

# 16-Bit 250-kSPS Sampling CMOS ANALOG-TO-DIGITAL CONVERTER

Check for Samples: [ADS8515](#)

## FEATURES

- Standard  $\pm 10$ -V Input Range
- 90-dB Min SNR with 20-kHz Input
- $\pm 2.0$  LSB Max INL
- $\pm 1$  LSB Max DNL, 16 Bits, No Missing Code
- 5-V Analog Supply, Flexible I/O Supply Voltage at 1.65 V to 5.25 V
- Pin-Compatible with ADS7805/10 (Low Speed), and 12-Bit ADS7804/8504
- Uses Internal or External Reference
- Full Parallel Data Output
- 100-mW Typ Power Dissipation at 250 kSPS
- 28-Pin SSOP Package

## DESCRIPTION

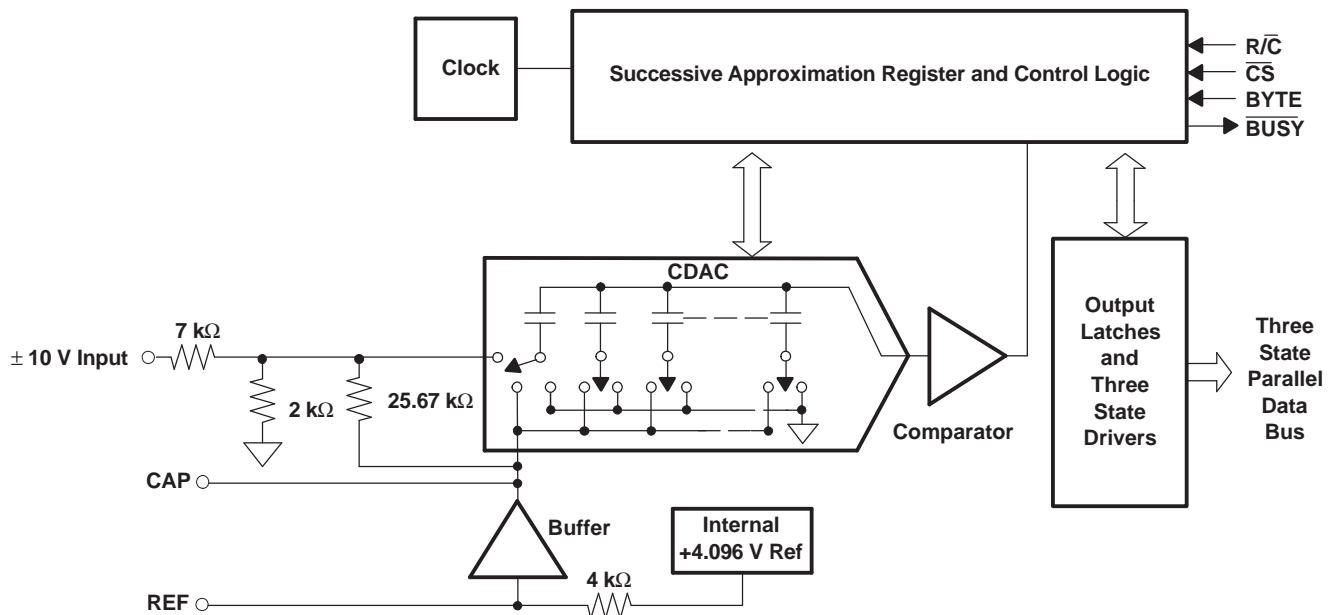

The ADS8515 is a complete 16-bit sampling analog-to-digital (A/D) converter using state-of-the-art CMOS structures. It contains a complete 16-bit, capacitor-based, SAR A/D converter with sample and hold (S/H), reference, clock, interface for microprocessor use, and 3-state output drivers.

The ADS8515 is specified at a 250-kHz sampling rate over the full temperature range. Precision resistors provide an industry standard  $\pm 10$ -V input range, while the innovative design allows operation from a single +5-V supply, with power dissipation under 100 mW.

The ADS8515 is available in a 28-pin SSOP package and is fully specified for operation over the industrial  $-40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$  temperature range.

