

# 64 Kbit (8K x 8) SoftStore nvSRAM

## Features

- 25 ns, 35 ns, and 45 ns access times
- Pin compatible with industry standard SRAMs
- Software initiated nonvolatile STORE
- Unlimited Read and Write endurance
- Automatic RECALL to SRAM on power up
- Unlimited RECALL cycles
- 1,000,000 STORE cycles
- 100 year data retention
- Single 5V±10% operation
- Commercial and industrial temperature
- 28-pin (330 mil) SOIC package
- 28-pin (300 mil) CDIP and 28-pad (350 mil) LCC packages
- RoHS compliance

## Functional Description

The Cypress STK11C68 is a 64Kb fast static RAM with a nonvolatile element in each memory cell. The embedded nonvolatile elements incorporate QuantumTrap technology producing the world's most reliable nonvolatile memory. The SRAM provides unlimited read and write cycles, while independent nonvolatile data resides in the highly reliable QuantumTrap cell. Data transfers under software control from SRAM to the nonvolatile elements (the STORE operation). On power up, data is automatically restored to the SRAM (the RECALL operation) from the nonvolatile memory. RECALL operations are also available under software control.

| V <sub>CC</sub>                  |                | Power Supply    | <b>Power Supply Inputs to the Device.</b>                                                                                                                                                    |

## Device Operation

The STK11C68 is a versatile memory chip that provides several modes of operation. The STK11C68 can operate as a standard 8K x 8 SRAM. A 8K x 8 array of nonvolatile storage elements shadow the SRAM. SRAM data can be copied nonvolatile memory or nonvolatile data can be recalled to the SRAM.

### SRAM Read

The STK11C68 performs a Read cycle whenever  $\overline{CE}$  and  $\overline{OE}$  are LOW while WE is HIGH. The address specified on pins A<sub>0-12</sub> determines the 8,192 data bytes accessed. When the Read is initiated by an address transition, the outputs are valid after a delay of t<sub>AA</sub> (Read cycle 1). If the Read is initiated by CE or OE, the outputs are valid at t<sub>ACE</sub> or at t<sub>DOE</sub>, whichever is later (Read cycle 2). The data outputs repeatedly respond to address changes within the t<sub>AA</sub> access time without the need for transitions on any control input pins, and remains valid until another address change or until CE or OE is brought HIGH, or WE brought LOW.

### SRAM Write

A Write cycle is performed whenever  $\overline{CE}$  and  $\overline{WE}$  are LOW. The address inputs must be stable prior to entering the Write cycle and must remain stable until either CE or WE goes HIGH at the end of the cycle. The data on the common I/O pins DQ<sub>0-7</sub> are written into the memory if it has valid t<sub>SD</sub>, before the end of a WE controlled Write or before the end of an CE controlled Write. Keep OE HIGH during the entire Write cycle to avoid data bus contention on common I/O lines. If OE is left LOW, internal circuitry turns off the output buffers t<sub>HZWE</sub> after WE goes LOW.

### Software STORE

Data is transferred from the SRAM to the nonvolatile memory by a software address sequence. The STK11C68 software STORE cycle is initiated by executing sequential CE controlled Read cycles from six specific address locations in exact order. During the STORE cycle, an erase of the previous nonvolatile data is first performed followed by a program of the nonvolatile elements. When a STORE cycle is initiated, input and output are disabled until the cycle is completed.

Because a sequence of Reads from specific addresses is used for STORE initiation, it is important that no other Read or Write accesses intervene in the sequence. If they intervene, the sequence is aborted and no STORE or RECALL takes place.

To initiate the software STORE cycle, the following Read sequence is performed:

1. Read address 0x0000, Valid READ
2. Read address 0x1555, Valid READ
3. Read address 0x0AAA, Valid READ
4. Read address 0x1FFF, Valid READ
5. Read address 0x10F0, Valid READ
6. Read address 0x0F0F, Initiate STORE cycle

The software sequence is clocked with CE controlled Reads. When the sixth address in the sequence is entered, the STORE cycle commences and the chip is disabled. It is important that Read cycles and not Write cycles are used in the sequence. It is not necessary that OE is LOW for a valid sequence. After the

t<sub>STORE</sub> cycle time is fulfilled, the SRAM is again activated for Read and Write operation.

