

## DS89C387

### Twelve Channel CMOS Differential Line Driver

#### General Description

The DS89C387 is a high speed twelve channel CMOS differential driver that meets the requirements of TIA/EIA-422-B. The DS89C387 features a low  $I_{CC}$  specification of 1.5 mA maximum, which makes it ideal for battery powered and power conscious applications. The device replaces three DS34C87s and offers a PC board space savings up to 30%. The twelve channel driver is available in a SSOP package. The device is ideal for wide parallel bus applications.

Each TRI-STATE® enable (EN) allows the driver outputs to be active or in a HI-impedance off state. Each enable is common to only two drivers for flexibility and control. The drivers may be disabled to turn off load current and to save power when data is not being transmitted.

The driver's input (DI) is compatible with both TTL and CMOS signal levels.

#### Features

- Low power  $I_{CC}$ : 1.5 mA maximum
- Meets TIA/EIA-422-B (RS-422)
- Guaranteed AC parameters:
  - Maximum driver skew  $-3$  ns
  - Maximum transition time  $-10$  ns
- Available in SSOP packaging:
  - Requires 30% less PCB space than 3 DS34C87TMs

#### Connection Diagram

**Order Number DS89C387TMEA**  
**See NS Package Number MS48A**

#### Functional Diagram

1/6 of package

#### Truth Table

Enable	Input	Outputs	
		DO	DO*
L	X	Z	Z
H	H	H	L
H	L	L	H

## Absolute Maximum Ratings (Notes 1, 2)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Supply Voltage ( $V_{CC}$ )	-0.5 to 7.0V
DC Voltage ( $V_{IN}$ )	-1.5 to $V_{CC} + 1.5V$
DC Output Voltage ( $V_{OUT}$ )	-0.5 to 7V
Clamp Diode Current ( $I_{IK}$ , $I_{OK}$ )	$\pm 20$ mA
DC Output Current, per pin ( $I_{OUT}$ )	$\pm 150$ mA
DC $V_{CC}$ or GND Current ( $I_{CC}$ )	$\pm 500$ mA
Storage Temperature Range ( $T_{STG}$ )	-65°C to +150°C
Maximum Power Dissipation ( $P_D$ ) @ 25°C (Note 3)	
SSOP Package	1359 mW

Lead Temperature ( $T_L$ )

(Soldering 4 sec.)

260°C

This device does not meet 2000V ESD rating. (Note 11)

## Operating Conditions

	Min	Max	Units
Supply Voltage ( $V_{CC}$ )	4.50	5.50	V
DC Input or Output Voltage ( $V_{IN}$ , $V_{OUT}$ )	0	$V_{CC}$	V
Operating Temperature Range ( $T_A$ )			
DS89C387T	-40	+85	°C
Input Rise or Fall Times ( $t_r$ , $t_f$ )		500	ns

## DC Electrical Characteristics (Notes 2, 4)

$V_{CC} = 5V \pm 10\%$  (unless otherwise specified)

