

DRAM MODULE

MT8D432(X)
MT16D832(X)

For the latest data sheet revisions, please refer to the Micron Web site: www.micron.com/mti/msp/html/datasheet.html

FEATURES

- JEDEC- and industry-standard pinout in a 72-pin, single in-line memory module (SIMM)
- 16MB (4 Meg x 32) and 32MB (8 Meg x 32)
- High-performance CMOS silicon-gate process
- Single 5V $\pm 10\%$ power supply
- All inputs, outputs and clocks are TTL-compatible
- Refresh modes: RAS#-ONLY, CAS#-BEFORE-RAS# (CBR) and HIDDEN
- 2,048-cycle refresh distributed across 32ms
- FAST PAGE MODE (FPM) access or Extended Data-Out (EDO) PAGE MODE access

GENERAL DESCRIPTION

The MT8D432(X) and MT16D832(X) are randomly accessed, 16MB and 32MB solid-state memories organized in a x32 configuration. During READ or WRITE cycles, each bit is uniquely addressed through 22 address bits that are entered 11 bits (A0-A10) at a time. RAS# is used to latch the first 11 bits and CAS# the latter 11 bits. READ and WRITE cycles are selected with the WE# input. A logic HIGH on WE# dictates read mode, while a logic LOW on WE# dictates write mode. During a WRITE cycle, data-in (D) is latched by the falling edge of CAS#. Since WE# goes LOW prior to CAS# going LOW, the output pin(s) remain open (High-Z) until the next CAS# cycle.

FAST PAGE MODE

FAST-PAGE-MODE operations allow faster data operations (READ or WRITE) within a row-address-defined page boundary. The FAST-PAGE-MODE cycle is always initiated with a row address strobed in by RAS#, followed by a column address strobed in by CAS#. Additional columns may be accessed by providing valid column addresses, strobing CAS# and holding RAS# LOW, thus executing faster memory cycles. Returning RAS# HIGH terminates the FAST-PAGE-MODE operation.

EDO PAGE MODE

EDO PAGE MODE, designated by the "X" version, is an accelerated FAST-PAGE-MODE cycle. The primary advantage of EDO is the availability of data-out even after CAS# goes back HIGH. EDO provides for CAS# precharge time

(^tCP) to occur without the output data going invalid. This elimination of CAS# output control provides for pipelined READs.

FAST-PAGE-MODE modules have traditionally turned the output buffers off (High-Z) with the rising edge of CAS#. EDO operates like FAST-PAGE-MODE READs, except data will be held valid or become valid after CAS# goes HIGH, as long as RAS# and OE# are held LOW. (Refer to the MT4C4M4E8 DRAM data sheet for additional information on EDO functionality.)

REFRESH

Returning RAS# and CAS# HIGH terminates a memory cycle and decreases chip current to a reduced standby level. Also, the chip is preconditioned for the next cycle during the RAS# HIGH time. Memory cell data is retained in its correct state by maintaining power and executing any RAS# cycle (READ, WRITE) or RAS# REFRESH cycle (RAS#-ONLY, CBR or HIDDEN) so that all 2,048 combinations of RAS# addresses are executed at least every 32ms, regardless of sequence. The CBR REFRESH cycle will invoke the refresh counter for automatic RAS# addressing.

x16 CONFIGURATION

For x16 applications, the corresponding DQ and CAS# pins must be connected together (DQ1 to DQ17, DQ2 to DQ18 and so forth, and CAS0# to CAS2# and CAS1# to CAS3#). Each RAS# is then a bank select for the x16 memory organization.

ABSOLUTE MAXIMUM RATINGS*

Voltage on Any Pin Relative to V_{SS} -1V to +7V
 Operating Temperature, T_A (ambient) 0°C to +70°C
 Storage Temperature (plastic) -55°C to +125°C
 Power Dissipation 8W
 Short Circuit Output Current 50mA

*Stresses greater than those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

NOTES

1. All voltages referenced to V_{SS} .
2. This parameter is sampled. Capacitance is measured using MIL-STD-883C, Method 3012.1 (1 MHz AC, $V_{DD} = 4.5V$, DC bias = 2.4V at 15mV RMS).
3. I_{CC} is dependent on output loading and cycle rates. Specified values are obtained with minimum cycle time and the outputs open.
4. Enables on-chip refresh and address counters.
5. The minimum specifications are used only to indicate cycle time at which proper operation over the full temperature range is ensured.
6. An initial pause of 100 μ s is required after power-up, followed by eight RAS# refresh cycles (RAS#-ONLY or CBR with WE# HIGH), before proper device operation is ensured. The eight RAS# cycle wake-ups should be repeated any time the t_{REF} refresh requirement is exceeded.
7. AC characteristics assume $t_T = 5ns$ for FPM and $t_T = 2.5ns$ for EDO.
8. V_{IH} (MIN) and V_{IL} (MAX) are reference levels for measuring timing of input signals. Transition times are measured between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}).
9. In addition to meeting the transition rate specification, all input signals must transit between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}) in a monotonic manner.
10. If CAS# = V_{IH} , data output is High-Z.
11. If CAS# = V_{IL} , data output may contain data from the last valid READ cycle.
12. Measured with a load equivalent to two TTL gates and 100pF, $V_{OL} = 0.8V$ and $V_{OH} = 2V$.
13. If CAS# is LOW at the falling edge of RAS#, Q will be maintained from the previous cycle. To initiate a new cycle and clear the data-out buffer, CAS# must be pulsed HIGH for t_{CP} .
14. The t_{RCD} (MAX) limit is no longer specified. t_{RCD} (MAX) was specified as a reference point only. If t_{RCD} was greater than the specified t_{RCD} (MAX) limit, then access time was controlled exclusively by t_{CAC} (t_{RAC} [MIN] no longer applied). With or without the t_{RCD} (MAX) limit, t_{AA} and t_{CAC} must always be met.
15. The t_{RAD} (MAX) limit is no longer specified. t_{RAD} (MAX) was specified as a reference point only. If t_{RAD} was greater than the specified t_{RAD} (MAX) limit, then access time was controlled exclusively by t_{AA} (t_{RAC} and t_{CAC} no longer applied). With or without the t_{RAD} (MAX) limit, t_{AA} , t_{RAC} and t_{CAC} must always be met.
16. Either t_{RCH} or t_{RRH} must be satisfied for a READ cycle.
17. t_{OFF} (MAX) defines the time at which the output achieves the open circuit condition and is not referenced to V_{OH} or V_{OL} .
18. These parameters are referenced to CAS# leading edge in EARLY WRITE cycles.
19. OE# is tied permanently LOW; LATE WRITE or READ-MODIFY-WRITE operations are not permissible and should not be attempted.
20. A HIDDEN REFRESH may also be performed after a WRITE cycle. In this case, WE# = LOW and OE# = HIGH.
21. The 3ns minimum is a parameter guaranteed by design.
22. Column address changed once each cycle.
23. 16MB module values will be half of those shown.
24. For the FPM option, t_{OFF} is determined by the first RAS# or CAS# signal to transition HIGH. In comparison, t_{OFF} on an EDO option is determined by the latter of the RAS# and CAS# signals to transition HIGH.
25. Applies to both EDO and FPM modules.
