

CMOS 8-Bit Microcontroller

TMP86CH06N/TMP86CH06U

The TMP86CH06 is the 8-bit single chip microcomputer, which contains ROM, RAM, multi-function timer/counters, serial interface (UART/SIO) with high speed, high performance and low power consumption.

Product No.	ROM	RAM	Package	OTP MCU
TMP86CH06N	16K × 8-bit	512 × 8-bit	P-SDIP42-600-1.78	TMP86PH06N
TMP86CH06U			P-LQFP44-1010-0.80A	TMP86PH06U

Features

- ◆ 8-bit single chip microcomputer TLCS-870/C Series
- ◆ Minimum Instruction execution time: 0.25 μ s (at 16.0 MHz)
 - Power consumption is reducible by means of conversion of instruction execution time
0.25 μ s, 0.50 μ s, 1.0 μ s, 2.0 μ s, 4.0 μ s, 8.0 μ s, 122 μ s
(at 16.0 MHz, 32.768 kHz operation)
- ◆ External Bus Interface
 - up to 64 Kbytes (for both Program and Data memory)
 - Multiplexed between Lower Address-bus and Data-bus
- ◆ 21 Interrupt factors (6 for External, 15 for Internal)
- ◆ Input/Output Ports: 35 pins
 - High-Current Output (Typ. 20 mA, LED direct drive): 8 pins
- ◆ 16-bit Timer/Counter: 1 channel
 - Timer, Event counter, Pulse Width measurement and External-triggered timer

- For a discussion of how the reliability of microcontrollers can be predicted, please refer to Section 1.3 of the chapter entitled Quality and Reliability Assurance / Handling Precautions.
- TOSHIBA is continually working to improve the quality and reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to comply with the standards of safety in making a safe design for the entire system, and to avoid situations in which a malfunction or failure of such TOSHIBA products could cause loss of human life, bodily injury or damage to property.
In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent TOSHIBA products specifications. Also, please keep in mind the precautions and conditions set forth in the "Handling Guide for Semiconductor Devices," or "TOSHIBA Semiconductor Reliability Handbook" etc..
- The TOSHIBA products listed in this document are intended for usage in general electronics applications (computer, personal equipment, office equipment, measuring equipment, industrial robotics, domestic appliances, etc.). These TOSHIBA products are neither intended nor warranted for usage in equipment that requires extraordinarily high quality and/or reliability or a malfunction or failure of which may cause loss of human life or bodily injury ("Unintended Usage"). Unintended Usage include atomic energy control instruments, airplane or spaceship instruments, transportation instruments, traffic signal instruments, combustion control instruments, medical instruments, all types of safety devices, etc.. Unintended Usage of TOSHIBA products listed in this document shall be made at the customer's own risk.
- The products described in this document are subject to the foreign exchange and foreign trade laws.

- ◆ 8-bit Timer/Counter: 2 channels
 - Available for 16-bit timer by cascade connection
 - Timer, Event counter, Pulse Width Modulation, Programmed Pulse Generator and Programmable Divider Output, Warming-up Counter
- ◆ Serial Interface
 - 8-bit UART: 2 channels
 - 8-bit SIO (synchronized): 1 channel
- ◆ Clock Oscillation circuit: 2 units
 - For Single or Dual clock mode
- ◆ Nine power saving operating modes
 - STOP mode: Oscillation stops. Battery/Capacitor back-up. Port output hold/High-impedance.
 - SLOW 1, 2 mode: Low power consumption operation using low-frequency clock (32.768 kHz)
 - IDLE 0 mode: CPU stops, and peripherals operate using high-frequency clock of Time-Base-Timer. Release by falling edge of TBTCCR<TBTCK> setting.
 - IDLE 1 mode: CPU stops, and peripherals operate using high-frequency clock. Release by interrupts.
 - IDLE 2 mode: CPU stops, and peripherals operate using high and low frequency clock. Release by interrupts.
 - SLEEP 0 mode: CPU stops, and peripherals operate using low-frequency clock of Time-Base-Timer. Release by falling edge of TBTCCR<TBTCK> setting.
 - SLEEP 1 mode: CPU stops, and peripherals operate using low-frequency clock. Release by interrupts.
 - SLEEP 2 mode: CPU stops, and peripherals operate using high and low frequency clock. Release by interrupts.
- ◆ Operating Voltage: 4.5 to 5.5 V at 16.0 MHz/32.768 kHz, 2.7 to 5.5 V at 8 MHz/32.768 kHz, 1.8 to 5.5 V at 4.2 MHz/32.768 kHz.

