: (Repeat)	W	----- C -----								Input Sector Parameters
	W	----- H -----								
	W	----- R -----								
	W	----- N -----								
Result	R	----- ST0 -----								Status information after command execution
	R	----- ST1 -----								
	R	----- ST2 -----								

	R	----- Undefined -----	
	R	----- Undefined -----	
	R	----- Undefined -----	
	R	----- Undefined -----	

(10) Recalibrate

PHASE	R/W	D7	D6	D5	D4	D3	D2	D1	D0	REMARKS
Command	W	0	0	0	0	0	1	1	1	Command codes
	W	0	0	0	0	0	0	DS1	DS0	
Execution										Head retracted to Track 0 Interrupt

(11) Sense Interrupt Status

PHASE	R/W	D7	D6	D5	D4	D3	D2	D1	D0	REMARKS
Command	W	0	0	0	0	1	0	0	0	Command code
Result	R	----- ST0 -----								Status information at the end of each seek operation
	R	----- PCN -----								

(12) Specify

PHASE	R/W	D7	D6	D5	D4	D3	D2	D1	D0	REMARKS
Command	W	0	0	0	0	0	0	1	1	Command codes
	W	-----SRT -----				----- HUT -----				
	W	----- HLT -----								

(13) Seek

PHASE	R/W	D7	D6	D5	D4	D3	D2	D1	D0	REMARKS
Command	W	0	0	0	0	1	1	1	1	Command codes
	W	0	0	0	0	0	HDS	DS1	DS0	
	W	----- NCN -----								
Execution	R									Head positioned over proper cylinder on the diskette

(14) Configure

PHASE	R/W	D7	D6	D5	D4	D3	D2	D1	D0	REMARKS	
Command	W	0	0	0	1	0	0	1	1	Configure information	
	W	0	0	0	0	0	0	0	0		
	W	0 EIS EFIFO POLL ----- FIFOTHR ----									
	W	-----PRETRK -----									
Execution										Internal registers written	

(15) Relative Seek

PHASE	R/W	D7	D6	D5	D4	D3	D2	D1	D0	REMARKS
Command	W	1	DIR	0	0	1	1	1	1	Command codes
	W	0	0	0	0	0	HDS	DS1	DS0	
	W	----- RCN -----								

(16) Dumpreg

PHASE	R/W	D7	D6	D5	D4	D3	D2	D1	D0	REMARKS	
Command	W	0	0	0	0	1	1	1	0	Registers placed in FIFO	
Result	R	----- PCN-Drive 0-----									
	R	----- PCN-Drive 1 -----									
	R	----- PCN-Drive 2-----									
	R	----- PCN-Drive 3 -----									
	R	-----SRT -----					----- HUT -----				
	R	----- HLT -----									ND
	R	----- SC/EOT -----									
	R	LOCK	0	D3	D2	D1	D0	GAP	WG		
	R	0	EIS	EFIFO	POLL		----- FIFOTHR -----				
	R	-----PRETRK -----									

(17) Perpendicular Mode

PHASE	R/W	D7	D6	D5	D4	D3	D2	D1	D0	REMARKS
Command	W	0	0	0	1	0	0	1	0	Command Code
	W	OW	0	D3	D2	D1	D0	GAP	WG	

(18) Lock

PHASE	R/W	D7	D6	D5	D4	D3	D2	D1	D0	REMARKS
Command	W	LOCK	0	0	1	0	1	0	0	Command Code
Result	R	0	0	0	LOCK	0	0	0	0	

(19) Sense Drive Status

PHASE	R/W	D7	D6	D5	D4	D3	D2	D1	D0	REMARKS
Command	W	0	0	0	0	0	1	0	0	Command Code
	W	0	0	0	0	0	HDS	DS1	DS0	
Result	R	----- ST3 -----								Status information about the disk drive

(20) Invalid

PHASE	R/W	D7	D6	D5	D4	D3	D2	D1	D0	REMARKS
Command	W	----- Invalid Codes -----								Invalid codes (no operation-FDC goes to standby state)
Result	R	----- ST0 -----								ST0 = 80h

10.2 Register Descriptions

There are several status, data, and control registers in the NCT6776F / NCT6776D. These registers are defined below, and the rest of this section provides more details about each one of them.

Table 10-2 FDC Registers

ADDRESS OFFSET	REGISTER	
	READ	WRITE
base address + 0	SA REGISTER	
base address + 1	SB REGISTER	
base address + 2		DO REGISTER
base address + 3	TD REGISTER	TD REGISTER
base address + 4	MS REGISTER	DR REGISTER
base address + 5	DT (FIFO) REGISTER	DT (FIFO) REGISTER
base address + 7	DI REGISTER	CC REGISTER

10.2.1 Status Register A (SA Register) (Read base address + 0)

Along with the SB register, the SA register is used to monitor several disk-interface pins in PS/2 and Model 30 modes. In PS/2 mode, the bit definitions for this register are as follows:

BIT	7	6	5	4	3	2	1	0
NAME	INIT PENDING	DRV 2#	STEP	TRAK0#	HEAD	INDEX#	WP#	DIR
DEFAULT	0	0	NA	1	NA	1	1	NA

BIT	DESCRIPTION
7	INIT PENDING. Indicates the value of the floppy disk interrupt output.
6	DRV2#. 0: A second drive has been installed. 1: A second drive has not been installed.
5	STEP. Indicates the complement of the STEP# output.
4	TRAK0#. Indicates the value of the TRAK# input.
3	HEAD. Indicates the complement of the HEAD# output. 0: Side 0. 1: Side 1.
2	INDEX#. Indicates the value of the INDEX# output.
1	WP#. 0: The disk is write-protected. 1: The disk is not write-protected.
0	DIR. Indicates the direction of head movement. 0: Outward direction. 1: Inward direction.

In PS/2 Model 30 mode, the bit definitions for this register are as follows:

BIT	7	6	5	4	3	2	1	0
NAME	INIT PENDING	DRQ	STEP F/F	TRAK0	HEAD#	INDEX	WP	DIR#
DEFAULT	0	0	NA	0	NA	0	0	NA

BIT	DESCRIPTION
7	INIT PENDING. Indicates the value of the floppy disk interrupt output.
6	DRQ. Indicates the value of the DRQ output pin.
5	SETP F/F. indicates the complement of latched STEP# output.
4	TRAK0. Indicates the complement of the TRAK0# input.
3	HEAD#. Indicates the value of the HEAD# output. 0: Side 1. 1: Side 0.
2	INDEX. Indicates the complement of the INDEX# output.
1	WP. 0: The disk is not write-protected. 1: The disk is write-protected.
0	DIR#. Indicates the direction of the head movement. 0: Inward direction. 1: Outward direction.

10.2.2 Status Register B (SB Register) (Read base address + 1)

Along with the SA register, the SB register is used to monitor several disk interface pins in PS/2 and Model 30 modes. In PS/2 mode, the bit definitions for this register are as follows:

BIT	7	6	5	4	3	2	1	0
NAME	Reserved		Drive SEL0	WDTA Toggle	RDTA Toggle	WE	Reserved	MOT EN A
DEFAULT	1	1	0	0	0	0	0	0

BIT	DESCRIPTION
7-6	Reserved.
5	Drive SEL0. Indicates the status of the DO Register, bit 0 (drive-select bit 0).
4	WDTA Toggle. Changes state on every rising edge of the WD# output pin.
3	RDATA Toggle. Changes state on every rising edge of the RDATA# output pin.
2	WE. Indicates the complement of the WE# output pin.
1	Reserved.
0	MOT EN A. Indicates the complement of the MOA# output pin.

In PS/2 Model 30 mode, the bit definitions for this register are as follows:

BIT	7	6	5	4	3	2	1	0
NAME	RESERVED		DSA#	WD F/F	RDATA F/F	WE F/F	DSD#	DSC#

DEFAULT	0	1	1	0	0	0	1	1
---------	---	---	---	---	---	---	---	---

BIT	DESCRIPTION
7-6	Reserved.
5	DSA#. This bit indicates the status of the DSA# output pin.
4	WD F/F. Indicates the complement of the WD# output pin, which is latched on every rising edge of the WD# output pin.
3	RDATA F/F. Indicates the complement of the latched RDATA# output pin.
2	WE F/F. Indicates the complement of the latched WE# output pin.
1	DSD#. 0: Drive D has been selected. 1: Drive D has not been selected.
0	Reserved.

10.2.3 Digital Output Register (DO Register) (Write base address + 2)

The Digital Output Register is a write-only register that controls drive motors, drive selection, DRQ/IRQ enable, and FDC reset. All the bits in this register are cleared by the MR pin. The bit definitions are as follows:

BIT	7	6	5	4	3	2	1	0
NAME	RESERVED			MOTOR ENABLE A	DMA&INT ENABLE	FDC RESET	DRIVE SELECT	
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7-5	Reserved.
4	MOTOR ENABLE A. A logical 1 enables Motor A.
3	DMA & INT ENABLE. A logical 1 enables DRQ/IRQ.
2	FDC RESET. Floppy Disk Controller Reset. A logical 0 resets the FDC.
1-0	DRIVE SELECT. Bits 1 0 0 0: Select Drive A. 0 1: Select Drive B. 1 0: Select Drive C. 1 1: Select Drive D.

10.2.4 Tape Drive Register (TD Register) (Read base address + 3)

This register is used to assign a particular drive number to the tape drive support mode of the data separator. This register also holds the media ID, drive type, and floppy boot drive information for the floppy disk drive.

In normal floppy mode, this register only has bits 0 and 1, and the bit definitions are as follows:

BIT	7	6	5	4	3	2	1	0
NAME	RESERVED						Tape sel 1	Tape sel 0

DEFAULT	NA	NA	NA	NA	NA	NA	0	0
----------------	----	----	----	----	----	----	---	---

BIT	DESCRIPTION
7-2	RESERVED.
1	Tape sel 1.
0	Tape sel 0.

If the three-mode FDD function is enabled (EN3MODE = 1 in LD0 CRF0, Bit 0), the bit definitions are as follows:

BIT	7	6	5	4	3	2	1	0
NAME	Media ID1	Media ID0	Drive Type ID1	Drive Type ID0	Floppy Boot Drive 1	Floppy Boot Drive 0	Tape Sel 1	Tape Sel 0
DEFAULT	0	0	1	1	0	0	0	0

BIT	DESCRIPTION
7	Media ID1. Read only. Reflects the value of LD0, CRF1, bit 5.
6	Media ID0. Read only. Reflects the value of LD0, CRF1, bit 4.
5	Drive Type ID1. Reflect the bit in LD0, CR[F2h]. Which bit is reflected depends on the last drive selected in the PO register.
4	
3	Floppy Boot Drive 1. Reflects the value of LD0, CRF1, bit 7.
2	Floppy Boot Drive 0. Reflects the value of LD0, CRF1, bit 6.
1	Tape Sel 1. Assign a logical drive number to the tape drive. Drive 0 is not available as a tape drive and is reserved for the floppy disk boot drive.
0	

TAPE SEL 1	TAPE SEL 0	DRIVE SELECTED
0	0	None
0	1	1
1	0	2
1	1	3

10.2.5 Main Status Register (MS Register) (Read base address + 4)

The Main Status Register is used to control the flow of data between the microprocessor and the controller. The bit definitions for this register are as follows:

BIT	7	6	5	4	3	2	1	0
NAME	RQM	DIO	Non-DMA mode	FDC Busy	RESERVED			FDD 0 Busy
DEFAULT	0	NA	NA	NA	NA	NA	NA	NA

BIT	DESCRIPTION
7	Request for Master (RQM). A high on this bit indicates Data Register is ready to send or receive data to or from the processor.
6	DATA INPUT/OUTPUT (DIO). If DIO = HIGH, then the transfer is from Data Register to the processor. If DIO = LOW, the transfer is from processor to Data Register.
5	Non-DMA mode. The FDC is in the non-DMA mode, this bit is set only during the execution phase in non-DMA mode.
4	FDC Busy (CB). A read or write command is in the process when CB = HIGH.
3-1	Reserved.
0	FDD 0 Busy. (D0B = 1) FDD number 0 is in the SEEK mode.

10.2.6 Data Rate Register (DR Register) (Write base address + 4)

The Data Rate Register is used to set the transfer rate and write precompensation. However, in PC-AT and PS/2 Model 30 and PS/2 modes, the data rate is controlled by the CC register, not by the DR register. As a result, the real data rate is determined by the most recent write to either the DR or CC register. The bit definitions for this register are as follows:

BIT	7	6	5	4	3	2	1	0
NAME	S/W RESET	POWER DOWN	RESERVED	PRECOMP2	PRECOMP1	PRECOMP0	DRATE1	DRATE0
DEFAULT	0	0	0	0	0	0	1	0

BIT	DESCRIPTION
7	S/W RESET. The software reset bit.
6	POWER DOWN. 0: FDC in normal mode. 1: FDC in power-down mode.
5	RESERVED.
4	PRECOMP 2.
3	PRECOMP 1.
2	PRECOMP 0.
1	DRATE 1.
0	DRATE 0.

Selects the value of write precompensation. The following tables show the precompensation values for every combination of these bits. Please see the tables below.

Select the data rate of the FDC and reduced write-current control.

Bits
1 0
0 0: 500 KB/S (MFM), 250 KB/S (FM), RWC# = 1
0 1: 300 KB/S (MFM), 150 KB/S (FM), RWC# = 0
1 0: 250 KB/S (MFM), 125 KB/S (FM), RWC# = 0
1 1: 1 MB/S (MFM), Illegal (FM), RWC# = 1

The 2 MB/S data rate for the tape drive is only supported by setting DRATE1 and DRATE0 to 01, as well as setting DRT1 and DRT0 (CRF4 and CRF5 for logical device 0) to 10. Please see the functional description of CRF4 or CRF5 and the data rate table for individual data-rate settings.

PRECOMP 2 1 0	PRECOMPENSATION DELAY	
	250K – 1 Mbps	2 Mbps Tape drive
0 0 0	Default Delays	Default Delays
0 0 1	41.67 ns	20.8 ns
0 1 0	83.34 ns	41.17 ns
0 1 1	125.00 ns	62.5ns
1 0 0	166.67 ns	83.3 ns
1 0 1	208.33 ns	104.2 ns
1 1 0	250.00 ns	125.00 ns
1 1 1	0.00 ns (disabled)	0.00 ns (disabled)

DATA RATE	DEFAULT PRECOMPENSATION DELAYS
250 KB/S	125 ns
300 KB/S	125 ns
500 KB/S	125 ns
1 MB/S	41.67ns
2 MB/S	20.8 ns

10.2.7 FIFO Register (R/W base address + 5)

The FIFO register consists of four status registers in a stack, and only one register is presented to the data bus at a time. The FIFO register stores data, commands, and parameters, and it provides disk-drive status information. In addition, data bytes pass through the data register to program or obtain results after a command. In the NCT6776F / NCT6776D, this register is disabled after reset. The FIFO can enable it and change its values through the CONFIGURE command.

BIT	7	6	5	4	3	2	1	0
NAME	IC		SE	EC	NR	HD	US1, US0 Drive Select	

Status Register 0 (ST0)

BIT	DESCRIPTION
7-6	IC (Interrupt Code). Bits 7 6 0 0: Normal termination of the command. 0 1: Abnormal termination of the command. 1 0: Invalid command issue. 1 1: Abnormal termination because the ready signal from FDD changed state during command execution.
5	SE (Seek End). 1: Seek end. 0: Seek error.
4	EC (Equipment Check). 1: When a fault signal is received from the FDD or the track. Signal fails to occur after 77 step pulses. 0: No error.

BIT	DESCRIPTION
3	NR (Not Ready). 1: Drive is not ready. 0: Drive is ready.
2	HD Head Address. (The current head address) 1: Head selected. 0: Head selected.
1-0	US 1, US0 Drive Select. Bits 1 0 0 0: Drive A selected. 0 1: Drive B selected. 1 0: Drive C selected. 1 1: Drive D selected.

Status Register 1 (ST1)

BIT	7	6	5	4	3	2	1	0
NAME	EN	Reserved	OE	OR	Reserved	ND	NW	MAM

BIT	DESCRIPTION
7	EN (End of Track). 1 will be written to this bit if the FDC tries to access a sector beyond the final sector or a cylinder.
6	Reserved. This bit is always 0.
5	DE (Data Error). 1 will be written to this bit if the FDC detects a CRC error in either the ID field or the data field.
4	OR (Over Run). 1 will be written to this bit if the FDC is not served by the host system within a certain time interval during data transfer.
3	Reserved. This bit is always 0.
2	ND (No Data). 1 will be written to this bit if the specified sector cannot be found during execution of a read, write or verify data.
1	NW (Not Writable). 1 will be written to this bit if a write protect signal is detected from the diskette drive during execution of write data.
0	MAM (Missing Address Mark). 1 will be written to this bit if the FDC cannot detect the data address mark or the data address mark has been deleted.

Status Register 2 (ST2)

BIT	7	6	5	4	3	2	1	0
NAME	NOT USED	CM	DD	WC	SH	SN	BC	MD

BIT	DESCRIPTION
7	Not used. This bit is always 0.
6	CM (Control Mark). 1: During execution of the read data or scan command. 0: No error.

BIT	DESCRIPTION
5	DD (Data error in the Data field). 1: If the FDC detects a CRC error in the data field. 0: No error.
4	WC (Wrong Cylinder). 1: Indicates wrong cylinder.
3	SH (Scan Equal Hit). 1: During execution of the Scan command, if the equal condition is satisfied. 0: No error.
2	SN (Scan Not Satisfied). 1: During execution of the Scan command. 0: No error.
1	BC (Bad Cylinder). 1: Bad Cylinder. 0: No error.
0	MD (Missing Address Mark in Data Field). 1: If FDC cannot find a data address mark (or the address mark has been deleted) when reading data from the media. 0: No error.

Status Register 3 (ST3)

BIT	7	6	5	4	3	2	1	0
NAME	FT	WP	RY	T0	TS	HD	US1	US0

BIT	DESCRIPTION
7	FT. Fault.
6	WP. Write protected.
5	RY. Ready.
4	T0. Track 0.
3	TS. Two-side.
2	HD. Head Address.
1	US1. Unit Select 1.
0	US0. Unit Select 0.

10.2.8 Digital Input Register (DI Register) (Read base address + 7)

The Digital Input Register is an 8-bit, read-only register used for diagnostic purposes. In PC/XT or PC/AT mode, only bit 7 is checked by the BIOS. When the register is read, bit 7 shows the complement of DSKCHG#, while the other bits remain in tri-state. The bit definitions are as follows:

BIT	7	6	5	4	3	2	1	0
NAME	DSKCHG	RESERVED						
DEFAULT	0	NA	NA	NA	NA	NA	NA	NA

BIT	DESCRIPTION
7	DSKCHG.
6-0	RESERVED. Reserved for the hard disk controller. During a read of this register, these bits are in tri-state.

In PS/2 mode, the bit definitions are as follows:

BIT	7	6	5	4	3	2	1	0
NAME	DSKCHG	RESERVED				DRATE1	DRATE0	HIGH DENS#
DEFAULT	0	1	1	1	1	1	0	1

BIT	DESCRIPTION
7	DSKCHG. Indicates the complement of the DSKCHG# input.
6-3	RESERVED. Always 1 during a read.
2	DRATE 1.
1	DRATE 0.
0	HIGHDENS#. 0: 500 KB/S or 1 MB/S data rate (high-density FDD). 1: 250 KB/S or 300 KB/S data rate.

