

TDA7310

SERIAL BUS CONTROLLED AUDIO PROCESSOR

- INPUT MULTIPLEXER:
 - 4 STEREO INPUTS
 - ONE DIFFERENTIAL STEREO INPUT FOR REMOTE SOURCES
- SELECTABLE INPUT GAIN FOR OPTIMAL ADAPTION TO DIFFERENT SOURCES
- INPUT AND OUTPUT FOR EXTERNAL EQUALIZER OR NOISE REDUCTION SYSTEM
- VOLUME CONTROL IN 1.25dB STEPS
- LOUDNESS FUNCTION
- TREBLE AND BASS CONTROL
- FOUR SPEAKER ATTENUATORS:
 - 4 INDEPENDENT SPEAKERS CONTROL IN 1.25dB STEPS FOR BALANCE AND FADER FACILITIES
 - INDEPENDENT MUTE FUNCTION
- ALL FUNCTIONS PROGRAMMABLE VIA SERIAL BUS
- SELECTABLE CHIP ADDRESS DEDICATED PIN

PQFP44 (10 x 10)

ORDERING NUMBER: TDA7310

DESCRIPTION

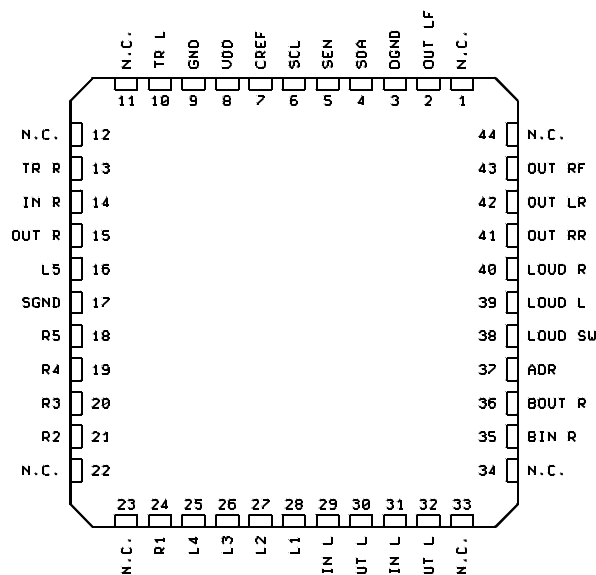

The TDA7310 is a volume, tone (bass and treble) and fader (front/rear) processor for high quality audio applications in car radio and Hi-Fi systems.

Loudness and selectable input gain are provided. The control of all functions is accomplished by serial bus microprocessor interface.

The AC signal setting is obtained by resistor networks and switches combined with operational amplifiers.

