

DRAM

MT4LC4M4E8, MT4LC4M4E9

For the latest data sheet revisions, please refer to the Micron Web site: www.micron.com/mti/msp/html/datasheet.html

FEATURES

- Industry-standard x4 pinout, timing, functions and packages
- High-performance, low-power CMOS silicon-gate process
- Single +3.3V $\pm 0.3V$ power supply
- All inputs, outputs and clocks are TTL-compatible
- Refresh modes: RAS#-ONLY, HIDDEN and CAS#-BEFORE-RAS# (CBR)
- Optional self refresh (S) for low-power data retention
- 11 row, 11 column addresses (2K refresh) or 12 row, 10 column addresses (4K refresh)
- Extended Data-Out (EDO) PAGE MODE access

OPTIONS

- Refresh Addressing

2,048 (2K) rows	E8
4,096 (4K) rows	E9

60ns access	-6
- Refresh Rates

Standard Refresh	None
Self Refresh (128ms period)	S*

MARKING

NOTE: 1. The 4 Meg x 4 EDO DRAM base number differentiates the offerings in one place - MT4LC4M4E8. The fifth field distinguishes various options: E8 designates a 2K refresh and E9 designates a 4K refresh for EDO DRAMs.

2. The “#” symbol indicates signal is active LOW.

*Contact factory for availability

-6	104ns	60ns	25ns	30ns	15ns	10ns

GENERAL DESCRIPTION

The 4 Meg x 4 DRAM is a randomly accessed, solid-state memory containing 16,777,216 bits organized in a x4 configuration. RAS# is used to latch the row address (first 11 bits for 2K and first 12 bits for 4K). Once the page has been opened by RAS#, CAS# is used to latch the column address

x = speed

(the latter 11 bits for 2K and the latter 10 bits for 4K; address pins A10 and A11 are “Don’t Care”). READ and WRITE cycles are selected with the WE# input.

A logic HIGH on WE# dictates read mode, while a logic LOW on WE# dictates write mode. During a WRITE cycle, data-in (D) is latched by the falling edge of WE# or CAS#, whichever occurs last. An EARLY WRITE occurs when WE# is taken LOW prior to CAS# falling. A LATE WRITE or READ-MODIFY-WRITE occurs when WE# falls after CAS# is taken LOW. During EARLY WRITE cycles, the data outputs (Q) will remain High-Z regardless of the state of OE#. During LATE WRITE or READ-MODIFY-WRITE

GENERAL DESCRIPTION (continued)

cycles, OE# must be taken HIGH to disable the data outputs prior to applying input data. If a LATE WRITE or READ-MODIFY-WRITE is attempted while keeping OE# LOW, no WRITE will occur, and the data outputs will drive read data from the accessed location.

The four data inputs and the four data outputs are routed through four pins using common I/O, and pin direction is controlled by WE# and OE#.

The 4 Meg x 4 DRAM must be refreshed periodically in order to retain stored data.

PAGE ACCESS

Page operations allow faster data operations (READ, WRITE or READ-MODIFY-WRITE) within a row-address-defined page boundary. The page cycle is always initiated with a row address strobed in by RAS#, followed by a column address strobed in by CAS#. Additional columns may be accessed by providing valid column addresses, strobing CAS# and holding RAS# LOW, thus executing faster memory cycles. Returning RAS# HIGH terminates the page mode of operation, i.e., closes the page.

EDO PAGE MODE

The 4 Meg x 4 EDO DRAM provides EDO PAGE MODE, which is an accelerated FAST-PAGE-MODE cycle. The primary advantage of EDO is the availability of data-out even after CAS# returns HIGH. EDO allows CAS# precharge time (t_{CP}) to occur without the output data going invalid. This elimination of CAS# output control allows pipelined READs.