In PS/2 Model 30 mode, the bit definitions are as follows:

BIT	7	6	5	4	3	2	1	0
NAME	DSKCHG#	RESERVED			DMAEN	NOPREC	DRATE1	DRATE0
DEFAULT	1	0	0	0	0	0	1	0

BIT	DESCRIPTION
7	DSKCHG. Indicates the status of the DSKCHG# input.
6-4	RESERVED. Always 0 during a read.
3	DMAEN. Indicates the value of DO register, bit 3.
2	NOPREC. Indicates the value of the NOPREC bit in the CC REGISTER.
1	DRATE 1.
0	DRATE 0.

10.2.9 Configuration Control Register (CC Register) (Write base address + 7)

This register is used to control the data rate. In PC/AT and PS/2 mode, the bit definitions are as follows:

BIT	7	6	5	4	3	2	1	0
NAME	RESERVED						DRATE1	DRATE0

DEFAULT	NA	NA	NA	NAN	NA	NA	1	0
---------	----	----	----	-----	----	----	---	---

BIT	DESCRIPTION	
7-2	RESERVED. Should be set to 0.	
1	DRATE 1.	Select the data rate of the FDC. See DR register bits 1 and 0 (Data Rate Register (DR Register) (Write base address +4)) for how the settings correspond to individual data rates.
0	DRATE 0.	

In the PS/2 Model 30 mode, the bit definitions are as follows:

BIT	7	6	5	4	3	2	1	0
NAME	RESERVED					NOPREC	DRATE1	DRATE0
DEFAULT	NA	NA	NA	NA	NA	0	1	0

BIT	DESCRIPTION	
7-3	RESERVED. Should be set to 0.	
2	NOPREC. Disables the precompensation function. This bit can be set by the software.	
1	DRATE1.	Select the data rate of the FDC. See DR register bits 1 and 0 (Data Rate Register (DR Register) (Write base address + 4)) for how the settings correspond to individual data rates.
0	DRATE0.	

11. UART PORT

11.1 UART Control Register (UCR) (Read/Write)

The UART Control Register defines and controls the protocol for asynchronous data communications, including data length, stop bit, parity, and baud rate selection.

BIT	7	6	5	4	3	2	1	0
NAME	BDLAB	SSE	PBFE	EPE	PBE	MSBE	DLS1	DLS0
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7	BDLAB (Baud Rate Divisor Latch Access Bit). When this bit is set to logic 1, designers can access the divisor (in 16-bit binary format) from the divisor latches of the baud-rate generator during a read or write operation. When this bit is set to logic 0, the Receiver Buffer Register, the Transmitter Buffer Register, and the Interrupt Control Register can be accessed.
6	SSE (Set Silence Enable). A logic 1 forces the Serial Output (SOUT) to a silent state (a logical 0). Only IRTX is affected by this bit; the transmitter is not affected.
5	PBFE (Parity Bit Fixed Enable). When PBE and PBFE of UCR are both set to logic 1, (1) if EPE is logic 1, the parity bit is logical 0 when transmitting and checking; (2) if EPE is logic 0, the parity bit is logical 1 when transmitting and checking.
4	EPE (Even Parity Enable). When PBE is set to logic 1, this bit counts the number of logic 1's in the data word bits and determines the parity bit. When this bit is set to logic 1, the parity bit is set to logic 1 if an even number of logic 1's are sent or checked. When the bit is set to logic 0, the parity bit is logic 1, if an odd number of logic 1's are sent or checked.
3	PBE (Parity Bit Enable). When this bit is set to logic 1, the transmitter inserts a stop bit between the last data bit and the stop bit of the SOUT, and the receiver checks the parity bit in the same position.
2	MSBE (Multiple Stop Bit Enable). Defines the number of stop bits in each serial character that is transmitted or received. (1) If MSBE is set to logic 0, one stop bit is sent and checked. (2) If MSBE is set to logic 1 and the data length is 5 bits, one-and-a-half stop bits are sent and checked. (3) If MSBE is set to logic 1 and the data length is 6, 7, or 8 bits, two stop bits are sent and checked.
1	DLS1 (Data Length Select Bit 1). Defines the number of data bits that are sent or checked in each serial character.
0	DLS0 (Data Length Select Bit 0). Defines the number of data bits that are sent or checked in each serial character.

DLS1	DLS0	DATA LENGTH
0	0	5 bits
0	1	6 bits
1	0	7 bits
1	1	8 bits

The following table identifies the remaining UART registers. Each one is described separately in the following sections.

Table 11-1 Register Summary for UART

Bit Number										
Register Address Base			0	1	2	3	4	5	6	7
+ 0 BDLAB = 0	Receiver Buffer Register (Read Only)	RBR	RX Data Bit 0	RX Data Bit 1	RX Data Bit 2	RX Data Bit 3	RX Data Bit 4	RX Data Bit 5	RX Data Bit 6	RX Data Bit 7
+ 0 BDLAB = 0	Transmitter Buffer Register (Write Only)	TBR	TX Data Bit 0	TX Data Bit 1	TX Data Bit 2	TX Data Bit 3	TX Data Bit 4	TX Data Bit 5	TX Data Bit 6	TX Data Bit 7
+ 1 BDLAB = 0	Interrupt Control Register	ICR	RBR Data Ready Interrupt Enable (ERDRI)	TBR Empty Interrupt Enable (ETBREI)	USR Interrupt Enable (EUSRI)	HSR Interrupt Enable (EHSRI)	0	0	0	0
+ 2	Interrupt Status Register (Read Only)	ISR	"0" if Interrupt Pending	Interrupt Status Bit (0)	Interrupt Status Bit (1)	Interrupt Status Bit (2)**	0	0	FIFOs Enabled **	FIFOs Enabled **
+ 2	UART FIFO Control Register (Write Only)	UFR	FIFO Enable	RCVR FIFO Reset	XMIT FIFO Reset	DMA Mode Select	Reserved	Reversed	RX Interrupt Active Level (LSB)	RX Interrupt Active Level (MSB)
+ 3	UART Control Register	UCR	Data Length Select Bit 0 (DLS0)	Data Length Select Bit 1 (DLS1)	Multiple Stop Bits Enable (MSBE)	Parity Bit Enable (PBE)	Even Parity Enable (EPE)	Parity Bit Fixed Enable (PBFE)	Set Silence Enable (SSE)	Baudrate Divisor Latch Access Bit (BDLAB)
+ 4	Handshake Control Register	HCR	Data Terminal Ready (DTR)	Request to Send (RTS)	Loopback RI Input	IRQ Enable	Internal Loopback Enable	0	0	0
+ 5	UART Status Register	USR	RBR Data Ready (RDR)	Overrun Error (OER)	Parity Bit Error (PBER)	No Stop Bit Error (NSER)	Silent Byte Detected (SBD)	TBR Empty (TBRE)	TSR Empty (TSRE)	RX FIFO Error Indication (RFEI) **
+ 6	Handshake Status Register	HSR	CTS Toggling (TCTS)	DSR Toggling (TDSR)	RI Falling Edge (FERI)	DCD Toggling (TDCD)	Clear to Send (CTS)	Data Set Ready (DSR)	Ring Indicator (RI)	Data Carrier Detect (DCD)
+ 7	User Defined Register	UDR	Bit 0	Bit 1	Bit 2	Bit 3	Bit 4	Bit 5	Bit 6	Bit 7
+ 0 BDLAB = 1	Baudrate Divisor Latch Low	BLL	Bit 0	Bit 1	Bit 2	Bit 3	Bit 4	Bit 5	Bit 6	Bit 7
+ 1 BDLAB = 1	Baudrate Divisor Latch High	BHL	Bit 8	Bit 9	Bit 10	Bit 11	Bit 12	Bit 13	Bit 14	Bit 15

*: Bit 0 is the least significant bit. The least significant bit is the first bit serially transmitted or received.

** : These bits are always 0 in 16450 Mode.

11.2 UART Status Register (USR) (Read/Write)

This 8-bit register provides information about the status of data transfer during communication.

BIT	7	6	5	4	3	2	1	0
NAME	RF EI	TSRE	TBRE	SBD	NSER	PBER	OER	RDR
DEFAULT	0	1	1	0	0	0	0	0

BIT	DESCRIPTION
7	RF EI (RX FIFO Error Indication). In 16450 mode, this bit is always set to logical 0. In 16550 mode, this bit is set to logical 1 when there is at least one parity-bit error and no stop0bit error or silent-byte detected in the FIFO. In 16550 mode, this bit is cleared to logical 0 by reading from the USR if there are no remaining errors left in the FIFO.
6	TSRE (Transmitter Shift Register Empty). In 16450 mode, this bit is set to logical 1 when TBR and TSR are both empty. In 16550 mode, it is set to logical 1 when the transmit FIFO and TSR are both empty. Otherwise, this bit is set to logical 0.
5	TBRE (Transmitter Buffer Register Empty). In 16450 mode, when a data character is transferred from TBR to TSR, this bit is set to logical 1. If ETREI of ICR is high, and interrupt is generated to notify the CPU to write next data. In 16550 mode, this bit is set to logical 1 when the transmit FIFO is empty. It is set to logical 0 when the CPU writes data into TBR or the FIFO.
4	SBD (Silent Byte Detected). This bit is set to logical 1 to indicate that received data are kept in silent state for the time it takes to receive a full word, which includes the start bit, data bits, parity bit, and stop bits. In 16550 mode, it indicates the same condition for the data on the top of the FIFO. When the CPU reads USR, it sets this bit to logical 0.
3	NSER (No Stop Bit Error). This bit is set to logical 1 to indicate that the received data have no stop bit. In 16550 mode, it indicates the same condition for the data on the top of the FIFO. When the CPU reads USR, it sets this bit to logical 0.
2	PBER (Parity Bit Error). This bit is set to logical 1 to indicate that the received data has the wrong parity bit. In 16550 mode, it indicates the same condition for the data on the top of the FIFO. When the CPU reads USR, it sets this bit to logical 0.
1	OER (Overrun Error). This bit is set to logical 1 to indicate that the received data have been overwritten by the next received data before they were read by the CPU. In 16550 mode, it indicates the same condition, instead of FIFO full. When the CPU reads USR, it sets this bit to logical 0.
0	RDR (RBR Data Ready). This bit is set to logical 1 to indicate that the received data are ready to be read by the CPU in the RBR or FIFO. When no data are left in the RBR or FIFO, the bit is set to logical 0.

11.3 Handshake Control Register (HCR) (Read/Write)

This register controls pins used with handshaking peripherals such as modems and also controls the diagnostic mode of the UART.

BIT	7	6	5	4	3	2	1	0
NAME	RESERVED			INTERNAL LOOPBACK ENABLE	IRQ ENABLE	LOOPBACK RI INPUT	RTS	DTR
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7-5	Reserved.
4	Internal Loopback Enable. When this bit is set to logic 1, the UART enters diagnostic mode, as follows: (1) SOUT is forced to logic 1, and SIN is isolated from the communication link. (2) The modem output pins are set to their inactive state. (3) The modem input pins are isolated from the communication link and connect internally as DTR (bit 0 of HCR) →DSR#, RTS (bit 1 of HCR) →CTS#, Loopback RI input (bit 2 of HCR) → RI# and IRQ enable (bit 3 of HCR) →DCD#. Aside from the above connections, the UART operates normally. This method allows the CPU to test the UART in a convenient way.
3	IRQ Enable. The UART interrupt output is enabled by setting this bit to logic 1. In diagnostic mode, this bit is internally connected to the modem control input DCD#.
2	Loopback RI Input. This bit is only used in the diagnostic mode. In diagnostic mode, this bit is internally connected to the modem control input RI#.
1	RTS (Request to Send). This bit controls the RTS# output. The value of this bit is inverted and output to RTS#.
0	DTR (Data Terminal Ready). This bit controls the DTR# output. The value of this bit is inverted and output to DTR#.

11.4 Handshake Status Register (HSR) (Read/Write)

This register reflects the current state of four input pins used with handshake peripherals such as modems and records changes on these pins.

BIT	7	6	5	4	3	2	1	0
NAME	DCD	RI	DSR	CTS	TDCD	FERI	TDSR	TCTS
DEFAULT	NA	NA	NA	NA	NA	NA	NA	NA

BIT	DESCRIPTION
7	DCD (Data Carrier Detect). This bit is the inverse of the DCD# input and is equivalent to bit 3 of HCR in Loopback mode.
6	RI (Ring Indicator). This bit is the inverse of the RI# input and is equivalent to bit 2 of HCR in Loopback mode.
5	DSR (Data Set Ready). This bit is the inverse of the DSR# input and is equivalent to bit 0 of HCR in Loopback mode.
4	CTS (Clear to Send). This bit is the inverse of the CTS# input and is equivalent to bit 1 of HCR in Loopback mode.
3	TDCD (DCD# Toggling). This bit indicates that the state of the DCD# pin has changed after HSR is read by the CPU.
2	FERI (RI Falling Edge). This bit indicates that the RI# pin has changed from low to high after HSR is read by the CPU.
1	TDSR (DSR# Toggling). This bit indicates that the state of the DSR# pin has changed after HSR is read by the CPU.
0	TCTS (CTS# Toggling). This bit indicates that the state of the CTS# pin has changed after HSR is read by the CPU.

11.5 UART FIFO Control Register (UFR) (Write only)

This register is used to control the FIFO functions of the UART.

BIT	7	6	5	4	3	2	1	0
NAME	MSB	LSB	RESERVED		DMA MODE SELECT	TRANSMITTER FIFO RESET	RECEIVER FIFO RESET	FIFO ENABLE
DEFAULT	0	0	NA	NA	0	0	0	0

BIT	DESCRIPTION	
7	MSB (RX Interrupt Active Level).	These two bits are used to set the active level of the receiver FIFO interrupt. The active level is the number of bytes that must be in the receiver FIFO to generate an interrupt.
6	LSB (RX Interrupt Active Level).	
5-4	RESERVED.	
3	DMS MODE SELECT. When this bit is set to logic 1, DMA mode changes from mode 0 to mode 1 if UFR bit 0 = 1.	
2	TRANSMITTER FIFO RESET. Setting this bit to logic 1 resets the TX FIFO counter logic to its initial state. This bit is automatically cleared afterwards.	
1	RECEIVER FIFO RESET. Setting this bit to logic 1 resets the RX FIFO counter logic to its initial state. This bit is automatically cleared afterwards.	
0	FIFO ENABLE. This bit enables 16550 (FIFO) mode. This bit should be set to logic 1 before other UFR bits are programmed.	

BIT 7	BIT 6	RX FIFO INTERRUPT ACTIVE LEVEL (BYTES)
0	0	01
0	1	04
1	0	08
1	1	14

11.6 Interrupt Status Register (ISR) (Read only)

This register reflects the UART interrupt status.

BIT	7	6	5	4	3	2	1	0
NAME	FIFOS ENABLED		RESERVED		INTERRUPT STATUS BIT 2	INTERRUPT STATUS BIT 1	INTERRUPT STATUS BIT 0	0 IF INTERRUPT PENDING
DEFAULT	0	0	0	0	0	0	0	1

BIT	DESCRIPTION
7-6	FIFOS ENABLED. Set to logical 1 when UFR, bit 0 = 1.
5-4	RESERVED.
3	INTERRUPT STATUS BIT 2. In 16450 mode, this bit is logical 0. In 16550 mode, bits 3 and 2 are set to logical 1 when a time-out interrupt is pending. Please see the table

	below.	
2	INTERRUPT STATUS BIT 1.	These two bits identify the priority level of the pending interrupt, as shown in the table below.
1	INTERRUPT STATUS BIT 0.	
0	0 IF INTERRUPT PENDING. This bit is logic 1 if there is no interrupt pending. If one of the interrupt sources has occurred, this bit is set to logical 0.	

ISR				INTERRUPT SET AND FUNCTION			
Bit 3	Bit 2	Bit 1	Bit 0	Interrupt priority	Interrupt Type	Interrupt Source	Clear Interrupt
0	0	0	1	-	-	No Interrupt pending	-
0	1	1	0	First	UART Receive Status	1. OER = 1 2. PBER =1 3. NSER = 1 4. SBD = 1	Read USR
0	1	0	0	Second	RBR Data Ready	1. RBR data ready 2. FIFO interrupt active level reached	1. Read RBR 2. Read RBR until FIFO data under active level
1	1	0	0	Second	FIFO Data Timeout	Data present in RX FIFO for 4 characters period of time since last access of RX FIFO.	Read RBR
0	0	1	0	Third	TBR Empty	TBR empty	1. Write data into TBR 2. Read ISR (if priority is third)
0	0	0	0	Fourth	Handshake status	1. TCTS = 1 2. TDSR = 1 3. FER1 = 1 4. TDCD = 1	Read HSR

** Bit 3 of ISR is enabled when bit 0 of UFR is logical 1.

11.7 Interrupt Control Register (ICR) (Read/Write)

This 8-bit register enables and disables the five types of controller interrupts separately. A selected interrupt can be enabled by setting the appropriate bit to logical 1. The interrupt system can be totally disabled by setting bits 0 through 3 to logical 0.

BIT	7	6	5	4	3	2	1	0
NAME	En_address_byte	RX_ctrl	RESERVED		EHSRI	EUSRI	ETBREI	ERDRI
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7	En_address_byte. 0: Tx block will send data byte. (If enable 9bit mode function CRF2 Bit0=1) 1: Tx block will send address byte. (If enable 9bit mode function CRF2 Bit0=1)
6	RX_ctrl. 0: Rx block could receive data byte. (If enable 9bit mode function CRF2 Bit0=1) 1: Rx block could receive address byte. (If enable 9bit mode function CRF2 Bit0=1)
5-4	RESERVED.
3	EHSRI (Handshake Status Interrupt Enable). Set this bit to logical 1 to enable the handshake status register interrupt.
2	EUSRI (UART Receive Status Interrupt Enable). Set this bit to logical 1 to enable the UART status register interrupt.

BIT	DESCRIPTION
1	ETBREI (TBR Empty Interrupt Enable). Set this bit to logical 1 to enable the TBR empty interrupt.
0	ERDRI (RBR Data Ready Interrupt Enable). Set this bit to logical 1 to enable the RBR data ready interrupt.

11.8 Programmable Baud Generator (BLL/BHL) (Read/Write)

Two 8-bit registers, BLL and BHL, compose a programmable baud generator that uses 24 MHz to generate a 1.8461 MHz frequency and divide it by a divisor from 1 to ($2^{16} - 1$). The output frequency of the baud generator is the baud rate multiplied by 16, and this is the base frequency for the transmitter and receiver. The table below illustrates the use of the baud generator with a frequency of 1.8461 MHz. In high-speed UART mode (CR0C, bits 7 and 6), the programmable baud generator directly uses 24 MHz and the same divisor as the normal speed divisor. As a result, in high-speed mode, the data transmission rate can be as high as 1.5M bps.

BAUD RATE FROM DIFFERENT PRE-DIVIDER				
PRE-DIV: 13 1.8461M HZ	PRE-DIV: 1.625 14.769M HZ	PRE-DIV: 1.0 24M HZ	DECIMAL DIVISOR USED TO GENERATE 16X CLOCK	ERROR PERCENTAGE
50	400	650	2304	**
75	600	975	1536	**
110	880	1430	1047	0.18%
134.5	1076	1478.5	857	0.099%
150	1200	1950	768	**
300	2400	3900	384	**
600	4800	7800	192	**
1200	9600	15600	96	**
1800	14400	23400	64	**
2000	16000	26000	58	0.53%
2400	19200	31200	48	**
3600	28800	46800	32	**
4800	38400	62400	24	**
7200	57600	93600	16	**
9600	76800	124800	12	**
19200	153600	249600	6	**
38400	307200	499200	3	**
57600	460800	748800	2	**
115200	921600	1497600	1	**

** Unless specified, the error percentage for all of the baud rates is 0.16%.

Note: Pre-Divisor is determined by CRF0 of UART A and B.