## APPLICATIONS

- Industrial Process Control
- Data Acquisition Systems
- Digital Signal Processing
- Medical Equipment
- Instrumentation

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

All trademarks are the property of their respective owners.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of the Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

Copyright © 2007–2010, Texas Instruments Incorporated

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### PACKAGE/ORDERING INFORMATION<sup>(1)</sup>

PRODUCT	MINIMUM INL (LSB)	NO MISSING CODE	MINIMUM SINAD (dB)	SPECIFIED TEMPERATURE RANGE	PACKAGE-LEAD	PACKAGE DESIGNATOR	ORDERING NUMBER	TRANSPORT MEDIA, QTY
ADS8515IB	±2	16 Bits	89	–40°C to 85°C	SSOP-28	DB	ADS8515IBDB	Tube, 50
							ADS8515IBDBR	Tape and Reel, 2000
ADS8515I	±3	16 Bits	87	–40°C to 85°C	SSOP-28	DB	ADS8515IDB	Tube, 50
							ADS8515IDBR	Tape and Reel, 2000

(1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the [ADS8515 product folder](#) at [www.ti.com](http://www.ti.com).

### ABSOLUTE MAXIMUM RATINGS<sup>(1)(2)</sup>

Over operating free-air temperature range (unless otherwise noted)

ADS8515		
Analog inputs	$V_{IN}$	±25V
	CAP	+ $V_{ANA}$ + 0.3 V to AGND2 – 0.3 V
	REF	Indefinite short to AGND2, momentary short to $V_{ANA}$
Ground voltage differences	DGND, AGND1, AGND2	±0.3 V
	$V_{ANA}$	6 V
	$V_{DIG}$	6 V
Digital inputs		–0.3 V to + $V_{DIG}$ + 0.3 V
Maximum junction temperature		165°C
Internal power dissipation		825 mW

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) All voltage values are with respect to network ground terminal.

## ELECTRICAL CHARACTERISTICS

At  $T_A = -40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$ ,  $f_s = 250\text{ kHz}$ ,  $V_{\text{DIG}} = V_{\text{ANA}} = 5\text{ V}$ , and using internal reference (unless otherwise noted).

DIGITAL OUTPUTS										

(1) LSB means least significant bit. For the 16-bit,  $\pm 10\text{-V}$  input ADS8515, one LSB is 305  $\mu\text{V}$ .

(2) Typical rms noise at worst case transitions and temperatures.

(3) As measured with fixed resistors shown in Figure 22. Adjustable to zero with external potentiometer.

(4) Full-scale error is the worst case of -full-scale or +full-scale deviation from ideal first and last code transitions, divided by the transition voltage (not divided by the full-scale range) and includes the effect of offset error.

(5) All specifications in dB are referred to a full-scale  $\pm 10\text{-V}$  input.

(6) Full-power bandwidth is defined as the full-scale input frequency at which signal-to-(noise + distortion) degrades to 60 dB, or 10 bits of accuracy.

(7) Recovers to specified performance after 2 x FS input overvoltage.

## ELECTRICAL CHARACTERISTICS (continued)

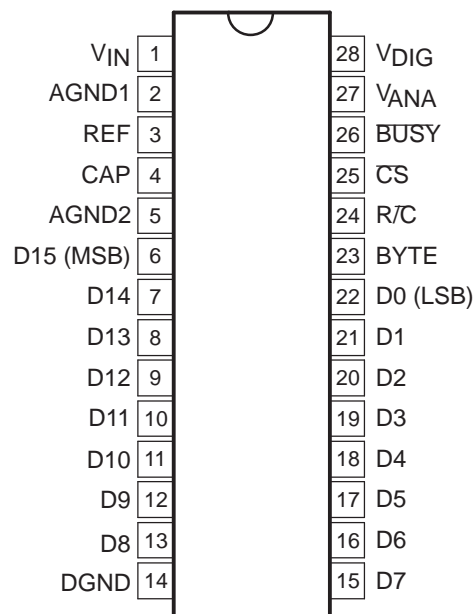

At  $T_A = -40^\circ\text{C}$  to  $85^\circ\text{C}$ ,  $f_s = 250\text{ kHz}$ ,  $V_{\text{DIG}} = V_{\text{ANA}} = 5\text{ V}$ , and using internal reference (unless otherwise noted).