### Software RECALL

Data is transferred from the nonvolatile memory to the SRAM by a software address sequence. A software RECALL cycle is initiated with a sequence of Read operations in a manner similar to the software STORE initiation. To initiate the RECALL cycle, the following sequence of CE controlled Read operations is performed:

1. Read address 0x0000, Valid READ
2. Read address 0x1555, Valid READ
3. Read address 0x0AAA, Valid READ
4. Read address 0x1FFF, Valid READ
5. Read address 0x10F0, Valid READ
6. Read address 0x0F0F, Initiate RECALL cycle

Internally, RECALL is a two step procedure. First, the SRAM data is cleared; then, the nonvolatile information is transferred into the SRAM cells. After the t<sub>RECALL</sub> cycle time, the SRAM is again ready for Read and Write operations. The RECALL operation does not alter the data in the nonvolatile elements. The nonvolatile data can be recalled an unlimited number of times.

### Hardware RECALL (Power Up)

During power up or after any low power condition ( $V_{CC} < V_{RESET}$ ), an internal RECALL request is latched. When  $V_{CC}$  once again exceeds the sense voltage of V<sub>SWITCH</sub>, a RECALL cycle is automatically initiated and takes t<sub>HRECALL</sub> to complete.

If the STK11C68 is in a Write state at the end of power up RECALL, the SRAM data is corrupted. To help avoid this situation, a 10 Kohm resistor is connected either between WE and system V<sub>CC</sub> or between CE and system V<sub>CC</sub>.

### Hardware Protect

The STK11C68 offers hardware protection against inadvertent STORE operation and SRAM Writes during low voltage conditions. When  $V_{CAP} < V_{SWITCH}$ , all externally initiated STORE operations and SRAM Writes are inhibited.

### Noise Considerations

The STK11C68 is a high speed memory. It must have a high frequency bypass capacitor of approximately 0.1 μF connected between V<sub>CC</sub> and V<sub>SS</sub>, using leads and traces that are as short as possible. As with all high speed CMOS ICs, careful routing of power, ground, and signals reduce circuit noise.

### Low Average Active Power

CMOS technology provides the STK11C68 the benefit of drawing significantly less current when it is cycled at times longer than 50 ns. Figure 2 shows the relationship between I<sub>CC</sub> and Read or Write cycle time. Worst case current consumption is shown for both CMOS and TTL input levels (commercial temperature range, V<sub>CC</sub> = 5.5V, 100% duty cycle on chip enable). Only standby current is drawn when the chip is disabled.

The overall average current drawn by the STK11C68 depends on the following items:

- The duty cycle of chip enable
- The overall cycle rate for accesses
- The ratio of Reads to Writes
- CMOS versus TTL input levels
- The operating temperature
- The  $V_{CC}$  level
- I/O loading

**Figure 2. Current Versus Cycle Time (Read)**

| L  | H  | 0x0000<br>0x1555<br>0x0AAA<br>0x1FFF<br>0x10F0<br>0x0F0E | Read SRAM<br>Read SRAM<br>Read SRAM<br>Read SRAM<br>Read SRAM<br>Nonvolatile RECALL | Output Data<br>Output Data<br>Output Data<br>Output Data<br>Output Data<br>Output High Z | [1]   |

**Note**

1. The six consecutive addresses must be in the order listed.  $\overline{WE}$  must be high during all six consecutive  $\overline{CE}$  controlled cycles to enable a nonvolatile cycle.

