

2M x 8 Static RAM

Features

- High speed
 - $t_{AA} = 10, 12 \text{ ns}$
- Low active power
 - 990 mW (max.)
- Operating voltages of $3.3 \pm 0.3\text{V}$
- 2.0V data retention
- Automatic power-down when deselected
- TTL-compatible inputs and outputs
- Easy memory expansion with $\overline{CE}_1$ and CE_2 features
- Available in Pb-free and non Pb-free 54-pin TSOP II, non Pb-free 60-ball fine-pitch ball grid array (FBGA) package

Functional Description

The CY7C1069AV33 is a high-performance CMOS Static RAM organized as 2,097,152 words by 8 bits. Writing to the device is accomplished by enabling the chip (by taking $\overline{CE}_1$ LOW and CE_2 HIGH) and Write Enable (WE) inputs LOW.

Reading from the device is accomplished by enabling the chip ($\overline{CE}_1$ LOW and CE_2 HIGH) as well as forcing the Output Enable ($\overline{OE}$) LOW while forcing the Write Enable (WE) HIGH. See the truth table at the back of this data sheet for a complete description of Read and Write modes.

The input/output pins (I/O_0 through I/O_7) are placed in a high-impedance state when the device is deselected ($\overline{CE}_1$ HIGH or CE_2 LOW), the outputs are disabled ($\overline{OE}$ HIGH), or during a Write operation ($\overline{CE}_1$ LOW, CE_2 HIGH, and WE LOW).

The CY7C1069AV33 is available in a 54-pin TSOP II package with center power and ground (revolutionary) pinout, and a 60-ball fine-pitch ball grid array (FBGA) package.

AC Test Loads and Waveforms^[5]

Notes:

3. $V_{IL} (\text{min.}) = -2.0V$ for pulse durations of less than 20 ns.

4. Tested initially and after any design or process changes that may affect these parameters.

5. Valid SRAM operation does not occur until the power supplies have reached the minimum operating V_{DD} (3.0V). As soon as 1ms (T_{power}) after reaching the minimum operating V_{DD} , normal SRAM operation can begin including reduction in V_{DD} to the data retention (V_{CCDR} , 2.0V) voltage.

Data Retention Waveform

Notes:

- Valid SRAM operation does not occur until the power supplies have reached the minimum operating V_{DD} (3.0V). As soon as 1ms (T_{power}) after reaching the minimum operating V_{DD} , normal SRAM operation can begin including reduction in V_{DD} to the data retention (V_{CCDR} , 2.0V) voltage.
- Test conditions assume signal transition time of 3 ns or less, timing reference levels of 1.5V, input pulse levels of 0 to 3.0V, and output loading of the specified I_{OL}/I_{OH} and transmission line loads. Test conditions for the Read cycle use output loading shown in part a) of the AC test loads, unless specified otherwise.
- This part has a voltage regulator which steps down the voltage from 3V to 2V internally. t_{power} time has to be provided initially before a Read/Write operation is started.
- t_{HZOE} , t_{HZSCE} , t_{HZWE} and t_{LZOE} , t_{LZCE} , and t_{LZWE} are specified with a load capacitance of 5 pF as in (b) of AC Test Loads. Transition is measured ± 200 mV from steady-state voltage.
- These parameters are guaranteed by design and are not tested.
- The internal Write time of the memory is defined by the overlap of $\overline{CE}_1$ LOW/ CE_2 HIGH, and $\overline{WE}$ LOW. $\overline{CE}_1$ and $\overline{WE}$ must be LOW along with CE_2 HIGH to initiate a Write, and the transition of any of these signals can terminate the Write. The input data set-up and hold timing should be referenced to the leading edge of the signal that terminates the Write.
- The minimum Write cycle time for Write Cycle No. 3 ($\overline{WE}$ controlled, $\overline{OE}$ LOW) is the sum of t_{HZWE} and t_{SD} .

Notes:

13. Device is continuously selected. $\overline{CE}_1 = V_{IL}$, $CE_2 = V_{IH}$.
14. $\overline{WE}$ is HIGH for Read cycle.
15. Address valid prior to or coincident with $\overline{CE}_1$ transition LOW and CE_2 transition HIGH.

Truth Table

$\overline{CE}_1$	$\overline{CE}_2$	$\overline{OE}$	$\overline{WE}$	I/O ₀ -I/O ₇	Mode	Power
H	X	X	X	High-Z	Power-down	Standby (I_{SB})
X	L	X	X	High-Z	Power-down	Standby (I_{SB})
L	H	L	H	Data Out	Read All Bits	Active (I_{CC})
L	H	X	L	Data In	Write All Bits	Active (I_{CC})
L	H	H	H	High-Z	Selected, Outputs Disabled	Active (I_{CC})

Notes:

16. Data I/O is high-impedance if $\overline{OE} = V_{IH}$.

17. If $\overline{CE}_1$ goes HIGH/ $\overline{CE}_2$ LOW simultaneously with $\overline{WE}$ going HIGH, the output remains in a high-impedance state.

18. $\overline{CE}$ above is defined as a combination of $\overline{CE}_1$ and $\overline{CE}_2$. It is active low.