11.9 User-defined Register (UDR) (Read/Write)

This is a temporary register that can be accessed and defined by the user.

11.10 UART RS485 Auto Flow Control

NCT6776F / NCT6776D supports RS485 auto flow control function for UARTA and UARTB. When enabling the RS485 auto control function, it will automatically drive RTS# pin to logic high or low for UARTA and UARTB when UART TX block transmits the data.

The diagram shown below illustrates the RS485 auto flow control function for UARTA andn UARTB.

The default behavior of RTS# pin will drive logic high the time edge between **Start bit** and **bit0** when the UART TX Block start to transmits the data on SOUT pin. Then the RTS# pin will drive logic low later than **Stop bit** about 1~2 x Bit-time when UART TX Block completes the data transmission. The driving behavior of RTS# will be inverted when we set RS485_RTS_inv_sel bit = 1'b1. (Bit-time: Depends on the baud rate of transmission)

The bellowing control register table relates to the RS485 auto flow control function for UARTA and UARTB.

	UARTA	UARTB
RTS485_enable	Logic Device 2, CRF2_Bit7	Logic Device 3, CRF2_Bit7
RTS485_inv_sel	Logic Device 2, CRF2_Bit6	Logic Device 3, CRF2_Bit6

12. PARALLEL PORT

12.1 Printer Interface Logic

The NCT6776F / NCT6776D parallel port can be attached to devices that accept eight bits of parallel data at standard TTL level. The NCT6776F / NCT6776D supports the IBM XT/AT compatible parallel port (SPP), the bi-directional parallel port (BPP), the Enhanced Parallel Port (EPP), and the Extended Capabilities Parallel Port (ECP).

The following tables show the pin definitions for different modes of the parallel port.

Table 12-1 Pin Descriptions for SPP, EPP, and ECP Modes

HOST CONNECTOR	PIN NUMBER OF NCT6776F / NCT6776D	PIN ATTRIBUTE	SPP	EPP	ECP
1	55	O	Nstb	nWrite	nSTB, HostClk ²
2-9	421-45, 47-50	I/O	PD<7:0>	PD<7:0>	PD<7:0>

16	52	O	nINIT
17	51	O	nSLIN

12.2 Enhanced Parallel Port (EPP)

The following table lists the registers used in the EPP mode and identifies the bit map of the parallel port and EPP registers. Some of the registers are used in other modes as well.

Table 12-2 EPP Register Addresses

A2	A1	A0	REGISTER	NOTE
0	0	0	Data port (R/W)	1
0	0	1	Printer status buffer (Read)	1
0	1	0	Printer control latch (Write)	1
0	1	0	Printer control swapper (Read)	1
0	1	1	EPP address port (R/W)	2
1	0	0	EPP data port 0 (R/W)	2
1	0	1	EPP data port 1 (R/W)	2
1	1	0	EPP data port 2 (R/W)	2
1	1	1	EPP data port 2 (R/W)	2

Notes:

1. These registers are available in all modes.
2. These registers are available only in EPP mode.

Table 12-3 Address and Bit Map for SPP and EPP Modes

REGISTER	7	6	5	4	3	2	1	0
Data Port (R/W)	PD7	PD6	PD5	PD4	PD3	PD2	PD1	PD0
Status Buffer (Read)	BUSY#	ACK#	PE	SLCT	ERROR#	1	1	TMOUT
Control Swapper (Read)	1	1	1	IRQEN	SLIN	INIT#	AUTOFD#	STROBE#
Control Latch (Write)	1	1	DIR	IRQ	SLIN	INIT#	AUTOFD#	STROBE#
EPP Address Port (R/W)	PD7	PD6	PD5	PD4	PD3	PD2	PD1	PD0
EPP Data Port 0 (R/W)	PD7	PD6	PD5	PD4	PD3	PD2	PD1	PD0
EPP Data Port 1 (R/W)	PD7	PD6	PD5	PD4	PD3	PD2	PD1	PD0
EPP Data Port 2 (R/W)	PD7	PD6	PD5	PD4	PD3	PD2	PD1	PD0
EPP Data Port 3 (R/W)	PD7	PD6	PD5	PD4	PD3	PD2	PD1	PD0

Each register (or pair of registers, in some cases) is discussed below.

12.2.1 Data Port (Data Swapper)

The CPU reads the contents of the printer's data latch by reading the data port.

12.2.2 Printer Status Buffer

The CPU reads the printer status by reading the printer status buffer. The bit definitions are as follows:

BIT	7	6	5	4	3	2	1	0
NAME	BUSY#	ACK#	PE	SLCT	ERROR#	RESERVED		TMOUT
DEFAULT	NA	NA	NA	NA	NA	1	1	0

BIT	DESCRIPTION
7	BUSY#. This signal is active during data entry, when the printer is off-line during printing, when the print head is changing position, or during an error state. When this signal is active, the printer is busy and cannot accept data.
6	ACK#. This bit represents the current state of the printer's ACK# signal. A logical 0 means the printer has received a character and is ready to accept another. Normally, this signal is active for approximately 5 μ s before BUSY# stops.
5	PE. A logical 1 means the printer has detected the end of paper.
4	SLCT. A logical 1 means the printer is selected.
3	ERROR#. A logical 0 means the printer has encountered an error condition.
2-1	RESERVED.
0	TMOUT. This bit is only valid in EPP mode. A logical 1 indicates that a 10- μ s time-out has occurred on the EPP bus; a logical 0 means that no time-out error has occurred. Writing a logical 1 to this bit clears the time-out status bit; writing a logical 0 has no effect.

12.2.3 Printer Control Latch and Printer Control Swapper

The CPU reads the contents of the printer control latch by reading the printer control swapper. The bit definitions are as follows:

BIT	7	6	5	4	3	2	1	0
NAME	RESERVED		DIR	IRQ ENABLE	SLCT IN	INIT#	AUTO FD	STROBE
DEFAULT	1	1	NA	0	NA	NA	NA	NA

BIT	DESCRIPTION
7-6	RESERVED. These two bits are always read as logical 1 and can be written.
5	DIR (Direction Control Bit). When this bit is logical 1, the parallel port is in the input mode (read). When it is logical 0, the parallel port is in the output mode (write). This bit can be read and written. In SPP mode, this bit is invalid and fixed at zero.
4	IRQ ENABLE. A logical 1 allows an interrupt to occur when ACK# changes from low to high.
3	SLCT IN. a logical 1 selects the printer.
2	INIT#. A logical 0 starts the printer (50 microsecond pulse, minimum).
1	AUTO FD. A logical 1 causes the printer to line-feed after a line is printed.
0	STROBE. A logical 1 generates an active-high pulse for a minimum of 0.5 μ s to clock data into the printer. Valid data must be presented for a minimum of 0.5 μ s before and after the strobe pulse.

12.2.4 EPP Address Port

The address port is available only in EPP mode. Bit definitions are as follows:

BIT	7	6	5	4	3	2	1	0
NAME	PD7	PD6	PD5	PD4	PD3	PD2	PD1	PD0

The contents of DB0-DB7 are buffered (non-inverting) and output to ports PD0-PD7 during a write operation. The leading edge of IOW# causes an EPP address write cycle to be performed, and the trailing edge of IOW# latches the data for the duration of the EPP write cycle.

PD0-PD7 ports are read during a read operation. The leading edge of IOR# causes an EPP address read cycle to be performed and the data to be output to the host CPU.

12.2.5 EPP Data Port 0-3

These four registers are available only in EPP mode. The bit definitions for each data port are the same and as follows:

BIT	7	6	5	4	3	2	1	0
NAME	PD7	PD6	PD5	PD4	PD3	PD2	PD1	PD0

When any EPP data port is accessed, the contents of DB0-DB7 are buffered (non-inverting) and output to ports PD0-PD7 during a write operation. The leading edge of IOW# causes an EPP data write cycle to be performed, and the trailing edge of IOW# latches the data for the duration of the EPP write cycle.

During a read operation, ports PD0-PD7 are read, and the leading edge of IOR# causes an EPP read cycle to be performed and the data to be output to the host CPU.

12.2.6 EPP Pin Descriptions

EPP NAME	TYPE	EPP DESCRIPTION
Nwrite	O	Denotes read or write operation for address or data.
PD<0:7>	I/O	Bi-directional EPP address and data bus.
Intr	I	Used by peripheral device to interrupt the host.
Nwait	I	Inactivated to acknowledge that data transfer is complete. Activated to indicate that the device is ready for the next transfer.
PE	I	Paper end; same as SPP mode.
Select	I	Printer-select status; same as SPP mode.
NDStrb	O	This signal is active low. It denotes a data read or write operation.
Nerror	I	Error; same as SPP mode.
Ninits	O	This signal is active low. When it is active, the EPP device is reset to its initial operating mode.
NAStrb	O	This signal is active low. It denotes an address read or write operation.

12.2.7 EPP Operation

When EPP mode is selected, the PDx bus is in standard or bi-directional mode when no EPP read, write, or address cycle is being executed. In this situation, all output signals are set by the SPP Control Port and the direction is controlled by DIR of the Control Port.

A watchdog timer is required to prevent system lockup. The timer indicates that more than 10 μ S have elapsed from the start of the EPP cycle to the time WAIT# is deasserted. The current EPP cycle is aborted when a time-out occurs. The time-out condition is indicated in status bit 0.

The EPP operates on a two-phase cycle. First, the host selects the register within the device for subsequent operations. Second, the host performs a series of read and/or write byte operations to the selected register. Four operations are supported on the EPP: Address Write, Data Write, Address Read, and Data Read. All operations on the EPP device are performed asynchronously.

12.2.8 EPP Version 1.9 Operation

The EPP read/write operation can be completed under the following conditions:

- If nWait is active low, the read cycle (nWrite inactive high, nDStrb/nAStrb active low) or write cycle (nWrite active low, nDStrb/nAStrb active low) starts, proceeds normally, and is completed when nWait goes inactive high.
- If nWait is inactive high, the read/write cycle cannot start. It must wait until nWait changes to active low, at which time it starts as described above.

12.2.9 EPP Version 1.7 Operation

The EPP read/write cycle can start without checking whether nWait is active or inactive. Once the read/write cycle starts, however, it does not finish until nWait changes from active low to inactive high.

12.3 Extended Capabilities Parallel (ECP) Port

This port is software- and hardware-compatible with existing parallel ports, so the NCT6776F / NCT6776D parallel port may be used in standard printer mode if ECP is not required. It provides an automatic high burst-bandwidth channel that supports DMA for ECP in both the forward (host-to-peripheral) and reverse (peripheral-to-host) directions.

Small FIFOs are used in both forward and reverse directions to improve the maximum bandwidth requirement. The size of the FIFO is 16 bytes. The ECP port supports an automatic handshake for the standard parallel port to improve compatibility mode transfer speed.

The ECP port hardware supports run-length-encoded (RLE) decompression. Compression is accomplished by counting identical bytes and transmitting an RLE byte that indicates how many times the next byte is to be repeated. RLE compression is required; the hardware support is optional.

For more information about the ECP Protocol, refer to the Extended Capabilities Port Protocol and ISA Interface Standard.

The NCT6776F / NCT6776D ECP supports the following modes.

Table 12-4 ECP Mode Description

MODE	DESCRIPTION
000	SPP mode
001	PS/2 Parallel Port mode
010	Parallel Port Data FIFO mode
011	ECP Parallel Port mode
100	EPP mode (If this option is enabled in the CRF0h to select ECP/EPP mode)

MODE	DESCRIPTION
101	Reserved
110	Test mode
111	Configuration mode

The mode selection bits are bits 7-5 of the Extended Control Register.

12.3.1 ECP Register and Bit Map

The next two tables list the registers used in ECP mode and provide a bit map of the parallel port and ECP registers.

Table 12-5 ECP Register Addresses

NAME	ADDRESS	I/O	ECP MODES	FUNCTION
data	Base+000h	R/W	000-001	Data Register
ecpAFifo	Base+000h	R/W	011	ECP FIFO (Address)
dsr	Base+001h	R	All	Status Register
dcr	Base+002h	R/W	All	Control Register
cFifo	Base+400h	R/W	010	Parallel Port Data FIFO
ecpDFifo	Base+400h	R/W	011	ECP FIFO (DATA)
tFifo	Base+400h	R/W	110	Test FIFO
cnfgA	Base+400h	R	111	Configuration Register A
cnfgB	Base+401h	R/W	111	Configuration Register B
ecr	Base+402h	R/W	All	Extended Control Register

Note: The base addresses are specified by CR60 and 61, which are determined by configuration register or hardware setting.

Table 12-6 Bit Map of the ECP Registers

	D7	D6	D5	D4	D3	D2	D1	D0	NOTE
Data	PD7	PD6	PD5	PD4	PD3	PD2	PD1	PD0	
ecpAFifo	Addr/RLE	Address or RLE field							2
Dsr	nBusy	nAck	Perror	Select	nFault	1	1	1	1
Dcr	1	1	Directio	ackIntEn	SelectIn	nInit	Autofd	strobe	1
cFifo	Parallel Port Data FIFO								2
ecpFifo	ECP Data FIFO								2
tFifo	Test FIFO								2
cnfgA	0	0	0	1	0	0	0	0	
cnfgB	compress	intrValue	1	1	1	1	1	1	
Ecr	MODE			nErrIntrEn	dmaEn	serviceIntr	full	empty	

Notes:

1. These registers are available in all modes.
2. All FIFOs use one common 16-byte FIFO.

Each register (or pair of registers, in some cases) is discussed below.

12.3.2 Data and ecpAFifo Port

Modes 000 (SPP) and 001 (PS/2) (Data Port)

During a write operation, the Data Register latches the contents of the data bus on the rising edge of the input, and the contents of this register are output to PD0-PD7. During a read operation, ports PD0-PD7 are read and output to the host. The bit definitions are as follows:

BIT	7	6	5	4	3	2	1	0
NAME	PD7	PD6	PD5	PD4	PD3	PD2	PD1	PD0

Mode 011 (ECP FIFO-Address/RLE)

A data byte written to this address is placed in the FIFO and tagged as an ECP Address/RLE. The hardware at the ECP port transmits this byte to the peripheral automatically. This operation is defined only for the forward direction. The bit definitions are as follows:

BIT	7	6	5	4	3	2	1	0
NAME	Address/RLE	Address or RLE						

12.3.3 Device Status Register (DSR)

These bits are logical 0 during a read of the Printer Status Register. The bits of this status register are defined as follows:

BIT	7	6	5	4	3	2	1	0
NAME	nBusy	nAck	Perror	Select	nFault	1	1	1

BIT	DESCRIPTION
7	nBusy. This bit reflects the complement of the Busy input.
6	nAck. This bit reflects the nAck input.
5	Perror. This bit reflects the Perror input.
4	Select. This bit reflects the Select input.
3	nFault. This bit reflects the nFault input.
2-0	These three bits are not implemented and are always logical 1 during a read.

12.3.4 Device Control Register (DCR)

The bit definitions are as follows:

BIT	7	6	5	4	3	2	1	0
NAME	Reserved		Director	ackInEn	SelectIn	nInit	Autofd	Strobe
DEFAULT	1	1	NA	NA	NA	NA	NA	NA

BIT	DESCRIPTION
7-6	Reserved. These two bits are always read as logical 1 and cannot be written.
5	Director. If the mode is 000 or 010, this bit has no effect and the direction is always out. In other modes, 0: The parallel port is in the output mode. 1: The parallel port is in the input mode.

BIT	DESCRIPTION
4	ackInEn (Interrupt Request Enable). When this bit is set to logical 1, it enables interrupt requests from the parallel port to the CPU on the low-to-high transition on ACK#.
3	SelectIn . This bit is inverted and output to the SLIN# output. 0: The printer is not selected. 1: The printer is selected.
2	nInit . This bit is output to the INIT# output.
1	AutoFd . This bit is inverted and output to the AFD# output.
0	Strobe . This bit is inverted and output to the STB# output.

12.3.5 CFIFO (Parallel Port Data FIFO) Mode = 010

This mode is defined only for the forward direction. Bytes written or DMAed to this FIFO are transmitted by a hardware handshake to the peripheral using the standard parallel port protocol. Transfers to the FIFO are byte-aligned.

12.3.6 ECPDFIFO (ECP Data FIFO) Mode = 011

When the direction bit is 0, bytes written or DMAed to this FIFO are transmitted by a hardware handshake to the peripheral using the ECP parallel port protocol. Transfers to the FIFO are byte-aligned.

When the direction bit is 1, data bytes from the peripheral are read via automatic hardware handshake from ECP into this FIFO. Reads or DMAs from the FIFO return bytes of ECP data to the system.

12.3.7 TFIFO (Test FIFO Mode) Mode = 110

Data bytes may be read, written, or DMAed to or from the system to this FIFO in any direction. Data in the tFIFO is not transmitted to the parallel port lines. However, data in the tFIFO may be displayed on the parallel port data lines.

12.3.8 CNFGA (Configuration Register A) Mode = 111

This register is a read-only register. When it is read, 10H is returned. This indicates that this is an 8-bit implementation.

12.3.9 CNFGB (Configuration Register B) Mode = 111

The bit definitions are as follows:

BIT	7	6	5	4	3	2	1	0
NAME	COMPRESS	intrVALUE	IRQx2	IRQx1	IRQx0	RESERVED		
DEFAULT	0	0	0	0	0	1	1	1

BIT	DESCRIPTION
7	Compress . This bit is read-only. It is logical 0 during a read, which means that this chip does not support hardware RLE compression.
6	intrValue . Returns the value on the ISA IRQ line to determine possible conflicts.

BIT	DESCRIPTION																	
5	IRQx2.	Reflects the IRQ resource assigned for ECP port.																
		<table><tr><th>cnfgB[5:3]</th><th>IRQ resource</th></tr><tr><td>000</td><td>Reflects other IRQ resources selected by PnP register (default)</td></tr><tr><td>001</td><td>IRQ7</td></tr><tr><td>010</td><td>IRQ9</td></tr><tr><td>011</td><td>IRQ10</td></tr><tr><td>100</td><td>IRQ11</td></tr><tr><td>101</td><td>IRQ14</td></tr><tr><td>110</td><td>IRQ15</td></tr><tr><td>111</td><td>IRQ5</td></tr></table>	cnfgB[5:3]	IRQ resource	000	Reflects other IRQ resources selected by PnP register (default)	001	IRQ7	010	IRQ9	011	IRQ10	100	IRQ11	101	IRQ14	110	IRQ15

12.3.10 ECR (Extended Control Register) Mode = all

This register controls the extended ECP parallel port functions. The bit definitions are follows:

BIT	7	6	5	4	3	2	1	0
NAME	MODE			nErrIntrEn	dmaEn	ServiceIntr	Full	Empty
DEFAULT	0	0	0	1	0	1	0	1

BIT	DESCRIPTION	
7-5	Mode. Read/Write. These bits select the mode.	
	000	Standard Parallel Port (SPP) mode. The FIFO is reset in this mode.
	001	PS/2 Parallel Port mode. This is the same as SPP mode except that direction may be used to tri-state the data lines. Furthermore, reading the data register returns the value on the data lines, not the value in the data register.
	010	Parallel Port FIFO mode. This is the same as SPP mode except that bytes are written or DMAed to the FIFO. FIFO data are automatically transmitted using the standard parallel port protocol. This mode is useful only when direction is 0.
	011	ECP Parallel Port Mode. When the direction is 0 (forward direction), bytes placed into the ecpDFifo and bytes written to the ecpAFifo are placed in a single FIFO and automatically transmitted to the peripheral using the ECP Protocol. When the direction is 1 (reverse direction), bytes are moved from the ECP parallel port and packed into bytes in the ecpDFifo.
	100	EPP Mode. EPP mode is activated if the EPP mode is selected.
	101	Reserved.
	110	Test Mode. The FIFO may be written and read in this mode, but the data is not transmitted on the parallel port.
	111	Configuration Mode. The cnfgA and cnfgB registers are accessible at

BIT	DESCRIPTION
	0x400 and 0x401 in this mode.
4	nErrIntrEn. Read/Write (Valid only in ECP Mode) 0: Enables the interrupt generated on the falling edge of nFault. This prevents interrupts from being lost in the time between the read of the ECR and the write of the ECR. 1: Disables the interrupt generated on the asserting edge of nFault.
3	dmaEn. Read/Write. 0: Disable DMA unconditionally. 1: Enable DMA.
2	serviceIntr. Read/Write. 0: Enable one of the following cases of interrupts. When one of the serviced interrupts occurs, this bit is set to logical 1 by the hardware. This bit must be reset to logical 0 to re-enable the interrupts. (a) dmaEn = 1: During DMA, this bit is set to logical 1 when terminal count is reached. (b) dmaEn = 0, direction = 0: This bit is set to logical 1 whenever there are writeIntr threshold or more bytes free in the FIFO. (c) dmaEn = 0, direction = 1: This bit is set to logical 1 whenever there are readIntr threshold or more valid bytes to be read from the FIFO. 1: Disable DMA and all of the service interrupts. Writing a logical 1 to this bit does not cause an interrupt.
1	Full. Read Only. 0: The FIFO has at least one free byte. 1: The FIFO is completely full; it cannot accept another byte.
0	Empty. Read Only. 0: The FIFO contains at least one byte of data. 1: The FIFO is completely empty.