## Best Practices

nvSRAM products have been used effectively for over 15 years. While ease of use is one of the product's main system values, experience gained working with hundreds of applications has resulted in the following suggestions as best practices:

- The nonvolatile cells in an nvSRAM are programmed on the test floor during final test and quality assurance. Incoming inspection routines at customer or contract manufacturer's sites sometimes reprograms these values. Final NV patterns are typically repeating patterns of AA, 55, 00, FF, A5, or 5A. The end product's firmware should not assume that an NV array is in a set programmed state. Routines that check memory content values to determine first time system configuration, cold or warm boot status, and so on must always program a unique NV pattern (for example, complex 4-byte pattern of 46 E6 49 53 hex or more random bytes) as part of the final system manufacturing test to ensure these system routines work consistently.
- Power up boot firmware routines should rewrite the nvSRAM into the desired state. While the nvSRAM is shipped in a preset state, best practice is to again rewrite the nvSRAM into the desired state as a safeguard against events that might flip the bit inadvertently (program bugs, incoming inspection routines, and so on).

## Maximum Ratings

Exceeding maximum ratings may shorten the useful life of the device. These user guidelines are not tested.

Storage Temperature ..... -65°C to +150°C

Temperature under bias..... -55°C to +125°C

Supply Voltage on  $V_{CC}$  Relative to GND ..... -0.5V to 7.0V

Voltage on Input Relative to  $V_{SS}$ ..... -0.6V to  $V_{CC} + 0.5V$

Voltage on  $DQ_{0-7}$  ..... -0.5V to  $V_{CC} + 0.5V$

Power Dissipation ..... 1.0W

DC Output Current (1 output at a time, 1s duration).... 15 mA

## Operating Range

| Range      | Ambient Temperature | $V_{CC}$     |
|------------|---------------------|--------------|
| Commercial | 0°C to +70°C        | 4.5V to 5.5V |
| Industrial | -40°C to +85°C      | 4.5V to 5.5V |

## DC Electrical Characteristics

Over the operating range ( $V_{CC} = 4.5V$  to  $5.5V$ )

| Parameter       | Description                                                     | Test Conditions                                                                                                                                                                             | Min            | Max            | Unit           |

| $V_{IH}$        | Input HIGH Voltage                                              |                                                                                                                                                                                             | 2.2            | $V_{CC} + 0.5$ | V              |
| $V_{IL}$        | Input LOW Voltage                                               |                                                                                                                                                                                             | $V_{SS} - 0.5$ | 0.8            | V              |
| $V_{OH}$        | Output HIGH Voltage                                             | $I_{OUT} = -4$ mA                                                                                                                                                                           | 2.4            |                | V              |
| $V_{OL}$        | Output LOW Voltage                                              | $I_{OUT} = 8$ mA                                                                                                                                                                            |                | 0.4            | V              |

## Data Retention and Endurance

| Parameter | Description                  | Min   | Unit  |
|-----------|------------------------------|-------|-------|
| $DATA_R$  | Data Retention               | 100   | Years |
| $NV_C$    | Nonvolatile STORE Operations | 1,000 | K     |

### Note

- $\overline{CE} \geq V_{IH}$  does not produce standby current levels until any nonvolatile cycle in progress has timed out.

## Capacitance

In the following table, the capacitance parameters are listed.<sup>[3]</sup>

| Parameter | Description        | Test Conditions                                                                       | Max | Unit |
|-----------|--------------------|---------------------------------------------------------------------------------------|-----|------|
| $C_{IN}$  | Input Capacitance  | $T_A = 25^\circ\text{C}$ , $f = 1\text{ MHz}$ ,<br>$V_{CC} = 0\text{ to }3.0\text{V}$ | 8   | pF   |
| $C_{OUT}$ | Output Capacitance |                                                                                       | 7   | pF   |

## Thermal Resistance

In the following table, the thermal resistance parameters are listed.<sup>[3]</sup>

| Parameter     | Description                              | Test Conditions                                                                                                | 28-SOIC | 28-CDIP | 28-LCC | Unit               |
|---------------|------------------------------------------|----------------------------------------------------------------------------------------------------------------|---------|---------|--------|--------------------|
| $\Theta_{JA}$ | Thermal Resistance (Junction to Ambient) | Test conditions follow standard test methods and procedures for measuring thermal impedance, per EIA / JESD51. | TBD     | TBD     | TBD    | $^\circ\text{C/W}$ |
| $\Theta_{JC}$ | Thermal Resistance (Junction to Case)    |                                                                                                                | TBD     | TBD     | TBD    | $^\circ\text{C/W}$ |