FAST-PAGE-MODE DRAMs have traditionally turned the output buffers off (High-Z) with the rising edge of CAS#. EDO-PAGE-MODE DRAMs operate like FAST-PAGE-MODE DRAMs, except data will remain valid or become valid after CAS# goes HIGH during READs, provided RAS# and OE# are held LOW. If OE# is pulsed while RAS# and CAS# are LOW, data will toggle from valid data to High-Z and back to the same valid data. If OE# is toggled or pulsed after CAS# goes HIGH while RAS# remains LOW, data will transition to and remain High-Z (refer to Figure 1). WE# can also perform the function of disabling the output devices under certain conditions, as shown in Figure 2.

During an application, if the DQ outputs are wire OR'd, OE# must be used to disable idle banks of DRAMs. Alterna-

Figure 1
OE# CONTROL OF DQs

EDO PAGE MODE (continued)

tively, pulsing WE# to the idle banks during CAS# HIGH time will also High-Z the outputs. Independent of OE# control, the outputs will disable after 'tOFF, which is referenced from the rising edge of RAS# or CAS#, whichever occurs last.

DRAM REFRESH

Preserve correct memory cell data by maintaining power and executing any RAS# cycle (READ, WRITE) or RAS# REFRESH cycle (RAS#-ONLY, CBR or HIDDEN) so that all combinations of RAS# addresses (2,048 for 2K and 4,096 for 4K) are executed within 'tREF (MAX), regardless of sequence. The CBR and SELF REFRESH cycles will invoke the internal refresh counter for automatic RAS# addressing.

An optional self refresh mode is also available on the "S" version. The self refresh feature is initiated by performing a CBR REFRESH cycle and holding RAS# LOW for the specified 'tRASS. The "S" option allows the user the choice of a fully static, low-power data retention mode or a dynamic refresh mode at the extended refresh period of 128ms,

or 31.25 μ s per row for a 4K refresh and 62.5 μ s per row for a 2K refresh, when using a distributed CBR REFRESH. This refresh rate can be applied during normal operation, as well as during a standby or battery backup mode.

The self refresh mode is terminated by driving RAS# HIGH for a minimum time of 'tRPS. This delay allows for the completion of any internal refresh cycles that may be in process at the time of the RAS# LOW-to-HIGH transition. If the DRAM controller uses a distributed refresh sequence, a burst refresh is not required upon exiting self refresh. However, if the DRAM controller utilizes a RAS#-ONLY or burst refresh sequence, all rows must be refreshed within the average internal refresh rate, prior to the resumption of normal operation.

STANDBY

Returning RAS# and CAS# HIGH terminates a memory cycle and decreases chip current to a reduced standby level. The chip is preconditioned for the next cycle during the RAS# HIGH time.

FUNCTIONAL BLOCK DIAGRAM - 4K REFRESH

ABSOLUTE MAXIMUM RATINGS*

Voltage on V_{DD} Pin Relative to V_{SS} -1V to +4.6V
 Voltage on NC, Inputs or I/O Pins

Relative to V_{SS} -1V to +4.6V

Operating Temperature, T_A (ambient) 0°C to +70°C

Storage Temperature (plastic) -55°C to +150°C

Power Dissipation 1W

*Stresses greater than those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