12.3.11ECP Pin Descriptions

NAME	TYPE	DESCRIPTION
Nstrobe (HostClk)	O	This pin loads data or address into the slave on its asserting edge during write operations. This signal handshakes with Busy.
PD<7:0>	I/O	These signals contain address, data or RLE data.
nAck (PeriphClk)	I	This signal indicates valid data driven by the peripheral when asserted. This signal handshakes with nAutoFd in reverse.
Busy (PeriphAck)	I	This signal deasserts to indicate that the peripheral can accept data. In the reverse direction, it indicates whether the data lines contain ECP command information or data. Normal data are transferred when Busy (PeriphAck) is high, and an 8-bit command is transferred when it is low.
Perror (nAckReverse)	I	This signal is used to acknowledge a change in the direction of the transfer (asserted = forward). The peripheral drives this signal low to acknowledge nReverseRequest. The host relies upon nAckReverse to determine when it is permitted to drive the data bus.

NAME	TYPE	DESCRIPTION
Select (Xflag)	I	Indicates printer on-line.
NautoFd (HostAck)	O	Requests a byte of data from the peripheral when it is asserted. In the forward direction, this signal indicates whether the data lines contain ECP address or data. Normal data are transferred when nAutoFd (HostAck) is high, and an 8-bit command is transferred when it is low.
nFault (nPeriphReuquest)	I	Generates an error interrupt when it is asserted. This signal is valid only in the forward direction. The peripheral is permitted (but not required) to drive this pin low to request a reverse transfer during ECP mode.
nInit (nReverseRequest)	O	This signal sets the transfer direction (asserted = reverse, deasserted = forward). This pin is driven low to place the channel in the reverse direction.
nSelectIn (ECPMode)	O	This signal is always deasserted in ECP mode.

12.3.12 ECP Operation

The host must negotiate on the parallel port to determine if the peripheral supports the ECP protocol before ECP operation. After negotiation, it is necessary to initialize some of the port bits.

- (a) Set direction = 0, enabling the drivers.
- (b) Set strobe = 0, causing the nStrobe signal to default to the deasserted state.
- I Set autoFd = 0, causing the nAutoFd signal to default to the deasserted state.
- (d) Set mode = 011 (ECP Mode)

ECP address/RLE bytes or data bytes may be sent automatically by writing the ecpAFifo or ecpDFifo, respectively.

12.3.12.1. Mode Switching

The software must handle P1284 negotiation and all operations prior to a data transfer in SPP or PS/2 modes (000 or 001). The hardware provides an automatic control line handshake, moving data between the FIFO and the ECP port, only in the data transfer phase (mode 011 or 010).

If the port is in mode 000 or 001, it may switch to any other mode. If the port is not in mode 000 or 001, it can only be switched into mode 000 or 001. The direction can only be changed in mode 001.

In extended forward mode, the software should wait for the FIFO to be empty before switching back to mode 000 or 001. In ECP reverse mode, the software should wait for all the data to be read from the FIFO before changing back to mode 000 or 001.

12.3.12.2. Command/Data

ECP mode allows the transfer of normal 8-bit data or 8-bit commands. In the forward direction, normal data are transferred when HostAck is high, and an 8-bit command is transferred when HostAck is low. The most significant bits of the command indicate whether it is a run-length count (for compression) or a channel address.

In the reverse direction, normal data are transferred when PeriphAck is high, and an 8-bit command is transferred when PeriphAck is low. The most significant bit of the command is always zero.

12.3.12.3. Data Compression

The NCT6776F / NCT6776D hardware supports RLE decompression and can transfer compressed data to a peripheral. Odd (RLE) compression is not supported in the hardware, however. In order to transfer data in ECP mode, the compression count is written to ecpAFifo and the data byte is written to ecpDFifo.

12.3.13FIFO Operation

The FIFO threshold is set in CR5. All data transferred to or from the parallel port can proceed in DMA or Programmed I/O (non-DMA) mode, as indicated by the selected mode. The FIFO is used in Parallel Port FIFO mode or ECP Parallel Port Mode. After a reset, the FIFO is disabled.

12.3.14DMA Transfers

DMA transfers are always to or from the ecpDFifo, tFifo, or Cfifo. DMA uses the standard PC DMA services. The ECP requests DMA transfers from the host by activating the PDRQ pin. The DMA empties or fills the FIFO using the appropriate direction and mode. When the terminal count in the DMA controller is reached, an interrupt is generated, and serviceIntr is asserted, which will disable the DMA.

12.3.15Programmed I/O (NON-DMA) Mode

The ECP and parallel port FIFOs can also be operated using interrupt-driven, programmed I/O. Programmed I/O transfers are

1. To the ecpDFifo at 400H and ecpAFifo at 000H
2. From the ecpDFifo located at 400H
3. To / from the tFifo at 400H.

The host must set dmaEn and serviceIntr to 0 and also must set the direction and state accordingly in the programmed I/O transfers.

The ECP requests programmed I/O transfers from the host by activating the IRQ pin. The programmed I/O empties or fills the FIFO using the appropriate direction and mode.

13. KEYBOARD CONTROLLER

The NCT6776F / NCT6776D KBC (8042 with licensed KB BIOS) circuit is designed to provide the functions needed to interface a CPU with a keyboard and/or a PS/2 mouse and can be used with IBM®-compatible personal computers or PS/2-based systems. The controller receives serial data from the keyboard or PS/2 mouse, checks the parity of the data, and presents the data to the system as a byte of data in its output buffer. Then, the controller asserts an interrupt to the system when data are placed in its output buffer. The keyboard and PS/2 mouse are required to acknowledge all data transmissions. No transmission should be sent to the keyboard or PS/2 mouse until an acknowledgement is received for the previous data byte.

Figure 13-1 Keyboard and Mouse Interface

13.1 Output Buffer

The output buffer is an 8-bit, read-only register at I/O address 60H (Default, PnP programmable I/O address LD5-CR60 and LD5-CR61). The keyboard controller uses the output buffer to send the scan code (from the keyboard) and required command bytes to the system. The output buffer can only be read when the output buffer full bit in the register (in the status register) is logical 1.

13.2 Input Buffer

The input buffer is an 8-bit, write-only register at I/O address 60h or 64h (Default, PnP programmable I/O address LD5-CR60, LD5-CR61, LD5-CR62, and LD5-CR63). Writing to address 60h sets a flag to indicate a data write; writing to address 64h sets a flag to indicate a command write. Data written to I/O address 60h is sent to the keyboard (unless the keyboard controller is expecting a data byte) through the controller's input buffer only if the input buffer full bit (in the status register) is logical 0.

13.3 Status Register

The status register is an 8-bit, read-only register at I/O address 64h (Default, PnP programmable I/O address LD5-CR62 and LD5-CR63) that holds information about the status of the keyboard controller and interface. It may be read at any time.

Table 13-1 Bit Map of Status Register

BIT	BUT FUNCTION	DESCRIPTION
0	Output Buffer Full	0: Output buffer empty 1: Output buffer full
1	Input Buffer Full	0: Input buffer empty 1: Input buffer full
2	System Flag	This bit may be set to 0 or 1 by writing to the system flag bit in the command byte of the keyboard controller. It defaults to 0 after a power-on reset.
3	Command/Data	0: Data byte 1: Command byte
4	Inhibit Switch	0: Keyboard is inhibited 1: Keyboard is not inhibited
5	Auxiliary Device Output Buffer	0: Auxiliary device output buffer empty 1: Auxiliary device output buffer full
6	General Purpose Time-out	0: No time-out error 1: Time-out error
7	Parity Error	0: Odd parity 1: Even parity (error)

03	Keyboard "Data" line is stuck low																		
04	Keyboard "Data" line is stuck high																		
Adh	Disable Keyboard Interface																		

COMMAND	FUNCTION
Aeh	Enable Keyboard Interface
C0h	Read Input Port (P1) and send data to the system
C1h	Continuously puts the lower four bits of Port1 into the STATUS register
C2h	Continuously puts the upper four bits of Port1 into the STATUS register
D0h	Send Port 2 value to the system
D1h	Only set / reset GateA20 line based on system data bit 1
D2h	Send data back to the system as if it came from the Keyboard
D3h	Send data back to the system as if it came from Auxiliary Device
D4h	Output next received byte of data from system to Auxiliary Device
E0h	Reports the status of the test inputs
FXh	Pulse only RC (the reset line) low for 6 μ s if the Command byte is even

13.5 Hardware GATEA20/Keyboard Reset Control Logic

The KBC includes hardware control logic to speed-up GATEA20 and KBRESET. This control logic is controlled by LD5-CRF0 as follows:

13.5.1 KB Control Register (Logic Device 5, CR-F0)

BIT	7	6	5	4	3	2	1	0
NAME	KCLKS1	KCLKS0	RESERVED			P92EN	HGA20	HKBRST#
DEFAULT	1	0	0	0	0	0	0	0

BIT	DESCRIPTION	
7	KCLKS1.	Select the KBC clock rate. Bits 7 6 0 0: Reserved 0 1: Reserved 1 0: KBC clock input is 12 MHz. 1 1: Reserved
6	KCLKS0.	
5-3	RESERVED.	
2	P92EN (Port 92 Enable). 1: Enables Port 92 to control GATEA20 and KBRESET. 0: Disables Port 92 functions.	
1	HGA20 (Hardware GATEA 20). 1: Selects hardware GATE A20 control logic to control GATE A20 signal. 0: Disables GATEA20 control logic functions.	
0	HKBRST# (Hardware Keyboard Reset). 1: Selects hardware KB RESET control logic to control KBRESET signal. 0: Disables hardware KB RESET control logic function.	

When the KBC receives data that follows a “D1” command, the hardware control logic sets or clears GATE A20 according to received data bit 1. Similarly, the hardware control logic sets or clears KBRESET depending on received data bit 0. When the KBC receives an “FE” command, the KBRESET is pulse low for 6 μ s (Min.) with a 14 μ s (Min.) delay.

GATE A20 and KBRESET are controlled by either software or hardware logic, and they are mutually exclusive. Then, GATE A20 and KBRESET are merged with Port92 when the P92EN bit is set.

13.5.2 Port 92 Control Register (Default Value = 0x24)

BIT	7	6	5	4	3	2	1	0
NAME	RES. (0)		RES. (1)	RES. (0)		RES. (1)	SGA20	PLKBRST#
DEFAULT	0	0	1	0	0	1	0	0

BIT	DESCRIPTION
7-6	RES. (0)
5	RES. (1)
4-3	RES. (0)
2	RES. (1)
1	SGA20 (Special GATE A20 Control) 1: Drives GATE A20 signal to high. 0: Drives GATE A20 signal to low.
0	PLKBRST# (Pulled-low KBRESET). A logical 1 on this bit causes KBRESET to drive low for 6 μ S(Min.) with a 14 μ S(Min.) delay. Before issuing another keyboard-reset command, the bit must be cleared.

14. CONSUMER INFRARED REMOTE (CIR)

Regarding the receiving of IR Block, the hardware uses the sampling rates of 1us, 25us, 50us and 100us to calculate the widths of H Level and L Level. The results are saved/stored in 32*8 RX FIFO. The max widths of H Level and L Level will be determined by Sample Limit Count Register. During the receiving, the hardware will reflect the FIFO status in RX FIFO Status Register. In addition, the hardware also generates status, such as Data Ready, Trigger Level Reach, FIFO Overrun and FIFO underrun, in RC Status Register.

As for the transmission, the user has to set up the Carrier frequency and the transmission mode first and then writes the widths of H Level and L Level via TX FIFO. The hardware will add Carrier to H Level according to the transmission mode.

14.1 CIR Register Table

Table 14-1 CIR Register Table

RC Block									
ExtAddr	Name	7	6	5	4	3	2	1	0
base+0	IRCON	R	WIREN	TXEN	RXEN	WRXINV	RXINV	Sample Period Select

14.1.1 IR Configuration Register – Base Address + 0

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Received	WIREN	TXEN	RXEN	WRXINV	RXINV	Sample Period Select	
DEFAULT	0	0	0	0	0	1	0	0

BIT	DESCRIPTION
7	Received.
6	Wide-band IR Enable

5	TX Enable 1: Transmission Enable. After confirming that FIFO is not empty, the transmission starts (the hardware will wait until TX FIFO data are written). If TX Enable is set to 0 during the transmission, the transmission stops when the transmission of FIFO data is completed. 0: Transmission Disable.
4	RX Enable
3	Wide-band IR Rx Invert Enable 0: Dongle Carrier ON is high, OFF (Idle) is low. 1: Dongle Carrier ON is low, OFF (Idle) is high.
2	IR Rx Invert Enable 0: Dongle Carrier ON is high, OFF (Idle) is low. 1: Dongle Carrier ON is low, OFF (Idle) is high.
1~0	Sample Period Select 00: 1us, 01: 25us, 10: 50us, 11: 100us Note: In the 1us mode, the pulse mode will not function due to the IR regulations.

14.1.2 IR Status Register – Base Address + 1

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
Name	RDR	RTR	PE	RFO	TE	TTR	TFU	GH
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7	RX Data Ready (Writing 1 will clear the bit).
6	RX FIFO Trigger Level Reach (Writing 1 will clear the bit).
5	Packet End (Writing 1 will clear the bit).
4	RX FIFO Overrun (Overrun and Data Ready will be simultaneously generated. Writing 1 will clear the bit).
3	TX FIFO Empty (Writing 1 will clear the bit).
2	TX FIFO Trigger Level Reach (Writing 1 will clear the bit).
1	TX FIFO Underrun (Writing 1 will clear the bit).
0	Min Length Detected (Writing 1 will clear the bit) 1: The IR Data length received is shorter than the default value. 0: The IR Data length received is longer than the default value.

14.1.3 IR Interrupt Configuration Register – Base Address + 2

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
-----	---	---	---	---	---	---	---	---

NAME	RDR	RTR	PE	RFO	TE	TTR	TFU	GH
DEFAULT	0	0	0	0	0	0	0	0

1: Enable interrupt; 0: Disable interrupt

BIT	DESCRIPTION
7	RX Data Ready
6	RX FIFO Trigger Level Reach
5	Packet End
4	RX FIFO Overrun (Overrun and Data Ready will be simultaneously generated).
3	TX FIFO Empty
2	TX FIFO Trigger Level Reach
1	TX FIFO Underrun
0	Min Length Detected

Note. When an Interrupt occurs, it only can be cleared by writing IR Status Register to 1.

14.1.4 RX FIFO Count– Base Address + 5

Attribute: Read

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	FIFO Count							
DEFAULT	0	0	0	0	0	0	0	0

1: Enable; 0: Disable

BIT	DESCRIPTION
7~0	RX FIFO Count

14.1.5 IR TX Carrier Prescaler Configuration Register (CP) – Base Address + 4

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Mode	Reserved						CP
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7	Mode 0 : DC Mode 1 : Pulse Mode
6~1	Reserved.
0	Carrier Prescaler (CP). This bit is set for the Prescaler value of the IR TX carrier

	frequency.
--	------------

14.1.6 IR TX Carrier Period Configuration Register (CC) – Base Address + 5

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Carrier Period (CC)							
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7~0	This byte is set for IR TX carrier period. The actual carrier period will be: $\text{Period} = 2 * (2^{CP*2}) * (CC+1) / (\text{System Clock})$, where the frequency = 1 / period, and System Clock = 24MHz. Setting CP and CC to 0 will cause stop the device to from use using anyno carrier at all (that is, no light modulation, just constant on and off periods). The period count value CC can be any number from 0 to 255.

14.1.7 IR RX Sample Limited Count High Byte Register (RCLCH) – Base Address + 6

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Sample Limited Count High Byte							
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7~0	This byte is defined as the high byte of the limited count in the IR RX mode.

14.1.8 IR RX Sample Limited Count Low Byte Register (RCLCL) – Base Address + 7

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Sample Limited Count low Byte							
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7~0	This byte is defined as the low byte of the limited count in the IR RX mode.

Note. (RCLCH, RCLCL) is defined as 16 bits value of the limited count in the IR RX mode. When the RX date length reaches the limited count, Packet End status will appear.

14.1.9 IR FIFO Configuration Register (FIFOCON) – Base Address + 8

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	TXFIFOCLR	Reserved	TX Trigger Level		RXFIFOCLR	Reserved	RX Trigger Level	
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7	TX FIFO Cleared.
6	Reserved.
5~4	TX Trigger Level Bits 5 4 0 0: 31 0 1: 24 1 0: 16 1 1: 8
3	RX FIFO Cleared.
2	Reserved.
1~0	RX Trigger Level Bits 1 0 0 0: 1 0 1: 8 1 0: 16 1 1: 24

14.1.10IR Sample RX FIFO Status Register – Base Address + 9

Attribute: Read Only

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	IR_Pending	RX_GS	RX_FTA	RX_Empty	RX_Full	TX_FTA	TX_Empty	TX_Full
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7	IR Pending 1: No Interrupt 0: Interrupt issue
6	Minimum Length Detect Status. This bit will be cleared when Packet End appears.
5	RX FIFO Trigger Level Active.
4	RX FIFO Empty Flag.
3	RX FIFO Full Flag.
2	TX FIFO Trigger Level Active.

BIT	DESCRIPTION
1	TX FIFO Empty Flag.
0	TX FIFO Full Flag.

14.1.11IR Sample RX FIFO Register – Base Address + A

Attribute: Read Only

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Voltage Level	Sample RX FIFO						

BIT	DESCRIPTION
7	Voltage Level 0: Low, 1: High
6~0	RX data length (Unit : Sample Period) Note: 1. 0x80 is Packet End. The hardware enters the Idle state after checking Rx Channel. 2. When 0x00 represents the glitch packet, it means pulses shorter than 3/4 sample period are received. 3. Pulses that are shorter than 1/4 sample periods will be ignored automatically.