Symbol	Parameter	Conditions	Min	Typ	Max	Units
$V_{IH}$	High Level Input Voltage		2.0		$V_{CC}$	V
$V_{IL}$	Low Level Input Voltage		GND		0.8	V
$V_{OH}$	High Level Output Voltage	$V_{IN} = V_{IH}$ or $V_{IL}$ , $I_{OUT} = -20$ mA	2.5	3.4		V
$V_{OL}$	Low Level Output Voltage	$V_{IN} = V_{IH}$ or $V_{IL}$ , $I_{OUT} = 48$ mA		0.3	0.5	V
$V_T$	Differential Output Voltage	$R_L = 100\Omega$ (Note 5)	2.0	3.1		V
$ V_T  -  \bar{V}_T $	Difference In Differential Output	$R_L = 100\Omega$ (Note 5)			0.4	V
$V_{OS}$	Common Mode Output Voltage	$R_L = 100\Omega$ (Note 5)		2.0	3.0	V
$ V_{OS} - \bar{V}_{OS} $	Difference In Common Mode Output	$R_L = 100\Omega$ (Note 5)			0.4	V
$I_{IN}$	Input Current	$V_{IN} = V_{CC}$ , GND, $V_{IH}$ , or $V_{IL}$			$\pm 1.0$	$\mu A$
$I_{CC}$	Quiescent Supply Current	$I_{OUT} = 0$ $\mu A$ , $V_{IN} = V_{CC}$ or GND		600	1500	$\mu A$
		$V_{IN} = 2.4V$ or 0.5V (Note 6)		0.8	2.0	mA
$I_{OZ}$	TRI-STATE Output Leakage Current	$V_{OUT} = V_{CC}$ or GND Control = $V_{IL}$		$\pm 0.5$	$\pm 5.0$	$\mu A$
$I_{SC}$	Output Short Circuit Current	$V_{IN} = V_{CC}$ or GND (Notes 5, 7)	-30	-115	-150	mA
$I_{OFF}$	Power Off Output Leakage Current	$V_{CC} = 0V$ (Note 5)			100	$\mu A$
		$V_{OUT} = 6V$ $V_{OUT} = -0.25V$			-100	$\mu A$

**Note 1:** Absolute Maximum Ratings are those values beyond which the safety of the device cannot be guaranteed. They are not meant to imply that the device should be operated at these limits. The table of "Electrical Characteristics" provide conditions for actual device operation.

**Note 2:** Unless otherwise specified, all voltages are referenced to ground. All currents into device pins are positive; all currents out of device pins are negative.

**Note 3:** Ratings apply to ambient temperature at 25°C. Above this temperature derate SSOP (MEA) Package 10.9 mW/°C.

**Note 4:** Unless otherwise specified, min/max limits apply across the -40°C to 85°C temperature range. All typicals are given for  $V_{CC} = 5V$  and  $T_A = 25^\circ C$ .

**Note 5:** See TIA/EIA-422-B for exact test conditions.

**Note 6:** Measured per input. All other inputs at  $V_{CC}$  or GND.

**Note 7:** This is the current sourced when a high output is shorted to ground. Only one output at a time should be shorted.

## Switching Characteristics (Note 4)

$V_{CC} = 5V \pm 10\%$ ,  $t_r, t_f \leq 6 \text{ ns}$  (Figures 1, 2, 3, 4)

Symbol	Parameter	Conditions	Min	Typ	Max	Units
$t_{PLH}, t_{PHL}$	Propagation Delay Input to Output	S1 Open	2	6	11	ns
Skew	(Note 8)	S1 Open	0	0.5	3	ns
$t_{TLH}, t_{THL}$	Differential Output Rise And Fall Times	S1 Open		6	10	ns
$t_{PZH}$	Output Enable Time	S1 Closed		12	25	ns
$t_{PZL}$	Output Enable Time	S1 Closed		13	26	ns
$t_{PHZ}$	Output Disable Time (Note 9)	S1 Closed		4	8	ns
$t_{PLZ}$	Output Disable Time (Note 9)	S1 Closed		6	12	ns
$C_{PD}$	Power Dissipation Capacitance (Note 10)			100		pF
$C_{IN}$	Input Capacitance			6		pF

**Note 8:** Skew is defined as the difference in propagation delays between complementary outputs at the crossing point.

**Note 9:** Output disable time is the delay from the control input being switched to the output transistors turning off. The actual disable times are less than indicated due to the delay added by the RC time constant of the load.

**Note 10:**  $C_{PD}$  determines the no load dynamic power consumption,  $P_D = C_{PD} V_{CC}^2 f + I_{CC} V_{CC}$ , and the no load dynamic current consumption,  $I_S = C_{PD} V_{CC} f + I_{CC}$ .