**Figure 4. AC Test Loads**

## AC Test Conditions

Input Pulse Levels ..... 0V to 3V  
 Input Rise and Fall Times (10% to 90%) .....  $\leq 5\text{ ns}$   
 Input and Output Timing Reference Levels ..... 1.5V

### Note

3. These parameters are guaranteed by design and are not tested.

## AC Switching Characteristics

### SRAM Read Cycle

| Parameter         |                      | Description                       | 25 ns |     | 35 ns |     | 45 ns |     | Unit |
|-------------------|----------------------|-----------------------------------|-------|-----|-------|-----|-------|-----|------|

| $t_{HZCE}^{[6]}$  | $t_{EHQZ}$           | Chip Disable to Output Inactive   |       | 10  |       | 13  |       | 15  | ns   |
| $t_{LZOE}^{[6]}$  | $t_{GLQX}$           | Output Enable to Output Active    | 0     |     | 0     |     | 0     |     | ns   |
| $t_{HZOE}^{[6]}$  | $t_{GHQZ}$           | Output Disable to Output Inactive |       | 10  |       | 13  |       | 15  | ns   |
| $t_{PU}^{[3]}$    | $t_{ELICCH}$         | Chip Enable to Power Active       | 0     |     | 0     |     | 0     |     | ns   |
| $t_{PD}^{[3]}$    | $t_{EHICCL}$         | Chip Disable to Power Standby     |       | 25  |       | 35  |       | 45  | ns   |

### Switching Waveforms

**Figure 5. SRAM Read Cycle 1: Address Controlled** <sup>[4, 5]</sup>

**Figure 6. SRAM Read Cycle 2:  $\overline{CE}$  and  $\overline{OE}$  Controlled** <sup>[4]</sup>

#### Notes

4. WE must be High during SRAM Read cycles.
5. I/O state assumes CE and OE  $\leq V_{IL}$  and WE  $\geq V_{IH}$ ; device is continuously selected.
6. Measured  $\pm 200$  mV from steady state output voltage.

## SRAM Write Cycle

| Parameter          |                         | Description                      | 25 ns |     | 35 ns |     | 45 ns |     | Unit |
|--------------------|-------------------------|----------------------------------|-------|-----|-------|-----|-------|-----|------|
| Cypress Parameter  | Alt                     |                                  | Min   | Max | Min   | Max | Min   | Max |      |
| $t_{WC}$           | $t_{AVAV}$              | Write Cycle Time                 | 25    |     | 35    |     | 45    |     | ns   |
| $t_{PWE}$          | $t_{WLWH}$ , $t_{WLEH}$ | Write Pulse Width                | 20    |     | 25    |     | 30    |     | ns   |
| $t_{SCE}$          | $t_{ELWH}$ , $t_{ELEH}$ | Chip Enable To End of Write      | 20    |     | 25    |     | 30    |     | ns   |
| $t_{SD}$           | $t_{DVWH}$ , $t_{DVEH}$ | Data Setup to End of Write       | 10    |     | 12    |     | 15    |     | ns   |
| $t_{HD}$           | $t_{WHDX}$ , $t_{EHDH}$ | Data Hold After End of Write     | 0     |     | 0     |     | 0     |     | ns   |
| $t_{AW}$           | $t_{AVWH}$ , $t_{AVEH}$ | Address Setup to End of Write    | 20    |     | 25    |     | 30    |     | ns   |
| $t_{SA}$           | $t_{AVWL}$ , $t_{AVEL}$ | Address Setup to Start of Write  | 0     |     | 0     |     | 0     |     | ns   |
| $t_{HA}$           | $t_{WHAX}$ , $t_{EHAX}$ | Address Hold After End of Write  | 0     |     | 0     |     | 0     |     | ns   |
| $t_{HZWE}^{[6,7]}$ | $t_{WLQZ}$              | Write Enable to Output Disable   |       | 10  |       | 13  |       | 15  | ns   |
| $t_{LZWE}^{[6]}$   | $t_{WHQX}$              | Output Active After End of Write | 5     |     | 5     |     | 5     |     | ns   |

