

36-Mbit (1 M × 36/2 M × 18) Pipelined SRAM with NoBL™ Architecture

Features

- Pin compatible and functionally equivalent to ZBT
- Supports 250 MHz bus operations with zero wait states
 - Available speed grades are 250, 200 and 167 MHz
- Internally self timed output buffer control to eliminate the need to use asynchronous OE
- Fully registered (inputs and outputs) for pipelined operation
- Byte write capability
- 3.3 V power supply
- 3.3 V/2.5 V I/O power supply
- Fast clock-to-output times
 - 2.6 ns (for 250 MHz device)
- Clock enable ($\overline{\text{CEN}}$) pin to suspend operation
- Synchronous self timed writes
- CY7C1460AV33 available in JEDEC-standard Pb-free 100-pin TQFP and non Pb-free 165-ball FBGA package. CY7C1462AV33 available in JEDEC-standard Pb-free 100-pin TQFP.
- IEEE 1149.1 JTAG-compatible boundary scan
- Burst capability – linear or interleaved burst order
- “ZZ” sleep mode option and stop clock option

Functional Description

The CY7C1460AV33/CY7C1462AV33 are 3.3 V, 1 M × 36/2 M × 18 synchronous pipelined burst SRAMs with No Bus Latency™ (NoBL™) logic, respectively. They are designed to support unlimited true back-to-back read/write operations with no wait states. The CY7C1460AV33/CY7C1462AV33 are equipped with the advanced (NoBL) logic required to enable consecutive read/write operations with data being transferred on every clock cycle. This feature dramatically improves the throughput of data in systems that require frequent write/read transitions. The CY7C1460AV33/CY7C1462AV33 are pin compatible and functionally equivalent to ZBT devices.

All synchronous inputs pass through input registers controlled by the rising edge of the clock. All data outputs pass through output registers controlled by the rising edge of the clock. The clock input is qualified by the clock enable (CEN) signal, which when deasserted suspends operation and extends the previous clock cycle.

Write operations are controlled by the byte write selects (BW_a – BW_d for CY7C1460AV33 and BW_a – BW_b for CY7C1462AV33) and a write enable (WE) input. All writes are conducted with on-chip synchronous self timed write circuitry.

Three synchronous chip enables ($\overline{\text{CE}}_1$, $\overline{\text{CE}}_2$, $\overline{\text{CE}}_3$) and an asynchronous output enable (OE) provide for easy bank selection and output tristate control. To avoid bus contention, the output drivers are synchronously tristated during the data portion of a write sequence.

Pin Definitions

Pin Name	I/O Type	Pin Description
A ₀ , A ₁ , A	Input-synchronous	Address inputs used to select one of the address locations. Sampled at the rising edge of the CLK.
$\overline{BW}_a$, $\overline{BW}_b$, $\overline{BW}_c$, $\overline{BW}_d$, $\overline{BW}_e$, $\overline{BW}_f$, $\overline{BW}_g$, $\overline{BW}_h$	Input-synchronous	Byte write select inputs, active LOW. Qualified with $\overline{WE}$ to conduct writes to the SRAM. Sampled on the rising edge of CLK. $\overline{BW}_a$ controls DQ _a and DQP _a , $\overline{BW}_b$ controls DQ _b and DQP _b , $\overline{BW}_c$ controls DQ _c and DQP _c , $\overline{BW}_d$ controls DQ _d and DQP _d , $\overline{BW}_e$ controls DQ _e and DQP _e , $\overline{BW}_f$ controls DQ _f and DQP _f , $\overline{BW}_g$ controls DQ _g and DQP _g , $\overline{BW}_h$ controls DQ _h and DQP _h .
$\overline{WE}$	Input-synchronous	Write enable input, active LOW. Sampled on the rising edge of CLK if $\overline{CEN}$ is active LOW. This signal must be asserted LOW to initiate a write sequence.
ADV/LD	Input-synchronous	Advance/load input used to advance the on-chip address counter or load a new address. When HIGH (and $\overline{CEN}$ is asserted LOW) the internal burst counter is advanced. When LOW, a new address can be loaded into the device for an access. After being deselected, ADV/LD should be driven LOW to load a new address.
CLK	Input-clock	Clock input. Used to capture all synchronous inputs to the device. CLK is qualified with $\overline{CEN}$. CLK is only recognized if $\overline{CEN}$ is active LOW.
$\overline{CE}_1$	Input-synchronous	Chip enable 1 input, active LOW. Sampled on the rising edge of CLK. Used in conjunction with $\overline{CE}_2$ and $\overline{CE}_3$ to select/deselect the device.
$\overline{CE}_2$	Input-synchronous	Chip enable 2 input, active HIGH. Sampled on the rising edge of CLK. Used in conjunction with $\overline{CE}_1$ and $\overline{CE}_3$ to select/deselect the device.
$\overline{CE}_3$	Input-synchronous	Chip enable 3 input, active LOW. Sampled on the rising edge of CLK. Used in conjunction with $\overline{CE}_1$ and $\overline{CE}_2$ to select/deselect the device.
$\overline{OE}$	Input-asynchronous	Output enable, active LOW. Combined with the synchronous logic block inside the device to control the direction of the I/O pins. When LOW, the I/O pins are allowed to behave as outputs. When deasserted HIGH, I/O pins are tristated, and act as input data pins. $\overline{OE}$ is masked during the data portion of a write sequence, during the first clock when emerging from a deselected state and when the device has been deselected.
$\overline{CEN}$	Input-synchronous	Clock enable input, active LOW. When asserted LOW the clock signal is recognized by the SRAM. When deasserted HIGH the clock signal is masked. Since deasserting $\overline{CEN}$ does not deselect the device, $\overline{CEN}$ can be used to extend the previous cycle when required.
DQ _a , DQ _b , DQ _c , DQ _d , DQ _e , DQ _f , DQ _g , DQ _h	I/O-synchronous	Bidirectional data I/O lines. As inputs, they feed into an on-chip data register that is triggered by the rising edge of CLK. As outputs, they deliver the data contained in the memory location specified by A _x during the previous clock rise of the read cycle. The direction of the pins is controlled by $\overline{OE}$ and the internal control logic. When $\overline{OE}$ is asserted LOW, the pins can behave as outputs. When HIGH, DQ _a –DQ _d are placed in a tristate condition. The outputs are automatically tristated during the data portion of a write sequence, during the first clock when emerging from a deselected state, and when the device is deselected, regardless of the state of $\overline{OE}$.
DQP _a , DQP _b , DQP _c , DQP _d , DQP _e , DQP _f , DQP _g , DQP _h	I/O-synchronous	Bidirectional data parity I/O lines. Functionally, these signals are identical to DQ _[31:0] . During write sequences, DQP _a is controlled by $\overline{BW}_a$, DQP _b is controlled by $\overline{BW}_b$, DQP _c is controlled by $\overline{BW}_c$, and DQP _d is controlled by $\overline{BW}_d$, DQP _e is controlled by $\overline{BW}_e$, DQP _f is controlled by $\overline{BW}_f$, DQP _g is controlled by $\overline{BW}_g$, DQP _h is controlled by $\overline{BW}_h$.
MODE	Input strap pin	Mode input. Selects the burst order of the device. Tied HIGH selects the interleaved burst order. Pulled LOW selects the linear burst order. MODE should not change states during operation. When left floating MODE defaults HIGH, to an interleaved burst order.
TDO	JTAG serial output synchronous	Serial data-out to the JTAG circuit. Delivers data on the negative edge of TCK.
TDI	JTAG serial input synchronous	Serial data-in to the JTAG circuit. Sampled on the rising edge of TCK.

