

Triple Channel Video Driver with LPF

The ISL59117 is a triple channel reconstruction filter with a -3dB roll-off frequency of 9MHz. Operating from single supplies ranging from +2.5V to +3.6V and drawing only 3.9mA quiescent current, the ISL59117 is ideally suited for low power, battery-operated applications. Additionally, enable pins shut the part down in under 14ns.

The ISL59117 is designed to meet the needs for very low power and bandwidth required in battery-operated communication, instrumentation, and modern industrial applications such as video on demand, cable set-top boxes, MP3 players, and HDTV. The ISL59117 is offered in a space-saving chipscale package guaranteed to a 0.57mm maximum height constraint and specified for operation from -40°C to +85°C temperature range.

Pinout

ISL59117 (WLCSP)
TOP VIEW

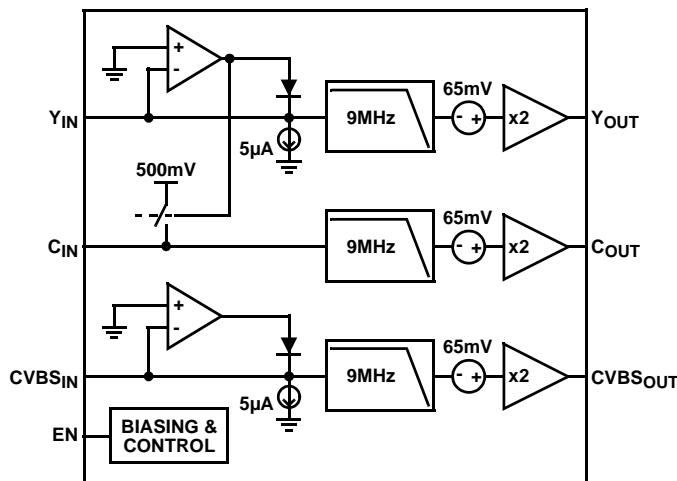

Features

- 3rd order 9MHz reconstruction filter
- 40V/μs slew rate
- Low supply current = 3.9mA
- Power-down current less than 1μA
- Supplies from 2.5V to 3.6V
- Rail-to-rail output
- CSP package
- Pb-free plus anneal available (RoHS compliant)

Applications

- Video amplifiers
- Portable and handheld products
- Communications devices
- Video on demand
- Cable set-top boxes
- Satellite set-top boxes
- MP3 players
- HDTV
- Personal video recorder

Ordering Information

| PART NUMBER (Note) | PART MARKING | TAPE AND REEL | TEMP. RANGE (°C) | PACKAGE (Pb-Free) | PKG. DWG. # |
|--------------------|--------------|---------------|------------------|-------------------|-------------|
| ISL59117IIZ-T7 | 117Z | 7" | -40 to +85 | WLCSP | W3x3.9A |

NOTE: Intersil Pb-free plus anneal products employ special Pb-free material sets; molding compounds/die attach materials and 100% matte tin plate termination finish, which are RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.

Absolute Maximum Ratings ($T_A = +25^\circ\text{C}$)

| | |
|-------------------------------------|-------------------------------------|
| Supply Voltage from V_{DD} to GND | 4.2V |
| Input Voltage | $V_{DD} + 0.3\text{V}$ to GND -0.3V |
| Continuous Output Current | 40mA |
| Power Dissipation | See Curves |
| Operating Junction Temperature | +125°C |

| | |
|-------------------------------|-----------------|
| ESD Classification | |
| Human Body Model | 3000V |
| Machine Model | 300V |
| Storage Temperature | -65°C to +125°C |
| Ambient Operating Temperature | -40°C to +85°C |