**Note 11:** ESD Rating: HBM (1.5 kΩ, 100 pF)

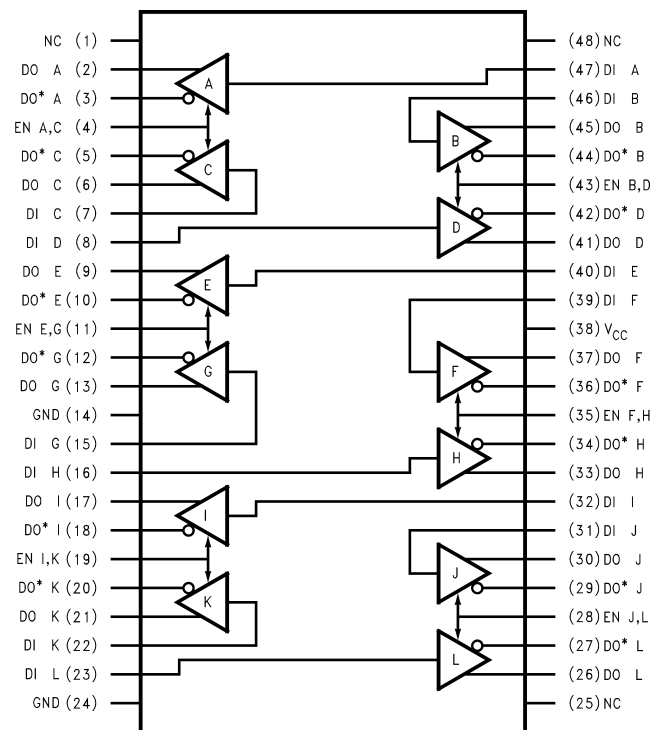

Inputs  $\geq 1500V$

Outputs  $\geq 1000V$

EIAJ (0Ω, 200 pF)

All Pins  $\geq 350V$

## Logic Diagram

## Parameter Measurement Information

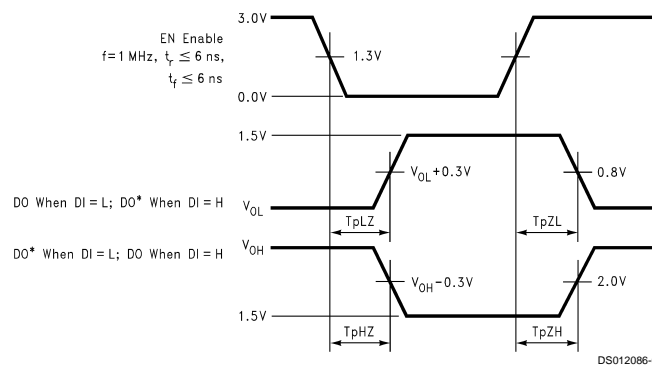

$C1 = C2 = C3 = 40 \text{ pF}$  (including Probe and Jig Capacitance),  $R1 = R2 = 50\Omega$ ,  $R3 = 500\Omega$

## Application Information

### SKEW

Skew may be thought of in a lot of different ways, the next few paragraphs should clarify what is represented by "Skew" in the datasheet and how it is determined. Skew, as used in this databook, is the absolute value of a mathematical difference between two propagation delays. This is commonly accepted throughout the semiconductor industry. However, there is no standardized method of measuring propagation delay, from which skew is calculated, of differential line drivers. Elucidating, the voltage level, at which propagation delays are measured, on both input and output waveforms are

not always constant. Therefore, skew calculated in this datasheet, may not be calculated the same as skew defined in another. This is important to remember whenever making a skew comparison.

Skew may be calculated for the DS89C387, from many different propagation delay measurements. They may be classified into three categories, single-ended, differential, and complementary. Single-ended skew is calculated from  $t_{PHL}$  and  $t_{PLH}$  measurements (see Figures 6, 7). Differential skew is calculated from  $t_{PHLD}$  and  $t_{PLHD}$  measurements (see Figures 8, 9). Complementary skew is calculated from  $t_{PHL}$  and  $t_{PLH}$  measurements (see Figures 10, 11).