Pin Definitions *(continued)*

Pin Name	I/O Type	Pin Description
TMS	Test mode select synchronous	This pin controls the test access port state machine. Sampled on the rising edge of TCK.
TCK	JTAG-clock	Clock input to the JTAG circuitry.
V _{DD}	Power supply	Power supply inputs to the core of the device.
V _{DDQ}	I/O power supply	Power supply for the I/O circuitry.
V _{SS}	Ground	Ground for the device. Should be connected to ground of the system.
NC	N/A	No connects. This pin is not connected to the die.
NC/72M	N/A	Not connected to the die. Can be tied to any voltage level.
NC/144M	N/A	Not connected to the die. Can be tied to any voltage level.
NC/288M	N/A	Not connected to the die. Can be tied to any voltage level.
NC/576M	N/A	Not connected to the die. Can be tied to any voltage level.
NC/1G	N/A	Not connected to the die. Can be tied to any voltage level.
ZZ	Input-asynchronous	ZZ “sleep” input. This active HIGH input places the device in a non-time critical “sleep” condition with data integrity preserved. During normal operation, this pin can be connected to V _{SS} or left floating. ZZ pin has an internal pull-down.

Functional Overview

The CY7C1460AV33/CY7C1462AV33 are synchronous-pipelined burst NoBL SRAMs designed specifically to eliminate wait states during write/read transitions. All synchronous inputs pass through input registers controlled by the rising edge of the clock. The clock signal is qualified with the clock enable input signal (CEN). If CEN is HIGH, the clock signal is not recognized and all internal states are maintained. All synchronous operations are qualified with CEN. All data outputs pass through output registers controlled by the rising edge of the clock. Maximum access delay from the clock rise (t_{CO}) is 2.6 ns (250 MHz device).

Accesses can be initiated by asserting all three chip enables ($\overline{CE}_1$, $\overline{CE}_2$, $\overline{CE}_3$) active at the rising edge of the clock. If clock enable (CEN) is active LOW and ADV/LD is asserted LOW, the address presented to the device is latched. The access can either be a read or write operation, depending on the status of the write enable ($\overline{WE}$). $\overline{BW}_{[x]}$ can be used to conduct byte write operations.

Write operations are qualified by the write enable ($\overline{WE}$). All writes are simplified with on-chip synchronous self timed write circuitry.

Three synchronous chip enables ($\overline{CE}_1$, $\overline{CE}_2$, $\overline{CE}_3$) and an asynchronous output enable ($\overline{OE}$) simplify depth expansion. All operations (reads, writes, and deselections) are pipelined. ADV/LD should be driven LOW after the device has been deselected to load a new address for the next operation.