DC ELECTRICAL CHARACTERISTICS AND OPERATING CONDITIONS

NOTES

1. All voltages referenced to V_{SS} .
2. The minimum specifications are used only to indicate cycle time at which proper operation over the full temperature range ($0^{\circ}\text{C} \leq T_A \leq 70^{\circ}\text{C}$) is ensured.
3. An initial pause of $100\mu\text{s}$ is required after power-up, followed by eight RAS# refresh cycles (RAS#-ONLY or CBR with WE# HIGH), before proper device operation is ensured. The eight RAS# cycle wake-ups should be repeated any time the t_{REF} refresh requirement is exceeded.
4. NC pins are assumed to be left floating and are not tested for leakage.
5. I_{CC} is dependent on output loading and cycle rates. Specified values are obtained with minimum cycle time and the outputs open.
6. Column address changed once each cycle.
7. Enables on-chip refresh and address counters.
8. This parameter is sampled. $V_{DD} = +3.3\text{V}$; $f = 1\text{ MHz}$.
9. AC characteristics assume $t_T = 2.5\text{ns}$.
10. V_{IH} (MIN) and V_{IL} (MAX) are reference levels for measuring timing of input signals. Transition times are measured between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}).
11. In addition to meeting the transition rate specification, all input signals must transit between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}) in a monotonic manner.
12. Measured with a load equivalent to two TTL gates and 100pF ; and $V_{OL} = 0.8\text{V}$ and $V_{OH} = 2\text{V}$.
13. t_{WCS} , t_{RWD} , t_{AWD} and t_{CWD} are not restrictive operating parameters. t_{WCS} applies to EARLY WRITE cycles. t_{RWD} , t_{AWD} and t_{CWD} apply to READ-MODIFY-WRITE cycles. If $t_{WCS} \geq t_{WCS}(\text{MIN})$, the cycle is an EARLY WRITE cycle and the data output will remain an open circuit throughout the entire cycle. If $t_{WCS} < t_{WCS}(\text{MIN})$ and $t_{RWD} \geq t_{RWD}(\text{MIN})$, $t_{AWD} \geq t_{AWD}(\text{MIN})$ and $t_{CWD} \geq t_{CWD}(\text{MIN})$, the cycle is a READ-MODIFY-WRITE and the data output will contain data read from the selected cell. If neither of the above conditions is met, the state of data-out is indeterminate. OE# held HIGH and WE# taken LOW after CAS# goes LOW results in a LATE WRITE (OE#-controlled) cycle. t_{WCS} , t_{RWD} , t_{CWD} and t_{AWD} are not applicable in a LATE WRITE cycle.
14. Requires that t_{AA} and t_{CAC} are not violated.
15. If CAS# is LOW at the falling edge of RAS#, Q will be maintained from the previous cycle. To initiate a new cycle and clear the data-out buffer, CAS# must be pulsed HIGH for t_{CP} .
16. These parameters are referenced to CAS# leading edge in EARLY WRITE cycles and WE# leading edge in LATE WRITE or READ-MODIFY-WRITE cycles.
17. If OE# is tied permanently LOW, LATE WRITE or READ-MODIFY-WRITE operations are not permissible and should not be attempted. Additionally, WE# must be pulsed during CAS# HIGH time in order to place I/O buffers in High-Z.
18. LATE WRITE and READ-MODIFY-WRITE cycles must have both t_{OD} and $t_{OE\#}$ met (OE# HIGH during WRITE cycle) in order to ensure that the output buffers will be open during the WRITE cycle. The DQs will provide the previously read data if CAS# remains LOW and OE# is taken back LOW after $t_{OE\#}$ is met. If CAS# goes HIGH prior to OE# going back LOW, the DQs will remain open.
19. Requires that t_{AA} and t_{CAC} are not violated.
20. $t_{OFF}(\text{MAX})$ defines the time at which the output achieves the open circuit condition and is not referenced to V_{OH} or V_{OL} . It is referenced from the rising edge of RAS# or CAS#, whichever occurs last.
21. The $t_{RAD}(\text{MAX})$ limit is no longer specified. $t_{RAD}(\text{MAX})$ was specified as a reference point only. If t_{RAD} was greater than the specified $t_{RAD}(\text{MAX})$ limit, then access time was controlled exclusively by t_{AA} (t_{RAC} and t_{CAC} no longer applied). With or without the $t_{RAD}(\text{MAX})$ limit, t_{AA} , t_{RAC} and t_{CAC} must always be met.
22. The $t_{RCD}(\text{MAX})$ limit is no longer specified. $t_{RCD}(\text{MAX})$ was specified as a reference point only. If t_{RCD} was greater than the specified $t_{RCD}(\text{MAX})$ limit, then access time was controlled exclusively by t_{CAC} ($t_{RAC}[\text{MIN}]$ no longer applied). With or without the t_{RCD} limit, t_{AA} and t_{CAC} must always be met.
23. Either t_{RCH} or t_{RRH} must be satisfied for a READ cycle.
24. A HIDDEN REFRESH may also be performed after a WRITE cycle. In this case, WE# is LOW and OE# is HIGH.
25. The refresh period is extended from 32ms (2K refresh) or 64ms (4K refresh) to 128ms (both 2K and 4K refresh). For 4K refresh, $t_{RC} = 31.25\mu\text{s}$ ($128\text{ms}/4,096\text{ rows} = 31.25\mu\text{s}$) and for 2K refresh, $t_{RC} = 62.5\mu\text{s}$ ($128\text{ms}/2,048\text{ rows} = 62.5\mu\text{s}$).
26. V_{IH} overshoot: $V_{IH}(\text{MAX}) = V_{DD} + 2\text{V}$ for a pulse width $\leq 10\text{ns}$, and the pulse width cannot be greater than one third of the cycle rate. V_{IL} undershoot: $V_{IL}(\text{MIN}) = -2\text{V}$ for a pulse width $\leq 10\text{ns}$, and the pulse width cannot be greater than one third of the cycle rate.

