Description

Connor-Winfield's high stability OH100 series are exceptionally precise frequency standards, excellent for use in cellular base stations, test equipment, Synchronous Ethernet, VSAT and Stratum 3E applications

These unique OCXO / VCOCXO oscillators provide temperature stabilities in the range of ± 5 ppb to ± 50 ppb, over the commercial, extended commercial or the industrial temperature range. Power requirements are 1.1W over the commercial temperature range and 1.5W over the industrial temperature range after warm-up. Additionally, excellent aging is achieved through the use of overtone SC cut crystals.

The OH100 series is available with CMOS logic or Sinewave output along with Voltage Controlled Option. These oscillators provide outstanding phase noise that varies depending on frequency. Allan Variance specifications are rated for primary reference standards. Warm up times are on the order of 5 minutes to 0.10 ppm of final frequency.

Features

- Frequency Range: 5 to 40 MHz
- OCXO - Fixed Frequency
- VCOCXO - Voltage Controlled Option
- 3.3 Vdc or 5.0 Vdc Operation
- Available Frequency Stabilities:
 - ± 5.0 ppb, ± 10.0 ppb, ± 20 ppb or ± 50 ppb
- Available Temperature Ranges:
 - 0 to 70°C, -20 to 70°C, -20 to 75°C, -40 to 70°C or -40 to 85°C
- Low Phase Noise / Phase Jitter
- Output: CMOS Logic or Sinewave
- Package: 1.0" x 1.0" x 0.500"
- RoHS Compliant / Lead Free

Absolute Ratings: Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only. The functional operation of the device at those or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to conditions outside the "recommended operating conditions" for any extended period of time may adversely impact device reliability and result in failures not covered by warranty.

Notes:

- ±5.0 ppb stability models are only available from 0 to 70°C.
- Referenced to the frequency measured @ 25°C.
- At time of shipment after 48 hours of operation.
- Inclusive of calibration, operating temperature, supply voltage change, load change and 20 years aging.
- Supply voltage must reach Vcc levels monotonically within a ramp-up time of <12 ms.
- Measured with Vcc = Nominal, in calm air.
- Measured @ 25°C, within ±100 ppb, referenced one hour after turn-on
- To ensure proper operation of VCOCXO's the control voltage input must be biased the nominal control voltage. Failure to bias the Vc input will cause an unstable output condition..