Single Read Accesses

A read access is initiated when the following conditions are satisfied at clock rise: (1) CEN is asserted LOW, (2) $\overline{CE}_1$, $\overline{CE}_2$, and $\overline{CE}_3$ are all asserted active, (3) the write enable input signal $\overline{WE}$ is deasserted HIGH, and (4) ADV/LD is asserted LOW. The address presented to the address inputs is latched into the address register and presented to the memory core and control

logic. The control logic determines that a read access is in progress and allows the requested data to propagate to the input of the output register. At the rising edge of the next clock the requested data is allowed to propagate through the output register and onto the data bus within 2.6 ns (250 MHz device) provided $\overline{OE}$ is active LOW. After the first clock of the read access the output buffers are controlled by $\overline{OE}$ and the internal control logic. $\overline{OE}$ must be driven LOW for the device to drive out the requested data. During the second clock, a subsequent operation (read/write/deselect) can be initiated. Deselecting the device is also pipelined. Therefore, when the SRAM is deselected at clock rise by one of the chip enable signals, its output tristates following the next clock rise.

Burst Read Accesses

The CY7C1460AV33/CY7C1462AV33 have an on-chip burst counter that enables the user the ability to supply a single address and conduct up to four reads without reasserting the address inputs. ADV/LD must be driven LOW in order to load a new address into the SRAM, as described in the section [Single Read Accesses](#) earlier. The sequence of the burst counter is determined by the MODE input signal. A LOW input on MODE selects a linear burst mode, a HIGH selects an interleaved burst sequence. Both burst counters use A0 and A1 in the burst sequence, and wraps around when incremented sufficiently. A HIGH input on ADV/LD increments the internal burst counter regardless of the state of chip enables inputs or $\overline{WE}$. $\overline{WE}$ is latched at the beginning of a burst cycle. Therefore, the type of access (read or write) is maintained throughout the burst sequence.

Single Write Accesses

Write access are initiated when the following conditions are satisfied at clock rise: (1) CEN is asserted LOW, (2) $\overline{CE}_1$, $\overline{CE}_2$, and $\overline{CE}_3$ are all asserted active, and (3) the write signal $\overline{WE}$ is

asserted LOW. The address presented to the address inputs is loaded into the address register. The write signals are latched into the control logic block.

On the subsequent clock rise the data lines are automatically tristated regardless of the state of the OE input signal. This enables the external logic to present the data on DQ and DQP ($DQ_{a,b,c,d}/DQP_{a,b,c,d}$ for CY7C1460AV33 and $DQ_{a,b}/DQP_{a,b}$ for CY7C1462AV33). In addition, the address for the subsequent access (read/write/deselect) is latched into the address register (provided the appropriate control signals are asserted).

On the next clock rise the data presented to DQ and DQP ($DQ_{a,b,c,d}/DQP_{a,b,c,d}$ for CY7C1460AV33 and $DQ_{a,b}/DQP_{a,b}$ for CY7C1462AV33) (or a subset for byte write operations, see Write Cycle Description table for details) inputs is latched into the device and the write is complete.

The data written during the write operation is controlled by $\overline{BW}$ ($BW_{a,b,c,d}$ for CY7C1460AV33 and $BW_{a,b}$ for CY7C1462AV33) signals. The CY7C1460AV33/CY7C1462AV33 provides byte write capability that is described in the Write Cycle Description table. Asserting the write enable input (WE) with the selected byte write select (BW) input selectively writes to only the desired bytes. Bytes not selected during a byte write operation remains unaltered. A synchronous self timed write mechanism has been provided to simplify the write operations. Byte write capability has been included in order to greatly simplify read/modify/write sequences, which can be reduced to simple byte write operations.

Because the CY7C1460AV33/CY7C1462AV33 are common I/O devices, data should not be driven into the device while the outputs are active. The output enable ($\overline{OE}$) can be deasserted HIGH before presenting data to the DQ and DQP ($DQ_{a,b,c,d}/DQP_{a,b,c,d}$ for CY7C1460AV33 and $DQ_{a,b}/DQP_{a,b}$ for CY7C1462AV33) inputs. Doing so tristates the output drivers. As a safety precaution, DQ and DQP ($DQ_{a,b,c,d}/DQP_{a,b,c,d}$ for CY7C1460AV33 and $DQ_{a,b}/DQP_{a,b}$ for CY7C1462AV33) are automatically tristated during the data portion of a write cycle, regardless of the state of OE.

Burst Write Accesses

The CY7C1460AV33/CY7C1462AV33 has an on-chip burst counter that allows the user the ability to supply a single address and conduct up to four WRITE operations without reasserting the address inputs. ADV/LD must be driven LOW in order to load the

initial address, as described in the section [Single Write Accesses on page 7](#) earlier. When ADV/LD is driven HIGH on the subsequent clock rise, the chip enables (CE_1 , CE_2 , and CE_3) and WE inputs are ignored and the burst counter is incremented. The correct BW ($BW_{a,b,c,d}$ for CY7C1460AV33 and $BW_{a,b}$ for CY7C1462AV33) inputs must be driven in each cycle of the burst write in order to write the correct bytes of data.

