

32-Macrocell MAX® EPLD

Features

- High-performance, high-density replacement for TTL, 74HC, and custom logic
- 32 macrocells, 64 expander product terms in one LAB
- 8 dedicated inputs, 16 I/O pins
- Advanced 0.65-micron CMOS EPROM technology to increase performance
- 28-pin, 300-mil DIP, cerDIP or 28-pin HLCC, PLCC package

Functional Description

Available in a 28-pin, 300-mil DIP or windowed J-led ceramic chip carrier (HLCC), the CY7C344B represents the

densest EPLD of this size. Eight dedicated inputs and 16 bi-directional I/O pins communicate to one logic array block. In the CY7C344B LAB there are 32 macrocells and 64 expander product terms. When an I/O macrocell is used as an input, two expanders are used to create an input path. Even if all of the I/O pins are driven by macrocell registers, there are still 16 "buried" registers available. All inputs, macrocells, and I/O pins are interconnected within the LAB.

The speed and density of the CY7C344B makes it a natural for all types of applications. With just this one device, the designer can implement complex state machines, registered logic, and combinatorial "glue" logic, without using multiple chips. This architectural flexibility allows the CY7C344B to replace multichip TTL solutions, whether they are synchronous, asynchronous, combinatorial, or all three.

Selection Guide

	7C344B-15	7C344B-20	7C344B-25
Maximum Access Time (ns)	15	20	25

Note:

1. Number in () refers to J-leaded packages.

MAX is a registered trademark of Altera Corporation.

Maximum Ratings

(Above which the useful life may be impaired. For user guidelines, not tested.)

Storage Temperature -65°C to +135°C

Ambient Temperature with
Power Applied..... -65°C to +135°C

Maximum Junction Temperature (Under Bias)..... 150°C

Supply Voltage to Ground Potential^[2]..... -2.0V to +7.0V

DC Output Current, per Pin^[2]..... -25 mA to +25 mA

DC Input Voltage^[2] -2.0V to +7.0V

Operating Range^[3]

Range	Ambient Temperature	V _{CC}
Commercial	-0°C to +70°C	5V ±5%
Industrial	-40°C to +85°C	5V ±10%

Electrical Characteristics Over the Operating Range

Parameter	Description	Test Conditions	Min.	Max.	Unit
V _{CC}	Supply Voltage	Maximum V _{CC} rise time is 10 ms	4.75(4.5)	5.25(5.5)	V
V _{OH}	Output HIGH Voltage	I _{OH} = -4.0 mA DC ^[4]	2.4		V
V _{OL}	Output LOW Voltage	I _{OL} = 8 mA DC ^[4]		0.45	V
V _{IH}	Input HIGH Level		2.0	V _{CC} +0.3	V
V _{IL}	Input LOW Level		-0.3	0.8	V
I _{IX}	Input Current	GND ≤ V _{IN} ≤ V _{CC}	-10	+10	μA
I _{OZ}	Output Leakage Current	V _O = V _{CC} or GND	-40	+40	μA
t _R	Recommended Input Rise Time			100	ns
t _F	Recommended Input Fall Time			100	ns

Capacitance

Parameter	Description	Test Conditions	Max.	Unit
C _{IN}	Input Capacitance	V _{IN} = 0V, f = 1.0 MHz	10	pF
C _{OUT}	Output Capacitance	V _{OUT} = 0V, f = 1.0 MHz	12	pF

AC Test Loads and Waveforms

C344B-5

C344B-6

Equivalent to: THÉVENIN EQUIVALENT (commercial)

C344B-7

Notes:

- Minimum DC input is -0.3V. During transactions, the inputs may undershoot to -2.0V or overshoot to 7.0V for input currents less than 100 mA and periods shorter than 20 ns.
- The Voltage on any input or I/O pin cannot exceed the power pin during power-up.
- The I_{OH} parameter refers to high-level TTL output current; the I_{OL} parameter refers to low-level TTL output current.

