

MSK**M.S.KENNEDY CORP.****HIGH VOLTAGE/HIGH CURRENT
OPERATIONAL AMPLIFIER****181**

4707 Dey Road Liverpool, N.Y. 13088

(315) 701-6751

FEATURES:

- Low Cost
- High Voltage Operation:
Single Supply: +8V to +60V
Dual Supply: $\pm 4V$ to $\pm 30V$
- High Output Current: 3 Amp Continuous
- High Speed: $10V/\mu S$
- Low Quiescent Current: 20 mA Typ.
- Adjustable Current Limits
- Thermal Shutdown
- Monolithic Technology
- Enable/Status Pin For Output Disable Control

MIL-PRF-38534 CERTIFIED**MSK181****MSK181Z****DESCRIPTION:**

The MSK 181 is a high power monolithic operational amplifier ideal for use with a wide variety of loads. With operation from either single or dual supplies, the MSK 181 offers excellent design flexibility. Power dissipation is kept to a minimum with a quiescent current rating of only 20mA, while 3 Amps of continuous available output current makes the MSK 181 a very good low cost choice for motor drive circuits and audio amplification. The MSK 181 is internally protected against current overloads and overtemperature conditions. Current limit can also be user-selected through the use of a resistor/potentiometer or voltage out/current out DAC. The MSK 181 is packaged in a hermetically sealed 8 pin power dip and the MSK 181Z is offered with bolt down tabs for applications that require heat sinking.

EQUIVALENT SCHEMATIC**TYPICAL APPLICATIONS**

- Servo Driver
- Actuator Driver
- Audio Amplifier
- Power Supplies

PIN-OUT INFORMATION

1	+VIN	8	-Vcc
2	-VIN	7	+Vcc
3	ILIM	6	Output
4	E/S	5	N/C

ABSOLUTE MAXIMUM RATINGS

V_{CC}	Total Supply Voltage	60V
$\pm I_{OUT}$	Output Current (within S.O.A.)	5A
V_{IND}	Input Voltage (Differential)	$\pm 29.5V$
V_{IN}	Input Voltage (Common Mode)	$+27V/-29V$
T_J	Junction Temperature, Internal Protection (See Application Note)	

T_{ST}	Storage Temperature Range	$-65^{\circ}C$ to $+150^{\circ}C$
T_{LD}	Lead Temperature Range (10 seconds)	$300^{\circ}C$
T_C	Case Operating Temperature (MSK181H/E)	$-55^{\circ}C$ to $+125^{\circ}C$
	(MSK181)	$-40^{\circ}C$ to $+85^{\circ}C$
R_{TH}	Thermal Resistance Junction to Case	$1.8^{\circ}C/W$

NOTES:

- ① Unless otherwise specified $\pm V_{CC} = \pm 30VDC$ and E/S pin is open.
- ② Devices shall be capable of meeting the parameter, but need not to be tested. Typical parameters are for reference only.
- ③ Industrial grade and 'E' suffix devices shall be tested to subgroups 1 and 4 unless otherwise specified.
- ④ Military grade devices ('H' suffix) shall be 100% tested to subgroups 1,2,3 and 4.
- ⑤ Subgroup 1,4 $T_A = T_C = +25^{\circ}C$
 Subgroup 2 $T_A = T_C = +125^{\circ}C$
 Subgroup 3 $T_A = T_C = -55^{\circ}C$

APPLICATION NOTES

POWER SUPPLIES:

The MSK 181 maximum total supply voltage is specified as 60V. However, dual and unbalanced power supply operation is permissible as long as total supply voltage does not exceed 60V.

POWER SUPPLY BYPASSING:

Power supply terminals must be effectively decoupled with a high and low frequency bypass circuit to avoid power supply induced oscillation. An effective decoupling scheme consists of a 0.1 μ F ceramic capacitor in parallel with a 10 μ F tantalum capacitor for each power supply pin to ground. In addition, it is recommended that a 0.01 μ F capacitor be placed between $\pm V_{cc}$ as close to the MSK 181 as possible.

CURRENT LIMIT:

The MSK 181 offers accurate, user-selectable current limit. Unlike typical designs that use a power resistor in series with the output to sense load, the MSK 181 senses the load indirectly and therefore does not require a resistor to handle the full output current. Current limit is selected by controlling the input to the I_{LM} pin.

The easiest method is to use a resistor or potentiometer connected between V_{cc} and the I_{LM} pin. Use the following equation to select proper resistor value:

$$R_{cc} = \frac{71,250}{I_{LM}} - 13.75K\Omega$$

A low level control signal (0-330 μ A) can also be used to control the current level digitally. If the pin is left open, the current is programmed to OA, while connecting I_{LM} directly to $-V_{cc}$ sets the output current to it's maximum, typically 5A.