Sleep Mode

The ZZ input pin is an asynchronous input. Asserting ZZ places the SRAM in a power conservation “sleep” mode. Two clock cycles are required to enter into or exit from this “sleep” mode. While in this mode, data integrity is guaranteed. Accesses pending when entering the “sleep” mode are not considered valid nor is the completion of the operation guaranteed. The device must be deselected prior to entering the “sleep” mode. CE_1 , CE_2 , and CE_3 , must remain inactive for the duration of t_{ZZREC} after the ZZ input returns LOW.

Interleaved Burst Address Table

(MODE = Floating or V_{DD})

First Address A1, A0	Second Address A1, A0	Third Address A1, A0	Fourth Address A1, A0

Notes

1. X = "Don't Care", H = Logic HIGH, L = Logic LOW, $\overline{CE}$ stands for all chip enables active. $\overline{BW}_x = L$ signifies at least one byte write select is active, $\overline{BW}_x = \text{valid}$ signifies that the desired byte write selects are asserted, see Write Cycle Description table for details.
2. Write is defined by $\overline{WE}$ and $\overline{BW}_x$. See Write Cycle Description table for details.
3. When a write cycle is detected, all I/Os are tristated, even during byte writes.
4. The DQ and DQP pins are controlled by the current cycle and the $\overline{OE}$ signal.
5. $\overline{CEN} = H$ inserts wait states.
6. Device powers up deselected and the I/Os in a tristate condition, regardless of $\overline{OE}$.
7. $\overline{OE}$ is asynchronous and is not sampled with the clock rise. It is masked internally during write cycles. During a read cycle DQ_s and $DQP_x = \text{Tristate}$ when $\overline{OE}$ is inactive or when the device is deselected, and $DQ_s = \text{data}$ when $\overline{OE}$ is active.

Partial Write Cycle Description

The Partial Write Cycle Description for CY7C1460AV33 follows. [8, 9, 10, 11]

Function (CY7C1460AV33)	$\overline{WE}$	$\overline{BW_d}$	$\overline{BW_c}$	$\overline{BW_b}$	$\overline{BW_a}$
Read	H	X	X	X	X
Write – no bytes written	L	H	H	H	H
Write byte a – (DQ _a and DQP _a)	L	H	H	H	L
Write byte b – (DQ _b and DQP _b)	L	H	H	L	H
Write bytes b, a	L	H	H	L	L
Write byte c – (DQ _c and DQP _c)	L	H	L	H	H
Write bytes c, a	L	H	L	H	L
Write bytes c, b	L	H	LL	L	H
Write bytes c, b, a	L	H	L	L	L
Write byte d – (DQ _d and DQP _d)	L	L	H	H	H
Write bytes d, a	L	L	H	H	L
Write bytes d, b	L	L	H	L	H
Write bytes d, b, a	L	L	H	L	L
Write bytes d, c	L	L	L	H	H
Write bytes d, c, a	L	L	L	H	L
Write bytes d, c, b	L	L	L	L	H
Write all bytes	L	L	L	L	L

Partial Write Cycle Description

The Partial Write Cycle Description for CY7C1462AV33 follows. [9, 11]

Function (CY7C1462AV33)	$\overline{WE}$	$\overline{BW_b}$	$\overline{BW_a}$
Read	H	x	x
Write – no bytes written	L	H	H
Write byte a – (DQ _a and DQP _a)	L	H	L
Write byte b – (DQ _b and DQP _b)	L	L	H
Write both bytes	L	L	L

Notes

8. X = "Don't Care", H = Logic HIGH, L = Logic LOW, $\overline{CE}$ stands for all chip enables active. $\overline{BW_x}$ = L signifies at least one byte write select is active, $\overline{BW_x}$ = valid signifies that the desired byte write selects are asserted, see Write Cycle Description table for details.

9. Write is defined by $\overline{WE}$ and $\overline{BW_x}$. See Write Cycle Description table for details.

10. When a write cycle is detected, all I/Os are tristated, even during byte writes.

11. Table only lists a partial listing of the byte write combinations. Any combination of $\overline{BW}_{[a:d]}$ is valid. Appropriate write is done based on which byte write is active.

IEEE 1149.1 Serial Boundary Scan (JTAG)

The CY7C1460AV33 incorporates a serial boundary scan test access port (TAP). This part is fully compliant with 1149.1. The TAP operates using JEDEC-standard 3.3 V or 2.5 V I/O logic level.

The CY7C1460AV33 contains a TAP controller, instruction register, boundary scan register, bypass register, and ID register.

Disabling the JTAG Feature

It is possible to operate the SRAM without using the JTAG feature. To disable the TAP controller, TCK must be tied LOW (V_{SS}) to prevent clocking of the device. TDI and TMS are internally pulled up and may be unconnected. They may alternately be connected to V_{DD} through a pull-up resistor. TDO should be left unconnected. Upon power-up, the device comes up in a reset state which does not interfere with the operation of the device.

Test Access Port (TAP)

Test Clock (TCK)

The test clock is used only with the TAP controller. All inputs are captured on the rising edge of TCK. All outputs are driven from the falling edge of TCK.

