MT58L512L18D, MT58L256L32D,
MT58L256L36D

**3.3V V_{DD}, 3.3V I/O, Pipelined, Double-
Cycle Deselect**

FEATURES

- Fast clock and OE# access times
- Single +3.3V +0.3V/-0.165V power supply (V_{DD})
- Separate +3.3V isolated output buffer supply (V_{DDQ})
- SNOOZE MODE for reduced-power standby
- Common data inputs and data outputs
- Individual BYTE WRITE control and GLOBAL WRITE
- Three chip enables for simple depth expansion and address pipelining
- Clock-controlled and registered addresses, data I/Os and control signals
- Internally self-timed WRITE cycle
- Burst control (interleaved or linear burst)
- Automatic power-down for portable applications
- 100-pin TQFP package
- 165-pin FBGA package
- Low capacitive bus loading
- x18, x32, and x36 versions available

OPTIONS

GENERAL DESCRIPTION

The Micron® SyncBurst™ SRAM family employs high-speed, low-power CMOS designs that are fabricated using an advanced CMOS process.

Micron's 8Mb SyncBurst SRAMs integrate a 512K x 18, 256K x 32, or 256K x 36 SRAM core with advanced synchronous peripheral circuitry and a 2-bit burst counter. All synchronous inputs pass through registers controlled by a positive-edge-triggered single-clock input (CLK). The synchronous inputs include all addresses, all data inputs, active LOW chip enable (CE#), two additional chip enables for easy depth expansion (CE2, CE2#), burst control inputs (ADSC#, ADSP#, ADV#), byte write enables (BWx#) and global write (GW#). Note that CE2# is not available on the T Version.

FUNCTIONAL BLOCK DIAGRAM 512K x 18

FUNCTIONAL BLOCK DIAGRAM 256K x 32/36

NOTE: Functional block diagrams illustrate simplified device operation. See truth tables, pin descriptions, and timing diagrams for detailed information.

GENERAL DESCRIPTION (continued)

Asynchronous inputs include the output enable (OE#), clock (CLK) and snooze enable (ZZ). There is also a burst mode input (MODE) that selects between interleaved and linear burst modes. The data-out (Q), enabled by OE#, is also asynchronous. WRITE cycles can be from one to two bytes wide (x18) or from one to four bytes wide (x32/x36), as controlled by the write control inputs.

Burst operation can be initiated with either address status processor (ADSP#) or address status controller (ADSC#) inputs. Subsequent burst addresses can be internally generated as controlled by the burst advance input (ADV#).

Address and write control are registered on-chip to simplify WRITE cycles. This allows self-timed WRITE cycles. Individual byte enables allow individual bytes to be written. During WRITE cycles on the x18 device, BWA# controls DQa pins and DQPa; BWb# controls DQb pins and DQPb. During WRITE cycles on the x32 and x36 devices, BWA# controls DQa pins and DQPa; BWb# controls DQb pins and DQPb; BWc# controls DQc pins and DQPC; BWd# controls DQd pins and DQPD. GW# LOW causes all bytes to be written. Parity bits are only available on the x18 and x36 versions.

This device incorporates an additional pipelined enable register which delays turning off the output buffer an additional cycle when a deselect is executed. This feature allows depth expansion without penalizing system performance.

Micron's 8Mb SyncBurst SRAMs operate from a +3.3V V_{DD} power supply, and all inputs and outputs are TTL-compatible. The device is ideally suited for Pentium® and PowerPC pipelined systems and systems that benefit from a very wide, high-speed data bus. The device is also ideal in generic 16-, 18-, 32-, 36-, 64-, and 72-bit-wide applications.

Please refer to Micron's Web site (www.micron.com/sramds) for the latest data sheet.

TQFP PINOUTS

At the time of the writing of this data sheet, there are two pinouts in the industry. Micron will support both pinouts for this part.

