

CMOS 8-BIT MICROCONTROLLER

TMP88PS49N, TMP88PS49F

The 88PS49 is a One-Time PROM microcontroller with low-power 514K bits (64K bytes + 256 bytes) electrically programmable read only memory for the 88CK49/CM49 system evaluation. The 88PS49 is pin compatible with the 88CK49/CM49. The operations possible with the 88CK49/CM49 can be performed by writing programs to PROM. The 88PS49 can write and verify in the same way as the TC571000 using an adaptor socket BM11110A/BM11111A and an EPROM programmer.

OPERATIONAL DESCRIPTION

The following explains the 88PS49 hardware configuration and operation. The configuration and functions of the 88PS49 are the same as those of the 88CK49/CM49, except in that a one-time PROM is used instead of an on-chip mask ROM.

1. OPERATING MODE

The 88PS49 has two modes: MCU and PROM.

1.1 MCU mode

The MCU mode is activated by fixing the TEST/VPP pin at low level.

In the MCU mode, operation is the same as with the 88CK49/CM49 (the TEST/VPP pin cannot be used open because it has no built-in pull-down resistance).

1.1.1 Program Memory

The 88PS49 has a 64K bytes (addresses 4000_H to 13FFF_H in the MCU mode, addresses 0000_H to FFFF_H in the PROM mode) and 256 bytes (addresses FFF0_H to FFFF_H in the MCU mode, addresses 1FF0_H to 1FFF_H in the PROM mode) of program memory (OTP).

Figure 1-1. Program Memory Area

1.1.2 Data Memory

The 88PS49 has an on-chip $2K \times 8$ -bit data memory (static RAM).

1.1.3 Input/Output Circuitry

(1) Control pins

The control pins of the 88PS49 are same as those of the 88CK49/CM49 except that the TEST pin has is no built-in pull-down resistance.

Figure 1-2. TEST Pin

(2) I/O ports

The I/O circuitries of 88PS49 I/O ports are the same as the I/O circuitries of the 88CK49/CM49.

1.2 PROM Mode

The PROM mode is activated by setting the TEST, $\overline{\text{RESET}}$ pin and the ports P17 to P10 and P22 to P20 as shown in Figure 1-2. The PROM mode is used to write and verify programs with general-purpose PROM programmer. The high-speed programming mode can be used for program operation.

The 88PS49 is not supported an *electric signature* mode, so the ROM type must be set to TC571000. Set the adaptor socket switch to "N".

Figure 1-2. Setting for PROM Mode

1.2.1 Programming Flowchart (High-speed Programming Mode)

The high-speed programming mode is achieved by applying the program voltage (+ 12.75 V) to the VPP pin when $V_{CC} = 6.25$ V. After the address and input data are stable, the data is programmed by applying a single 0.1 ms program pulse to the PGM input. The programmed data is verified. If incorrect, another 0.1 ms program pulse is applied. This process should be repeated (up to 25 times) until the program operates correctly. After that, change the address and input data, and program as before. When programming has been completed, the data in all addresses should be verified with $V_{CC} = V_{PP} = 5$ V.

1.2.2 Writing method for General-purpose PROM Program

(1) Adapters

BM11110A : TMP88PS49N

BM11111A : TMP88PS49F

(2) Adapter setting

Switch (SW1) is set to side N.

(3) PROM programmer specifying

i) PROM type is specified to TC571000. (Note 1)

Writing voltage: 12.75 V (high-speed program mode)

ii) Data transfer (copy) (Note 2)

In TMP87PS49, EPROM is within the address 00000 to 0FFFF_H (program memory area), and 1FF00 to 1FFFF_H (vector memory area). Data is required to be transferred (copied) to the addresses where it is possible to write. The program area in MCU mode and PROM mode is referred to "program memory area" in figure 1-1.

Ex. In the block transfer (copy) mode, executed as below.

Program memory area

ROM capacity of 24 KB : transferred addresses 4000 to 9FFF_H to address 0000 to 5FFF_H.

ROM capacity of 32 KB : transferred addresses 4000 to BFFF_H to address 0000 to 7FFF_H.

Vector memory area

ROM capacity of 24 KB/32 KB: transferred addresses FFF00 to FFFF_H to address 1FF00 to 1FFFF_H.

iii) Writing address is specified. (Note 3)

Start address : 00000_H

End address : 1FFFF_H

(4) Writing

Writing/Verifying is required to be executed in accordance with PROM programmer operating procedure.

Note 1 : The specifying method is referred to the PROM programmer description. The unused area must be specified to FF_H.

Note 2 : When MCU is set to an adapter or the adapter is set to PROM programmer, a position of pin 1 must be adjusted. If the setting is reversed, MCU, the adapter and PROM program is damaged.

Note 3 : TMP88PS49 does not support the electric signature mode (hereinafter referred to as "signature"). If the signature is used in PROM program, a device is damaged due to applying 12 V $\pm$ 0.5 V to the address pin 9 (A9). The signature must not be used.
