

MC10H175

Quint Latch

The MC10H175 is a quint D type latch with common reset and clock lines. This MECL 10KH part is a functional/pinout duplication of the standard MECL 10K family part, with 100% improvement in propagation delay and no increase in power-supply current.

- Propagation Delay, 1.2 ns Typical
- Power Dissipation, 400 mW Typical
- Improved Noise Margin 150 mV (Over Operating Voltage and Temperature Range)
- Voltage Compensated
- MECL 10K–Compatible

DIP
PIN ASSIGNMENT

Pin assignment is for Dual-in-Line Package.
For PLCC pin assignment, see the Pin Conversion Tables on page 18 of the ON Semiconductor MECL Data Book (DL122/D).

- Each MECL 10H series circuit has been designed to meet the dc specifications shown in the test table, after thermal equilibrium has been established. The circuit is in a test socket or mounted on a printed circuit board and transverse air flow greater than 500 linear fpm is maintained. Outputs are terminated through a 50-ohm resistor to -2.0 volts.

MC10H175

APPLICATION INFORMATION

The MC10H175 is a high speed, low power quint latch. It features five D type latches with common reset and a common two-input clock. Data is transferred on the negative edge of the clock and latched on the positive edge. The two clock inputs are “OR”ed together.

Any change on the data input will be reflected at the outputs while the clock is low. The outputs are latched on the

positive transition of the clock. While the clock is in the high state, a change in the information present at the data inputs will not affect the output information. **THE RESET INPUT IS ENABLED ONLY WHEN THE CLOCK IS IN THE HIGH STATE.**