87	87	BWE#	Input	Byte Write Enable: This active LOW input permits BYTE WRITE operations and must meet the setup and hold times around the rising edge of CLK.
88	88	GW#	Input	Global Write: This active LOW input allows a full 18-, 32- or 36-bit WRITE to occur independent of the BWE# and BWx# lines and must meet the setup and hold times around the rising edge of CLK.
89	89	CLK	Input	Clock: This signal registers the address, data, chip enable, byte write enables and burst control inputs on its rising edge. All synchronous inputs must meet setup and hold times around the clock's rising edge.
98	98	CE#	Input	Synchronous Chip Enable: This active LOW input is used to enable the device and conditions the internal use of ADSP#. CE# is sampled only when a new external address is loaded.
92 (S Version)	92 (S Version)	CE2#	Input	Synchronous Chip Enable: This active LOW input is used to enable the device and is sampled only when a new external address is loaded. CE2# is only available on the S Version.
64	64	ZZ	Input	Snooze Enable: This active HIGH, asynchronous input causes the device to enter a low-power standby mode in which all data in the memory array is retained. When ZZ is active, all other inputs are ignored.
97	97	CE2	Input	Synchronous Chip Enable: This active HIGH input is used to enable the device and is sampled only when a new external address is loaded.
86	86	OE#	Input	Output Enable: This active LOW, asynchronous input enables the data I/O output drivers.
83	83	ADV#	Input	Synchronous Address Advance: This active LOW input is used to advance the internal burst counter, controlling burst access after the external address is loaded. A HIGH on this pin effectively causes wait states to be generated (no address advance). To ensure use of correct address during a WRITE cycle, ADV# must be HIGH at the rising edge of the first clock after an ADSP# cycle is initiated.

- NOTE:**
1. X means "Don't Care." # means active LOW. H means logic HIGH. L means logic LOW.
 2. For WRITE#, L means any one or more byte write enable signals (BWA#, BWB#, BWC# or BWD#) and BWE# are LOW or GW# is LOW. WRITE# = H for all BWx#, BWE#, GW# HIGH.
 3. BWA# enables WRITES to DQa's and DQPa. BWB# enables WRITES to DQb's and DQPb. BWC# enables WRITES to DQc's and DQPC. BWD# enables WRITES to DQd's and DQPD. DQPa and DQPb are only available on the x18 and x36 versions. DQPC and DQPD are only available on the x36 version.
 4. All inputs except OE# and ZZ must meet setup and hold times around the rising edge (LOW to HIGH) of CLK.
 5. Wait states are inserted by suspending burst.
 6. For a WRITE operation following a READ operation, OE# must be HIGH before the input data setup time and held HIGH throughout the input data hold time.
 7. This device contains circuitry that will ensure the outputs will be in High-Z during power-up.
 8. ADSP# LOW always initiates an internal READ at the L-H edge of CLK. A WRITE is performed by setting one or more byte write enable signals and BWE# LOW or GW# LOW for the subsequent L-H edge of CLK. Refer to WRITE timing diagram for clarification.

*Stresses greater than those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

**Maximum junction temperature depends upon package type, cycle time, loading, ambient temperature and airflow. See Micron Technical Note TN-05-14 for more information.

- NOTE:**
1. Test conditions as specified with the output loading shown in Figure 1 unless otherwise noted.
 2. Measured as HIGH above V_{IH} and LOW below V_{IL} .
 3. This parameter is measured with the output loading shown in Figure 2.
 4. This parameter is sampled.
 5. Transition is measured $\pm 500\text{mV}$ from steady state voltage.
 6. Refer to Technical Note TN-58-09, "Synchronous SRAM Bus Contention Design Considerations," for a more thorough discussion on these parameters.
 7. OE# is a "Don't Care" when a byte write enable is sampled LOW.
 8. A WRITE cycle is defined by at least one byte write enable LOW and ADSP# HIGH for the required setup and hold times. A READ cycle is defined by all byte write enables HIGH and ADSC# or ADV# LOW or ADSP# LOW for the required setup and hold times.
 9. This is a synchronous device. All addresses must meet the specified setup and hold times for all rising edges of CLK when either ADSP# or ADSC# is LOW and chip enabled. All other synchronous inputs must meet the setup and hold times with stable logic levels for all rising edges of clock (CLK) when the chip is enabled. Chip enable must be valid at each rising edge of CLK when either ADSP# or ADSC# is LOW to remain enabled.

LOAD DERATING CURVES

Micron 512K x 18, 256K x 32, and 256K x 36 SyncBurst SRAM timing is dependent upon the capacitive loading on the outputs.

SNOOZE MODE

SNOOZE MODE is a low-current, “power-down” mode in which the device is deselected and current is reduced to I_{SB2Z} . The duration of SNOOZE MODE is dictated by the length of time ZZ is in a HIGH state. After the device enters SNOOZE MODE, all inputs except ZZ become gated inputs and are ignored.

ZZ is an asynchronous, active HIGH input that causes the device to enter SNOOZE MODE. When ZZ becomes a logic HIGH, I_{SB2Z} is guaranteed after the setup time t_{ZZ} is met. Any READ or WRITE operation pending when the device enters SNOOZE MODE is not guaranteed to complete successfully. Therefore, SNOOZE MODE must not be initiated until valid pending operations are completed.
