

±15kV ESD-Protected, 2.5V, 1μA, 460kbps, RS-232 Compatible Transceivers

General Description

The MAX3316E–MAX3319E are 2.5V powered RS-232 compatible transceivers. These devices feature shutdown (MAX3317E), AutoShutdown Plus™ (MAX3318E/MAX3319E), and enhanced electrostatic discharge (ESD) protection integrated into the chip. All transmitter outputs and receiver inputs are protected to ±15kV using the IEC 1000-4-2 Air-Gap Discharge method, ±8kV using the IEC 1000-4-2 Contact Discharge method, and ±15kV using the Human Body Model.

All devices are guaranteed at a data rate of 460kbps. The transceivers have a proprietary low-dropout transmitter output stage enabling RS-232 compatible operation from a +2.25V to +3.0V supply with a dual charge pump. The charge pump requires only four 0.1μF capacitors. The MAX3318E/MAX3319E feature a logic-level output (READY) that asserts when the charge pump is regulating and the device is ready to begin transmitting.

The MAX3318E/MAX3319E achieve a 1μA supply current using Maxim's revolutionary AutoShutdown Plus feature. These devices automatically enter a low-power shutdown mode when the RS-232 cable is disconnected or the transmitters of the connected peripherals are inactive for more than 30 seconds. They turn on again when they sense a valid transition at any transmitter or receiver input. AutoShutdown Plus saves power without changes to the existing BIOS or operating system. The MAX3317E also features a 1μA shutdown mode that can be entered by driving SHDN low. The MAX3317E's receivers remain active while in shutdown mode, allowing external devices such as modems to be monitored using only 1μA supply current.

These devices are available in space-saving packages: MAX3316E (16-pin SSOP and 20-pin TSSOP), MAX3317E/MAX3318E (20-pin SSOP and 20-pin TSSOP), and MAX3319E (16-pin SSOP).

Applications

Palmtop Computers
 Hand-Held Instruments
 Pagers
 Cellular Phones
 GPS
 Handy Terminals
 Hand-Held Electronic Books

Selector Guide and Typical Application Circuits appear at end of data sheet.

AutoShutdown Plus is a trademark of Maxim Integrated Products.

Features

- ♦ ESD Protection for RS-232 I/O Pins
 - ±15kV—Human Body Model
 - ±8kV—IEC 1000-4-2, Contact Discharge
 - ±15kV—IEC 1000-4-2, Air-Gap Discharge
- ♦ 300μA Operating Supply Current
- ♦ 1μA Low-Power Shutdown with Receivers Active
- ♦ Guaranteed 460kbps Data Rate
- ♦ Guaranteed 4V/μs Slew Rate
- ♦ RS-232 Compatible Down to 2.25V

—		—	14	12	FORCEON	Force-On Input, Active High. Drive high to override AutoShutdown Plus, keeping transmitters and receivers on ($\overline{\text{FORCEOFF}}$ must be high) (Table 1).
—		—	20	16	$\overline{\overline{\overline{\text{FORCEOFF}}}}$	Force-Off Input, Active Low. Drive low to shut down transmitters, receivers, and charge pump. This overrides AutoShutdown Plus and FORCEON (Table 1).

MAX3316E–MAX3319E

Detailed Description

Dual Charge-Pump Voltage Converter

The MAX3316E–MAX3319Es' internal power supply consists of a regulated dual charge pump that provides output voltages of +4.4V (doubling charge pump) and -4.3V (inverting charge pump), over the +2.25V to +3.0V range. The charge pump operates in discontinuous mode: if the output voltages are less than 4.4V, the charge pump is enabled; if the output voltages exceed 4.4V, the charge pump is disabled. Each charge pump requires a flying capacitor (C1, C2) and a reservoir capacitor (C3, C4) to generate the V+ and V- supplies.

The READY output (MAX3318E/MAX3319E) is low when the charge pumps are disabled in shutdown mode. The READY signal asserts high when V- goes below -2.75V.

RS-232 Compatible Transmitters

The MAX3316E–MAX3319Es' transmitters are inverting level translators that convert CMOS-logic levels to RS-232 compatible voltage levels. They guarantee a 460kbps data rate with worst-case loads of 3kΩ in parallel with 1000pF, providing compatibility with PC-to-PC communication software (such as LapLink™).

The MAX3317E's transmitters are turned off (high impedance) when $\overline{\text{SHDN}}$ is asserted low, putting the device in shutdown mode. The MAX3318E/MAX3319Es'

transmitters are turned off (high impedance) when $\overline{\text{FORCEOFF}}$ is asserted low, or when the AutoShutdown Plus circuitry senses that all receiver and transmitter inputs are inactive for more than 30 seconds.

The transmitter outputs can be driven to ±12V when power is off. The transmitter inputs do not have internal pull-up resistors. Connect unused inputs to GND or VCC.

