QUAD DARLINGTON POWER DRIVER

Combining AND logic gates and inverting high-current bipolar outputs, the UDN2540B and A2540SLB quad Darlington power drivers provide interface between low-level signal-processing circuits and power loads totaling 360 W. Each of the four independent outputs can sink up to 1.8 A in the on state with peak inrush currents to 2.5 A. The four power outputs are each comprised of an open-collector Darlington driver and an internal flyback/clamp diode for switching inductive leads. They feature a minimum breakdown and sustaining voltage of 50 V. The logic inputs are compatible with TTL and 5 V CMOS logic systems.

Typical applications include print heads, relays, solenoids, and dc stepping motors. These drivers can also be used to drive high-current incandescent lamps, LEDS, and heaters.

The UDN2540B is supplied in a 16-pin batwing power DIP; the A2540SLB is supplied in a 20-lead batwing power SOIC for surface-mount applications. The batwing construction provides for maximum package power dissipation in a standard construction. At 25°C, and with pcb copper foil heat dissipators at the ground tabs, either package is capable of safely dissipating more than 2 W.

Dwg. PP-017-2

FEATURES

■ 1.8 A Continuous Output Current
■ Output Voltage to 50 V
■ TTL and 5 V CMOS Compatible Inputs
■ Efficient Input/Output Pinning
■ Integral Transient-Suppression Diodes
■ Replaces L6221A and L6221CD

ABSOLUTE MAXIMUM RATINGS
at $T_A = 25°C$

ALLOWABLE PACKAGE POWER DISSIPATION IN WATTS

R$_{\theta JT}$ = 6.0°C/W

SUFFIX 'B', R$_{\theta JA}$ = 43°C/W

SUFFIX 'LB', R$_{\theta JA}$ = 87°C/W

TEMPERATURE IN °C

Dwg. GP-049-3A

R$_{\theta JA}$ is measured on typical two-sided PCB with minimal copper ground area. For the SOIC, adding 3.57 in^2 copper ground area will reduce the thermal resistance to 52°C/W (2.4 W allowable package power dissipation at 25°C). See Application Note 29501.5, *Improving Batwing Power Dissipation*.

Input Current	Logic 1	$V_{IN(1)}$ or $V_{EN(1)}$ = 2.4 V	—	—	10	μA
	Logic 0	$V_{IN(0)}$ or $V_{EN(0)}$ = 0.8 V	—	—	-100	μA
Total Supply Current	I_{CC}	V_{IN}* = V_{EN} = 2.4 V, V_{CC} = 5.0 V, Outputs Open	—	14	20	mA
		V_{IN}* = V_{EN} = 0.8 V, V_{CC} = 5.0 V	—	0.4	2.0	mA
Clamp Diode Forward Voltage	V_F	I_F = 1.0 A	—	1.3	1.6	V
		I_F = 1.8 A	—	1.6	2.0	V
Clamp Diode Leakage Current	I_R	V_R = 50 V	—	<1.0	100	μA

Typical Data is for design information only.
Negative current is defined as coming out of (sourcing) the specified terminal.
As used here, -100 is defined as greater than +10 (absolute magnitude convention) and the minimum is implicitly zero.
*All inputs simultaneously, all other tests are performed with each input tested separately.

QUAD DARLINGTON POWER DRIVER

TYPICAL APPLICATION
### (QUAD RELAY DRIVER WITH ZENER FLYBACK)

Dwg. EP-016

APPLICATIONS INFORMATION

A typical application is shown for driving four high-current relays, solenoids, or print heads. A Zener diode is used to increase the flyback voltage, providing a much faster inductive load turn-off current decay, resulting in faster dropout (reduced relay contact arcing), and improved performance. The maximum Zener voltage, plus the load supply voltage, plus the flyback diode forward voltage must not exceed the device's rated sustaining voltage.

With external control circuitry, the ENABLE input can be used for chopper (PWM) applications. If the ENABLE input is not used, it should be tied high.
All inputs will float high if open circuited.