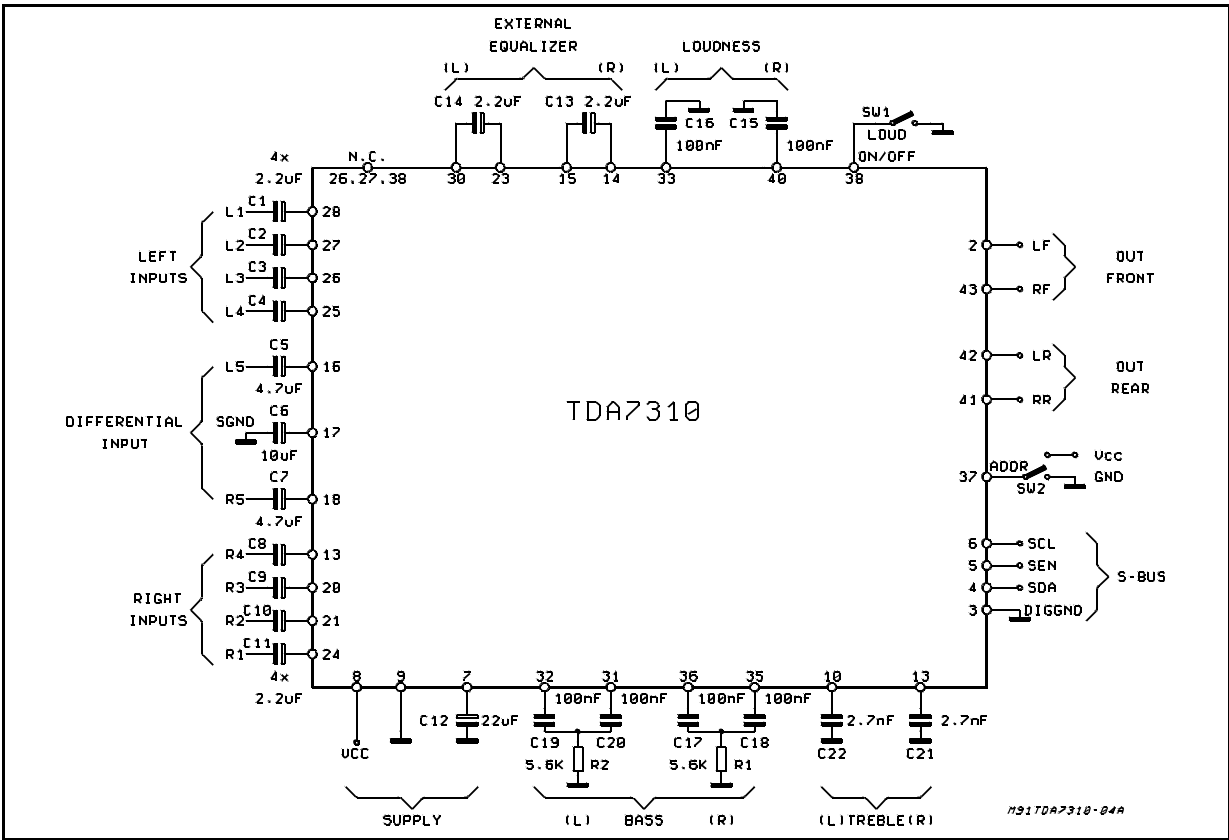

Thanks to the used BIPOLAR/CMOS Technology, Low Distortion, Low Noise and DC stepping are obtained.

APPLICATION INFORMATION (continued)**SERIAL BUS INTERFACE****S-BUS Interface and I²C BUS Compatibility**

Data transmission from microprocessor to the TDA7310 and viceversa takes place thru the 3-wire S-BUS interface, consisting of the three lines SDA, SCL, SEN. If SDA and SEN inputs are short-circuited together, then the TDA7310 appears as a standard I²C BUS slave.

According to I²C BUS specification the S-BUS lines are connected to a positive supply voltage via pull-up resistors.

Data Validity

As shown in fig. 15, the data on the SDA line must be stable during the high period of the clock. The HIGH and LOW state of the data line can only change when the clock signal on the SCL line is LOW.

Start and Stop Conditions**I²C BUS:**

as shown in fig. 16 a start condition is a HIGH to LOW transition of the SDA line while SCL is HIGH. The stop condition is a LOW to HIGH transition of the SDA line while SCL is HIGH.

S-bus:

the start/stop conditions (points 1 and 6) are detected exclusively by a transition of the SEN line (1 → 0 / 0 → 1) while the SCL line is at the HIGH level.

The SDA line is only allowed to change during the time the SCL line is low (points 2, 3, 4, 5). after the start information (point 1) the SEN line returns to the HIGH level and remains unchanged for all the time the transmission is performed.

Byte Format

Every byte transferred on the SDA line must contain 8 bits. Each byte must be followed by an acknowledge bit. The MSB is transferred first.

Acknowledge

The master (μP) puts a resistive HIGH level on

Figure 17: Acknowledge on the I²C BUS**Figure 15: Data Validity on the I²C BUS****Figure 16: Timing Diagram of S-BUS and I²C BUS**

the SDA line during the acknowledge clock pulse (see fig. 17). The peripheral (audioprocessor) that acknowledges has to pull-down (LOW) the SDA line during the acknowledge clock pulse, so that the SDA line is stable LOW during this clock.

APPLICATION INFORMATION (continued)

The audioprocessor which has been addressed has to generate an acknowledge after the reception of each byte, otherwise the SDA line remains at the HIGH level during the ninth clock pulse time. In this case the master transmitter can generate the STOP information in order to abort the transfer.

Transmission without Acknowledge

Avoiding to detect the acknowledge of the audioprocessor, the μ P can use a simpler transmission: simply it waits one clock without checking the slave acknowledging, and sends the new data.

This approach of course is less protected from misworking and decreases the noise immunity.

Interface Protocol

The interface protocol comprises:

- A start condition (s)
- A chip address byte, containing the TDA7310 address (the 8th bit of the byte must be 0). The TDA7310 must always acknowledge at the end of each transmitted byte.
- A sequence of data (N-bytes + acknowledge)
- A stop condition (P)

ACK = Acknowledge

S = Start

P = Stop