## PIN DESCRIPTIONS

PIN		DIGITAL I/O	DESCRIPTION
NAME	NO.		
AGND1	2		Analog ground. Used internally as ground reference point.
AGND2	5		Analog ground.
$\overline{\text{BUSY}}$	26	O	At the start of a conversion, $\overline{\text{BUSY}}$ goes low and stays low until the conversion is completed and the digital outputs have been updated.
BYTE	23	I	Selects 8 most significant bits (low) or 8 least significant bits (high).
CAP	4		Reference buffer capacitor. 2.2- $\mu\text{F}$ tantalum capacitor to ground.
$\overline{\text{CS}}$	25	I	Internally ORed with $\text{R}/\overline{\text{C}}$ . If $\text{R}/\overline{\text{C}}$ low, a falling edge on $\overline{\text{CS}}$ initiates a new conversion.
DGND	14		Digital ground.
D15 (MSB)	6	O	Data bit 15. Most significant bit (MSB) of conversion results. Hi-Z state when $\overline{\text{CS}}$ is high, or when $\text{R}/\overline{\text{C}}$ is low.
D14	7	O	Data bit 14. Hi-Z state when $\overline{\text{CS}}$ is high, or when $\text{R}/\overline{\text{C}}$ is low.
D13	8	O	Data bit 13. Hi-Z state when $\overline{\text{CS}}$ is high, or when $\text{R}/\overline{\text{C}}$ is low.
D12	9	O	Data bit 12. Hi-Z state when $\overline{\text{CS}}$ is high, or when $\text{R}/\overline{\text{C}}$ is low.
D11	10	O	Data bit 11. Hi-Z state when $\overline{\text{CS}}$ is high, or when $\text{R}/\overline{\text{C}}$ is low.
D10	11	O	Data bit 10. Hi-Z state when $\overline{\text{CS}}$ is high, or when $\text{R}/\overline{\text{C}}$ is low.
D9	12	O	Data bit 9. Hi-Z state when $\overline{\text{CS}}$ is high, or when $\text{R}/\overline{\text{C}}$ is low.
D8	13	O	Data bit 8. Hi-Z state when $\overline{\text{CS}}$ is high, or when $\text{R}/\overline{\text{C}}$ is low.
D7	15	O	Data bit 7. Hi-Z state when $\overline{\text{CS}}$ is high, or when $\text{R}/\overline{\text{C}}$ is low.
D6	16	O	Data bit 6. Hi-Z state when $\overline{\text{CS}}$ is high, or when $\text{R}/\overline{\text{C}}$ is low.
D5	17	O	Data bit 5. Hi-Z state when $\overline{\text{CS}}$ is high, or when $\text{R}/\overline{\text{C}}$ is low.
D4	18	O	Data bit 4. Hi-Z state when $\overline{\text{CS}}$ is high, or when $\text{R}/\overline{\text{C}}$ is low.
D3	19	O	Data bit 3. Hi-Z state when $\overline{\text{CS}}$ is high, or when $\text{R}/\overline{\text{C}}$ is low.
D2	20	O	Data bit 2. Hi-Z state when $\overline{\text{CS}}$ is high, or when $\text{R}/\overline{\text{C}}$ is low.
D1	21	O	Data bit 1. Hi-Z state when $\overline{\text{CS}}$ is high, or when $\text{R}/\overline{\text{C}}$ is low.
D0 (LSB)	22	O	Data bit 0. Least significant bit (LSB) of conversion results. Hi-Z state when $\overline{\text{CS}}$ is high, or when $\text{R}/\overline{\text{C}}$ is low.
$\text{R}/\overline{\text{C}}$	24	I	With $\overline{\text{CS}}$ low and $\overline{\text{BUSY}}$ high, a falling edge on $\text{R}/\overline{\text{C}}$ initiates a new conversion. With $\overline{\text{CS}}$ low, a rising edge on $\text{R}/\overline{\text{C}}$ enables the parallel output.
REF	3		Reference input/output. 2.2- $\mu\text{F}$ tantalum capacitor to ground.
$\text{V}_{\text{ANA}}$	27		Analog supply input. Nominally +5 V. Decouple to ground with 0.1- $\mu\text{F}$ ceramic and 10- $\mu\text{F}$ tantalum capacitors.
$\text{V}_{\text{DIG}}$	28		Digital supply input. Can be connected directly to pin 27.
$\text{V}_{\text{IN}}$	1		Analog input. See <a href="#">Figure 24</a> .