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

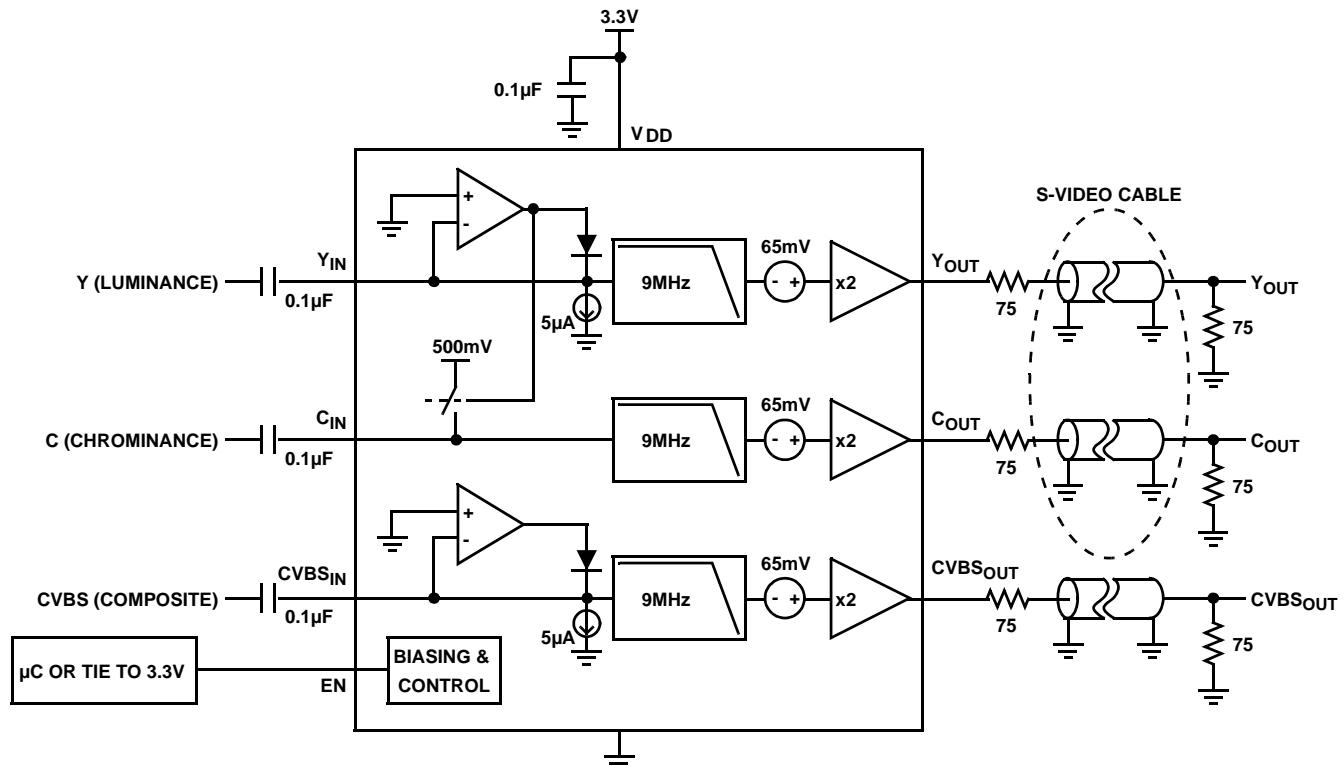

IMPORTANT NOTE: All parameters having Min/Max specifications are guaranteed. Typ values are for information purposes only. Unless otherwise noted, all tests are at the specified temperature and are pulsed tests, therefore: $T_J = T_C = T_A$

Electrical Specifications $V_{DD} = 3.3\text{V}$, $T_A = +25^\circ\text{C}$, $R_L = 150\Omega$ to GND, unless otherwise specified.

| PARAMETER | DESCRIPTION | CONDITIONS | MIN | Typ | MAX | UNIT |

Application Information

The ISL59117 is a single-supply rail-to-rail triple (one s-video channel and one composite channel) video amplifier with internal sync tip clamps, a typical -3dB bandwidth of 9MHz and slew rate of about 40V/μs. This part is ideally suited for applications requiring high composite and s-video performance with very low power consumption. As the performance characteristics and features illustrate, the ISL59117 is optimized for portable video applications.

Internal Sync Clamp

Embedded video DACs typically use ground as their most negative supply. This places the sync tip voltage at a minimum of 0V. Presenting a 0V input to most single supply amplifiers will saturate the output stage of the amplifier resulting in a clipped sync tip and degraded video image.

The ISL59117 features an internal sync clamp and offset function that level shifts the entire video signal to the optimum level before it reaches the amplifiers' input stage. These features also help avoid saturation of the output stage of the amplifier by setting the signal closer to the best voltage range.

The simplified block diagram on the front page shows the basic operation of the ISL59117's sync clamp. The Y and CVBS inputs' AC-coupled video sync signal is pulled negative by a current source at the input. When the sync tip goes below the comparator threshold, the comparator output goes high, pulling up on the input through the diode, forcing current into the coupling capacitor until the voltage at the input is again 0V, and the comparator turns off. This forces the sync tip clamp to always be 0V, setting the offset for the entire video signal. The C channel is slaved to the Y channel and clamped to a 500mV level.

The Sallen Key Low Pass Filter

The Sallen Key is a classic low pass configuration. This provides a very stable low pass function, and in the case of the ISL59117, a three-pole roll-off at 9MHz. The three-pole function is accomplished with an RC low pass network placed in series with and before the Sallen Key. The first pole is formed by an RC network, with poles two and three generated with a Sallen Key, creating a nice three-pole roll-off at 9MHz.