Design Recommendations

Operation of the devices described herein with conditions above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this data sheet is not implied. Exposure to absolute maximum ratings conditions for extended periods of time may affect device reliability. The CY7C344B contains circuitry to protect device pins from high-static voltages or electric fields; however, normal precautions should be taken to avoid applying any voltage higher than maximum rated voltages.

For proper operation, input and output pins must be constrained to the range $GND \leq (V_{IN} \text{ or } V_{OUT}) \leq V_{CC}$. Unused inputs must always be tied to an appropriate logic level (either V_{CC} or GND). Each set of V_{CC} and GND pins must be connected together directly at the device. Power supply decoupling capacitors of at least 0.2 μF must be connected between V_{CC} and GND . For the most effective decoupling, each V_{CC} pin should be separately decoupled.

Timing Considerations

Unless otherwise stated, propagation delays do not include expanders. When using expanders, add the maximum expander delay t_{EXP} to the overall delay.

When calculating synchronous frequencies, use t_{SU} if all inputs are on the input pins. When expander logic is used in the data path, add the appropriate maximum expander delay, t_{EXP} to t_{SU} . Determine which of $1/(t_{WH} + t_{WL})$, $1/t_{CO1}$, or $1/(t_{EXP} + t_{SU})$ is the lowest frequency. The lowest of these frequencies is the maximum data-path frequency for the synchronous configuration.

When calculating external asynchronous frequencies, use t_{AS1} if all inputs are on dedicated input pins.

When expander logic is used in the data path, add the appropriate maximum expander delay, t_{EXP} to t_{AS1} . Determine which of $1/(t_{AWH} + t_{AWL})$, $1/t_{ACO1}$, or $1/(t_{EXP} + t_{AS1})$ is the lowest frequency. The lowest of these frequencies is the maximum data-path frequency for the asynchronous configuration.

The parameter t_{OH} indicates the system compatibility of this device when driving other synchronous logic with positive input hold times, which is controlled by the same synchronous clock. If t_{OH} is greater than the minimum required input hold time of the subsequent synchronous logic, then the devices are guaranteed to function properly with a common synchronous clock under worst-case environmental and supply voltage conditions.

Typical I_{CC} vs. f_{MAX}

Output Drive Current

Figure 1. CY7C344B Timing Model

External Synchronous Switching Characteristics Over Operating Range

Parameter	Description		7C344B-15		7C344B-20		7C344B-25		Unit
			Min.	Max.	Min.	Max.	Min.	Max.	
t_{PD1}	Dedicated Input to Combinatorial Output Delay ^[5]	Com'I/Ind		15		20		25	ns
t_{PD2}	I/O Input to Combinatorial Output Delay ^[5]	Com'I/Ind		15		20		25	ns
t_{SU}	Global Clock Set-up Time	Com'I/Ind	9		12		15		ns
t_{CO1}	Synchronous Clock Input to Output Delay ^[5]	Com'I/Ind		10		12		15	ns
t_H	Input Hold Time from Synchronous Clock Input	Com'I/Ind	0		0		0		ns
t_{WH}	Synchronous Clock Input HIGH Time	Com'I/Ind	6		7		8		ns
t_{WL}	Synchronous Clock Input LOW Time	Com'I/Ind	6		7		8		ns
f_{MAX}	Maximum Register Toggle Frequency ^[6]	Com'I/Ind	83.3			71.4		62.5	MHz
t_{CNT}	Minimum Global Clock Period	Com'I/Ind		13		16		20	ns
t_{ODH}	Output Data Hold Time After Clock	Com'I/Ind	1		1		1		ns
f_{CNT}	Maximum Internal Global Clock Frequency ^[7]	Com'I/Ind	76.9		62.5		50		MHz

Notes:

5. $C_1 = 35$ pF
6. The f_{MAX} values represent the highest frequency for pipeline data.
7. This parameter is measured with a 32-bit counter programmed into each LAB.

External Asynchronous Switching Characteristics Over Operating Range

Parameter	Description		7C344B-15		7C344B-20		7C344B-25		Unit
			Min.	Max.	Min.	Max.	Min.	Max.