## BASIC OPERATION

Figure 19 shows a basic circuit to operate the ADS8515 with a full parallel data output. Taking  $\overline{R/C}$  (pin 24) low for a minimum of 40 ns initiates a conversion.  $\overline{BUSY}$  (pin 26) goes low and stays low until the conversion is completed and the output registers are updated. Data are output in binary twos complement with the MSB on pin 6.  $\overline{BUSY}$  going high can be used to latch the data.

The ADS8515 begins tracking the input signal at the end of the conversion. Allowing 4  $\mu$ s between convert commands assures accurate acquisition of a new signal.

**Figure 19. Basic Operation**

## STARTING A CONVERSION

The combination of  $\overline{\text{CS}}$  (pin 25) and  $\text{R}/\overline{\text{C}}$  (pin 24) held low for a minimum of 40 ns immediately puts the sample/hold of the ADS8515 in the hold state and starts conversion  $n$ .  $\text{BUSY}$  (pin 26) goes low and stays low until conversion  $n$  is completed and the internal output register has been updated.

The ADS8515 begins tracking the input signal at the end of the conversion. Allowing 4  $\mu\text{s}$  between convert commands assures accurate acquisition of a new signal. Refer to [Table 1](#) for a summary of  $\overline{\text{CS}}$ ,  $\text{R}/\overline{\text{C}}$ , and  $\text{BUSY}$  states and [Figure 21](#), [Figure 22](#), and [Figure 23](#) for the timing diagrams.

$\overline{\text{CS}}$  and  $\text{R}/\overline{\text{C}}$  are internally ORed and level triggered. There is no requirement regarding which input goes low first when initiating a conversion. If, however, it is critical that  $\overline{\text{CS}}$  or  $\text{R}/\overline{\text{C}}$  initiates conversion  $n$ , be sure the less critical input is low at least 10 ns prior to the initiating input.

To reduce the number of control pins,  $\overline{\text{CS}}$  can be tied low using  $\text{R}/\overline{\text{C}}$  to control the read and convert modes. The parallel output becomes active whenever  $\text{R}/\overline{\text{C}}$  goes high. Refer to the Reading Data section.

**Table 1. Control Line Functions for Read and Convert**

$\overline{\text{CS}}$	$\text{R}/\overline{\text{C}}$	$\text{BUSY}$	OPERATION
1	X	X	None. Databus is in Hi-Z state.
↓	0	1	Initiates conversion $n$ . Databus remains in Hi-Z state.
0	↓	1	Initiates conversion $n$ . Databus enters Hi-Z state.
0	1	↑	Conversion $n$ completed. Valid data from conversion $n$ on the databus.
↓	1	1	Enables databus with valid data from conversion $n$ .
↓	1	0	Enables databus with valid data from conversion $-1$ <sup>(1)</sup> . Conversion $n$ in progress.
0	↑	0	Enables databus with valid data from conversion $-1$ <sup>(1)</sup> . Conversion $n$ in progress.
0	0	↑	New conversion initiated without acquisition of a new signal. Data is invalid. $\overline{\text{CS}}$ and/or $\text{R}/\overline{\text{C}}$ must be high when $\text{BUSY}$ goes high.
X	X	0	Conversion $n$ in progress.

(1) See [Figure 21](#) and [Figure 22](#) for constraints on data valid from conversion  $n - 1$ .

## READING DATA

The ADS8515 outputs full or byte-reading parallel data in binary twos complement data output format. The parallel output is active when  $\text{R}/\overline{\text{C}}$  (pin 24) is high and  $\overline{\text{CS}}$  (pin 25) is low. Any other combination of  $\overline{\text{CS}}$  and  $\text{R}/\overline{\text{C}}$  3-states the parallel output. Valid conversion data can be read in a full parallel, 16-bit word or two 8-bit bytes on pins 6 to 13 and pins 15 to 22.  $\text{BYTE}$  (pin 23) can be toggled to read both bytes within one conversion cycle. Refer to [Table 2](#) for ideal output codes and [Figure 20](#) for bit locations relative to the state of  $\text{BYTE}$ .

