Dual tandem electronic potentiometer circuit

TDA1074A

GENERAL DESCRIPTION

The TDA1074A is a monolithic integrated circuit designed for use as volume and tone control circuit in stereo amplifiers. This dual tandem potentiometer IC consists of two ganged pairs of electronic potentiometers with the eight inputs connected via impedance converters, and the four outputs driving individual operational amplifiers. The setting of each electronic potentiometer pair is controlled by an individual d.c. control voltage. The potentiometers operate by current division between the arms of cross-coupled long-tailed pairs. The current division factor is determined by the level and polarity of the d.c. control voltage with respect to an externally available reference level of half the supply voltage. Since the electronic potentiometers are adjusted by a d.c. control voltage, each pair can be controlled by single linear potentiometers which can be located in any position dictated by the equipment styling. Since the input feedback impedances around the operational amplifier gain blocks are external, the TDA1074A can perform bass/treble and volume/loudness control. It also can be used as a low-level fader to control the sound distribution between the front and rear loudspeakers in car radio installations.

Features

- High impedance inputs to both 'ends' of each electronic potentiometer
- Ganged potentiometers track within 0,5 dB
- Electronic rejection of supply ripple
- Internally generated reference level available externally so that the control voltage can be made to swing positively and negatively around a well-defined 0 V level
- The operational amplifiers have push-pull outputs for wide voltage swing and low current consumption
- The operational amplifier outputs are current limited to provide output short-circuit protection
- Although designed to operate from a 20 V supply (giving a maximum input and output signal level of 6 V), the TDA1074A can work from a supply as low as 7,5 V with reduced input and output signal levels.

QUICK REFERENCE DATA

| | | | |
|--------------------------------------|----------------|------|----------------|
| Supply voltage (pin 11) | V_P | typ. | 20 V |
| Supply current (pin 11) | I_P | typ. | 22 mA |
| Input signal voltage (r.m.s. value) | $V_{i(rms)}$ | max. | 6 V |
| Output signal voltage (r.m.s. value) | $V_{o(rms)}$ | max. | 6 V |
| Total harmonic distortion | THD | typ. | 0,05 % |
| Output noise voltage (r.m.s. value) | $V_{no(rms)}$ | typ. | 50 μ V |
| Control range | $\Delta\alpha$ | typ. | 110 dB |
| Cross-talk attenuation (L/R) | α_{ct} | typ. | 80 dB |
| Ripple rejection (100 Hz) | α_{100} | typ. | 46 dB |
| Tracking of ganged potentiometers | ΔG_v | typ. | 0,5 dB |
| Supply voltage range | V_P | | 7,5 to 23 V |
| Operating ambient temperature range | T_{amb} | | -30 to + 80 °C |

PACKAGE OUTLINE

18-lead DIL; plastic (SOT102); SOT102-1; 1996 July 18.

Dual tandem electronic
potentiometer circuit

TDA1074A

Fig.1 Block diagram and basic external components; I_{c1} (at pin 9) and I_{c2} (at pin 10) are control input currents; V_{c1} (at pin 9) and V_{c2} (at pin 10) are control input voltages with respect to $V_{ref} = V_p/2$ at pin 8; $Z1 = Z2 = Z3 = Z4 = 22$ kΩ; the input generator resistance $R_G = 60$ Ω; the output load resistance $R_L = 4,7$ kΩ; the coupling capacitors at the inputs and outputs are $C_i = 2,2$ μF and $C_o = 10$ μF respectively.

Application recommendations

1. If one or more electronic potentiometers in an IC are not used, the following is recommended:
 - a) Unused signal inputs of an electronic potentiometer should be connected to the associated output, e.g. pins 3 and 4 to pin 2.
 - b) Unused control voltage inputs should be connected directly to pin 8 (V_{ref}).
2. Where more than one TDA1074A IC are used in an application, pins 1 can be connected together; however, pins 8 (V_{ref}) may not be connected together directly.
3. Additional circuitry for limiting the frequency response in the ultrasonic range: see Fig.13
4. Alternative circuitry for limiting the gain of the treble control circuit in the ultrasonic range: see Fig.14

(1) $f_{-3\text{ dB}} = 110\text{ kHz}$ at linear setting.

Fig.13 Circuit diagram for frequency response limiting.

Dual tandem electronic
potentiometer circuit

TDA1074A

For $R_{S1} = R_{S2} = 3,3 \text{ k}\Omega$; $f_{-3 \text{ dB}} \cong 1 \text{ MHz}$ at linear setting.

For $R_{S1} = R_{S2} = 0 \Omega$; $f_{-3 \text{ dB}} \cong 100 \text{ kHz}$ at linear setting.

SOLDERING

Introduction

There is no soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and surface mounted components are mixed on one printed-circuit board. However, wave soldering is not always suitable for surface mounted ICs, or for printed-circuits with high population densities. In these situations reflow soldering is often used.

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our *"IC Package Databook"* (order code 9398 652 90011).

Soldering by dipping or by wave

The maximum permissible temperature of the solder is 260 °C; solder at this temperature must not be in contact with the joint for more than 5 seconds. The total contact time of successive solder waves must not exceed 5 seconds.

The device may be mounted up to the seating plane, but the temperature of the plastic body must not exceed the specified maximum storage temperature ($T_{stg\ max}$). If the printed-circuit board has been pre-heated, forced cooling may be necessary immediately after soldering to keep the temperature within the permissible limit.

Repairing soldered joints

Apply a low voltage soldering iron (less than 24 V) to the lead(s) of the package, below the seating plane or not more than 2 mm above it. If the temperature of the soldering iron bit is less than 300 °C it may remain in contact for up to 10 seconds. If the bit temperature is between 300 and 400 °C, contact may be up to 5 seconds.

DEFINITIONS

| Data sheet status | |
|---|---|
| Objective specification | This data sheet contains target or goal specifications for product development. |
| Preliminary specification | This data sheet contains preliminary data; supplementary data may be published later. |
| Product specification | This data sheet contains final product specifications. |
| Limiting values | |
| Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability. | |
| Application information | |
| Where application information is given, it is advisory and does not form part of the specification. | |

LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.