14.1.12TX FIFO Count– Base Address + 5

Attribute: Read

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	TX FIFO Count							
DEFAULT	0	0	0	0	0	0	0	0

1: Enable; 0: Disable

BIT	DESCRIPTION
7~0	TX FIFO Count

14.1.13IR Sample TX FIFO Register – Base Address + C

Attribute: Read Only

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Voltage Level	Sample TX FIFO						

BIT	DESCRIPTION
-----	-------------

7	Voltage Level 0: Low, 1: High
6~0	TX data length (Unit : Sample Period)

14.1.14IR Carrier Count High Byte Register – Base Address + D

Attribute: Read Only

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Carrier Count High Byte							

BIT	DESCRIPTION
7~0	Carrier Count High Byte. This byte records the total amount of the total rising edges until time-out event appears.

14.1.15IR Carrier Count Low Byte Register – Base Address + E

Attribute: Read Only

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Carrier Count Low Byte							

BIT	DESCRIPTION
7~0	Carrier Count Low Byte. This byte records the total amount of the the rising edges until time-out event appears.

After a time-out of reception on the learning receiver, this response is sent to tell the host the carrier frequency of the previous sample. The Carrier Count High Byte (ch) and Carrier Count Low Byte (cl) specify the cycle counts of cycles of the carrier. Carrier counts can also be thought of regarded as the number of leading edges in the previous sample.

This is used to calculate carrier frequency is as follows:

$$\text{lastCarrierCount}_{(\text{decimal})} = \text{ch} * 256 + \text{cl};$$

Thus,

$$\text{Carrier frequency} = (\text{lastCarrierCount}) / (\text{irPacketOnDuration});$$

The **irPacketOnDuration** value is the total amount of time that the envelope of the signal was is high. The IR receiver should keep track of the time that of the high envelope is high and return it using this response.

This response is unsolicited. It is returned by the receiver when IR arrives but is never explicitly requested.

14.1.16IR FSM Status Register (IRFSM) – Base Address + F

Attribute: Read Only

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Reserved	Decoder FSM			Reserved	Encoder FSM		

DEFAULT	0	0	0	0	0	0	0	0
---------	---	---	---	---	---	---	---	---

BIT	DESCRIPTION
7	Reserved.
6	Decoder over status
5	Decoder continuing status
4	Decoder wait H status 1: idle, 0: RX busy
3	Reserved.
2	Encoder Idle Status. 1: idle, 0: TX busy
1	Encoder Read Status
0	Encoder Level Output Status

14.1.17IR Minimum Length Register – Base Address + F

Attribute: Write Only

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Min Length Register							
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7~0	Min Length Register. Set up the shortest expected length of each carrier on the RX receiver (Unit: Sample Clock).

15. CONSUMER INFRARED REMOTE (CIR) WAKE-UP

One of the features of the NCT6776F / NCT6776D is system boot-up by a remote controller. The hardware will store a specifically appointed key command from the IR remote controller in the FIFO of 67Byte.

The same key is required to re-boot the system after the computer shut-down. Such way can be applied to any remote controllers. Learning is necessary only at the first time.

15.1 CIR WAKE-UP Register Table

RC Block									
ExtAddr	Name	7	6	5	4	3	2	1	0
base+0	IRCON	DEC_RST	Mode[1]	Mode[0]	RXEN	IgnoreEN	RXINV	Sample Period Select

15.1.1 IR Configuration Register – Base Address + 0

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	DEC_RST	Mode[1]	Mode[0]	RXEN	Received	RXINV	Sample Period Select	
DEFAULT	0	0	1	0	0	1	1	0

BIT	DESCRIPTION
7	Reset CIR DECODER (Write 1 to clear)
6	Mode[1] : 0: FIFO can't be written 1: FIFO can be written
5	Mode[0] 0: Learning Mode

BIT	DESCRIPTION
	1: Wake up Mode (Before enter in Power S3 state, this bit should be set) This bit reset by VCC.
4	RX Enable
3	Ignore Bit Enable
2	IR Rx Invert Enable 0: Dongle Carrier ON is high, OFF (Idle) is low. 1: Dongle Carrier ON is low, OFF (Idle) is high.
1~0	Sample Period Select 00: 1us, 01: 25us, 10: 50us, 11: 100us Note: In the 1us mode, the pulse mode will not function due to the IR regulations.

15.1.2 IR Status Register – Base Address + 1

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	RDR	RTR	PE	RFO	GH	Received		IR_Pending
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7	RX Data Ready (Writing 1 will clear the bit).
6	RX FIFO Trigger Level Reach (Writing 1 will clear the bit).
5	Packet End (Writing 1 will clear the bit).
4	RX FIFO Overrun (Overrun and Data Ready will be simultaneously generated. Writing 1 will clear the bit).
3	Min Length Detected (Writing 1 will clear the bit) 1: The IR Data length received is shorter than the default value. 0: The IR Data length received is longer than the default value.
2~1	Reserved.
0	IR Pending 1: No Interrupt 0: Interrupt issue

15.1.3 IR Interrupt Configuration Register – Base Address + 2

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	RDR	RTR	PE	RFO	GH	Reserved		
DEFAULT	0	0	0	0	0	0	0	0

1: Enable interrupt; 0: Disable interrupt

BIT	DESCRIPTION
7	RX Data Ready
6	RX FIFO Trigger Level Reach
5	Packet End
4	RX FIFO Overrun (Overrun and Data Ready will be simultaneously generated).
3	Min Length Detected
2~0	Reserved

Note. When an Interrupt occurs, it only can be cleared by writing IR Status Register to 1.

15.1.4 IR TX Configuration Register – Base Address + 3

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	FIFO Compare Deep							
DEFAULT	0	1	0	0	0	0	1	1

1: Enable; 0: Disable

BIT	DESCRIPTION
7~0	When in S3 state, how many bytes need to compare. Default is 67 bytes.

15.1.5 IR FIFO Compare Tolerance Configuration Register – Base Address + 4

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	FIFO Compare Tolerance							
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7~0	FIFO Data Tolerance between Learning mode and Wakeup mode. (Every byte) FIFO Date Tolerance = (Learning mode data) – (Wakeup mode data)

15.1.6 RX FIFO Count– Base Address + 5

Attribute: Read

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	FIFO Count							
DEFAULT	0	0	0	0	0	0	0	0

1: Enable; 0: Disable

BIT	DESCRIPTION
7~0	RX FIFO Count

15.1.7 IR RX Sample Limited Count High Byte Register (RCLCH) – Base Address + 6

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Sample Limited Count High Byte							
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7~0	This byte is defined as the high byte of the limited count in the IR RX mode.

15.1.8 IR RX Sample Limited Count Low Byte Register (RCLCL) – Base Address + 7

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Sample Limited Count low Byte							
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7~0	This byte is defined as the low byte of the limited count in the IR RX mode.

Note. (RCLCH, RCLCL) is defined as 16 bits value of the limited count in the IR RX mode. When the RX data length reaches the limited count, Packet End status will appear.

15.1.9 IR FIFO Configuration Register (FIFOCON) – Base Address + 8

Attribute: Read/Write

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Reserved				RXFIFOCLR	Reserved	RX Trigger Level	
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7~4	Reserved
3	RX FIFO Cleared.
2	Reserved.
1~0	RX Trigger Level Bits 1 0 0 0: 67

0 1: 66
1 0: 65
1 1: 64

15.1.10IR Sample RX FIFO Status Register – Base Address + 9

Attribute: Read Only

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	GS	FTA	Empty	Full	Reserved			
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7	Minimum Length Detect Status. This bit will be cleared when Packet End appears.
6	RX FIFO Trigger Level Active.
5	RX FIFO Empty Flag.
4	RX FIFO Full Flag.
3~0	Reserved

15.1.11IR Sample RX FIFO Register – Base Address + A

Attribute: Read Only

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Voltage Level	Sample RX FIFO						

BIT	DESCRIPTION
7~6	Voltage Level 0: Low, 1: High
0	RX data length (Unit : Sample Period) Note: 1. 0x80 is Packet End. The hardware enters the Idle state after checking Rx Channel. 2. When 0x00 represents the glitch packet, it means pulses shorter than 3/4 sample period are received. 3. Pulses that are shorter than 1/4 sample periods will be ignored automatically.

15.1.12Write FIFO – Base Address + B

Attribute: Write Only

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Voltage Level	Write Sample RX FIFO						

BIT	DESCRIPTION
7~6	Voltage Level 0: Low, 1: High
0	RX data length (Unit : Sample Period)

Note. Before writing FIFO Data, mode[1] register should be set.

15.1.13Read FIFO Only – Base Address + C

Attribute: Read Only

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Voltage Level	Sample RX FIFO						

BIT	DESCRIPTION
7~6	Voltage Level 0: Low, 1: High
0	RX data length (Unit : Sample Period)

Note. Only Read FIFO Data.

15.1.14Read FIFO Index – Base Address + D

Attribute: Read Only

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	FIFO Index							

BIT	DESCRIPTION
7~0	Indicate that FIFO Index when only read FIFO data(Base Address + C)

Note. Only Read FIFO Data.

15.1.15Reserved – Base Address + E

15.1.16 IR FSM Status Register (IRFSM) – Base Address + F

Attribute: Read Only

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Reserved	Decoder FSM			Reserved			Wake up event
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7	Reserved
6~4	CIR State Machine
3~1	Reserved
0	Wake up event: 0: CIR wake up event has not been triggered. 1: CIR wake up event has been triggered. (Wake up event clear: Write 11b to “Logic Decice A, CRE8h, bit7~6” then 00b.)

15.1.17IR Minimum Length Register – Base Address + F

Attribute: Write Only

Size: 8 bits

BIT	7	6	5	4	3	2	1	0
NAME	Min Length Register							
DEFAULT	0	0	0	0	0	0	0	0

BIT	DESCRIPTION
7~0	Min Length Register. Set up the shortest expected length of each carrier on the RX receiver (Unit: Sample Clock).

16. POWER MANAGEMENT EVENT

The PME# (pin 65) signal is connected to the South Bridge and is used to wake up the system from S1 sleeping states.

One control bit and four registers in the NCT6776F / NCT6776D are associated with the PME function. The control bit is at Logical Device A, CR[F2h], bit[0] and is for enabling or disabling the PME function. If this bit is set to "0", the NCT6776F / NCT6776D won't output any PME signal when any of the wake-up events has occurred and is enabled. The four registers are divided into PME status registers and PME interrupt registers of wake-up events ^{Note.1}.

- 1) The PME status registers of wake-up event:
 - At Logical Device A, CR[F3h] and CR[F4h]
 - Each wake-up event has its own status
 - The PME status should be cleared by writing a "1" before enabling its corresponding bit in the PME interrupt registers
- 2) The PME interrupt registers of wake-up event:
 - At Logical Device A, CR[F6h] and CR[F7h]
 - Each wake-up event can be enabled / disabled individually to generate a PME# signal

^{Note.1} PME wake-up events that the NCT6776F / NCT6776D supports include:

- Mouse event*
- Keyboard event*
- GP41, GP46, GP92, GP93 events
- CIR*
- Printer IRQ event
- Floppy IRQ event
- UART A IRQ event
- IR IRQ event
- Hardware Monitor IRQ event
- WDT1 event
- RIB (UARTB Ring Indicator) event

^{Note.2} All the above support both S0 and S1 states. Events with the "*" mark can use PSOUT# to wake up the system from S3 ~ S5 states.

16.1 Power Control Logic

This chapter describes how the NCT6776F / NCT6776D implements its ACPI function via these power control pins: PSIN# (Pin 61), PSOUT# (Pin 60), SLP_S3# (Pin 64) and PSON# (Pin 63). The following figure illustrates the relationships.

Figure 16-1 Power Control Mechanism

16.1.1 PSIN# Logic

16.1.1.1. Normal Operation

The PSOUT# signal will be asserted low if the PSIN# signal is asserted low. The PSOUT# signal is held low for as long as the PSIN# is held low. The South Bridge controls the SLP_S3# signal through the PSOUT# signal. The PSON# is directly connected to the power supply to turn on or off the power.

Figure 16-2 shows the power on and off sequences.

The ACPI state changes from S5 to S0, then to S5

Figure 16-2 Power Sequence from S5 to S0, then Back to S5

16.1.2 AC Power Failure Resume

By definition, AC power failure means that the standby power is removed. The power failure resume control logic of the NCT6776F / NCT6776D is used to recover the system to a pre-defined state after AC power failure. Two control bits at Logical Device A, CR[E4h], bits[6:5] indicate the pre-defined state. The definition of these two bits is listed in the following table:

Table 16-1 Bit Map of Logical Device A, CR[E4h], Bits[6:5]

LOGICAL DEVICE A, CR[E4H], BITS[6 :5]	DEFINITION
00	System always turns off when it returns from AC power failure
01	System always turns on when it returns from AC power failure
10	System turns off / on when it returns from power failure depending on the state before the power failure. (Please see Note 1)

LOGICAL DEVICE A, CR[E4H], BITS[6 :5]	DEFINITION
11	User defines the state before the power failure. (The previous state is set at CRE6[4]. Please see Note 2)

Note1. The NCT6776F / NCT6776D detects the state before power failure (on or off) through the SLP_S3# signal and the 3VCC power. The relation is illustrated in the following two figures.

Figure 16-3 The previous state is “on”
3VCC falls to 2.6V and SLP_S3# keeps at 2.0V.

Figure 16-4 The previous state is “off”.
3VCC falls to 2.6V and SLP_S3# keeps at 0.8V.

Note 2.

Logical Device A, CR[E6h] bit [4]	Definition
0	User defines the state to be “on”
1	User defines the state to be “off”

To ensure that VCC does not fall faster than VSB in various ATX Power Supplies, the NCT6776F / NCT6776D adds the option of “user define mode” for the pre-defined state before AC power failure. BIOS can set the pre-defined state to be “On” or “Off”. According to this setting, the system is returned to the pre-defined state after the AC power recovery.

16.2 Wake Up the System by Keyboard and Mouse

The NCT6776F / NCT6776D generates a low pulse through the PSOUT# pin to wake up the system when it detects a key code pressed or mouse button clicked. The following sections describe how the NCT6776F / NCT6776D works.

16.2.1 Waken up by Keyboard events

The keyboard Wake-Up function is enabled by setting Logical Device A, CR[E0h], bit 6 to “1”.

There are two keyboard events can be used for the wake-up

- 1) Any key – Set bit 0 at Logical Device A, CR[E0h] to “1” (Default).
- 2) Specific keys (Password) – Set bit 0 at Logical Device A, CR[E0h] to “0”.

Three sets of specific key combinations are stored at Logical Device A. CR[E1h] is an index register to indicate which byte of key code storage (0x00h ~ 0x0Eh, 0x30h ~ 0x3Eh, 0x40h ~ 0x4Eh) is going to be read or written through CR[E2h]. According to IBM 101/102 keyboard specification, a complete key code contains a 1-byte make code and a 2-byte break code. For example, the make code of “0” is 0x45h, and the corresponding break code is 0xF0h, 0x45h.

The approach to implement Keyboard Password Wake-Up Function is to fill key codes into the password storage. Assume that we want to set “012” as the password. The storage should be filled as below. Please note that index 0x09h ~ 0x0Eh must be filled as 0x00h since the password has only three numbers.

Index(CRE1)→	00	01	02	03	04	05	06	07	08	09	0A	0B	0C	0D	0E
Data(CRE2)→	1E	F0	1E	16	F0	16	45	F0	45	00	00	00	00	00	00

16.2.2 Waken up by Mouse events

The mouse Wake-Up function is enabled by setting Logical Device A, CR[E0h], bit 5 to “1”.

The following specific mouse events can be used for the wake-up:

- Any button clicked or any movement
- One click of the left or the right button
- One click of the left button
- One click of the right button
- Two clicks of the left button
- Two clicks of the right button.

Three control bits (ENMDAT_UP, MSRKEY, MSXKEY) define the combinations of the mouse wake-up events. Please see the following table for the details.

Table 16-2 Definitions of Mouse Wake-Up Events

ENMDAT_UP (LOGICAL DEVICE A, CR[E6H], BIT 7)	MSRKEY (LOGICAL DEVICE A, CR[E0H], BIT 4)	MSXKEY (LOGICAL DEVICE A, CR[E0H], BIT 1)	WAKE-UP EVENT
1	x	1	Any button clicked or any movement.
1	x	0	One click of the left or right button.
0	0	1	One click of the left button.
0	1	1	One click of the right button.

ENMDAT_UP (LOGICAL DEVICE A, CR[E6H], BIT 7)	MSRKEY (LOGICAL DEVICE A, CR[E0H], BIT 4)	MSXKEY (LOGICAL DEVICE A, CR[E0H], BIT 1)	WAKE-UP EVENT
0	0	0	Two clicks of the left button.
0	1	0	Two clicks of the right button.

16.3 Resume Reset Logic

The RSMRST# (Pin 101) signal is a reset output and is used as the VSB power on reset signal for the South Bridge.

When the NCT6776F / NCT6776D detects the 3VSB voltage rises to “V1”, it then starts a delay – “t1” before the rising edge of RSMRST# asserting. If the 3VSB voltage falls below “V2”, the RSMRST# de-asserts immediately.

Timing and voltage parameters are shown in Figure 16-5 and Table 16-3.

Figure 16-5 Mechanism of Resume Reset Logic

Table 16-3 Timing and Voltage Parameters of RSMRST#

NAME	PARAMETER	MIN.	MAX.	UNIT
V1	3VSB Valid Voltage	-	3.033	V
V2	3VSB Ineffective Voltage	2.882	-	V
t1	Valid 3VSB to RSMRST# inactive	100	200	mS

17. SERIALIZED IRQ

The NCT6776F / NCT6776D supports a serialized IRQ scheme. This allows a signal line to be used to report the parallel interrupt requests. Since more than one device may need to share the signal serial SERIRQ signal, an open drain signal scheme is employed. The clock source is the PCI clock. The serialized interrupt is transferred on the SERIRQ signal, one cycle consisting of three frames types: the Start Frame, the IRQ/Data Frame, and the Stop Frame.

17.1 Start Frame

There are two modes of operation for the SERIRQ Start Frame: Quiet mode and Continuous mode.

In the Quiet mode, the NCT6776F / NCT6776D drives the SERIRQ signal active low for one clock, and then tri-states it. This brings all the state machines of the NCT6776F / NCT6776D from idle to active states. The host controller (the South Bridge) then takes over driving SERIRQ signal low in the next clock and continues driving the SERIRQ low for programmable 3 to 7 clock periods. This makes the total number of clocks low 4 to 8 clock periods. After these clocks, the host controller drives the SERIRQ high for one clock and then tri-states it.

In the Continuous mode, the START Frame can only be initiated by the host controller to update the information of the IRQ/Data Frame. The host controller drives the SERIRQ signal low for 4 to 8 clock periods. Upon a reset, the SERIRQ signal is defaulted to the Continuous mode for the host controller to initiate the first Start Frame.

Please see the diagram below for more details.

Start Frame Timing with source sampled a low pulse on IRQ1.

Figure 17-1 Start Frame Timing with Source Sampled A Low Pulse on IRQ1

H=Host Control

SL=Slave Control

R=Recovery

T=Turn-around

S=Sample

Note:

1. The Start Frame pulse can be 4-8 clocks wide.
2. The first clock of Start Frame is driven low by the NCT6776F / NCT6776D because IRQ1 of the NCT6776F / NCT6776D needs an interrupt request. Then the host takes over and continues to pull the SERIRQ low.

17.2 IRQ/Data Frame

Once the Start Frame has been initiated, the NCT6776F / NCT6776D must start counting frames based on the rising edge of the start pulse. Each IRQ/Data Frame has three clocks: the Sample phase, the Recovery phase, and the Turn-around phase.