**Table 2. Ideal Input Voltages and Output Codes**

DESCRIPTION	ANALOG INPUT	DIGITAL OUTPUT BINARY TWOS COMPLEMENT	
		BINARY CODE	HEX CODE
Full-scale range	$\pm 10\text{ V}$		
Least significant bit (LSB)	305 $\mu\text{V}$		
Full scale (10 V – 1 LSB)	9.999695 V	0111 1111 1111 1111	7FFF
Midscale	0 V	0000 0000 0000 0000	0000
One LSB below midscale	–305 $\mu\text{V}$	1111 1111 1111 1111	FFFF
–Full scale	–10 V	1000 0000 0000 0000	8000

## PARALLEL OUTPUT (After a Conversion)

After conversion  $n$  is completed and the output registers have been updated,  $\overline{\text{BUSY}}$  (pin 26) goes high. Valid data from conversion  $n$  are available on D15 to D0 (pins 6 to 13 and 15 to 22).  $\text{BUSY}$  going high can be used to latch the data. Refer to Table 3 and Figure 21, Figure 22, and Figure 23 for timing specifications.

## PARALLEL OUTPUT (During a Conversion)

After conversion  $n$  has been initiated, valid data from conversion  $-1$  can be read and are valid up to  $t_2$  after the start of conversion  $n$ . Do not attempt to read data from  $t_2$  after the start of conversion  $n$  until  $\text{BUSY}$  (pin 26) goes high; this may result in reading invalid data. Refer to Table 3 and Figure 21, Figure 22, and Figure 23 for timing specifications.

**Note:** For the best possible performance, data should not be read during a conversion. The switching noise of the asynchronous data transfer can cause digital feedthrough degrading the converter performance.

