3-state**

Rev. 7.1 — 12 August 2024

Product data sheet

## 1. General description

The 74AVC2T45-Q100 is a dual-bit, dual-supply transceiver that enables bidirectional level translation. It features two data input-output ports (nA and nB), a direction control input (DIR) and dual-supply pins ( $V_{CC(A)}$  and  $V_{CC(B)}$ ). Both  $V_{CC(A)}$  and  $V_{CC(B)}$  can be supplied at any voltage between 0.8 V and 3.6 V making the device suitable for translating between any of the low voltage nodes (0.8 V, 1.2 V, 1.5 V, 1.8 V, 2.5 V and 3.3 V). Pins nA and DIR are referenced to  $V_{CC(A)}$  and pins nB are referenced to  $V_{CC(B)}$ . A HIGH on DIR allows transmission from nA to nB and a LOW on DIR allows transmission from nB to nA.

The device is fully specified for partial power-down applications using  $I_{OFF}$ . The  $I_{OFF}$  circuitry disables the output, preventing any damaging backflow current through the device when it is powered down. In Suspend mode when either  $V_{CC(A)}$  or  $V_{CC(B)}$  are at GND level, both A and B are in the high-impedance OFF-state.

This product has been qualified to the Automotive Electronics Council (AEC) standard Q100 (Grade 1) and is suitable for use in automotive applications.

## 12. Application information

## 12.1. Unidirectional logic level-shifting application

The circuit given in [Fig. 6](#) is an example of the 74AVC2T45-Q100 being used in an unidirectional logic level-shifting application.

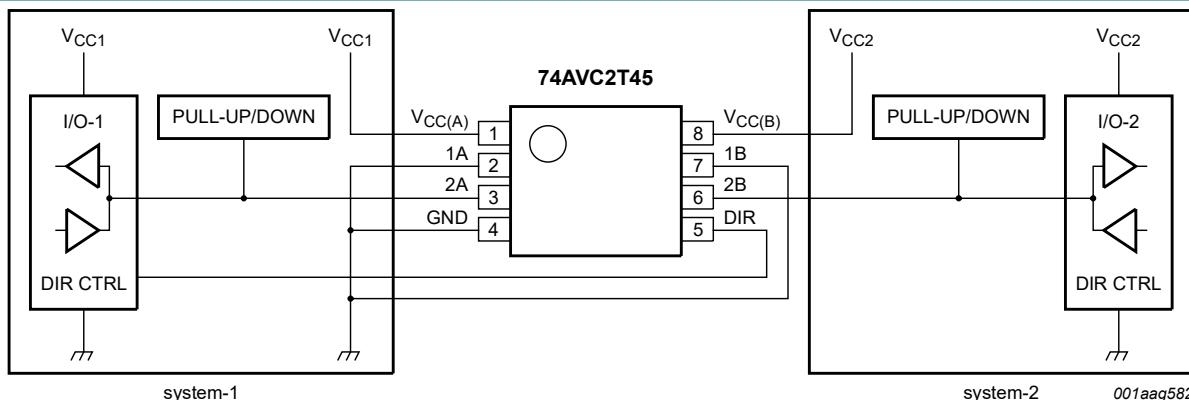

**Table 16. Unidirectional logic level-shifting application**

Pin	Name	Function	Description
-----	------	----------	-------------

Pin	Name	Function	Description
1	V <sub>CC(A)</sub>	V <sub>CC1</sub>	supply voltage of system-1 (0.8 V to 3.6 V)
2	1A	OUT1	output level depends on V <sub>CC1</sub> voltage
3	2A	OUT2	output level depends on V <sub>CC1</sub> voltage
4	GND	GND	device GND
5	DIR	DIR	the GND (LOW level) determines B port to A port direction
6	2B	IN2	input threshold value depends on V <sub>CC2</sub> voltage
7	1B	IN1	input threshold value depends on V <sub>CC2</sub> voltage
8	V <sub>CC(B)</sub>	V <sub>CC2</sub>	supply voltage of system-2 (0.8 V to 3.6 V)

## 12.2. Bidirectional logic level-shifting application

[Fig. 7](#) shows the 74AVC2T45-Q100 being used in a bidirectional logic level-shifting application. Since the device does not have an output enable (OE) pin, the system designer should take precautions to avoid bus contention between system-1 and system-2 when changing directions.

System-1 and system-2 must use the same conditions, i.e., both pull-up or both pull-down.

**Fig. 7. Bidirectional logic level-shifting application**

[Table 17](#) gives a sequence that will illustrate data transmission from system-1 to system-2 and then from system-2 to system-1.

**Table 17. Bidirectional logic level-shifting application**

*H = HIGH voltage level; L = LOW voltage level; Z = high-impedance OFF-state.*

State	DIR CTRL	I/O-1	I/O-2	Description
1	H	output	input	system-1 data to system-2
2	H	Z	Z	system-2 is getting ready to send data to system-1. I/O-1 and I/O-2 are disabled. The bus-line state depends on the pull-up or pull-down.
3	L	Z	Z	DIR bit is set LOW. I/O-1 and I/O-2 still are disabled. The bus-line state depends on the pull-up or pull-down.
4	L	input	output	system-2 data to system-1

System-1 and system-2 must use the same conditions, i.e., both pull-up or both pull-down.

### 12.3. Power-up considerations

The device is designed such that no special power-up sequence is required other than GND being applied first.

**Table 18. Typical total supply current ( $I_{CC(A)} + I_{CC(B)}$ )**

$V_{CC(A)}$	$V_{CC(B)}$							<b>Unit</b>
	<b>0 V</b>	<b>0.8 V</b>	<b>1.2 V</b>	<b>1.5 V</b>	<b>1.8 V</b>	<b>2.5 V</b>	<b>3.3 V</b>	
0 V	0	0.1	0.1	0.1	0.1	0.1	0.1	$\mu A$
0.8 V	0.1	0.1	0.1	0.1	0.1	0.7	2.3	$\mu A$
1.2 V	0.1	0.1	0.1	0.1	0.1	0.3	1.4	$\mu A$
1.5 V	0.1	0.1	0.1	0.1	0.1	0.1	0.9	$\mu A$
1.8 V	0.1	0.1	0.1	0.1	0.1	0.1	0.5	$\mu A$
2.5 V	0.1	0.7	0.3	0.1	0.1	0.1	0.1	$\mu A$
3.3 V	0.1	2.3	1.4	0.9	0.5	0.1	0.1	$\mu A$

### 12.4. Enable times

The enable times for the 74AVC2T45-Q100 are calculated from the following formulas:

- $t_{en}(\text{DIR to nA}) = t_{dis}(\text{DIR to nB}) + t_{pd}(\text{nB to nA})$
- $t_{en}(\text{DIR to nB}) = t_{dis}(\text{DIR to nA}) + t_{pd}(\text{nA to nB})$

In a bidirectional application, these enable times provide the maximum delay from the time the DIR bit is switched until an output is expected. For example, if the 74AVC2T45-Q100 initially is transmitting from A to B, then the DIR bit is switched, the B port of the device must be disabled before presenting it with an input. After the B port has been disabled, an input signal applied to it appears on the corresponding A port after the specified propagation delay.
