Explanations:

- t_r rise time at given load resistor R and 70% of the output pulse height.
- L_p primary inductance measured at 1 kHz (secondary coil open).
- L_{str} stray inductance measured at the secondary side, short circuit at the primary side. If there are several secondary coils only one at the time is connected (measuring frequency 10 kHz).
- The ignition current is a set peak value where the voltage drop over the coil resistance is still insignificant (mostly below 1 V).