During the Sample phase, the NCT6776F / NCT6776D drives SERIRQ low if the corresponding IRQ is active. If the corresponding IRQ is inactive, then SERIRQ must be left tri-stated. During the Recovery phase, the NCT6776F / NCT6776D device drives the SERIRQ high. During the Turn-around phase, the NCT6776F / NCT6776D device leaves the SERIRQ tri-stated. The NCT6776F / NCT6776D starts to drive the SERIRQ line from the beginning of "IRQ0 FRAME" based on the rising edge of PCICLK.

The IRQ/Data Frame has a specific numeral order, as shown in Table 17-1.

Table 17-1 SERIRQ Sampling Periods

SERIRQ SAMPLING PERIODS			
IRQ/DATA FRAME	SIGNAL SAMPLED	# OF CLOCKS PAST START	EMPLOYED BY
1	IRQ0	2	Reserved
2	IRQ1	5	Keyboard
3	SMI#	8	H/W Monitor & SMI
4	IRQ3	11	IR
5	IRQ4	14	UART A
6	IRQ5	17	-
7	IRQ6	20	FDC
8	IRQ7	23	LPT
9	IRQ8	26	-
10	IRQ9	29	-
11	IRQ10	32	-
12	IRQ11	35	-
13	IRQ12	38	Mouse
14	IRQ13	41	Reserved
15	IRQ14	44	-
16	IRQ15	47	-
17	IOCHCK#	50	-
18	INTA#	53	-
19	INTB#	56	-
20	INTC#	59	-
21	INTD#	62	-
32:22	Unassigned	95	-

17.3 Stop Frame

After all IRQ/Data Frames have completed, the host controller will terminate SERIRQ with a Stop frame. Only the host controller can initiate the Stop Frame by driving SERIRQ low for 2 or 3 clocks. If the Stop Frame is low for 2 clocks, the Sample mode of next SERIRQ cycle's Sample mode is the Quiet mode. If the Stop Frame is low for 3 clocks, the Sample mode of next SERIRQ cycle is the Continuous mode.

Please see the diagram below for more details.

Stop Frame Timing with Host Using 17 SERIRQ sampling period.

Figure 17-2 Stop Frame Timing with Host Using 17 SERIRQ Sampling Period

H=Host Control R=Recovery T=Turn-around S=Sample I= Idle.

Note:

1. There may be none, one or more Idle states during the Stop Frame.
2. The Start Frame pulse of next SERIRQ cycle may or may not start immediately after the turn-around clock of the Stop Frame.

18. WATCHDOG TIMER

The Watchdog Timer of the NCT6776F / NCT6776D consists of an 8-bit programmable time-out counter and a control and status register. GPIO0, GPIO2, GPIO3, GPIO4, GPIO5, GPIO6, GPIO8, GPIO9, GPIOA provides an alternative WDT1 function. This function can be configured by the relative GPIO control register. The units of Watchdog Timer counter can be selected at Logical Device 8, CR[F5h], bit[3]. The time-out value is set at Logical Device 8, CR[F6h]. Writing zero disables the Watchdog Timer function. Writing any non-zero value to this register causes the counter to load this value into the Watchdog Timer counter and start counting down.

When Watchdog Timer 1 time-out event is occurring, GPIO0, bit[0],[3],[4],[7], GPIO2, GPIO3, GPIO4, GPIO5, GPIO6, GPIO8, bit[0],[4], and GPIO9, GPIOA, bit[0] will trigger a low pulse approx 100mS. In other words, when the value is counted down to zero, the timer stops, and the NCT6776F / NCT6776D sets the WDT1 status bit in Logical Device 8, CR[F7h], bit[4]. Writing a zero will clear the status bit. This bit will also be cleared if LRESET# or PWROK# signal is asserted.

19. GENERAL PURPOSE I/O

19.1 GPIO ARCHITECTURE

The NCT6776F / NCT6776D provides 76 input/output ports that can be individually configured to perform a simple basic I/O function or alternative, pre-defined function. Users can configure each individual port to be an input or output port by programming respective bit in selection register (0 = output, 1 = input). Invert port value by setting inversion register (0 = non-inverse, 1 = inverse). Port value is read/write through data register.

In addition, only **GP41**, **GP46**, **GP92** and **GP93** are designed to be able to assert **PSOUT#** or **PME#** signal to wake up the system if any of them has any transitions. There are about 16ms debounced circuit inside these 4 GPIOs and it can be disabled by programming respective bit (LD9, CR[Feh] bit 4~7). Users can set what kind of event type, level or edge, and polarity, rising or falling, to perform the wake-up function. The following table gives more detailed register map on GP41, GP46, GP92 and GP93.

Table 19-1 Relative Control Registers of **GPIO 41, 46, 92 and 93** that Support Wake-Up Function

	EVENTROUTE I (PSOUT#) 0: DISABLE 1: ENABLE	EVENTROUTE II (PME#) 0: DISABLE 1: ENABLE	EVENT DEBOUNCED 0 : ENABLE 1 : DISABLE	EVENT TYPE 0 : EDGE 1: LEVEL	EVENT POLARITY 0 : RISING 1 : FALLING	EVENT STATUS
GPIO41 (PIN52)	LDA, CR[Feh] bit7	LDA, CR[Feh] bit3	LD9, CR[Feh] bit4	LD9, CR[Feh] bit0	LD9, CR[F2h] bit1	LD9, CR[E8h] bit1
GPIO46 (PIN38)	LDA, CR[Feh] bit6	LDA, CR[Feh] bit2	LD9, CR[Feh] bit5	LD9, CR[Feh] bit1	LD9, CR[F2h] bit6	LD9, CR[E8h] bit6
GPIO92 (PIN76)	LDA, CR[Feh] bit5	LDA, CR[Feh] bit1	LD9, CR[Feh] bit6	LD9, CR[Feh] bit2	LD7, CR[EAh] bit2	LD9, CR[EBh] bit2
GPIO93 (PIN75)	LDA, CR[Feh] bit4	LDA, CR[Feh] bit0	LD9, CR[Feh] bit7	LD9, CR[Feh] bit3	LD7, CR[EAh] bit3	LD9, CR[EBh] bit3

Table 19-2 GPIO Group Programming Table

19.2 ACCESS CHANNELS

There are two different channels to set up/access the GPIO ports. The first one is the indirect access via register 2E/2F (4E/4F, it depends by HEFRAS trapping). The registers can be read / written only when the respective logical device ID and port number are selected.

The other is the direct access through GPIO register table that can be configured by {CR61, CR60} of logic device 8. The mapped 7 registers are defined in table 19-2. Base address plus 0 to 4 are GPIO registers, base address plus 5 and 6 are watchdog registers. Since the base address is set, the GPIO number can be selected by writing the group number to GSR [INDEX] (GPIO Select Register, #0~#A for GPIO0 ~ GPIOA respectively). Then the I/O register, the Data register and the Inversion register are mapped to addresses Base+0, Base+1 and Base+2 respectively. Only one GPIO can be accessed at one time.

Table 19-3 GPIO Register Addresses

ADDRESS	ABBR	BIT NUMBER							
		7	6	5	4	3	2	1	0
Base + 0	GSR	Reserved				INDEX			
Base + 1	IOR	GPIO I/O Register							
Base + 2	DAT	GPIO Data Register							
Base + 3	INV	GPIO Inversion Register							
Base + 4	DST	GPIO Status Register							
Base + 5	Wdtmod	Watchdog Timer I (WDT1) and KBC P20 Control Mode Register							
Base + 6	Wdttim	Watchdog Timer I (WDT1) Control Register							

20. PARALLEL VID (PVID)

The NCT6776F / NCT6776D provides individual eight pins for VID input and output function. These pins can be configured by setting Logical Device D, CR [E0h] to CR [E4h]. The configuration is applied to four modes, Bypass mode, Manual mode, Offset mode, and Maximum mode. More details can refer to Logical Device D, CR [E0h] to CR [E4h].

Logic Device D, CRE4 bit [7:6]	VID Mode Selection
00	Bypass mode (default)
01	Offset make up mode
10	Manual mode
11	Max mode (manual, VID_IN)

Logic Device D, CRE4 bit[2:0]	Tables	Voltage/step
000	AMD 5-bit	25mV
010	AMD 6-bit	25mV
100	VRM 10.1 (6-bit)	12.5 mV
101	VRM 10.2 (7-bit)	6.25 mV
11x	VRM 11.1 (8-bit) (default)	6.25 mV

VID input is decoded by SIO according VID table to VID output , and fed to VRM .

We support 2 table (amd6bit and vrm11) and 4 mode (bypass , offset , manual , compare) to decode different VID output .

To decide VID function , user should make sure CR2A[6:5] are 2'b10 , if not , pin116~123 and pin 86~93 will be other function .

20.1 VID Input Detection

The NCT6776F / NCT6776D supports Intel VRM 9/10/11 and AMD 5/6-bit VID detections. VID input level is design for GTL. The transition point is at 0.7V ~ 0.8V.

20.2 VID Output Control

The output type of the eight VID pins is open-drain stage. The output data can be read in the data register (Logical Device D, CR[E2h], bit 7 ~ 0).

20.3 VID Reset Source

The reset source is illustrated below. SKTOCC# and RSMRST# are always effective. WDT1, POWEROK and LRESET# are optional and can be enable/disable by the respective mask registers.

User define mode includes: By-pass, Offset, Manual, MAX, and Rolling mode. It will translate into user define mode after PWROK rising edge.

Mode configuration registers are reset by RSMRST

Rolling Mode :

Disable : VID_OUT will reflect the VID_IN

Enable : VID_OUT will increase/decrease one step every **step time** when PWROK assert.

step time can set by register.

21. INTEL SERIAL VID (SVID)

Block Diagram

Intel Serial VID use *pmbus* to transmit serial data SVC and SVD, thus its max speed can up to 33MHz. We support 4 mode (Bypass; offset; manual; compare) liked as Parallel VID.

There are two strapping control to decide AMD SVID. One is DSW_EN, if it is "1", then pin 69~66 will be DSW function, otherwise they are SVID function. Two is GP25 (CR2F[5]) , if it is "0", then pin 69~66 will be Intel_SVID function, otherwise they are AMD_SVID function.

DSW_EN(Pin69)	GP25 (CR2F[5])	Pin69~66 Function
1	-	DSW function
0	1	AMD SVID
0	0	Intel SVID

Fig. VRM Start Up Timing

As the Figure above showing, after VRM_EN active, SVID bus can transmit serial code by CPU to VRM. SVID will have multiple data packets to initialize the VRM and the process. Example of this are setting Vout_Max register, reading Icc_Max register etc, followed by SetVID_Slow to the initial voltage to start voltage ramp.

Description		Min	Typ	Max	Note
T_A	VR_EN until VR Controller is ready accept SVID command			1 ms	PWM IC must complete all internal analog and digital configuration and reset protocols during T_A .
T_B	Duration of SVID data packets and SetVID CMD @25 MHz typical.	SVID protocol dependent			Any number of packets may occur before 1 SetVID_Slow command
T_C	Acknowledge of SetVID_x CMD to start of voltage ramp, SVID protocol parameter	0		600 ns	Validate using reference change (600ns is IMVP spec today)
T_D	Voltage ramp time, (SetVID_slow ramp, target voltage dependent)		440 us	2 ms	Typ represents 1.1V @ SetVID slow 2.5 mV/us. Maximum represents maximum time with optional soft start programmed.
T_E	Completion of SetVID ramp to assertion of ALERT# signal			1 us	
T_F	Completion of SetVID ramp to assertion of associated VR_READY	T_E actual		5 ms	

Table. VR Start Up Timing

Fig. Typical Start Up Sequence On Each Rail

Intel define 16 individual address to multi_rail and 32 command to write or read from VR , but it reserve 8bit command to extend in the future . CPU can control the slew rate when set VID target by SetVID_fast or SetVID_slow or SetVID_Decay , and it can also Set specified register liked as SetRegADR and SetRegDAT .

	Command	Master Payload	Slave Payload
00h	Extended	Extended Command index	
01h	SetVID-fast(10mv/us)	VID code	N/A
02h	SetVID-slow(2.5mv/us)	VID code	N/A
03h	SetVID-Decay	VID code	N/A
04h	SetPS	Information to VR	N/A
05h	SetRegADR	Address pointer	N/A
06h	SetRegDAT	Data content	N/A
07h	GetReg	Address of Register	Specified register content
08h	Test Mode		N/A
...	Reserved		N/A
1Fh	Reserved		N/A

Table. Command Set (max:32)

If a VRM does not respond with acknowledge, the master detect the open drain 11b called NAK as reject. In order to intercept CPU Serial Code and transmit to VRM synchronously, we send *NAK* to CPU first when we receive a command frame and send the copy of Serial code to VRM. Because CPU can resend serial code, in the next transmission, we will send back CPU the real *ACK* and data from VRM.

Pin out

PIN	SYMBOL	I/O	POWER WELL	Description
74	VRM_EN	I	VSB	VR Enable
69	VDIOI			VID input
68	VCLKI			VID input
54	ALERTI			ALERT input
67	VDIOO	O	VSB	VID output
66	VCLKO			VID output
55	ALERTO			ALERT output

22. AMD SERIAL VID (SVID)

Block Diagram

AMD SVID use *smbus* to transmit serial data VCLK and VDIO, thus its max speed can up to 400KHz. We support 4 mode (Bypass; offset; manual; compare) liked as PVID, and we can control output frequency according *Factor_L* and *Factor_M* register.

There are two strapping control to decide AMD SVID. One is DSW_EN, if it is "1". then pin 69~66 will be DSW function, otherwise they are SVID function. Two is GP25 (CR2F[5]), if it is "0", then pin 69~66 will be Intel_SVID function, otherwise they are AMD_SVID function.

AMD SVID has two table, one is metal VID table and another is Serial table. When VRM_EN = 1 (t1), VRM should look up metal VID table to decode. After a while (t2), as CPU send Serial Code, VRM should look up serial table.

VCLK	VDIO	Output Voltage (V)
0	0	1.1
0	1	1.0
1	0	0.9
1	1	0.8

Pre-PWROK 2-Bit Metal VID Codes

After system POWEROK signal detect, AMD processor will transmit serial VID code to VRM, and it is byte mode. It define three address (VDD0; VDD1; VDDNB) and six-bits table, thus we support three offsets and three manual data to control each VID code. Maybe process want to change VDD0 and VDD1 at the same time and it send ADD 0x66, but user could set different offset, thus, SIO will send two frame of serial VID protocol to VRM separately.

Bits	Description
6:4	Always 110b
3	Reserved for future use
2	VDD1, if set then the following data byte contains the VID for VDD1
1	VDD0, if set then the following data byte contains the VID for VDD0
0	VDDNB, if set then the following data byte contains the VID for VDDNB

Table: Serial VID Address table

SVID[6:0]	Voltage (V)	SVID[6:0]	Voltage (V)	SVID[6:0]	Voltage (V)		SVID[6:0]	Voltage (V)

68	VCLKI			SVID input
67	VDIOO	O	VSB	SVID output
66	VCLKO			SVID output

23. SMBUS MASTER INTERFACE

23.1 General Description

The SMBus interface module is two wire serial interface compatible to the SMBus physical layer. It is also compatible with Intel's SMBus and Philips' I²C bus.

The rest of this section introduces the various features of the SMBus master capability. These features are divided into the following sections:

- ◆ SMBus and I²C compliant
- ◆ AMD-TSI
- ◆ PCH
- ◆ SMBus master

23.2 Introduction to the SMBus Master

23.2.1 Data Transfer Format

Every byte transferred on the bus consists of 8 bits. After the start condition, the master places the 7-bit address to the slave device it wants to address on the bus. The address followed an eight bit indicating the direction of the data transfer (R/W#); a zero indicates a transmission for data while a one indicates a request for data. Each byte is transferred with the most significant bit first, and after each byte, an acknowledge signal must follow. A data transfer is always terminated by stop condition generated by master.

Figure 23-1 Data Transfer Format

23.2.2 Arbitration

Arbitration takes place on the SMBDAT data line while the SMBCLK line is high. Two devices may generate a start condition at the same time and enter the arbitration procedure. Arbitration continues until one master generates a HIGH level on the SMBDAT line while another competing master generates a LOW level on the SMBDAT line while SMBCLK is high. The master device which generated the HIGH level on SMBDAT loses arbitration. If a device loses arbitration during the first byte following a start condition i.e. while transmitting a slave address it becomes a slave receiver and monitors the address for a potential match. Arbitration may also be lost in the master receive mode during the acknowledge cycle.

Figure 23-2 SMBus Arbitration

23.2.3 Clock Synchronization

Clock synchronization is performed while the arbitration procedure described above is in effect. Clock Synchronization takes place between two competing devices by utilizing the wired-AND nature of the SMBCLK line. The SMBCLK line will go low as soon as the master with the shortest high time pulls SMBCLK low. SMBCLK will remain low until the device with the longest SMBCLK low time relinquishes the SMBCLK line. Therefore the SMBCLK high time is determined by device with the shortest high time while the SMBCLK low time is determined by the device with the longest low time.

Figure 23-3 Clock synchronization

23.3 SB-TSI

The combined-format repeated start sequence is not supported in standard-mode and fast-mode.

- ◆ Only 7-bit SMBus addresses are supported.
- ◆ SB-TSI implements the Send/Receive Byte and Read/Write Byte protocols.
- ◆ SB-TSI registers can only be written using a write byte command.
- ◆ Address Resolution Protocol (ARP) is not implemented.
- ◆ Packet Error Checking (PEC) is not supported.

23.3.1 SB-TSI Address

The SMBus address is really 7 bits. The SB-TSI address is normally 98h or 4Ch. The address could vary with address select bits.

Table 23-1 SB-TSI Address Encoding

Address Select Bits	SB-TSI Address
000b	98h
001b	9Ah
010b	9Ch
011b	9Eh
100b	90h
101b	92h
110b	94h
111b	96h

23.4 PCH

The PCH provide system thermal data to EC. The EC can manage the fans and other cooling elements based on this data. A subset of the thermal collection is that the PCH can be programmed to alert the EC when a device has gone outside of its temperature limits.

23.4.1 Command Summary

Table 23-2 PCH Command Summary

Trans-action	Slave Addr.	Data Byte 0 = Command	Data Byte 1 = Byte Count	Data Byte 2	Data Byte 3	Data Byte 4	Data Byte 5	Data Byte 6	Data Byte 7
Write STS Preferences	I2C	0x41	0x6	STS [47:40]	STS [39:32]	STS [31:24]	STS [23:16]	STS [15:8]	STS [7:0]
Write CPU Temp Limits	I2C	0x42	0x6	Lower Limit [15:8]	Lower Limit [7:0]	Upper Limit [15:8]	Upper Limit [15:8]		
Write MCH	I2C	0x43	0x2	Lower	Upper	na	na		

Temp Limits				Limit [7:0]	Limit [7:0]				
Write IBX Temp Limits	I2C	0x44	0x2	Lower Limit [7:0]	Upper Limit [7:0]	na	na		
Write DIMM Temp Limits	I2C	0x45	0x2	Lower Limit [7:0]	Upper Limit [7:0]	na	na		
Write MPC CPU Power Clamp	I2C	0x50	0x2	Lower Limit [7:0]	Power Clamp [7:0]				
Block Read	Block Read Address	0x40	Block Read Address	Byte Count	Data 0	Data N	PEC (optional)

23.5.6 Manual Mode interface

The SMBus host supports Block/Word/Byte Write and Block/Word/Byte read with PEC. The SMBus host can use the interface to access the smbus slave. The timing diagrams below illustrate how to use the smbus interface to write the data or read the data to the smbus slave.