Test Mode Select (TMS)

The TMS input is used to give commands to the TAP controller and is sampled on the rising edge of TCK. It is allowable to leave this ball unconnected if the TAP is not used. The ball is pulled up internally, resulting in a logic HIGH level.

Test Data-In (TDI)

The TDI ball is used to serially input information into the registers and can be connected to the input of any of the registers. The register between TDI and TDO is chosen by the instruction that is loaded into the TAP instruction register. For information about loading the instruction register, see the [TAP Controller State Diagram on page 13](#). TDI is internally pulled up and can be unconnected if the TAP is unused in an application. TDI is connected to the most significant bit (MSB) of any register.

Test Data-Out (TDO)

The TDO output ball is used to serially clock data-out from the registers. The output is active depending upon the current state of the TAP state machine (see [Instruction Codes on page 17](#)). The output changes on the falling edge of TCK. TDO is connected to the least significant bit (LSB) of any register.

Performing a TAP Reset

A RESET is performed by forcing TMS HIGH (V_{DD}) for five rising edges of TCK. This RESET does not affect the operation of the SRAM and may be performed while the SRAM is operating.

At power up, the TAP is reset internally to ensure that TDO comes up in a high Z state.

TAP Registers

Registers are connected between the TDI and TDO balls and allow data to be scanned into and out of the SRAM test circuitry. Only one register can be selected at a time through the

instruction register. Data is serially loaded into the TDI ball on the rising edge of TCK. Data is output on the TDO ball on the falling edge of TCK.

Instruction Register

Three bit instructions can be serially loaded into the instruction register. This register is loaded when it is placed between the TDI and TDO balls as shown in the [TAP Controller Block Diagram on page 14](#). Upon power-up, the instruction register is loaded with the IDCODE instruction. It is also loaded with the IDCODE instruction if the controller is placed in a reset state as described in the previous section.

When the TAP controller is in the Capture-IR state, the two least significant bits are loaded with a binary "01" pattern to enable fault isolation of the board-level serial test data path.

Bypass Register

To save time when serially shifting data through registers, it is sometimes advantageous to skip certain chips. The bypass register is a single bit register that can be placed between the TDI and TDO balls. This allows data to be shifted through the SRAM with minimal delay. The bypass register is set LOW (V_{SS}) when the BYPASS instruction is executed.

Boundary Scan Register

The boundary scan register is connected to all the input and bidirectional balls on the SRAM. The length of the boundary scan register for the SRAM in different packages is listed in the Scan Register Sizes table.

The boundary scan register is loaded with the contents of the RAM I/O ring when the TAP controller is in the Capture-DR state and is then placed between the TDI and TDO balls when the controller is moved to the Shift-DR state. The EXTEST, SAMPLE/PRELOAD and SAMPLE Z instructions can be used to capture the contents of the I/O ring.

The [Boundary Scan Order on page 18](#) and show the order in which the bits are connected. Each bit corresponds to one of the bumps on the SRAM package. The MSB of the register is connected to TDI, and the LSB is connected to TDO.

Identification (ID) Register

The ID register is loaded with a vendor-specific, 32-bit code during the Capture-DR state when the IDCODE command is loaded in the instruction register. The IDCODE is hardwired into the SRAM and can be shifted out when the TAP controller is in the Shift-DR state. The ID register has a vendor code and other information described in the [Identification Register Definitions on page 16](#).

TAP Instruction Set

Overview

Eight different instructions are possible with the three bit instruction register. All combinations are listed in the Instruction Codes table. Three of these instructions are listed as RESERVED and should not be used. The other five instructions described in detail are as follows.

Instructions are loaded into the TAP controller during the Shift-IR state when the instruction register is placed between TDI and TDO. During this state, instructions are shifted through the

instruction register through the TDI and TDO balls. To execute the instruction after it is shifted in, the TAP controller needs to be moved into the Update-IR state.

IDCODE

The IDCODE instruction causes a vendor-specific, 32-bit code to be loaded into the instruction register. It also places the instruction register between the TDI and TDO balls and allows the IDCODE to be shifted out of the device when the TAP controller enters the Shift-DR state.

The IDCODE instruction is loaded into the instruction register upon power up or whenever the TAP controller is given a test logic reset state.

SAMPLE Z

The SAMPLE Z instruction causes the boundary scan register to be connected between the TDI and TDO pins when the TAP controller is in a Shift-DR state. The SAMPLE Z command puts the output bus into a high Z state until the next command is given during the "Update IR" state.

SAMPLE/PRELOAD

SAMPLE/PRELOAD is a 1149.1 mandatory instruction. When the SAMPLE/PRELOAD instructions are loaded into the instruction register and the TAP controller is in the Capture-DR state, a snapshot of data on the inputs and output pins is captured in the boundary scan register.

The user must be aware that the TAP controller clock can only operate at a frequency up to 20 MHz, while the SRAM clock operates more than an order of magnitude faster. Because there is a large difference in the clock frequencies, it is possible that during the Capture-DR state, an input or output undergoes a transition. The TAP may then try to capture a signal while in transition (metastable state). This does not harm the device, but there is no guarantee as to the value that is captured. Repeatable results may not be possible.

