

# NLSX3018

## 8-Bit 100 Mb/s Configurable Dual-Supply Level Translator

The NLSX3018 is a 8-bit configurable dual-supply bidirectional level translator without a direction control pin. The I/O  $V_{CC}$  and I/O  $V_L$  ports are designed to track two different power supply rails,  $V_{CC}$  and  $V_L$  respectively. The  $V_{CC}$  supply rail is configurable from 1.3 V to 4.5 V while the  $V_L$  supply rail is configurable from 0.9 V to ( $V_{CC} - 0.4$ ) V. This allows lower voltage logic signals on the  $V_L$  side to be translated into higher voltage logic signals on the  $V_{CC}$  side, and vice-versa. Both I/O ports are auto-sensing; thus, no direction pin is required.

The Output Enable (EN) input, when Low, disables both I/O ports by putting them in 3-state. This significantly reduces the supply currents from both  $V_{CC}$  and  $V_L$ . The EN signal is designed to track  $V_L$ .

### Features

- Wide High-Side  $V_{CC}$  Operating Range: 1.3 V to 4.5 V  
Wide Low-Side  $V_L$  Operating Range: 0.9 V to ( $V_{CC} - 0.4$ ) V
- High-Speed with 100 Mb/s Guaranteed Data Rate for  $V_L > 1.6$  V
- Low Bit-to-Bit Skew
- Overvoltage Tolerant Enable and I/O Pins
- Non-preferential Powerup Sequencing
- Small packaging: 4.0 mm x 2.0 mm UDFN20
- This is a Pb-Free Device

### Typical Applications

- Mobile Phones, PDAs, Other Portable Devices

### PIN ASSIGNMENT

|            |    |    |               |
|------------|----|----|---------------|

1. Normal test conditions are V<sub>EN</sub> = 0 V, C<sub>I/OVCC</sub> = 15 pF and C<sub>I/OVL</sub> = 15 pF, unless otherwise specified.
2. V<sub>CC</sub> is the supply voltage associated with the high voltage port, and V<sub>CC</sub> ranges from +1.3 V to 4.5 V under normal operating conditions.
3. V<sub>L</sub> is the supply voltage associated with the low voltage port. V<sub>L</sub> must be less than or equal to (V<sub>CC</sub> - 0.4) V during normal operation. However, during startup and shutdown conditions, V<sub>L</sub> can be greater than (V<sub>CC</sub> - 0.4) V.
4. Typical values are for V<sub>CC</sub> = +2.8 V, V<sub>L</sub> = +1.8 V and T<sub>A</sub> = +25°C. All units are production tested at T<sub>A</sub> = +25°C. Limits over the operating temperature range are guaranteed by design.

13.  $V_{CC}$  is the supply voltage associated with the high voltage port, and  $V_{CC}$  ranges from +1.3 V to 4.5 V under normal operating conditions.

14.  $V_L$  is the supply voltage associated with the low voltage port.  $V_L$  must be less than or equal to ( $V_{CC} - 0.4$ ) V during normal operation. However, during startup and shutdown conditions,  $V_L$  can be greater than ( $V_{CC} - 0.4$ ) V.

15. Typical values are for  $V_{CC} = +2.8$  V,  $V_L = +1.8$  V and  $T_A = +25$  °C. All units are production tested at  $T_A = +25$  °C. Limits over the operating temperature range are guaranteed by design.

## IMPORTANT APPLICATIONS INFORMATION

### Level Translator Architecture

The NLSX3018 auto sense translator provides bi-directional voltage level shifting to transfer data in multiple supply voltage systems. This device has two supply voltages,  $V_L$  and  $V_{CC}$ , which set the logic levels on the input and output sides of the translator. When used to transfer data from the  $V_L$  to the  $V_{CC}$  ports, input signals referenced to the  $V_L$  supply are translated to output signals with a logic level matched to  $V_{CC}$ . In a similar manner, the  $V_{CC}$  to  $V_L$  translation shifts input signals with a logic level compatible to  $V_{CC}$  to an output signal matched to  $V_L$ .

The NLSX3018 consists of four bi-directional channels that independently determine the direction of the data flow without requiring a directional pin. The one-shot circuits are used to detect the rising or falling input signals. In addition, the one shots decrease the rise and fall time of the output signal for high-to-low and low-to-high transitions.

### Input Driver Requirements

For proper operation, the input driver to the auto sense translator should be capable of driving 2.0 mA of peak output current.