SAFE OPERATING AREA:

The safe operating area curve is a graphical representation of the power handling capability of the amplifier under various conditions. Power dissipation of the device is equal to the product of the voltage across the output transistor times the output current. As can be seen in the curve, safe operating current decreases with an increase in temperature as well as an increase in the voltage across the output transistor. Therefore, for maximum amplifier performance it is important to keep case temperature as low as possible and to keep $\pm V_{cc}$ as close to the output rail as achievable.

THERMAL PROTECTION:

The MSK 181 is equipped with thermal protection circuitry that protects the amplifier from damage caused by excessive junction temperature. The output is disabled when the junction temperature reaches approximately 160°C. After the junction temperature cools to approximately 140°C, the output is again enabled. The thermal protection may cycle on and off depending on the output load and signal conditions; this may have an undesirable effect on the load.

It should be noted that even though this internal protection circuitry does protect against overload conditions, it does not take the place of proper heat sinking. For reliable operation, junction temperature should be limited to 150°C, maximum.

ENABLE/STATUS PIN:

This pin actually has a dual function. First, when the pin is forced low, the output stage is disabled. Second, it can be monitored to determine if the device is in thermal shutdown. These functions can be used on the same device with either single or dual supplies. For normal operation, the E/S pin must be left open or pulled at least 2.4 volts above the negative rail. In noisy applications, a small value capacitor between the E/S pin and $-V_{cc}$ may be required.

To disable the output, the user must pull the E/S pin low, no greater than 0.8V above $-V_{cc}$. To once again enable the device, the E/S pin must be brought at least 2.4 volts above $-V_{cc}$ or disconnected. It should be noted that when the E/S pin is high, the internal thermal shutdown is still active.

If the E/S pin is used to monitor thermal shutdown, during normal operation the voltage on the E/S pin is typically 3.5V above $-V_{cc}$. Once shutdown has occurred this voltage will drop to approximately 350mV above $-V_{cc}$.

COMPENSATION:

For normal operation output compensation is not typically required. However, if the MSK 181 is intended to be driven into current limit the user may find that an R/C network is required. A snubber network from the output to ground will provide stability. If driving large capacitive or inductive loads, a snubber network will also enhance stability. Typically 3 Ω to 10 Ω in series with 0.01 μ F is acceptable.

TYPICAL CONNECTION DIAGRAM

APPLICATION NOTES cont.

RESISTOR METHOD

$$R_{CL} = \frac{15000 (4.75V)}{I_{LIM}} - 13750\Omega$$

DAC METHOD (Current or voltage)

$$I_{SET} = I_{LIM} / 15000$$

$$V_{SET} = (V-) + 4.75V - (13750\Omega)(I_{LIM}) / 15000$$

DESIRED CURRENT LIMIT	RESISTOR(1) (RCL)	CURRENT (ISET)	VOLTAGE (VSET)
0A	I _{LIM} Open	0uA	(V-)+4.75V
1A	57.6KΩ	67uA	(V-)+3.8V
2.5A	14.7KΩ	167uA	(V-)+2.5V
3A	10KΩ	200uA	(V-)+2V
4A	4.02KΩ	267uA	(V-)+1.1V
5A	I _{LIM} Connected to V-	333uA	(V-)

NOTE: (1) Resistors are nearest standard 1% values.

Figure 1
Adjustable Current Limit

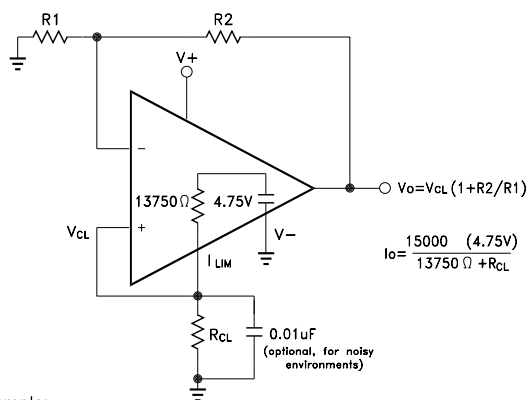

Figure 3

Thermal Shutdown Status With a Single Supply

For Example:

If $I_{LIM} = 3A$, $R_{CL} = 10K\Omega$

$$V_{CL} = \frac{10K\Omega \cdot 4.75V}{(10K\Omega + 13750\Omega)} = 2V$$

Desired $V_o = 20V$, $G = \frac{20}{2} = 10$

$R_1 = 1K\Omega$ and $R_2 = 9K\Omega$

Uses voltage developed at I_{LIM} pin
as a moderately accurate reference voltage.