To guarantee that the boundary scan register captures the correct value of a signal, the SRAM signal must be stabilized long enough to meet the TAP controller's capture setup plus hold times (t_{CS} and t_{CH}). The SRAM clock input might not be captured correctly if there is no way in a design to stop (or slow) the clock during a SAMPLE/PRELOAD instruction. If this is an issue, it is still possible to capture all other signals and simply ignore the value of the CK and CK# captured in the boundary scan register.

After the data is captured, it is possible to shift out the data by putting the TAP into the Shift-DR state. This places the boundary scan register between the TDI and TDO pins.

PRELOAD allows an initial data pattern to be placed at the latched parallel outputs of the boundary scan register cells prior to the selection of another boundary scan test operation.

The shifting of data for the SAMPLE and PRELOAD phases can occur concurrently when required – that is, while data captured is shifted out, the preloaded data can be shifted in.

BYPASS

When the BYPASS instruction is loaded in the instruction register and the TAP is placed in a Shift-DR state, the bypass register is placed between the TDI and TDO pins. The advantage of the BYPASS instruction is that it shortens the boundary scan path when multiple devices are connected together on a board.

EXTEST

The EXTEST instruction enables the preloaded data to be driven out through the system output pins. This instruction also selects the boundary scan register to be connected for serial access between the TDI and TDO in the shift-DR controller state.

EXTEST OUTPUT BUS TRISTATE

IEEE Standard 1149.1 mandates that the TAP controller be able to put the output bus into a tristate mode.

The boundary scan register has a special bit located at bit #89 (for 165-ball FBGA package) or bit #138 (for 209-ball FBGA package). When this scan cell, called the "extest output bus tristate," is latched into the preload register during the "Update-DR" state in the TAP controller, it directly controls the state of the output (Q-bus) pins, when the EXTEST is entered as the current instruction. When HIGH, it enables the output buffers to drive the output bus. When LOW, this bit places the output bus into a high Z condition.

This bit can be set by entering the SAMPLE/PRELOAD or EXTEST command, and then shifting the desired bit into that cell, during the "Shift-DR" state. During "Update-DR," the value loaded into that shift-register cell latches into the preload register. When the EXTEST instruction is entered, this bit directly controls the output Q-bus pins. Note that this bit is preset HIGH to enable the output when the device is powered-up, and also when the TAP controller is in the "Test-Logic-Reset" state.

Reserved

These instructions are not implemented but are reserved for future use. Do not use these instructions.

TAP Controller State Diagram

The 0/1 next to each state represents the value of TMS at the rising edge of TCK.

Note

16. Bit# 89 is preset HIGH.

Maximum Ratings

Exceeding maximum ratings may shorten the useful life of the device. User guidelines are not tested.

Storage temperature –65 °C to +150 °C

Ambient temperature with power applied –55 °C to +125 °C

Supply voltage on V_{DD} relative to GND –0.5 V to +4.6 V

Supply voltage on V_{DDQ} relative to GND –0.5 V to + V_{DD}

DC to outputs in tri-state –0.5 V to $V_{DDQ} + 0.5$ V

DC input voltage –0.5 V to $V_{DD} + 0.5$ V

Current into outputs (LOW) 20 mA

Static discharge voltage (per MIL-STD-883, method 3015) > 2001 V

Latch-up current > 200 mA

Operating Range

Range	Ambient Temperature	V_{DD}	V_{DDQ}
Commercial	0 °C to +70 °C	3.3 V – 5% / + 10%	2.5 V – 5% to V_{DD}
Industrial	–40 °C to +85 °C		

Neutron Soft Error Immunity

Parameter	Description	Test Conditions	Typ	Max*	Unit
LSBU	Logical single bit upsets	25 °C	361	394	FIT/Mb
LMBU	Logical multi bit upsets	25 °C	0	0.01	FIT/Mb
SEL	Single event latch-up	85 °C	0	0.1	FIT/Dev

* No LMBU or SEL events occurred during testing; this column represents a statistical χ^2 , 95% confidence limit calculation. For more details refer to Application Note AN 54908 "Accelerated Neutron SER Testing and Calculation of Terrestrial Failure Rates"

Electrical Characteristics

Over the Operating Range

Parameter ^[17, 18]	Description	Test Conditions	Min	Max	Unit
V_{DD}	Power supply voltage		3.135	3.6	V

Notes

20. Timing reference is 1.5 V when $V_{DDQ} = 3.3$ V and is 1.25 V when $V_{DDQ} = 2.5$ V.

21. Test conditions shown in (a) of [Figure 3 on page 21](#) unless otherwise noted.

22. This part has a voltage regulator internally; t_{Power} is the time power needs to be supplied above $V_{DD(minimum)}$ initially, before a Read or Write operation can be initiated.

23. t_{CHZ} , t_{CLZ} , t_{EOLZ} , and t_{EOHZ} are specified with AC test conditions shown in (b) of [Figure 3 on page 21](#). Transition is measured ± 200 mV from steady-state voltage.

24. At any voltage and temperature, t_{EOHZ} is less than t_{EOLZ} and t_{CHZ} is less than t_{CLZ} to eliminate bus contention between SRAMs when sharing the same data bus.