Figure 23-9 Manual Mode Programming Flow

23.6 Register Type Abbreviations

The following abbreviations are used to indicate the Register Type:

- ◆ R/W = Read/Write.
- ◆ R = Read from register.
- ◆ W = Write.
- ◆ RO = Read-only.

To program the SMBus master configuration registers, the following configuration procedures must be followed in sequence:

- (1). Enter the Extended Function Mode.
- (2). Configure the configuration registers.

23.6.1 Enter the Extended Function Mode

To place the chip into the Extended Function Mode, two successive writes of 0x26 must be applied to Extended Function Enable Registers (EFERs, i.e. 2Eh or 4Eh).

23.6.2 Configure the Configuration Registers

The chip selects the Logical Device and activates the desired Logical Devices through Extended Function Index Register (EFIR) and Extended Function Data Register (EFDR). The EFIR is located at the same address as the EFER, and the EFDR is located at address (EFIR+1).

First, write the Logical Device Number (i.e. 0x07) to the EFIR and then write the number of the desired Logical Device to the EFDR. If accessing the Chip (Global) Control Registers, this step is not required.

Secondly, write the address of the desired configuration register within the Logical Device to the EFIR and then write (or read) the desired configuration register through the EFDR.

23.7 SMBus Master Register Set

23.7.1 SMBus Register Map

SMBus Master base address in register Logic Device B CR62h(MSB), CR63h(LSB).

Table 23-3 SMBus Master Bank 0 Registers

Offset	Type	Name	Section
0	R/W	SMBus Data	23.7.2
1	R/W	SMBus Write Data Size	23.7.3
2	R/W	SMBus Command	23.7.4
3	R/W	SMBus Index	23.7.5
4	R/W	SMBus Control	23.7.6
5	R/W	SMBus Address	23.7.7
6	R/W	SMBCLK Frequency	23.7.8
7	RO	Reserved	--
8	R/W	PCH Address	23.7.9
9	R/W	Error status	23.7.10
A	R/W	Reserved	--
B	R/W	PCH Command	23.7.11
D	R/W	TSI Agent Enable	23.7.12
E	R/W	SMBus Control 3 Register	23.7.13
F	R/W	SMBus Control 3 Register	23.7.14
10	R/W	BYTE_ADDR	23.7.15
11	R/W	BYTE Index High Byte	23.7.16
12	R/W	BYTE Index Low Byte	23.7.17
13	R/W	Reserved	
14	R/W	Reserved	

23.7.2 SMBus Data (SMDATA) – Bank 0

This 32 bits register is the data in and out register of SMBus data register. Before writing to SMDATA register, this register contains the input data, after writing to SMDATA register, this register contains the output data.

Offset: 0h

Type: R/W

Byte	3	2	1	0
Name	SMFIFO3	SMFIFO2	SMFIFO1	SMFIFO0
Default	00h	00h	00h	00h

Byte	Description
3	SMFIFO3 (SMBus FIFO 3). This byte represents the high byte of the 32 bits SMBus data.
2	SMFIFO2 (SMBus FIFO 2). This byte represents the second byte of the 32 bits SMBus data.
1	SMFIFO1 (SMBus FIFO 1). This byte represents the first byte of the 32 bits SMBus data.
0	SMFIFO0 (SMBus FIFO 0). This byte represents the low byte of the 32 bits SMBus data.

23.7.3 SMBus Write Data Size (SMWRSIZE) – Bank 0

Offset: 1h

Type: R/W

Bit	7	6	5	4	3	2	1	0
Name	Reserved				SMWRSIZE			
Default	0	0	0	0	0	0	0	0

Bit	Description
7-5	Reserved.
4-0	SMWRSIZE (SMBus Write Byte Counter). This field sets the write byte counter, the max counter size is 32 bytes, and the minimal size is 1 bytes.

23.7.4 SMBus Command (SMCMD) – Bank 0

Offset: 2h

Type: R/W

Bit	7	6	5	4	3	2	1	0
NAME	REV				SMBus CMD			
Default	0	0	0	0	0	0	0	0

Bit	Description
7-4	Reserved.

3-0	SMBCMD (SMBus Command). This field sets SMBus Command: 0000 : Read Byte (Default) 0001 : Read Word 0010 : Read Block 0011 : Block Write and Read Process Call 0100 : Process Call 1000 : Write Byte 1001 : Write Word 1010 : Write Block
-----	--

23.7.5 SMBus INDEX (SMIDX) – Bank 0

Offset: 3h

Type: R/W

Bit	7	6	5	4	3	2	1	0
Name	SMCMD							
Default	0	0	0	0	0	0	0	0

Bit	Description
7-0	SMIDX (SMBus INDEX). This field represents the index data of the SMBus.

23.7.6 SMBus Control (SMCTL) – Bank 0

Offset: 4h

Type: R/W

Bit	7	6	5	4	3	2	1	0
Name	MMODE_S	S_RST	CRC8_EN	REFLASH_CLK			BYTE_EN	PCH_EN
Default	0	0	0	0	0	0	0	0

Bit	Description
7	MMODE_S (Manual Mode Set). 0 : Disable. 1 : Enable.
6	S_RST (Soft Reset SMBus). 0 : Disable. 1 : Enable.
5	CRC8_EN (CRC8 Enable). 0 : CRC8 function is disable. 1 : CRC8 function is enable.

4-2	REFRASH_CLK (Refrash Clock Select). 000, 100 – 128ms 001, 101 – 256ms 010, 110 – 512ms 011, 111 – 64ms (1KHz)
1	BYTE_EN (BYTE Enable). 0 : BYTE function is disable. 1 : BYTE function is enable.
0	PCH_EN (PCH Enable). 0 : PCH function is disable. 1 : PCH function is enable.

23.7.7 SMBus Address (SMADDR) – Bank 0

Offset: 5h

Type: R/W

Bit	7	6	5	4	3	2	1	0
Name	SMADDR							REV
Default	0	0	0	0	0	0	0	0

Bit	Description
7-1	SMADDR (SMBus Address). AMD-TSI only supports 7-bit SMBus address.
0	Reserved: 0 : Write. If the protocol is write, the WR_SIZE can't be zero. (Default)

23.7.8 SCL_FREQ (SCLFREQ) – Bank 0

Offset: 6h

Type: R/W

Bit	7	6	5	4	3	2	1	0
	Reserved:				SCLFREQ			
Default	0	0	0	0	0	1	1	1

Bit	Description
7-4	Reserved

3-0	SCLFQ (SMBCLK Frequency). This field defines the SMBCLK period (low time and high time). The clock low time and high time are defined as follows: 0000 : 365KHz 0001 : 261KHz 0010 : 200KHz 0011 : 162KHz 0100 : 136KHz 0101 : 117KHz 0110 : 103KHz 0111 : 92KHz (Default) 1000 : 83KHz 1001 : 76KHz 1010 : 71KHz 1011 : 65KHz 1100 : 61KHz 1101 : 57KHz 1110 : 53KHz 1111 : 47KHz
-----	---

23.7.9 PCH Address (PCHADDR) – Bank 0

Offset: 8h

Type: R/W

Bit	7	6	5	4	3	2	1	0
Name	PCHADDR							REV
Default	1	0	0	1	0	1	0	0

Bit	Description
7-1	PCHADDR (PCH Address). PCH supports 8-bit SMBus address. The default address is 94h. The last bit is read or write bit. It needs to set to "0".

23.7.10 SMBus Error Status (Error_status) – Bank 0

Offset: 9h

Type: RO/W1C

Bit	7	6	5	4	3	2	1	0
Name	REV		ADNACK	Timeout	Reserved	BER	NACK	Reserve
Default	1	0	0	1	0	1	0	0

Bit	Description
7-6	Reserved.
5	ADDR Non ACK. This bit reflects SMBus occurred ADDRESS NON ACK in Manual mode..
4	Timeout. This bit reflects when SMBus occurs timeout.

3	Reserved.
2	BER (Bus Error). This bit reflects when a start or stop condition is detected during data transfer, or when an arbitration problem is detected.
1	NACK (Negative acknowledge). This bit is set by hardware when a transmission is not acknowledged on the ninth clock. While NACK is set SCL will be drive low and subsequent bus transactions are stalled until NACK is cleared.
0	Reserved.

23.7.11PCH Command (PCHCMD) – Bank 0

Offset: Bh

Type: R/W

Bit	7	6	5	4	3	2	1	0
Name	PCHCMD							
Default	0	1	0	0	0	0	0	0

Bit	Description
7-0	PCHCMD (PCH Command). This field represents the command data of the PCH. The default command is block read (40h).

23.7.12TSI Agent Enable Register (TSI_AGENT) – Bank

Offset: Dh

Type: RO

Bit	7	6	5	4	3	2	1	0
Name	AG7	AG6	AG5	AG4	AG3	AG2	AG1	AG0
Default	0	0	0	0	0	0	0	0

Bit	Description
7	TSI_AGENT7 Enable. : This bit reflects AMD-TSI Agent enable. 0: Disable 1: Enable
6	TSI_AGENT6 Enable. : This bit reflects AMD-TSI Agent enable. 0: Disable 1: Enable
5	TSI_AGENT5 Enable. : This bit reflects AMD-TSI Agent enable. 0: Disable 1: Enable
4	TSI_AGENT4 Enable. : This bit reflects AMD-TSI Agent enable. 0: Disable 1: Enable

3	TSI AGENT3 Enable. : This bit reflects AMD-TSI Agent enable. 0: Disable 1: Enable
2	TSI AGENT2 Enable. : This bit reflects AMD-TSI Agent enable. 0: Disable 1: Enable
1	TSI AGENT1 Enable. : This bit reflects AMD-TSI Agent enable. 0: Disable 1: Enable
0	TSI AGENT0 Enable. : This bit reflects AMD-TSI Agent enable. 0: Disable 1: Enable

23.7.13 SMBus Control 3 Register (SMCTL3) – Bank 0

Offset: Eh

Type: RO

Bit	7	6	5	4	3	2	1	0
Name	Reserved				CRC_CHK	M_MODE	F_FULL	F_EMPTY
Default	0	0	0	0	0	0	0	0

Bit	Description
7-4	Reserved
3	CRC_CHK (CRC Check). 0 : incorrect 1 : correct
2	M_MODE (Manual Mode). 0 : Non-active 1 : Active
1	F_FULL (fifo_full). : This bit reflects SMBus data fifo is full. 0 : Non-full 1 : Full
0	F_EMPTY (fifo empty). : This bit reflects the SMBus data fifo is empty. 0 : Non-empty 1 : Empty

23.7.14 SMBus Control 2 Register (SMCTL2) – Bank 0

Offset: Fh

Type: R/W

Bit	7	6	5	4	3	2	1	0
Name	Reserved		INT_LCH_E	Reserved		BYTE_SEL	BANKSEL	
Default	0	0	0	0	0	0	0	0

Bit	Description
7-6	Reserved.
5	INT_LCH_E (Interrupt Latch Enable). : This bit will latch the I2CSTA register. 0 : Disable. 1 : Enable.
2	BYTE_SEL :This field represents byte polling 8-bit/16bit select bits. 0: BYTE_TEMP is 16 bit data 1: BYTE_TEMP is 8 bit data
1-0	BANKSEL (Bank Select). 00 – Bank 0. 01 – Bank 1. 10 – Bank 2.

23.7.15 BYTE ADDRESS (BYTE ADDR) – Bank 0

Offset: 10h

Type: R/W

Bit	7	6	5	4	3	2	1	0
Name	BYTE_ADDRESS							
Default	0	1	0	0	0	0	0	0

Bit	Description
7-0	BYTE ADDRESS (BYTE ADDR). This field represents the address data of the BYTE.

23.7.16 BYTE INDEX_H (BYTE_IDX_H) – Bank 0

Offset: 11h

Type: R/W

Bit	7	6	5	4	3	2	1	0
Name	BYTE_IDX_H							
Default	0	0	0	0	0	0	0	1

Bit	Description
7-0	BYTE_IDX_H (High BYTE INDEX). This field represents the high byte index of the Byte polling. The default command is byte read (01h).

23.7.17 BYTE INDEX_L (BYTE_IDX_L) – Bank 0

Offset: 12h

Type: R/W

Bit	7	6	5	4	3	2	1	0
Name	BYTE_IDX_L							
Default	0	0	0	1	0	0	0	0

Bit	Description
7-0	BYTE_IDX_L (LOW BYTE INDEX). This field represents the low byte index of the Byte polling. The default command is byte read (10h).

The EC may read thermal information from IBX using the SMBus block read command. The IBX doesn't support byte-read or word-read SMBus commands. The read use a different address that the writes. The address must be different so that the IBX knows which target is intended, either the I2C target or the block read buffer.

The IBX and EC are set up by BIOS with the length of the read that is supported by the platform. The EC must always do reads of the lengths set up by BIOS. There is no way to change the length of the read after BIOS has set things up.

An EC that only wants the single highest temperature among MCH, and CPU could read one byte. A 2 byte read would provide both IBX and CPU/MCH package temperature. An EC that wanted each components temperature would do a 4 byte read. An EC that also wanted DIMM information would read 9 bytes. If an EC wanted to read the HOST STS status, it must read 19 bytes. An EC can also read the energy data provided by the CPU by reading 12 bytes.

24. CONFIGURATION REGISTER

24.1 Chip (Global) Control Register

Default Value of Global Control Register:

Register	Default	Register	Default	Register	Default
CR 10h	FFh	CR 21h	3Xh (ID_L)	CR 2Bh	00h
CR 11h	FFh	CR 22h	FFh	CR 2Ch	81h
CR 13h	00h	CR 24h	64h	CR 2Dh	00h
CR 14h	00h	CR 25h	00h	CR 2Fh	00ssssssb
CR 1Ah	F0h	CR 26h	0s000000b		
CR 1Bh	78h	CR 27h	00h		
CR 1Ch	00h	CR 28h	00h		
CR 20h	C3h (ID_H)	CR 2Ah	C0h		

Note. The value of “s” means hardware strapping result: strapping high will report 1; strapping low will report 0.

In addition, BIOS can write the value of strapping result after hardware strapping.

Note. The CR21h is low-byte of the Chip-ID; the “X” means IC version. EX. 31=A version, 32=B version, 33=C version.

Reserved Registers of Global Control Register:

Register	Default	Register	Default
CR 02h	00h	CR 1Dh	00h
CR 16h	FFh	CR 1Eh	FFh
CR 17h	FFh	CR 1Fh	FFh
CR 18h	FFh	CR 23h	00h
CR 19h	FFh	CR 2Eh	00h

Note. All reserved registers must keep default value.

Note. Before accessing CR10, CR11, CR13 and CR14, CR26 [Bit4] must be set to logic 1.

CR 02h. Reserved.Software Reset Register

Attribute: Write Only

Power Well: VCC

Reset by: LRESET#

Default : 00h

CR 07h. Logical Device Selection

Attribute: Read/Write

Power Well: VCC

Reset by: LRESET#

Default : 00h

BIT	READ / WRITE	DESCRIPTION
7-0	R / W	Logical Device Number.

CR 10h. Device IRQ TYPE Selection

Attribute: Read/Write

Power Well: VCC

Reset by: LRESET#

Default : FFh

BIT	READ / WRITE	DESCRIPTION
7	R / W	FDC IRQ TYPE SELECT (note1.) 0: Edge. 1: Level.
6	R / W	PRT IRQ TYPE SELECT (note1.) 0: Edge. 1: Level.

CR F5h. Watchdog Timer I(WDT1) and KBC P20 Control Mode Register

Attribute: Read/Write

Power Well: VCC

Reset by: LRESET# or PWROK(see LDA E7[3])

Default : 00h

BIT	READ / WRITE	DESCRIPTION
7-5	Reserved.	
4	R / W	Watchdog Timer I count mode is 1000 times faster. 0: Disable. 1: Enable. (If bit-3 is 0, the count mode is 1/1000 seconds mode.) (If bit-3 is 1, the count mode is 1/1000 minutes mode.)
3	R / W	Select Watchdog Timer I count mode. 0: Second Mode. 1: Minute Mode.
2	R / W	Enable the rising edge of a KBC reset (P20) to issue a time-out event. 0: Disable. 1: Enable.
1	R / W	Disable / Enable the Watchdog Timer I output low pulse to the KBRST# pin (PIN28) 0: Disable. 1: Enable.
0	Reversed	

CR F6h. Watchdog Timer I(WDT1) Counter Register

Attribute: Read/Write

Power Well: VCC

Reset by: LRESET# or PWROK(see LDA E7[3])

Default : 00h

BIT	READ / WRITE	DESCRIPTION
7-0	R / W	Watch Dog Timer I Time-out value. Writing a non-zero value to this register causes the counter to load the value into the Watch Dog Counter and start counting down. If CR F7h, bits 7 and 6 are set, any Mouse Interrupt or Keyboard Interrupt event causes the previously-loaded, non-zero value to be reloaded to the Watch Dog Counter and the count down resumes. Reading this register returns the current value in the Watch Dog Counter, not the Watch Dog Timer Time-out value. 00h: Time-out Disable 01h: Time-out occurs after 5.03×10^7 CLKIN cycle time, by analogy. ($5.03 \times 10^7 \times (1/48\text{MHz}) = 1.046\text{s}$)

CR F7h. Watchdog Timer I(WDT1) Control & Status Register

Attribute: Read/Write

Power Well: VCC

Reset by: LRESET# or PWROK(see LDA E7[3])

Default : 00h

BIT	READ / WRITE	DESCRIPTION
7	R / W	Mouse interrupt reset enables watch-dog timer reload 0: Watchdog Timer I is not affected by mouse interrupt. 1: Watchdog Timer I is reset by mouse interrupt.
6	R / W	Keyboard interrupt reset enables watch-dog timer reload 0: Watchdog Timer I is not affected by keyboard interrupt. 1: Watchdog Timer I is reset by keyboard interrupt.
5	Write "1" Only	Trigger Watchdog Timer I event. This bit is self-clearing.
4	R / W Write "0" Clear	Watchdog Timer I status bit 0: Watchdog Timer I is running. 1: Watchdog Timer I issues time-out event.
3-0	R / W	These bits select the IRQ resource for the Watchdog Timer I

CR F0h. GPIO4 I/O Register

Attribute: Read/Write

Power Well: VSB

Reset by: GP4X_MRST

Default : FFh

BIT	READ / WRITE	DESCRIPTION
7-0	R / W	GPIO4 I/O register 0: The respective GPIO4 PIN is programmed as an output port 1: The respective GPIO4 PIN is programmed as an input port.

CR F1h. GPIO4 Data Register

Attribute: Read/Write

Power Well: VSB

Reset by: GP4X_MRST

Default : 00h

BIT	READ / WRITE	DESCRIPTION
7-0	R / W	GPIO4 Data register For output ports, the respective bits can be read and written by the pins.
	Read Only	For Input ports, the respective bits can only be read by the pins. Write accesses are ignored.

CR F2h. GPIO4 Inversion Register

Attribute: Read/Write

Power Well: VSB

Reset by: GP4X_MRST

Default : 00h

BIT	READ / WRITE	DESCRIPTION
7-0	R / W	GPIO4 Inversion register 0: The respective bit and the port value are the same. 1: The respective bit and the port value are inverted. (Applies to both input and output ports)

CR E8h. GPIO4 Status Register

Attribute: Read Only

Power Well: VSB

Reset by: GP4X_MRST

Default : 00h

BIT	READ / WRITE	DESCRIPTION
7-0	Read Only Read-Clear	GPIO4 Event Status Bit 7-0 corresponds to GP47-GP40, respectively. 0 : No active edge (rising/falling) has been detected 1 : An active edge (rising/falling) has been detected Read the status bit clears it to 0.

