### description

The TL7770 is an integrated-circuit system supervisor designed for use as a reset controller in microcomputer and microprocessor power-supply systems. This device contains two independent supply-voltage supervisors that monitor the supplies for overvoltage and undervoltage conditions at the VSO and VSU terminals, respectively. When  $V_{CC}$  attains the minimum voltage of 1 V during power up, the  $\overline{RESET}$  output becomes active (low). As  $V_{CC}$  approaches 3.5 V, the time-delay function activates, latching RESET and  $\overline{RESET}$  active (high and low, respectively) for a time delay (t<sub>d</sub>) after system voltages have achieved normal levels. Above  $V_{CC} = 3.5$  V, taking  $\overline{RESIN}$  low activates the time-delay function during normal system-voltage levels. To ensure that the microcomputer system has reset, the outputs remain active until the voltage at VSU exceeds the threshold value,  $V_{IT+}$ , for a time delay, which is determined by an external timing capacitor such that:

$$t_d \approx 20 \times 10^3 \times capacitance$$

where t<sub>d</sub> is in seconds and capacitance is in farads.

The overvoltage-detection circuit is programmable for a wide range of designs. During an overvoltage condition, an internal silicon-controlled rectifier (SCR) is triggered, providing 250-mA peak instantaneous current and 25-mA continuous current to the SCR gate drive terminal, which can drive an external high-current SCR gate or an overvoltage-warning circuit.

The TL7770C series is characterized for operation from 0°C to 70°C. The TL7770I series is characterized for operation from –40°C to 85°C.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

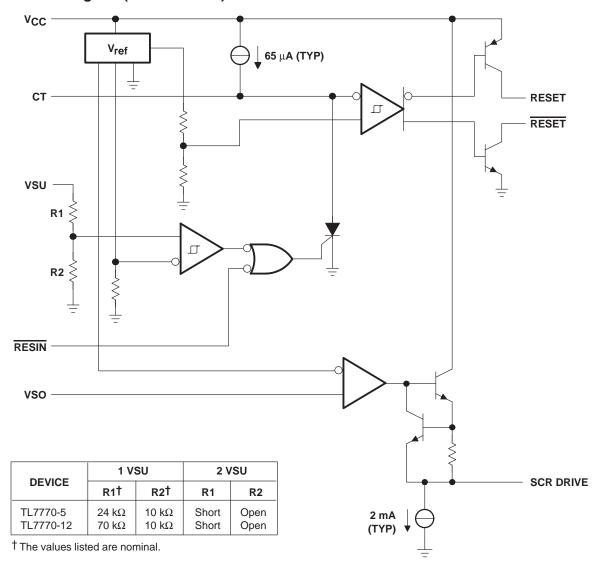

#### **AVAILABLE OPTIONS**

	PACKAGED	CHIP FORM	
TA	SMALL OUTLINE (DW)	PLASTIC DIP (N)	(Y)
0°C to 70°C	TL7770-5CDW TL7770-12CDW	TL7770-5CN TL7770-12CN	TL7770-5Y TL7770-12Y
–40°C to 85°C	TL7770-5IDW	TL7770-5IN	_

DW package is available taped and reeled. Add the suffix R to the device type (e.g., TL7770-5CDWR). Chip forms are tested at  $25^{\circ}$ C.

## functional block diagram (each channel)

### timing requirements

## absolute maximum ratings over operating free-air temperature range (unless otherwise noted)†

Supply voltage, V <sub>CC</sub> (see Note 1)	20 V
Input voltage range, V <sub>I</sub> : 1VSU, 2VSU, 1VSO, and 2VSO (see Note 1)	
Low-level output current (1RESET and 2RESET), IOL	20 mA
High-level output current (1RESET and 2RESET), IOH	–20 mA
Package thermal impedance, θ <sub>JA</sub> (see Notes 2 and 3): DW package	57°C/W
N package	88°C/W
Lead temperature 1,6 mm (1/16 in) from case for 10 seconds: DW or N package	260°C
Storage temperature range, T <sub>sta</sub>	-65°C to 150°C

<sup>†</sup> Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

- NOTES: 1. All voltage values are with respect to the network ground terminal.
  - 2. Maximum power dissipation is a function of  $T_J(max)$ ,  $\theta_{JA}$ , and  $T_A$ . The maximum allowable power dissipation at any allowable ambient temperature is  $P_D = (T_J(max) T_A)/\theta_{JA}$ . Operating at the absolute maximum  $T_J$  of 150°C can impact reliability.
  - 3. The package thermal impedance is calculated in accordance with JESD 51, except for through-hole packages, which use a trace length of zero.