Output Coupling

The ISL59117 can be AC or DC coupled to its output. When AC coupling, a 220μF coupling capacitor is recommended to ensure that low frequencies are passed, preventing video "tilt" or "droop" across a line.

The ISL59117's internal sync clamp makes it possible to DC couple the output to a video load, eliminating the need for any AC coupling capacitors, saving board space, cost, and eliminating any "tilt" or offset shift in the output signal. The trade off is larger supply current draw, since the DC component of the signal is now dissipated in the load resistor. Typical load current for AC coupled signals is 5mA compared to 10mA for DC coupling.

Output Drive Capability

The ISL59117 does not have internal short circuit protection circuitry. If the output is shorted indefinitely, the power dissipation could easily overheat the die or the current could eventually compromise metal integrity. Maximum reliability is maintained if the output current never exceeds ± 40 mA. This limit is set by the design of the internal metal interconnect. Note that for transient short circuits, the part is robust.

Short circuit protection can be provided externally with a back match resistor in series with the output placed close as possible to the output pin. In video applications this would be a 75Ω resistor and will provide adequate short circuit protection to the device. Care should still be taken not to stress the device with a short at the output.

Power Dissipation

With the high output drive capability of the ISL59117, it is possible to exceed the +125°C absolute maximum junction temperature under certain load current conditions. Therefore, it is important to calculate the maximum junction temperature for an application to determine if load conditions or package types need to be modified to assure operation of the amplifier in a safe operating area.

The maximum power dissipation allowed in a package is determined according to:

$$PD_{MAX} = \frac{T_{JMAX} - T_{AMAX}}{\Theta_{JA}}$$

Where:

T_{JMAX} = Maximum junction temperature

T_{AMAX} = Maximum ambient temperature

Θ_{JA} = Thermal resistance of the package

The maximum power dissipation actually produced by an IC is the total quiescent supply current times the total power supply voltage, plus the power in the IC due to the load, or:

for sourcing:

$$PD_{MAX} = V_S \times I_{SMAX} + (V_S - V_{OUT}) \times \frac{V_{OUT}}{R_L}$$

for sinking:

$$PD_{MAX} = V_S \times I_{SMAX} + (V_{OUT} - V_S) \times I_{LOAD}$$

Where:

V_S = Supply voltage

I_{SMAX} = Maximum quiescent supply current

V_{OUT} = Maximum output voltage of the application

R_{LOAD} = Load resistance tied to ground

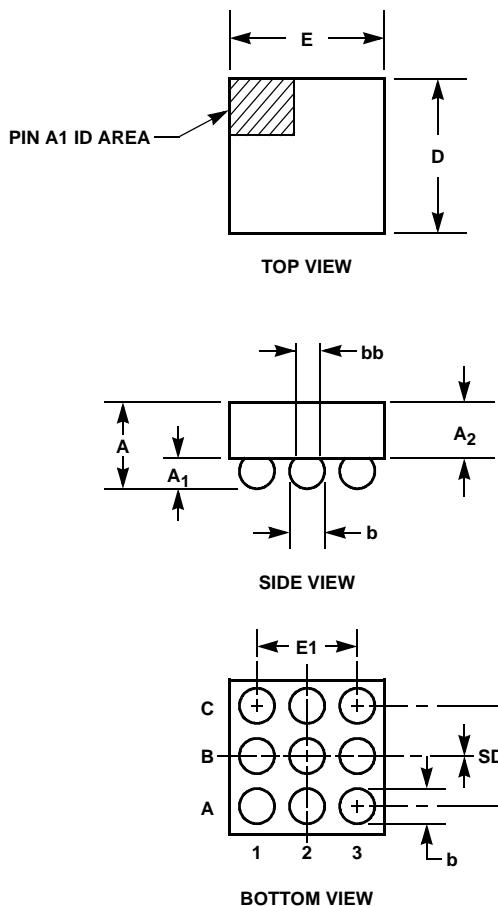

I_{LOAD} = Load current

Power Supply Bypassing Printed Circuit Board Layout

As with any modern operational amplifier, a good printed circuit board layout is necessary for optimum performance. Lead lengths should be as short as possible. The power supply pin must be well bypassed to reduce the risk of oscillation. For normal single supply operation, a single 4.7µF tantalum capacitor in parallel with a 0.1µF ceramic capacitor from V_{S+} to GND will suffice.

Printed Circuit Board Layout

For good AC performance, parasitic capacitance should be kept to minimum. Use of wire wound resistors should be avoided because of their additional series inductance. Use of sockets should also be avoided if possible. Sockets add parasitic inductance and capacitance that can result in compromised performance.