## Switching Waveforms

**Figure 7. SRAM Write Cycle 1:  $\overline{WE}$  Controlled** <sup>[7, 8]</sup>

**Figure 8. SRAM Write Cycle 2:  $\overline{CE}$  and  $\overline{OE}$  Controlled** <sup>[7, 8]</sup>

### Notes

7. If  $\overline{WE}$  is Low when  $\overline{CE}$  goes Low, the outputs remain in the high impedance state.
8.  $\overline{CE}$  or  $\overline{WE}$  must be greater than  $V_{IH}$  during address transitions.

## AutoStore INHIBIT or Power Up RECALL

| Parameter           | Alt           | Description               | STK11C68 |     | Unit    |
|---------------------|---------------|---------------------------|----------|-----|---------|
|                     |               |                           | Min      | Max |         |
| $t_{HRECALL}^{[9]}$ | $t_{RESTORE}$ | Power up RECALL Duration  |          | 550 | $\mu$ s |
| $t_{STORE}$         | $t_{HLHZ}$    | STORE Cycle Duration      |          | 10  | ms      |
| $V_{SWITCH}$        |               | Low Voltage Trigger Level | 4.0      | 4.5 | V       |
| $V_{RESET}$         |               | Low Voltage Reset Level   |          | 3.6 | V       |

## Switching Waveform

Figure 9. AutoStore INHIBIT/Power Up RECALL

### Note

9.  $t_{HRECALL}$  starts from the time  $V_{CC}$  rises above  $V_{SWITCH}$ .

## Software Controlled STORE/RECALL Cycle

The software controlled STORE/RECALL cycle follows. <sup>[10, 11]</sup>

| Parameter           | Alt        | Description                        | 25 ns |     | 35 ns |     | 45 ns |     | Unit    |
|---------------------|------------|------------------------------------|-------|-----|-------|-----|-------|-----|---------|
|                     |            |                                    | Min   | Max | Min   | Max | Min   | Max |         |
| $t_{RC}$            | $t_{AVAV}$ | STORE/RECALL Initiation Cycle Time | 25    |     | 35    |     | 45    |     | ns      |
| $t_{SA}^{[10]}$     | $t_{AVEL}$ | Address Setup Time                 | 0     |     | 0     |     | 0     |     | ns      |
| $t_{CW}^{[10]}$     | $t_{ELEH}$ | Clock Pulse Width                  | 20    |     | 25    |     | 30    |     | ns      |
| $t_{HACE}^{[10]}$   | $t_{ELAX}$ | Address Hold Time                  | 20    |     | 20    |     | 20    |     | ns      |
| $t_{RECALL}^{[10]}$ |            | RECALL Duration                    |       | 20  |       | 20  |       | 20  | $\mu$ s |

## Switching Waveform

Figure 10.  $\overline{CE}$  Controlled Software STORE/RECALL Cycle <sup>[11]</sup>

### Notes

10. The software sequence is clocked on the falling edge of  $\overline{CE}$  without involving  $\overline{OE}$  (double clocking aborts the sequence).

11. The six consecutive addresses must be read in the order listed in Table 1 on page 5.  $\overline{WE}$  must be HIGH during all six consecutive cycles.

## Part Numbering Nomenclature

### STK11C68 - S F 45 I TR

## Ordering Information

These parts are not recommended for new designs. They are in production to support ongoing production programs only.

| Speed (ns) | Ordering Code    | Package Diagram | Package Type          | Operating Range |
|------------|------------------|-----------------|-----------------------|-----------------|
| 25         | STK11C68-SF25TR  | 001-85058       | 28-Pin SOIC (330 mil) | Commercial      |
|            | STK11C68-SF25    | 001-85058       | 28-Pin SOIC (330 mil) |                 |
|            | STK11C68-SF25ITR | 001-85058       | 28-Pin SOIC (330 mil) | Industrial      |