# TL7770-5, TL7770-12 DUAL POWER-SUPPLY SUPERVISORS

SLVS019F - OCTOBER 1987 - REVISED JULY 1999

### recommended operating conditions

		MIN	MAX	UNIT
Supply voltage, V <sub>CC</sub>	Supply voltage, V <sub>CC</sub>			
Input voltage range, V <sub>I</sub> (see Note 4)	1VSU, 2VSU, 2VSO, 1VSO	0	18	V
Output voltage, VO (1CT, 2CT)			5	V
High-level input voltage range, V <sub>IH</sub> (1RESIN, 2RESIN)		2	18	V
Low-level input voltage range, V <sub>IL</sub> (1RESIN, 2RESIN)		0	0.8	V
Output sink current, IO (1CT, 2CT)			50	μА
High-level output current, IOH (1RESET, 2RESET)			-16	mA
Low-level output current, IOL (1RESET, 2RESET)			16	mA
Continuous output current, IO (1SCR DRIVE, 2SCR DRIVE)			25	mA
Timing capacitor, C <sub>T</sub>			10	μF
Operating free oir temperature Te	TL7770C series	0	70	°C
ligh-level input voltage range, V <sub>IH</sub> (1RESIN, 2RESIN)  ow-level input voltage range, V <sub>IL</sub> (1RESIN, 2RESIN)  output sink current, I <sub>O</sub> (1CT, 2CT)  ligh-level output current, I <sub>OH</sub> (1RESET, 2RESET)  ow-level output current, I <sub>OL</sub> (1RESET, 2RESET)  continuous output current, I <sub>O</sub> (1SCR DRIVE, 2SCR DRIVE)	TL7770I series	-40	85	°C

NOTE 4: The algebraic convention, in which the least positive (most negative) value is designated minimum, is used in this data sheet for logic voltage levels only.

### PARAMETER MEASUREMENT INFORMATION

NOTE A: This includes jig and probe capacitance.

Figure 1. RESET and RESET Output Configurations

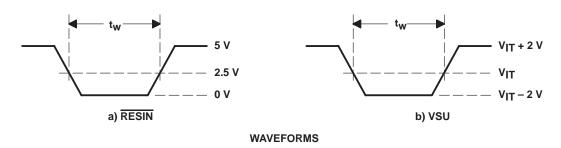

Figure 2. Input Pulse Definition

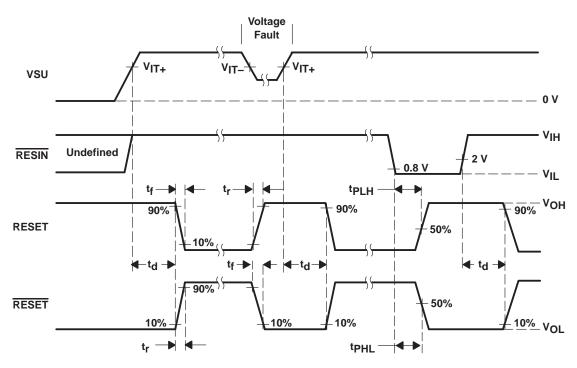

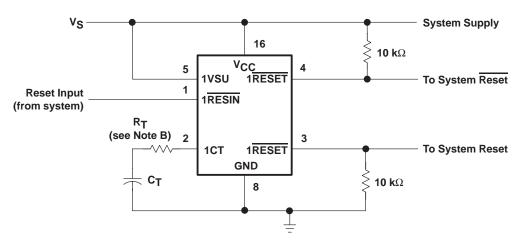

Figure 3. Voltage Waveforms

### **APPLICATION INFORMATION**

NOTE B: When  $V_{CC}$  and 1VSU are connected to the same point, it is recommended that series resistance (R<sub>T</sub>) be added between the time-delay programming capacitor (C<sub>T</sub>) and the voltage-supervisor device terminal (1CT). The suggested R<sub>T</sub> value is given by:

$$R_T > \frac{V_I - V_{IT-}}{1 \times 10^{-3}}$$
, where  $V_I = \left( \text{the lesser of 7.1 V or V}_S \right)$ 

When this series resistor is used, the  $t_{\mbox{\scriptsize d}}$  calculation is as follows:

$$t_{d} = \frac{1.3 - \left[ ((6.5 E - 5) \times 10^{-5}) \times R_{T} \right]}{6.5 \times 10^{-5}} \times C_{T}$$