RS-232 Receivers

The MAX3316E–MAX3319Es' receivers convert ±3.7V to ±13.2V RS-232 signal levels into CMOS-logic output levels. The receivers are rated to receive signals up to ±25V. The MAX3316E/MAX3318E/MAX3319Es' receivers feature inverting outputs that always remain active (Table 1). The MAX3317E's receivers have inverting, three-state outputs. In shutdown, the receivers can be active or inactive (Table 2).

The MAX3318E/MAX3319E feature an $\overline{\text{INVALID}}$ output that is asserted low when no valid RS-232 voltage levels have been detected on all receiver inputs. Because $\overline{\text{INVALID}}$ indicates the receiver's input condition, it is independent of the states of FORCEON and $\overline{\text{FORCEOFF}}$.

MAX3317E Shutdown Mode

Supply current falls to less than 1μA in shutdown mode ($\text{SHDN} = \text{low}$). When shut down, the device's charge pumps are turned off, V+ is pulled down to VCC, V- is pulled to ground, and the transmitter outputs are disabled (high impedance). The time required to exit shut-

LapLink is a trademark of Traveling Software.

±15kV ESD-Protected, 2.5V, 1μA, 460kbps, RS-232 Compatible Transceivers

Table 1. Output Control Truth Table (MAX3318E/MAX3319E)

OPERATION STATUS	FORCEON	$\overline{\text{FORCEOFF}}$	VALID RECEIVER LEVEL	RECEIVER OR TRANSMITTER EDGE WITHIN 30s	T_OUT	R_OUT
Shutdown (Forced Off)	X	0	X	X	High-Z	Active

X = Don't care

* $\overline{\text{INVALID}}$ connected to FORCEON

** $\overline{\text{INVALID}}$ connected to FORCEON and $\overline{\text{FORCEOFF}}$

Table 2. Shutdown and Enable Control Truth Table (MAX3317E)

SHDN	EN	T_OUT	R_OUT
0	0	High-Z	Active
0	1	High-Z	High-Z
1	0	Active	Active
1	1	Active	High-Z

down is typically 30μs, as shown in Figure 2. Connect SHDN to VCC if the shutdown mode is not used; SHDN has no effect on R_OUT.

MAX3318E/MAX3319E AutoShutdown Plus Mode

Maxim's AutoShutdown Plus feature on the MAX3318E/MAX3319E allows the supply current to fall to 1μA. These devices will enter the AutoShutdown Plus mode if $\overline{\text{FORCEOFF}}$ is high, FORCEON is low, and they do not

sense a valid signal transition on any receiver or transmitter input for 30 seconds. This may occur if the RS-232 cable is disconnected or if the peripheral transmitters are turned off, and the UART driving the transmitter inputs is inactive. The system turns on again when a valid transition is applied to any RS-232 receiver or transmitter input. As a result, the system saves power without changes to the existing BIOS or operating system.

Figure 4a depicts valid and invalid RS-232 receiver voltage levels. $\overline{\text{INVALID}}$ indicates the receiver input's condition and is independent of FORCEON and $\overline{\text{FORCEOFF}}$ states. Figure 3 and Table 1 summarize the operating modes of the MAX3318E/MAX3319E. FORCEON and $\overline{\text{FORCEOFF}}$ override AutoShutdown Plus circuitry. When neither control is asserted, the IC selects between these states automatically based on the last receiver or transmitter edge received.

When shut down, the device's charge pumps turn off, V+ is pulled to VCC, V- is pulled to ground, the transmitter outputs are high impedance, and READY is driven low. The time required to exit shutdown is typically 30μs (Figure 2).

$\pm 15\text{kV}$ ESD-Protected, 2.5V, 1 μA , 460kbps, RS-232 Compatible Transceivers

MAX3316E-MAX3319E

Figure 1a. RS-232 Compatibility Circuit

Figure 1b. MAX3316E-MAX3319E Transmitter Output Compatibility with an RS-232 Receiver

Figure 2. Transmitter Outputs when Exiting Shutdown or Powering Up

$\pm 15\text{kV}$ ESD-Protected, 2.5V, 1 μA , 460kbps, RS-232 Compatible Transceivers

By connecting FORCEON to $\overline{\text{INVALID}}$, the MAX3318E/MAX3319E shut down when no valid receiver level is detected and wake up when a valid receiver level is detected.

A system with AutoShutdown Plus may need time to wake up. Figure 5 shows a circuit that forces the transmitters on for 100ms, allowing enough time for the other system to realize that the MAX3318E/MAX3319E is awake. If the other system outputs valid RS-232 signal transitions within that time, the RS-232 ports on both systems remain enabled.

Connecting to the PC (MAX3318E/MAX3319E)

If direct software control is desired, use $\overline{\text{INVALID}}$ to indicate DTR or ring indicator (RI) signal. This can be used to connect a hand-held device to a PC. One example is using the Hot Sync™ function on a personal digital assistant (PDA). The transmitter and receiver signals (T_OUT and R_IN) are used for communication, while $\overline{\text{INVALID}}$ causes a change of state on RI. The change of state on RI will trigger an interrupt on the PC and allow communication to begin between the device and the PC. This eliminates the need for the PC to poll constantly the receiver or transmitter lines to determine if the device is connected.