CR EEh. GPIO4 Multi-function Select Register

Attribute: Read/Write

Power Well: VSB

Reset by: GP4X_MRST

Default : 00h

BIT	READ / WRITE	DESCRIPTION
7	R / W	0: GPIO47 1: GPIO47 → YLW (Please also set this GPIO to “output” type.)
6	R / W	0: GPIO46 1: GPIO46 → BEEP (Please also set this GPIO to “output” type.)
5	R / W	0: GPIO45 1: GPIO45 → SMI (Please also set this GPIO to “output” type.)
4	R / W	0: GPIO44 1: GPIO44 → WDTO (Please also set this GPIO to “output” type.)
3	R / W	0: GPIO43 1: GPIO43 → YLW (Please also set this GPIO to “output” type.)
2	R / W	0: GPIO42 1: GPIO42 → BEEP (Please also set this GPIO to “output” type.)
1	R / W	0: GPIO41 1: GPIO41 → SMI (Please also set this GPIO to “output” type.)
0	R / W	0: GPIO40 1: GPIO40 → WDTO (Please also set this GPIO to “output” type.)

CR E1h. KBC Wake-Up Index Register

Attribute: Read/Write

Power Well: VSB

Reset by: RSMRST#

Default : 00h

BIT	READ / WRITE	DESCRIPTION
7-0	R / W	Keyboard wake-up index register. This is the index register of CRE2, which is the access window for the keyboard's pre-determined key key-combination characters. The first set of wake-up keys is in of 0x00 – 0x0E, the second set 0x30 – 0x3E, and the third set 0x40 – 0x4E. Incoming key combinations can be read through 0x10 – 0x1E.

CR E2h. KBC Wake-Up Data Register

Attribute: Read/Write

Power Well: VSB

Reset by: RSMRST#

Default : 00h

BIT	READ / WRITE	DESCRIPTION
7-0	R / W	Keyboard wake-up data register. This is the data register for the keyboard's pre-determined key-combination characters, which is indexed by CRE1.

CR E3h. Event Status Register

Attribute: Read Only

Power Well: VRTC

Reset by: Battery reset

Default : 00h

BIT	READ / WRITE	DESCRIPTION
7-5	Reserved.	
4	Read Only Read-Clear	This status flag indicates VSB power off/on.
3	Read Only Read-Clear	Thermal shutdown status. 0: No thermal shutdown event issued. 1: Thermal shutdown event issued.
2	Read Only Read-Clear	PSIN_STS 0: No PSIN event issued. 1: PSIN event issued.
1	Read Only Read-Clear	MSWAKEUP_STS => The bit is latched by the mouse wake-up event. 0: No mouse wake-up event issued. 1: Mouse wake-up event issued.
0	Read Only Read-Clear	KBWAKEUP_STS => The bit is latched by the keyboard wake-up event. 0: No keyboard wake-up event issued. 1: Keyboard wake-up event issued.

CR E4h.

Attribute: Read/Write

Power Well: VRTC

Reset by: [Battery reset](#), [PWROK\(Bit4\)](#), [LRESET#\(Bit3-2\)](#)

Default : 00h

BIT	READ / WRITE	DESCRIPTION
7	Reserved	
6-5	R / W	Power-loss control ^{Note} (These two bits will determine the system turn on or off after AC resume, from G3 to S5 state.) Bits 6 5 0 0: Always turn off. 0 1: Always turn on. (PSON# will active when S3# is high.) 1 0: Pre-state. (System turns On or Off which depends on the state before the power loss. Please check the definition of the pre-state is "ON" or "OFF" in chapter 26.2.) 1 1: User defined mode for power loss last-state. (The last-state flag is located on "CRE6h, bit4.")
4	R / W	3VSBSW# enable bit 0: Disable. 1: Enable.
3	R / W	Keyboard wake-up options. 0: Password or sequence hot keys programmed in the registers. 1: Any key.
2	R / W	Enable the hunting mode for wake-up events set in CRE0. This bit is cleared when any wake-up event is captured. (Note. This bit is use for KB and MS to generate PSOUT# while VCC valid, for example, wake-up from S1 to S0 via PSOUT#.) 0: Disable.(Default) 1: Enable.
1-0	Reserved.	

Note. Whether "Always turn on", "Pre-state" or "User defined mode", the PSON#'s active condition for system to turn-on is S3# goes high. For south-bridge which S3# default is low while AC resume, please refer "CRE7h, bit4" to achieve the power-loss control application.

BIT	READ / WRITE	DESCRIPTION
7-4	R / W	Deep S3_YLW_BLK_FREQ bits (This function affects by LDB CRF9 Bit 7) 0000: High-Z. (The output type of YLW_LED is open-drain.) (Default) 0001: YLW_LED outputs 0.0625Hz. 0010: YLW_LED outputs 0.125Hz. 0011: YLW_LED outputs 0.25Hz. 0100: YLW_LED outputs 0.5Hz 0101: YLW_LED outputs 1Hz. 0110: YLW_LED outputs 2Hz. 0111: YLW_LED outputs low. 1XXX: Fading LED.
3-0	R / W	Deep S3_GRN_BLK_FREQ bits (This function affects by LDB CRF9 Bit 6) 0000: High-Z. (The output type of YLW_LED is open-drain.) (Default) 0001: GRN_LED outputs 0.0625Hz. 0010: GRN_LED outputs 0.125Hz. 0011: GRN_LED outputs 0.25Hz. 0100: GRN_LED outputs 0.5Hz 0101: GRN_LED outputs 1Hz. 0110: GRN_LED outputs 2Hz. 0111: GRN_LED outputs low. 1XXX: Fading LED.

CR F5h. SMBus de-bouncer Register

Attribute: Read/Write

Power Well: VSB

Reset by: RSMRST#

Default : 10h

BIT	READ / WRITE	DESCRIPTION
7-2	Reserved.	
1	R / W	1: Enable SCL input de-bouncer 160ns. 0: Disable SCL input de-bouncer.
0	R / W	1: Enable SDA input de-bouncer 160ns. 0: Disable SDA input de-bouncer.

CR F6h. Deep S5 Front Panel Green & Yellow LED control register

Attribute: Read/Write

Power Well: VRTC

Reset by: Battery reset

Default : 00h

BIT	READ / WRITE	DESCRIPTION
7-4	R / W	Deep S5_YLW_BLK_FREQ bits (This function affects by LDB CRF9 Bit 5) 0000: High-Z. (The output type of YLW_LED is open-drain.) (Default) 0001: YLW_LED outputs 0.0625Hz. 0010: YLW_LED outputs 0.125Hz. 0011: YLW_LED outputs 0.25Hz. 0100: YLW_LED outputs 0.5Hz 0101: YLW_LED outputs 1Hz. 0110: YLW_LED outputs 2Hz. 0111: YLW_LED outputs low. 1XXX: Fading LED.
3-0	R / W	Deep S5_GRN_BLK_FREQ bits (This function affects by LDB CRF9 Bit 4) 0000: High-Z. (The output type of YLW_LED is open-drain.) (Default) 0001: GRN_LED outputs 0.0625Hz. 0010: GRN_LED outputs 0.125Hz. 0011: GRN_LED outputs 0.25Hz. 0100: GRN_LED outputs 0.5Hz 0101: GRN_LED outputs 1Hz. 0110: GRN_LED outputs 2Hz. 0111: GRN_LED outputs low. 1XXX: Fading LED.

CR F7h. Front Panel Green LED (GRN_LED) control register

Attribute: Read/Write

Power Well: VRTC

Reset by: Battery reset

Default : 87h

BIT	READ / WRITE	DESCRIPTION
-----	--------------	-------------

BIT	READ / WRITE	DESCRIPTION
7	R / W	AUTO_EN (Powered by VSB, RSMRST# reset , default = 1) 0: GRN_LED and YLW_LED are controlled by GRN_LED_RST, GRN_BLK_FREQ and YLW_LED_RST, YLW_BLK_FREQ bits. 1: GRN_LED and YLW_LED are controlled by "SLP_S5#" and "SLP_S3#".
6	R / W	GRN_LED_RST# (Default= 0) 0: GRN_BLK_FREQ will be set to "0000" (High-Z) when into S3~S5 state. 1: GRN_BLK_FREQ will be kept when into S3~S5 state.
5	R / W	GRN_LED_POL 0: GRN_LED output is active low. (Default) 1: GRN_LED output is active high.
4	Reserved.	
3-0	R / W	GRN_BLK_FREQ bits (The reset depends on bit6, GRN_LED_RST#) 0000: High-Z. (The output type of YLW_LED is open-drain.) 0001: GRN_LED outputs 0.0625Hz. 0010: GRN_LED outputs 0.125Hz. 0011: GRN_LED outputs 0.25Hz. 0100: GRN_LED outputs 0.5Hz 0101: GRN_LED outputs 1Hz. 0110: GRN_LED outputs 2Hz. 0111: GRN_LED outputs low. (Default) 1XXX: Fading LED.

CR F8h. Front Panel Yellow LED (YLW_LED) control register

Attribute: Read/Write

Power Well: VRTC

Reset by: Battery reset

Default : 47h

BIT	READ / WRITE	DESCRIPTION
7	Reserved.	
6	R / W	YLW_LED_RST# (Default =1) 0: YLW_BLK_FREQ will be set to "0000" (High-Z) when into S3~S5 state. 1: YLW_BLK_FREQ will be kept when into S3~S5 state.
5	R / W	YLW_LED_POL 0: YLW_LED output is active low. (Default) 1: YLW_LED output is active high.
4	Reserved.	

BIT	READ / WRITE	DESCRIPTION
3-0	R / W	YLW_BLK_FREQ bits (The reset depends on bit6,YLW_LED_RST#) 0000: High-Z. (The output type of YLW_LED is open-drain.) 0001: YLW_LED outputs 0.0625Hz. 0010: YLW_LED outputs 0.125Hz. 0011: YLW_LED outputs 0.25Hz. 0100: YLW_LED outputs 0.5Hz 0101: YLW_LED outputs 1Hz. 0110: YLW_LED outputs 2Hz. 0111: YLW_LED outputs low. (Default) 1XXX: Fading LED.

CR F9h. Deep Sleep LED Enable register

Attribute: Read/Write

Power Well: VRTC

Reset by: Battery reset

Default : 00h

BIT	READ / WRITE	DESCRIPTION
7	R / W	Deep S3_YLW_BLK_FREQ : 0: Depend on setting of CRF2h, bit7~4. 1: Always output high.
6	R / W	Deep S3_GRN_BLK_FREQ : 0: Depend on setting of CRF2h, bit3~0. 1: Always output high.
5	R / W	Deep S5_YLW_BLK_FREQ : 0: Depend on setting of CRF6h, bit7~4. 1: Always output high.
4	R / W	Deep S5_GRN_BLK_FREQ : 0: Depend on setting of CRF2h, bit3~0. 1: Always output high.
3-0	Reserved.

Output High Voltage	V _{OH}	0.75*V _{tt}			V	
Hysteresis	V _{Hys}	0.1*V _{tt}			V	
O12cu – Output pin 12mA source-sink capability with controllable pull-up						
Output Low Voltage	VOL			0.4	V	IOL = 12 mA
Output High Voltage	VOH	2.4			V	IOH = -12 mA
OD12cu – Open-drain 12mA sink capability output pin with controllable pull-up						
Output Low Voltage	VOL			0.4	V	IOL = 12 mA

26. AC CHARACTERISTICS

26.1 Power On / Off Timing

	T1	T2	T3	T4
IDEAL TIMING	64ms	Over 64ms at least	< 10ns	32ms

26.2 AC Power Failure Resume Timing

(1) Logical Device A, CR [E4h] bits [6:5] =00 means “OFF” state
 (“OFF” means the system is always turned off after the AC power loss recovered.)

(2) Logical Device A, CR [E4h] bits [6:5]=01 means "ON" state.
 ("ON" means the system is always turned on after AC power loss recovered.)

** What's the definition of former state at AC power failure?

1) The previous state is "ON"

VCC falls to 2.6V and SLP_S3# keeps at VIH 2.0V

2) The previous state is "OFF"

VCC fall to 2.6V and SLP_S3# keeps at VIL 0.8V

To ensure that VCC does not fall faster than VSB in various ATX Power Supplies, the NCT6776F / NCT6776D adds the option of "user define mode" for the pre-defined state before AC power failure. BIOS can set the pre-defined state for the system to be "On" or "Off". According to this setting, the system chooses the state after the AC power recovery.

Please refer to the descriptions of bit 6~5 of CR E4h and bit 4 of CR E6h in Logical Device A.

CR E4h

BIT	READ/WRITE	DESCRIPTION
6~5	R / W	Power-loss control bits => (VBAT) 0 0: System always turns off when it returns from power-loss state. 0 1: System always turns on when it returns from power-loss state. 1 0: System turns off / on when it returns from power-loss state depending on the state before the power loss. 1 1: User defines the resuming state before power loss.(refer to Logic Device A, CRE6[4])

CR E6h

BIT	READ/WRITE	DESCRIPTION
4	R / W	Power loss Last State Flag. (VBAT) 0: ON 1: OFF

26.3 Clock Input Timing

PARAMETER	48MHZ / 24MHZ		UNIT
	MIN	MAX	
Cycle to cycle jitter		300/500	ps
Duty cycle	45	55	%

PARAMETER	DESCRIPTION	48MHZ / 24MHZ			UNIT
		MIN	TYP	MAX	
t1	Clock cycle time		20.8 / 41.7		ns
t2	Clock high time/low time	9 / 19	10 / 21		ns
t3	Clock rising time/falling time (0.4V~2.4V)			3	ns

26.4 PECI Timing

SYMBOL		MIN	TYP	MAX	UNITS
t_{BIT}	Client	0.495		500	μs
	Originator	0.495		250	
t_{H1}		0.6	3/4	0.8	$\times t_{BIT}$
t_{H0}		0.2	1/4	0.4	$\times t_{BIT}$

26.5 SMBus Timing

26.6 Floppy Disk Drive Timing

FDC: Data rate = 1MB, 500KB, 300KB, 250KB/sec.

PARAMETER	SYM.	MIN.	TYP. (NOTE 1)	MAX.	UNIT
DIR# setup time to STEP#	TDST	1.0/1.6 /2.0/4.0			μS
DIR# hold time from STEP#	TSTD	24/40 /48/96			μS
STEP# pulse width	TSTP	6.8/11.5 /13.8/27.8	7/11.7 /14/28	7.2/11.9 /14.2/28.2	μS
STEP# cycle width	TSC	NOTE 2	NOTE 2	NOTE 2	mS
INDEX# pulse width	TIDX	125/250 /417/500			nS
RDATA# pulse width	TRD	40			nS
WD# pulse width	TWD	100/185 /225/475	125/210 /250/500	150/235 /275/525	nS

Notes:

- Typical values for T = 25°C and normal supply voltage.
- Programmable from 0.5 mS through 32 mS as described in step rate table.
(Please refer to the description of the SPECIFY command set.)

Step Rate Table

DATA RATE SRT	1MB/S	500KB/S	300KB/S	250KB/S
------------------	-------	---------	---------	---------

0	8	16	26.7	32
1	7.5	15	25	30
...	...	...	...	...
E	1.0	2	3.33	4
F	0.5	1	1.67	2

NCT6776D, 128-pin LQFP (14mm x 14mm x 1.4mm)

30. REVISION HISTORY

VE RSI ON	DATE	PAGE	DESCRIPTION
0.1	03/16/2010	N.A.	Draft datasheet to define features and pin configuration
0.6	05/26/2010	N.A.	Preliminary datasheet
0.7	07/23/2010	P.305, P.265, P.388, P.264, P.271, P.382, P.33, P.34, P.364, P.39, P.41, P.94, P.92, P.96, P.179, P.180, P.180	1. Update Chip ID at global control register CR 21h. from 31h to 32h 2. Add GPIO group programming table 3. Modify Logical Device F, CRE0~CRE9 default value 4. Modify watchdog1 & watchdog2 description 5. Add watchdog access channel description 6. Modify of SVID0 offset register bit description 7. Modify BKFD_CUT and LATCH_BKFD_CUT waveform 8. Add 3VSBSW# waveform 9. Modify Logical Device A, CRE4 bit6:5 description 10. Modify S0-S5 LED Blink Block Diagram 11. Modify Deeper Sleeping state detection Block Diagram 12. Modify Hardware Monitor, Bank0 Index46h bit1 description 13. Modify Hardware Monitor, Bank0 Index42h description 14. Modify Hardware Monitor, Bank0 Index4Eh description 15. Modify Logical Device B, Bank7 Index01h description 16. Modify Logical Device B, Bank7 Index03h description 17. Modify Logical Device B, Bank7 Index04h description
0.8	09/23/2010	N.A.	Update the contents

1.0	03/01/2011	1. P7 2. P36 3. P82 4. P92 5. P94 6. P100 7. P102 8. P103~105 9. P108 10. P115 11. P120 12. P127 13. P132 14. P139 15. P180 16. P188 17. P222 18. P257 19. P266 20. P301~385 21. P304 22. P320 23. P332 24. P365 25. P367 26. P369 27. P373~376 28. P381 29. P389 30. P392	1. Pin103 rename to VIN2. Pin73 rename to BKFD_CUT 2. Update PWROK block diagram. 3. Update Table 8-8 OVT# function. 4. Update Bank0, Index40h, bit4~6. 5. Update Bank0, Index43h and 44h. 6. Reserved Bank0, Index 65h and 66h, 7. Add Bank0, Index AEh, PECl temperature reading enable register. 8. Add Beep control registers (Bank0, Index B2h~B5h). 9. Rename Bank1, Index 07h register. 10. Reserved Bank1, Index 3Fh, 41h, 45h and 46h. 11. Rename Bank2, Index 07h register. 12. Reserved Bank2, Index 3Fh, 41h, 45h and 46h. 13. Rename Bank3, Index 07h register. 14. Reserved Bank2, Index 3Fh, 41h, 45h and 46h. 15. Add Bank7, Index 01~04h default value table. 16. Rename Bank7, Index 20h and 21h register. 17. Update baud rate table 18. Update PME# support item description. 19. Update GPIO wake-up table 20. Update Global registers' reset source 21. Revise Global register CR1Ah,bit6 22. Revise Global register CR2Ah,bit2 23. Revise Logic Device 2, CRF0h,bit1~0 24. Revise Logic Device A, CRE6h,bit0 25. Reserve Logic Device A, CRF2h,bit5 26. Reserve Logic Device A, CRF6h,bit0 27. Update Front Panel LED blinking frequency 28. Revise Logic Device D, CRF0h 29. Reserve Logic Device 16, CR30h,bit2 30. Revise Logic Device 17, CRE5h
1.1	03/24/2011	257	1. Update PME# support item description.
1.2	07/12/2011	N.A.	Add part number NCT6776D

Important Notice

Nuvoton products are not designed, intended, authorized or warranted for use as components in systems or equipment intended for surgical implantation, atomic energy control instruments, airplane or spaceship instruments, transportation instruments, traffic signal instruments, combustion control instruments, or for other applications intended to support or sustain life. Furthermore, Nuvoton products are not intended for applications wherein failure of Nuvoton products could result or lead to a situation wherein personal injury, death or severe property or environmental damage could occur.

Nuvoton customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Nuvoton for any damages resulting from such improper use or sales.

*Please note that all data and specifications are subject to change without notice.
All the trademarks of products and companies mentioned in this datasheet belong to their respective owners.*