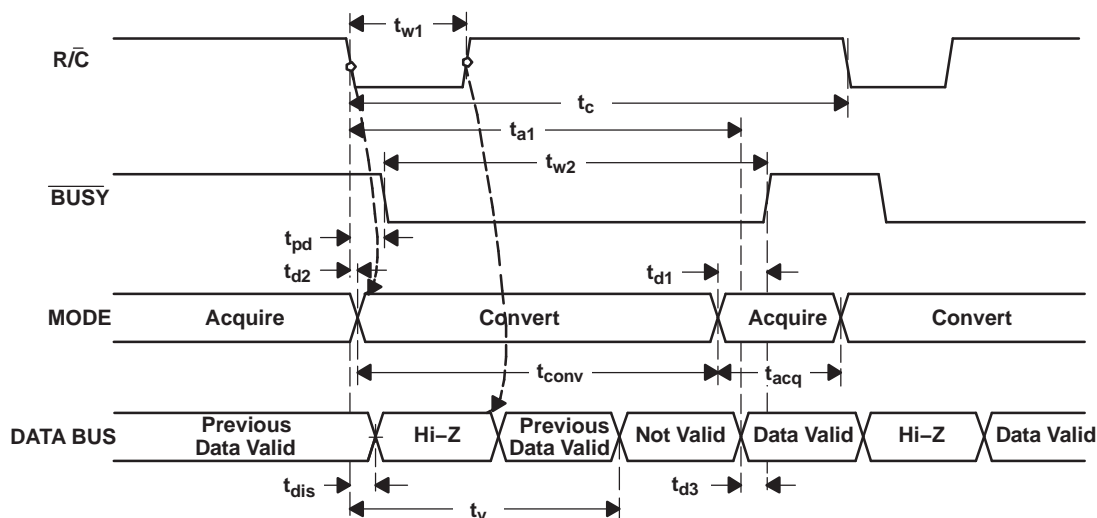

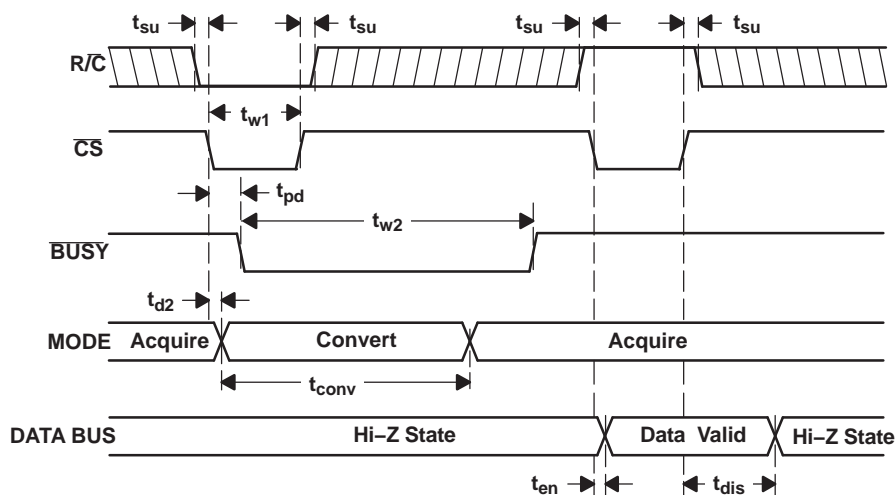

The number of control lines can be reduced by tying  $\overline{\text{CS}}$  low while using the falling edge of  $\text{R}/\overline{\text{C}}$  to initiate conversions and the rising edge of  $\text{R}/\overline{\text{C}}$  to activate the output mode of the converter. See Figure 21.

**Table 3. Conversion Timing**

SYMBOL	DESCRIPTION	MIN	TYP	MAX	UNITS
$t_{w1}$	Pulse duration, convert	40			ns
$t_a$	Access time, data valid after $\text{R}/\overline{\text{C}}$ low		0.8	1.2	$\mu\text{s}$
$t_{pd}$	Propagation delay time, $\overline{\text{BUSY}}$ from $\text{R}/\overline{\text{C}}$ low		6	20	ns
$t_{w2}$	Pulse duration, $\overline{\text{BUSY}}$ low			2	$\mu\text{s}$
$t_{d1}$	Delay time, $\overline{\text{BUSY}}$ after end of conversion		5		ns
$t_{d2}$	Delay time, aperture		5		ns
$t_{\text{conv}}$	Conversion time			2	$\mu\text{s}$
$t_{\text{acq}}$	Acquisition time	2			$\mu\text{s}$
$t_{\text{dis}}$	Disable time, bus	10	15	83	ns
$t_{d3}$	Delay time, $\overline{\text{BUSY}}$ after data valid	35	50		ns
$t_v$	Valid time, previous data remains valid after $\text{R}/\overline{\text{C}}$ low	1.5	2		$\mu\text{s}$
$t_{\text{conv}} + t_{\text{acq}}$	Throughput time			4	$\mu\text{s}$

## ADC RESET

The ADC reset function of the ADS8515 can be used to terminate the current conversion cycle. Bringing  $R/\overline{C}$  low for at least 40 ns while BUSY is low will initiate the ADC reset. To initiate a new conversion,  $R/\overline{C}$  must return to the high state and remain high long enough to acquire a new sample (see Table 3,  $t_c$ ) before going low to initiate the next conversion sequence. In applications that do not monitor the BUSY signal, it is recommended that the ADC reset function be implemented as part of a system initialization sequence.

## INPUT RANGES

The ADS8515 offers a standard  $\pm 10$ -V input range. Figure 24 shows the necessary circuit connections for the ADS8515 with and without hardware trim. Offset and full-scale error specifications are tested and specified with the fixed resistors shown in Figure 25(b). Full-scale error includes offset and gain errors measured at both +FS and –FS. Adjustments for offset and gain are described in the Calibration section of this data sheet.

The offset and gain are adjusted internally to allow external trimming with a single supply. The external resistors compensate for this adjustment and can be left out if the offset and gain are corrected in software (refer to the Calibration section).

The nominal input impedance of 6.35 k $\Omega$  results from the combination of the internal resistor network shown on the front page of the product data sheet. The input resistor divider network provides inherent overvoltage protection assured to at least  $\pm 25$  V. The 1% resistors used for the external circuitry do not compromise the accuracy or drift of the converter. They have little influence relative to the internal resistors, and tighter tolerances are not required.