These specifications do not imply a bus contention condition, but reflect parameters guaranteed over worst case user conditions. Device is designed to achieve high Z prior to low Z under the same system conditions.

25. This parameter is sampled and not 100% tested.

Switching Waveforms

Figure 4. Read/Write/Timing [26, 27, 28]

Notes

26. For this waveform $\overline{ZZ}$ is tied low.

27. When $\overline{CE}$ is LOW, $\overline{CE}_1$ is LOW, $\overline{CE}_2$ is HIGH and $\overline{CE}_3$ is LOW. When $\overline{CE}$ is HIGH, $\overline{CE}_1$ is HIGH or $\overline{CE}_2$ is LOW or $\overline{CE}_3$ is HIGH.

28. Order of the burst sequence is determined by the status of the MODE (0 = Linear, 1 = Interleaved). Burst operations are optional.

Switching Waveforms (continued)

Figure 5. NOP, STALL and DESELECT Cycles [29, 30, 31]

Figure 6. ZZ Mode Timing [32, 33]

Notes

29. For this waveform ZZ is tied low.

30. When $\overline{CE}$ is LOW, $\overline{CE}_1$ is LOW, $\overline{CE}_2$ is HIGH and $\overline{CE}_3$ is LOW. When $\overline{CE}$ is HIGH, $\overline{CE}_1$ is HIGH or $\overline{CE}_2$ is LOW or $\overline{CE}_3$ is HIGH.

31. The IGNORE CLOCK EDGE or STALL cycle (Clock 3) illustrated $\overline{CEN}$ being used to create a pause. A write is not performed during this cycle.

32. Device must be deselected when entering ZZ mode. See cycle description table for all possible signal conditions to deselect the device.

33. I/Os are in high Z when exiting ZZ sleep mode.

Speed (MHz)	Ordering Code	Package Diagram	Part and Package Type	Operating Range
167	CY7C1460AV33-167AXC	51-85050	100-pin TQFP (14 × 20 × 1.4 mm) Pb-free	Commercial
	CY7C1462AV33-167AXC			
	CY7C1460AV33-167BZC	51-85195	165-ball FBGA (15 × 17 × 1.4 mm)	Industrial
	CY7C1460AV33-167AXI	51-85050	100-pin TQFP (14 × 20 × 1.4 mm) Pb-free	
200	CY7C1460AV33-200AXC	51-85050	100-pin TQFP (14 × 20 × 1.4 mm) Pb-free	Commercial
	CY7C1462AV33-200AXI			Industrial
250	CY7C1460AV33-250AXC	51-85050	100-pin TQFP (14 × 20 × 1.4 mm) Pb-free	Commercial
	CY7C1460AV33-250AXI			Industrial

Acronyms

Acronym	Description
$\overline{\text{CE}}$	chip enable
$\overline{\text{CEN}}$	clock enable
CMOS	complementary metal oxide semiconductor
EIA	electronic industries alliance
FBGA	fine-pitch ball grid array
I/O	input/output
JEDEC	joint electron devices engineering council
JTAG	joint test action group
LMBU	logical multi bit upsets
LSB	least significant bit
LSBU	logical single bit upsets
MSB	most significant bit
NoBL	No Bus Latency
$\overline{\text{OE}}$	output enable
SEL	single event latch-up
SRAM	static random access memory
TAP	test access port
TCK	test clock
TMS	test mode select
TDI	test data-in
TDO	test data-out
TQFP	thin quad flat pack
TTL	transistor-transistor logic
$\overline{\text{WE}}$	write enable

Document Conventions

Units of Measure

Symbol	Unit of Measure
°C	degree Celsius
MHz	megahertz
μA	microampere
mA	milliampere
ms	millisecond
mm	millimeter
mV	millivolt
nm	nanometer
ns	nanosecond
Ω	ohm
%	percent
pF	picofarad
V	volt
W	watt