### Output Load Requirements

The NLSX3018 is designed to drive CMOS inputs. Resistive pullup or pulldown loads of less than 50 k $\Omega$  should not be used with this device. The NLSX3373 or NLSX3378 open-drain auto sense translators are alternate translator options for an application such as the I<sup>2</sup>C bus that requires pullup resistors.

### Enable Input (EN)

The NLSX3018 has an Enable pin (EN) that provides tri-state operation at the I/O pins. Driving the Enable pin to a low logic level minimizes the power consumption of

the device and drives the I/O  $V_{CC}$  and I/O  $V_L$  pins to a high impedance state. Normal translation operation occurs when the EN pin is equal to a logic high signal. The EN pin is referenced to the  $V_L$  supply and has Over-Voltage Tolerant (OVT) protection.

### Uni-Directional versus Bi-Directional Translation

The NLSX3018 can function as a non-inverting uni-directional translator. One advantage of using the translator as a uni-directional device is that each I/O pin can be configured as either an input or output. The configurable input or output feature is especially useful in applications such as SPI that use multiple uni-directional I/O lines to send data to and from a device. The flexible I/O port of the auto sense translator simplifies the trace connections on the PCB.

### Power Supply Guidelines

It is recommended that the  $V_L$  supply should be less than or equal to the value of the  $V_{CC}$  minus 0.4 V. The sequencing of the power supplies will not damage the device during the power up operation; however, the current consumption of the device will increase if  $V_L$  exceeds  $V_{CC}$  minus 0.4 V. In addition, the I/O  $V_{CC}$  and I/O  $V_L$  pins are in the high impedance state if either supply voltage is equal to 0 V.

For optimal performance, 0.01 to 0.1  $\mu$ F decoupling capacitors should be used on the  $V_L$  and  $V_{CC}$  power supply pins. Ceramic capacitors are a good design choice to filter and bypass any noise signals on the power supply voltage lines to the ground plane of the PCB. The noise immunity will be maximized by placing the capacitors as close as possible to the supply and ground pins, along with minimizing the PCB connection traces.

## ORDERING INFORMATION

| Device        | Package               | Shipping <sup>†</sup> |
|---------------|-----------------------|-----------------------|
| NLSX3018MUTAG | UDFN20<br>(Pb-Free)   | 3000 / Tape & Reel    |

## PACKAGE DIMENSIONS

UDFN20 4x2, 0.4P  
CASE 517AK  
ISSUE O

### NOTES:

1. DIMENSIONING AND TOLERANCING PER ASME Y14.5M, 1994.
2. CONTROLLING DIMENSION: MILLIMETERS.
3. DIMENSIONS b APPLIES TO PLATED TERMINAL AND IS MEASURED BETWEEN 0.15 AND 0.30 MM FROM TERMINAL TIP.
4. MOLD FLASH ALLOWED ON TERMINALS ALONG EDGE OF PACKAGE. FLASH MAY NOT EXCEED 0.03 ONTO BOTTOM SURFACE OF TERMINALS.
5. DETAIL A SHOWS OPTIONAL CONSTRUCTION FOR TERMINALS.

| DIM | MILLIMETERS |      |
|-----|-------------|------|
|     | MIN         | MAX  |
| A   | 0.45        | 0.55 |
| A1  | 0.00        | 0.05 |
| A3  | 0.13 REF    |      |
| b   | 0.15        | 0.25 |

ISSUE C

### NOTES:

1. DIMENSIONING AND TOLERANCING PER ANSI Y14.5M, 1982.
2. CONTROLLING DIMENSION: MILLIMETER.
3. DIMENSION A DOES NOT INCLUDE MOLD FLASH, PROTRUSIONS OR GATE BURRS. MOLD FLASH OR GATE BURRS SHALL NOT EXCEED 0.15 (0.006) PER SIDE.
4. DIMENSION B DOES NOT INCLUDE INTERLEAD FLASH OR PROTRUSION. INTERLEAD FLASH OR PROTRUSION SHALL NOT EXCEED 0.25 (0.010) PER SIDE.
5. DIMENSION K DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL BE 0.08 (0.003) TOTAL IN EXCESS OF THE K DIMENSION AT MAXIMUM MATERIAL CONDITION.
6. TERMINAL NUMBERS ARE SHOWN FOR REFERENCE ONLY.
7. DIMENSION A AND B ARE TO BE DETERMINED AT DATUM PLANE -W-.
