

FEATURES

- ◆ CW operation up to 300 mA from 2.4 to 15 V supply voltage
- ◆ Rapid soft start after power-on typical within 70 μ s
- ◆ Optimised for N-type laser diodes
- ◆ Simple output power adjustment via an external resistor (APC)
- ◆ Power control loop accuracy better than 1.5% with changes in temperature, supply voltage and load current
- ◆ Integrated reverse polarity protection for the iC and laser diode
- ◆ Strong suppression of transients with very small external capacitors; integrated flyback path
- ◆ Permanent shut-down with excessive temperature and overcurrent (i.e. if the laser diode is damaged or the feedback current path fails)
- ◆ Two feedback inputs permit all current LD types to be used (N/P/M configurations)
- ◆ Modulation via the feedback inputs is possible
- ◆ Wide monitor current range from 2.5 μ A to 6.25 mA
- ◆ Pin compatible to iC-WK and iC-WKL (SO8 package)

APPLICATIONS

- ◆ Laser diode modules
- ◆ Laser levels

BLOCK DIAGRAM

DESCRIPTION

iC-WKN is a driver for laser diodes in continuous wave operation with laser currents of up to 300 mA, which requires only four external components. The wide power supply range of up to 15 V allows for operation of blue laser diodes.

The iC includes integrated circuitry protecting against destruction by ESD, excessive temperature and overcurrent plus a soft start of the regulator to protect the laser diode when the power supply is switched on. The iC also filters the laser diode power supply for transients.

The regulator is adapted to the laser diode by an external resistor at MDA. The monitor current acts as a reference and is regulated independent of the influence of temperature and supply voltage (range: 2.5 μ A to 6.25 mA). The capacitor at CI determines the control time constants and start-up time.

A second monitor input, pin MDK, allows the driver to be used for other types of laser diode configuration; alternatively, it can be used as an analogue modulation input (DC to a few kHz).

In the event of failure, such as overcurrent in the laser path due to a lack of feedback, for example, a quick power lockout is activated. The shut-down persists until power is reapplied, permitting a restart. The strain on power packs and batteries is relieved and the laser class is retained even in the event of a disturbance.

iC-WKN offers additional protection by means of spike detection at pin MDA. Should spikes or oscillation occur at pin MDA the power lockout is activated after a certain time-out.

PACKAGING INFORMATION SO8-TP, DFN10 4 mm x 4 mm to JEDEC standard

PIN CONFIGURATION SO8-TP

PIN FUNCTIONS

No. Name Function

1	GND	Ground
2	CI	Capacitance for Power Control
3	AGND	Reference Ground for CI, RM
4	MDK	Monitor Input 2 (MD Cathode, modulation)
5	MDA	APC Setup, Monitor Input 1 (MD Anode)
6	VCC	+2.4...+15 V Supply Voltage
7	LDA	Laser Supply (LD Anode)
8	LDK	Driver Output (LD Cathode)

The *Thermal Pad* is to be connected to a Ground Plane on the PCB. Do not short-circuit pins AGND and GND, for this may deteriorate the precision of the regulator and interfere with the soft-start!

PIN CONFIGURATION DFN10

PIN FUNCTIONS

No. Name Function

SAFETY PRECAUTIONS

Laser light can damage the human eye and the eyes of animals. Do not look at any laser light directly or through any optical lens. When handling a laser diode, do not look directly at the light generated by it. Wear appropriate safety glasses to prevent light from entering the eye even by reflection.

FUNCTION DESCRIPTION

Turn-on behaviour

After switching the supply voltage on, the output stage remains disabled until the internal enabling flip-flop is set by a sufficiently high voltage at LDA.

Figure 1: Turn-on behaviour

A quick soft-start follows during phase I; the control capacitor CI is charged at an accelerated rate until the voltage at pin MDA reaches 1/3 of its nominal value.

With $V(MDA) > 1/3 V(MDA)_{nom}$ phase II starts, the controlled start-up. The transition to CW operation (phase III) is gradual and primarily determined by the values of CI and RM. CI is properly dimensioned when the voltage overshoot at MDA is at a minimum.

Turn-off behaviour

iC-WKN works without a fixed undervoltage lockout, thus the laser diode forward voltage is the prime factor determining the lowest possible supply voltage.

If the voltage drops below this value, the output driver is forcibly saturated and the laser current decreases. iC-WKN simultaneously discharges the control capacitor CI so that no excessive laser diode currents occur when the supply voltage rises again.

Figure 2: Turn-off behaviour

Disruptions in operation

The power control is shut down with excessive driver temperature or when the laser current reaches the overcurrent shut-down threshold, for example when the feedback is interrupted. If the monitor diode or the bias resistor RM fail, the device is shut down in less than 250 μ s, provided that the supply voltage applied is high enough. When modulating the laser current via pin MDK, excessive voltage occurring at pin MDA also may cause a shut-down.

APPLICATION NOTES

Setting the output power

The output power is simply set by

$$RM = \frac{V(MDA)}{I(MD)}$$

with

V(MDA) = Item-No. 101 and

$I(MD)$ = monitor current of the laser diode at the desired operating point.

RM should be combined from a fixed resistor (max. output power) and a trimmer (calibration).

Layout

Pin AGND acts solely as a ground reference for the power regulator (CI and RM) and must not be short-circuited with GND externally. This could have a negative effect on the control behaviour and monitor functions.

Cooling

Laser diodes should be sufficiently cooled, particularly with the power-regulated operation of setups which use iC-WKN, for example. The power dissipation in the laser diode otherwise causes the diode to heat up and the level of efficiency to drop which the power control unit then compensates for by increasing the laser current. This in turn brings about a rise in power dissipation in the laser diode and thus also in temperature. In this instance the laser diode could be damaged (resulting in spottiness and an increase in operating current) or even destroyed before the overcurrent shutdown threshold in iC-WKN is reached.

For improved power dissipation with N-type laser diodes the common terminal (= case) can be connected to the power supply line. This eases the heat conducting assembly into a module case, connected to the power supply (e.g. battery powered modules). Alternatively the power supply may be e.g. -5V with the module case grounded.

Figure 3: Laser diode case connected to the power supply

Figure 3 shows this setup with VCC and LDA short circuited. The function of the now by-passed transient protection resistor is replaced by an external resistor (typ. $3\ \Omega$) in the GND line.

Current limiting

Figure 4 shows a relatively simple way to add a selectable current limiter to iC-WKN. $V_{BE}(Q_{lim})/R_{lim}$ sets the maximum current through the laser diode..

Figure 4: iC-WKN with selectable current limiter

Miscellaneous

Further application notes on the iC-WK family (iC-WK, iC-WKL, iC-WKN) and the data sheet of the demo board are available as separate documents.