t _{RC}	84		104		ns
t _{RP}	30		40		ns
t _{RPC}	5		5		ns
t _{WRH}	8		10		ns
t _{WRP}	8		10		ns

NOTE: 1. End of first CBR REFRESH cycle.

HIDDEN REFRESH CYCLE²⁴

(WE# = HIGH; OE# = LOW)

TIMING PARAMETERS

SYMBOL	-5		-6		UNITS
	MIN	MAX	MIN	MAX	
t _{AA}		25		30	ns
t _{AR}	38		45		ns
t _{ASC}	0		0		ns
t _{ASR}	0		0		ns
t _{CAC}		13		15	ns
t _{CAH}	8		10		ns
t _{CHR}	8		10		ns
t _{CLZ}	0		0		ns
t _{CRP}	5		5		ns
t _{OD}	0	12	0	15	ns

SYMBOL	-5		-6		UNITS
	MIN	MAX	MIN	MAX	
t _{OE}		12		15	ns
t _{OFF}	0	12	0	15	ns
t _{ORD}	0		0		ns
t _{RAC}		50		60	ns
t _{RAD}	9		12		ns
t _{RAH}	9		10		ns
t _{RAS}	50	10,000	60	10,000	ns
t _{RCD}	11		14		ns
t _{RP}	30		40		ns
t _{RSH}	13		15		ns

SELF REFRESH CYCLE

(Addresses and OE# = DON'T CARE)

TIMING PARAMETERS

SYMBOL	-5		-6		UNITS
	MIN	MAX	MIN	MAX	
t_{CHD}	15		15		ns
t_{CP}	8		10		ns
t_{CSR}	5		5		ns
t_{RASS}	100		100		μ s
t_{RP}	30		40		ns

SYMBOL	-5		-6		UNITS
	MIN	MAX	MIN	MAX	
t_{RPC}	5		5		ns
t_{RPS}	90		105		ns
t_{WRH}	8		10		ns
t_{WRP}	8		10		ns

NOTE: 1. Once t_{RASS} (MIN) is met and RAS# remains LOW, the DRAM will enter self refresh mode.
 2. Once t_{RPS} is satisfied, a complete burst of all rows should be executed.

24/26-PIN PLASTIC SOJ (300 mil)
DA-1

- NOTE:**
1. All dimensions in inches (millimeters) $\frac{\text{MAX}}{\text{MIN}}$ or typical where noted.
 2. Package width and length do not include mold protrusion; allowable mold protrusion is .01" per side.

24/26-PIN PLASTIC TSOP (300 mil)
DB-1

- NOTE:**
1. All dimensions in inches (millimeters) $\frac{\text{MAX}}{\text{MIN}}$ or typical where noted.
 2. Package width and length do not include mold protrusion; allowable mold protrusion is .01" per side.