Document History Page

Document Title: CY7C1460AV33/CY7C1462AV33, 36-Mbit (1 M × 36/2 M × 18) Pipelined SRAM with NoBL™ Architecture Document Number: 38-05353				
Revision	ECN	Orig. of Change	Submission Date	Description of Change
**	254911	SYT	See ECN	New data sheet. Part number changed from previous revision. New and old part number differ by the letter "A".
*A	303533	SYT	See ECN	Updated Pin Configurations (Changed H9 pin from V _{SSQ} to V _{SS} on 209-ball FBGA). Updated Electrical Characteristics (Changed the test condition from V _{DD} = Min to V _{DD} = Max for V _{OL} parameter, changed maximum value of I _{DD} parameter from 450, 400 and 350 mA to 475, 425 and 375 mA for 250, 200 and 167 MHz respectively, changed maximum value of I _{SB1} parameter from 190, 180 and 170 mA to 225 mA for 250, 200 and 167 MHz respectively, changed maximum value of I _{SB2} parameter from 80 mA to 100 mA for all frequencies, changed maximum value of I _{SB3} parameter from 180, 170 and 160 mA to 200 mA for 250, 200 and 167 MHz respectively, changed maximum value of I _{SB4} parameter from 100 mA to 110 mA for all frequencies). Updated Capacitance (Changed the values of C _{IN} , C _{CLK} and C _{I/O} parameters to 6.5, 3 and 5.5 pF from 5, 5 and 7 pF for 100-pin TQFP package). Updated Thermal Resistance (Replaced the values of Θ_{JA} and Θ_{JC} parameters from TBD to respective Thermal Values for all packages). Updated Switching Characteristics (Changed maximum value of t _{CO} parameter from 3.0 ns to 3.2 ns and minimum value of t _{DOH} parameter from 1.3 ns to 1.5 ns for 200 MHz speed bin). Updated Ordering Information (Added Pb-free information for 100-pin TQFP and 165-ball FBGA and 209-ball BGA packages).
*B	331778	SYT	See ECN	Updated Pin Configurations (Modified Address Expansion balls in the pinouts for 165-ball FBGA and 209-ball BGA Package as per JEDEC standards) and updated Pin Definitions accordingly. Updated Operating Range (Added Industrial Temperature Grade). Updated Electrical Characteristics (Modified test conditions for V _{OL} and V _{OH} parameters, changed maximum value of I _{SB2} parameter from 100 mA to 120 mA and maximum value of I _{SB4} parameter from 110 mA to 135 mA). Updated Capacitance (Changed C _{IN} , C _{CLK} and C _{I/O} to 7, 7 and 6 pF from 5, 5 and 7 pF for 165-ball FBGA Package). Updated Ordering Information (by Shading and Unshading MPNs as per availability).
*C	417509	R XU	See ECN	Changed status from Preliminary to Final Changed address of Cypress Semiconductor Corporation on Page# 1 from "3901 North First Street" to "198 Champion Court" Updated Electrical Characteristics (Modified the description of I _X parameter "Input Load Current except ZZ and MODE" to "Input Leakage Current except ZZ and MODE", changed minimum value of I _X parameter from -5 μ A to -30 μ A and maximum value of I _X parameter from 30 μ A to 5 μ A respectively for "Input Current of MODE", and also changed minimum value of I _X parameter from -30 μ A to -5 μ A and maximum value of I _X parameter from 5 μ A to 30 μ A respectively for "Input Current of ZZ", Modified test condition from V _{IH} ≤ V _{DD} to V _{IH} < V _{DD}). Updated Ordering Information (Replaced Package Name column with Package Diagram in the Ordering Information table). Updated Package Diagrams (for spec 51-85050).

Document History Page *(continued)*

Document Title: CY7C1460AV33/CY7C1462AV33, 36-Mbit (1 M × 36/2 M × 18) Pipelined SRAM with NoBL™ Architecture Document Number: 38-05353				
Revision	ECN	Orig. of Change	Submission Date	Description of Change
*D	473229	NXR	See ECN	Updated TAP AC Switching Characteristics (Changed minimum value of t_{TH} , t_{TL} parameters from 25 ns to 20 ns and maximum value of t_{DOV} parameter from 5 ns to 10 ns). Updated Maximum Ratings (Added the Maximum Rating for Supply Voltage on V_{DDQ} Relative to GND). Updated Ordering Information (Updated part numbers).
*E	2756998	VKN	08/28/09	Included Neutron Soft Error Immunity . Updated Ordering Information (by including parts that are available) and modified the disclaimer for the Ordering Information . Updated Package Diagrams (for spec 51-85165).
*F	2900822	NJY	03/29/2010	Updated Ordering Information (Added part number CY7C1460AV33-167AXI). Updated Package Diagrams (100-pin TQFP and 209-ball FBGA). Updated links in Sales, Solutions, and Legal Information .
*G	3043005	NJY	09/30/2010	Added Ordering Code Definitions . Added Acronyms and Units of Measure . Minor edits and updated in new template.
*H	3051765	NJY	10/07/2010	Removed all information of CY7C1464 and 209-ball FBGA across the document as those part numbers are pruned. Corrected typos in Units of Measure .
*I	3207715	NJY	03/28/2011	Updated Ordering Information (Updated part numbers). Updated Package Diagrams .
*J	3365114	PRIT	09/14/2011	Updated Package Diagrams .
*K	3538377	PRIT	03/02/2012	Updated Features (Removed all information related to CY7C1462AV33 165-ball FBGA packages). Updated Pin Configurations (Removed all information related to CY7C1462AV33 165-ball FBGA packages). Updated IEEE 1149.1 Serial Boundary Scan (JTAG) (Removed all information related to CY7C1462AV33 165-ball FBGA packages). Updated Identification Register Definitions (Removed all information related to CY7C1462AV33 165-ball FBGA packages). Updated Scan Register Sizes (Removed all information related to CY7C1462AV33 165-ball FBGA packages). Updated Boundary Scan Order (Removed all information related to CY7C1462AV33 165-ball FBGA packages). Updated Ordering Information (Added part number CY7C1462AV33-200AXI). Updated Package Diagrams .
*L	3767562	PRIT	10/05/2012	No technical updates. Completing sunset review.

Sales, Solutions, and Legal Information

Worldwide Sales and Design Support

Cypress maintains a worldwide network of offices, solution centers, manufacturer's representatives, and distributors. To find the office closest to you, visit us at [Cypress Locations](#).