FIGURE 6. Circuits for Measuring Single-Ended Propagation Delays (See Figure 7)

## Application Information (Continued)

**FIGURE 7. Propagation Delay Waveforms for Circuit 1 and Circuit 2 (See Figure 6)**

In Figure 2,  $V_X$ , where  $X$  is a number, is the waveform voltage level at which the propagation delay measurement either starts or stops. Furthermore,  $V_1$  and  $V_2$  are normally identical. The same is true for  $V_3$  and  $V_4$ . However, as mentioned before, these levels are not standardized and may vary, even with similar devices from other companies. Also note, NC (no connection) in Figure 1 means the pin is not used in propagation delay measurement for the corresponding circuit.

The single-ended skew provides information about the pulse width distortion of the output waveform. The lower the skew, the less the output waveform will be distorted. For best case, skew would be zero, and the output duty cycle would be 50%, assuming the input has a 50% duty cycle.

**FIGURE 8. Circuit for Measuring Differential Propagation Delays (See Figure 9)**

**FIGURE 9. Propagation Delay Waveforms for Circuit 3 (See Figure 8)**

For differential propagation delays,  $V_1$  should equal  $V_2$ . Furthermore, the crossing point of  $DO$  and  $DO^*$  corresponds to zero volts on the differential waveform (see bottom waveform in Figure 9). This is true whether  $V_3$  equals  $V_4$  or not.

**FIGURE 10. Circuit for Measuring Complementary Skew (See Figure 11)**

**FIGURE 11. Waveforms for Circuit 4 (See Figure 10)**

Complementary skew is calculated from single-ended propagation delay measurements on complementary output signals,  $DO$  and  $DO^*$ . Note, when  $V_3$  and  $V_4$  are absolute values, they are identical on  $DO$  and  $DO^*$ ; but vary whenever they are relative values.

The complementary skew reveals information about the contour of the rising and falling edge of the differential output

## Application Information (Continued)

signal of the driver. This is important information because the receiver will interpret the differential output signal. If the differential transitions do not continuously ascend or descend through the receivers threshold region, errors may occur. Errors may also occur if the transitions are too slow.

In addition, complementary skew provides information about the common mode modulation of the driver. The common mode voltage is represented by  $(DO-DO^*)/2$ . This information may be used as a means for determining EMI affects.

Only "Skew" is specified in this datasheet for the DS89C387. It refers to the complementary skew of the driver. Complementary skew is measured at both V3 and V4 (see Figure 11).

More information can be calculated from the propagation delays. The channel to channel and device to device skew may be calculated in addition to the types of skew mentioned previously. These parameters provide timing performance information beneficial when designing. The channel to channel skew is calculated from the variation in propagation delay from receiver to receiver within one package. The device to device skew is calculated from the variation in propagation delay from one DS89C387 to another DS89C387.

For the DS89C387, the maximum channel to channel skew is 9 ns ( $t_p \text{ max} - t_p \text{ min}$ ) where  $t_p$  is the low to high or high to

low propagation delay. The minimum channel to channel skew is 0 ns since it is possible for all 12 drivers to have identical propagation delays. Note, this is best and worst case calculations used whenever Skew (channel) is not independently characterized and specified in the datasheet. The device to device skew may be calculated in the same way and the results are the same. Therefore, the device to device skew is 9 ns and 0 ns maximum and minimum respectively.

TABLE 1. DS89C387 Skew Table

Parameter	Min	Typ	Max	Units
Skew (comp.)	0	0.5	3	ns
Skew (channel)	0		9	ns
Skew (device)	0		9	ns

Note Skew (comp.) in Table 1 is the same as "Skew" in the datasheet. Also Skew (channel) and Skew (device) are calculations, but are guaranteed by the propagation delay tests. Both Skew (channel) and Skew (device) would normally be tighter whenever specified from characterization data.

The information in this section of the datasheet is to help clarify how skew is defined in this datasheet. This should help when designing the DS89C387 into most applications.

## LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component in any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