The input signal must be referenced to AGND1. This minimizes the ground loop problem typical to analog designs. The analog signal should be driven by a low impedance source. A typical driving circuit using an OPA627 or OPA132 is shown in Figure 24.

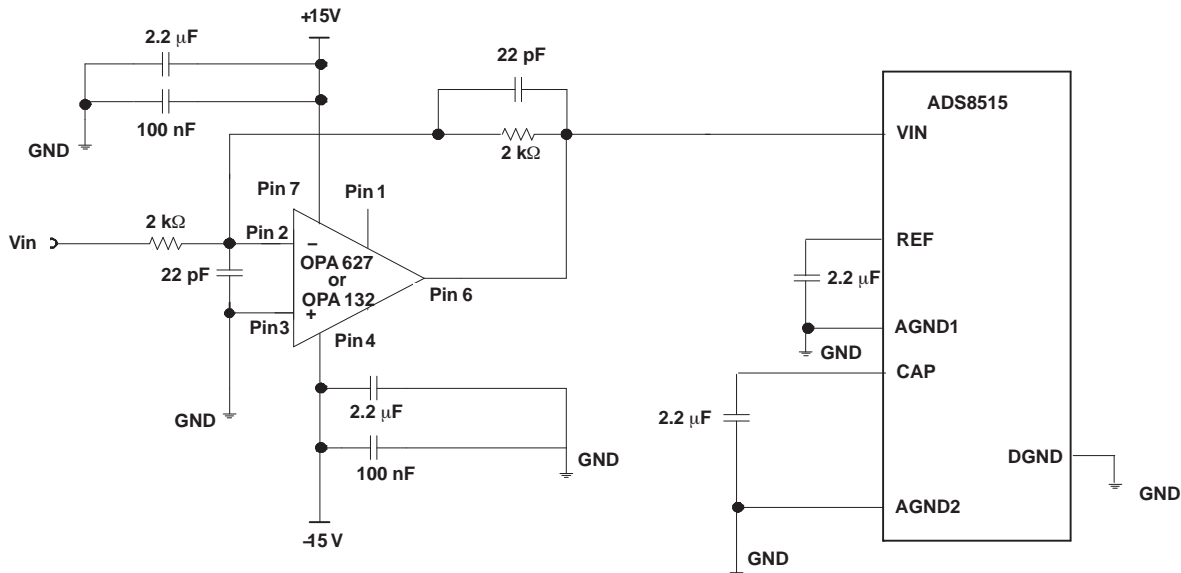

Figure 24. Typical Driving Circuit ( $\pm 10$  V, No Trim)

## APPLICATION INFORMATION

### CALIBRATION

The gain of the ADS8515 can be trimmed in software. To achieve optimum performance, several iterations may be required.

#### Hardware Calibration

To calibrate the gain of the ADS8515, install the resistors and potentiometer as shown in Figure 25(a). The calibration range is approximately  $\pm 100$  mV.

#### Software Calibration

The offset and gain of the ADS8515 is calibrated with software. See Figure 25(b) for the circuit connections.

Note: Use 1% metal film resistors.

**Figure 25. Circuit Diagram For Software Trim**

### REFERENCE

The ADS8515 can operate with its internal 4.096-V reference or an external reference. By applying an external reference to pin 5, the internal reference can be bypassed. The reference voltage at REF is buffered internally with the output on CAP (pin 4).

The internal reference has an 8 ppm/ $^{\circ}$ C drift (typical) and accounts for approximately 20% of the full-scale error (FSE =  $\pm 0.5\%$  for low grade,  $\pm 0.25\%$  for high grade).

#### REF

REF (pin 3) is an input for an external reference or the output for the internal 4.096-V reference. A 2.2- $\mu$ F capacitor should be connected as close to the REF pin as possible. The capacitor and the output resistance of REF create a low-pass filter to bandlimit noise on the reference. Using a smaller value capacitor introduces more noise to the reference degrading the SNR and SINAD. The REF pin should not be used to drive external ac or dc loads.

The range for the external reference is 3.9 V to 4.2 V and determines the actual LSB size. Increasing the reference voltage increases the full-scale range and the LSB size of the converter which can improve the SNR.