The diagram illustrates the internal architecture of the TMS320C80, organized into several functional blocks:

- Program Memory Mask ROM:** Connected to the top Address/Data Bus.
- TLC8-870/C CPU Core:** The central processing unit, connected to the top Address/Data Bus and the Interrupt Control Circuit.
- Data Memory (RAM):** Connected to the top Address/Data Bus.
- Interrupt Control Circuit:** Receives signals from the CPU Core and various peripheral timers and counters.
- Standby Controller:** Manages power states, receiving RESET and TEST signals.
- System Controller:** Coordinates system operations.
- Timing Generator:** Provides clock signals to the system.
- Clock gear:** Adjusts the clock frequency.
- High Frequency / Low Frequency:** Part of the clock system, connected to XIN and XOUT signals.
- Timer Base Timer:** Provides a base timing reference.
- Watchdog Timer:** Monitors system health.
- 16-Bit Timer Counter:** Provides precise timing for various functions.
- 8-Bit Timer Counter (TC0, TC1):** Provides additional timing resolution.
- UART (2ch):** Serial communication interface.
- SIO:** Serial Input/Output interface.
- External Bus Controller:** Manages communication with external devices via the EA signal.
- Address/Data Buses:** Internal buses connecting the CPU core to memory and peripherals.
- I/O Port:** Consists of five ports (P0, P1, P2, P3, P4) connected to the external bus controller and the internal system.

Pin Names And Functions (1/3)

Operational Description

1. CPU Core Functions

The CPU core consists of a CPU, a system clock controller, and an interrupt controller.

This section provides a description of the CPU core, the program memory, the data memory, the external memory interface, and the reset circuit.

1.1 Memory Address Maps

The TMP86CH06 memory consists of 3 blocks: ROM, RAM and SFR (Special Function Register). They are all mapped in 64K-byte address space. Figure 1-1 shows the TMP86CH06 memory address maps. The general-purpose register banks are not assigned to the RAM address space.

Figure 1-1. Memory Address Maps

1.2 Program Memory (ROM)

The TMP86CH06 can address up to 64 Kbytes of external program memory space except the SFR area and the internal RAM. However, placing program memory on the internal RAM is deregulated if a certain procedure is executed (See 2.4.5 Address trap). The TMP86CH06 contains a 16-Kbyte program memory (mask ROM) at addresses from C000H to FFFFH.

1.3 Data Memory (RAM)

The TMP86CH06 is available up to 64 Kbytes of data memory area. Data memory consists of internal data memory (internal ROM or RAM) and external data memory (ROM or RAM). The TMP86CH06 has 512 bytes of internal RAM. The first 192 bytes (0040H to 00FFH) of the internal RAM are located in the direct area; instructions with shorten operations are available against such an area.

Electrical Characteristics

Absolute Maximum Rating

(V_{SS} = 0 V)

Parameter	Symbol	Pins	Rating	Unit
Supply Voltage	V _{DD}		– 0.3 to 6.5	V
Input Voltage	V _{IN}		– 0.3 to V _{DD} + 0.3	
Output Voltage	V _{OUT}		– 0.3 to V _{DD} + 0.3	
Output Current	I _{OUT1}	P1 to P4	3.2	mA
	I _{OUT3}	P0	30	
Output Current	Σ I _{OUT1}		80	
	Σ I _{OUT3}		120	
Power Dissipation (Topr = 85°C)	PD	TMP86CH06N	600	mW
		TMP86CH06U	350	
Soldering Temperature (Time)	Tsld		260 (10 s)	°C
Storage Temperature	Tstg		– 55 to 125	
Operating Temperature	Topr		– 40 to 85	

Note: The absolute maximum ratings are rated values which must not be exceeded during operation, even for an instant. Any one of the ratings must not be exceeded. If any absolute maximum rating is exceeded, a device may break down or its performance may be degraded, causing it to catch fire or explode resulting in injury to the user. Thus, when designing products which include this device, ensure that no absolute maximum rating value will ever be exceeded.

Recommended Operating Conditions

	V _{IL5}		V _{DD} = 1.8 V	0.2			
Clock Frequency	fc	XIN, XOUT	V _{DD} = 4.5 V to 5.5 V		1.0	16	MHz
			V _{DD} = 2.7 V to 5.5 V			8	
			V _{DD} = 1.8 V to 5.5 V			4.2	
	fs	XTIN, XTOUT			30.0	34.0	kHz

Note 1: The recommended operating conditions for a device are operating conditions under which it can be guaranteed that the device will operate as specified. If the device is used under operating conditions other than the recommended operating conditions (supply voltage, operating temperature range, specified AC/DC values etc.), malfunction may occur. Thus, when designing products which include this device, ensure that the recommended operating conditions for the device are always adhered to.

Note 2: Clock Frequency fc; The condition of supply voltage range is the value under NORMAL1/2 and IDLE0/1/2 mode.

Note 3: The minimum fc with clock gear is calculated as following formula with the ratio on divider n.

(Min fc) = (ratio on divider n) × 1 [MHz]