$\pm 15\text{kV}$ ESD Protection

All the pins on the MAX3316E-MAX3319E are protected against ESDs encountered during handling and assembly. The driver outputs and receiver inputs have extra protection against static electricity. Maxim's engineers have developed state-of-the-art structures to protect these pins against ESD of $\pm 15\text{kV}$ without damage. The ESD structures withstand high ESD in all states: normal operation, shutdown, and powered down. After an ESD event, Maxim's E versions keep working without latchup, whereas competing products can latch and must be powered down to remove latchup.

ESD protection can be tested in various ways; the transmitter outputs and receiver inputs of the product family are characterized for protection to the following limits:

- $\pm 15\text{kV}$ using the Human Body Model
- $\pm 8\text{kV}$ using the IEC 1000-4-2 Contact Discharge method
- $\pm 15\text{kV}$ using IEC 1000-4-2 Air-Gap method

ESD Test Conditions

ESD performance depends on a variety of conditions. Contact Maxim for a reliability report that documents test setup, test methodology, and test results.

Hot Sync is a trademark of 3Com.

IEC 1000-4-2

The IEC 1000-4-2 standard covers ESD testing and performance of finished equipment; it does not specifically refer to ICs. The MAX3316E-MAX3319E help you design equipment that meets Level 4 (the highest level) of IEC 1000-4-2 without the need for additional ESD-protection components.

The major difference between tests done using the Human Body Model and IEC 1000-4-2 is higher peak current in IEC 1000-4-2 because series resistance is lower in the IEC 1000-4-2 model. Hence, the ESD withstand voltage measured to IEC 1000-4-2 is generally lower than that measured using the Human Body Model. Figure 7a shows the IEC 1000-4-2 model, and Figure 7b shows the current waveform for the 8kV, IEC 1000-4-2, Level 4, ESD Contact Discharge test.

The Air-Gap Discharge test involves approaching the device with a charged probe. The Contact Discharge method connects the probe to the device before the probe is energized.

Machine Model

The Machine Model for ESD tests all pins using a 200pF storage capacitor and zero discharge resistance. Its objective is to emulate the stress caused by contact that occurs with handling and assembly during manufacturing. All pins require this protection during manufacturing, not just RS-232 inputs and outputs. Therefore, after PC board assembly, the Machine Model is less relevant to I/O ports.

Applications Information

RS-232 Compatible Operation

The MAX3316E-MAX3319E do not meet EIA-232 requirements for transmitter output voltage levels. EIA-232 compliance specifies transmitter output voltage swings of $\pm 5\text{V}$ when loaded with 3k Ω and 2500pF.

The receiver inputs are fully EIA-232 compliant.

The MAX3316E-MAX3319E will function properly with most modern RS-232 interfaces. This allows RS-232 compatible communication in low-voltage systems without the added expense of a voltage tripler or switched-mode power supply.

Capacitor Selection

The capacitor type used for C1–C4 is not critical for proper operation; polarized or nonpolarized capacitors can be used. The charge pump requires 0.1μF capacitors. Increasing the capacitor values (e.g., by a factor of 2) reduces ripple on the transmitter outputs and slightly reduces power consumption. C2, C3, and C4 can be increased without changing C1's value. **However, do not increase C1 without also increasing the values of C2, C3, C4, and C_{BYPASS} to maintain proper ratios (C1 to other capacitors).**

When using the minimum-required capacitor values, make sure the capacitor value does not degrade excessively with temperature. If in doubt, use capacitors with a higher nominal value. The capacitor's equivalent series resistance (ESR), which usually rises at low temperatures, influences the amount of ripple on V+ and V-.

Power-Supply Decoupling

In most circumstances, a 0.1μF bypass capacitor is adequate. In applications that are sensitive to power-supply noise, decouple VCC to ground with a capacitor of the same value as charge pump capacitor C1. Connect bypass capacitors as close to the IC as possible.

Transmitter Outputs when Exiting Shutdown

Figure 2 shows two transmitter outputs when exiting shutdown mode. As they become active, the two transmitter outputs are shown going to opposite RS-232 compatible levels (one transmitter input is high, the other is low). Each transmitter is loaded with 3kΩ in parallel with 2500pF. The transmitter outputs display no ringing or undesirable transients as they come out of shutdown. Note that the transmitters are enabled only when the magnitude of V- exceeds approximately -3V.

High Data Rates

The MAX3316E–MAX3319E maintain RS-232 compatible ±3.7V minimum transmitter output voltage even at high data rates. Figure 8 shows a transmitter loopback test circuit. Figure 9 shows a loopback test result at 230kbps. For Figure 9, all transmitters were driven simultaneously at 230kbps into EIA/TIA-562 loads in parallel with 1000pF.

Chip Information

TRANSISTOR COUNT: 1130