## CAP

CAP (pin 4) is the output of the internal reference buffer. A 2.2- $\mu$ F capacitor should be placed as close to the CAP pin as possible to provide optimum switching currents for the CDAC throughout the conversion cycle and compensation for the output of the internal buffer. Using a capacitor any smaller than 1  $\mu$ F can cause the output buffer to oscillate and may not have sufficient charge for the CDAC. Capacitor values larger than 2.2  $\mu$ F have little effect on improving performance. The ESR (equivalent series resistance) of these compensation capacitors is also critical. Keep the total ESR under 3  $\Omega$ . See the [Typical Characteristics](#) section for how the worst case INL is affected by ESR.

The output of the buffer is capable of driving up to 2 mA of current to a dc load, but any external load from the CAP pin may degrade the linearity of the ADS8515. Using an external buffer allows the internal reference to be used for larger dc loads and ac loads. Do not attempt to directly drive an ac load with the output voltage on CAP. This causes performance degradation of the converter. The ESR (equivalent series resistance) of these compensation capacitors is also critical. Keep the total ESR under 3  $\Omega$ . See the [Typical Characteristics](#) section concerning how ESR affects performance.

## LAYOUT

### POWER

The analog power pin ( $V_{ANA}$ ) and digital power pin ( $V_{DIG}$ ) can be tied together from the same +5V power supply, or from two different power-supply sources. The ADS8515 uses 90% of its power from the analog circuitry, and therefore should be considered as an analog component. Care must be taken to ensure that both the analog and digital power supplies power on before any voltage is applied to the analog input pin. Failure to do so may create a latch-up condition. There is no power sequencing requirement between  $V_{ANA}$  and  $V_{DIG}$ .

### GROUNDING

Three ground pins are present on the ADS8515. DGND is the digital supply ground. AGND2 is the analog supply ground. AGND1 is the ground which all analog signals internal to the A/D converter are referenced. AGND1 is more susceptible to current induced voltage drops and must have the path of least resistance back to the power supply.

All the ground pins of the A/D converter should be tied to the analog ground plane, separated from the system digital logic ground, to achieve optimum performance. Both analog and digital ground planes should be tied to the system ground as near to the power supplies as possible. This helps to prevent dynamic digital ground currents from modulating the analog ground through a common impedance to power ground.

### SIGNAL CONDITIONING

The FET switches used for the sample hold on many CMOS A/D converters release a significant amount of charge injection which can cause the driving op amp to oscillate. The FET switch on the ADS8515, compared to the FET switches on other CMOS A/D converters, releases 5% to 10% of the charge. There is also a resistive front end which attenuates any charge which is released. The end result is a minimal requirement for the antialias filter on the front end. Any op amp sufficient for the signal in an application is sufficient to drive the ADS8515.

The resistive front end of the ADS8515 also provides an assured  $\pm 25$ -V overvoltage protection. In most cases, this eliminates the need for external input protection circuitry.

### INTERMEDIATE LATCHES

The ADS8515 does have 3-state outputs for the parallel port, but intermediate latches should be used if the bus is to be active during conversions. If the bus is not active during conversion, the 3-state outputs can be used to isolate the A/D converter from other peripherals on the same bus. The 3-state outputs can also be used when the A/D converter is the only peripheral on the data bus.

Intermediate latches are beneficial on any monolithic A/D converter. The ADS8515 has an internal LSB size of 38  $\mu$ V. Transients from fast switching signals on the parallel port, even when the A/D converter is 3-stated, can be coupled through the substrate to the analog circuitry causing degradation of converter performance.

## REVISION HISTORY

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision C (August 2010) to Revision D	Page
• Deleted row from <i>Absolute Maximum Ratings</i> regarding $V_{DIG}$ to $V_{ANA}$ .....	2
• Deleted text regarding $V_{ANA}$ from the pin 28 description in the <i>Pin Description</i> table .....	5
• Changed text in first and second sentences of the <i>Power</i> section .....	15

Changes from Revision B (June 2010) to Revision C	Page
• Updated document format to current standards .....	1
• Added text to end of <i>Power</i> section .....	15

## PACKAGING INFORMATION

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## TAPE AND REEL INFORMATION

\*All dimensions are nominal

## NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MO-150.
