2. Frequency stability vs. change in temperature. $[\pm(F_{max} - F_{min}) / (2 \cdot F_0)]$.
3. Inclusive of frequency stability, supply voltage change ($\pm 1\%$), load change, aging, for 24 hours.
4. Frequency change after reciprocal temperature ramped over the operating range. Frequency measured before and after at 25°C.
5. Inclusive of calibration @ 25 °C, frequency vs. change in temperature, change in supply voltage ($\pm 5\%$), load change ($\pm 5\%$), reflow soldering process and 20 years aging, referenced to Fo
6. BW = 12 KHz to 20 MHz.
7. For best performance it is recommended that the circuit connected to this output should have an equivalent input capacitance of 15pF.

Test Circuit

Attention: To achieve optimal frequency stability, and in some cases to meet the specification stated on this data sheet, it is required that the circuit connected to this TCXO output must have the equivalent input capacitance that is specified by the nominal load capacitance. Deviations from the nominal load capacitance will have a graduated effect on the stability of approximately 20 ppb per pF load difference.
