

±250V Input Range
G = 1, 10, Micropower,
Difference Amplifier

APPLICATIONS

- Pin Selectable Gain of 1 or 10
- High Common Mode Voltage Range:
 85V Window ($V_S = 5V, 0V$)
 ±250V ($V_S = \pm 15V$)
- Common Mode Rejection Ratio: 70dB Min
- Input Protection to ±350V
- Gain Error: 0.28% Max
- PSRR: 82dB Min
- High Input Impedance: 2MΩ Differential,
 500kΩ Common Mode
- Micropower: 120μA Max Supply Current
- Wide Supply Range: 2.7V to 36V
- -3dB Bandwidth: 100kHz
- Rail-to-Rail Output
- 8-Pin SO Package

FEATURES

- Battery Cell Voltage Monitoring
- High Voltage Current Sensing
- Signal Acquisition in Noisy Environments
- Input Protection
- Fault Protected Front Ends
- Level Sensing
- Isolation

DESCRIPTION

The LT[®]1990 is a micropower precision difference amplifier with a very high common mode input voltage range. It has pin selectable gains of 1 or 10. The LT1990 operates over a ±250V common mode voltage range on a ±15V supply. The inputs are fault protected from common mode voltage transients up to ±350V and differential voltages up to ±500V. The LT1990 is ideally suited for both high side and low side current or voltage monitoring.

On a single 5V supply, the LT1990 has an adjustable 85V input range, 70dB min CMRR and draws less than 120μA supply current. The rail-to-rail output maximizes the dynamic range, especially important for single supplies as low as 2.7V.

The LT1990 is specified for single 3V, 5V and ±15V supplies over both commercial and industrial temperature ranges. The LT1990 is available in the 8-pin SO package.

LT, LTC and LT are registered trademarks of Linear Technology Corporation.

TYPICAL APPLICATION

Full-Bridge Load Current Monitor

1990f

ABSOLUTE MAXIMUM RATINGS

(Notes 1, 2)

Total Supply Voltage (V^+ to V^-)	36V
Input Voltage Range	
Continuous	$\pm 250V$
Transient (0.1s)	$\pm 350V$
Differential	$\pm 500V$
Output Short-Circuit Duration (Note 3)	Indefinite
Operating Temperature Range (Note 4) ...	-40°C to 85°C
Specified Temperature Range (Note 5)	-40°C to 85°C
Storage Temperature Range	-65°C to 150°C
Lead Temperature (Soldering, 10 sec.)	300°C

Note 1: Absolute Maximum Ratings are those values beyond which the life of a device may be impaired.

Note 2: ESD (Electrostatic Discharge) sensitive device. Extensive use of ESD protection devices are used internal to the LT1990, however, high electrostatic discharge can damage or degrade the device. Use proper ESD handling precautions.

Note 3: A heat sink may be required to keep the junction temperature below absolute maximum.

Note 4: The LT1990C/LT1990I are guaranteed functional over the operating temperature range of -40°C to 85°C .

Note 5: The LT1990C is guaranteed to meet the specified performance from 0°C to 70°C and is designed, characterized and expected to meet specified performance from -40°C to 85°C but is not tested or QA sampled at these temperatures. The LT1990I is guaranteed to meet specified performance from -40°C to 85°C .

Note 6: $G = 10$ limits are guaranteed by correlation to $G = 1$ tests and gain error tests at $G = 10$.

Note 7: Limits are guaranteed by correlation to -5V to 80V CMRR tests.

Note 8: $V_S = 3\text{V}$ limits are guaranteed by correlation to $V_S = 5\text{V}$ and $V_S = \pm 15\text{V}$ tests.

Note 9: $V_S = 5\text{V}$ limits are guaranteed by correlation to $V_S = 3\text{V}$ and $V_S = \pm 15\text{V}$ tests.

Note 10: This parameter is not 100% tested.

Note 11: Hysteresis in offset voltage is created by package stress that differs depending on whether the IC was previously at a higher or lower temperature. Offset voltage hysteresis is always measured at 25°C , but the IC is cycled to 85°C I-grade (or 70°C C-grade) or -40°C I-grade (0°C C-grade) before successive measurement.

PIN FUNCTIONS

REF (Pin 1): Reference Input. Sets the output level when the difference between the inputs is zero.

-IN (Pin 2): Inverting Input. Connects a $1M\Omega$ resistor to the op amp's inverting input. Designed to permit high voltage operation.

+IN (Pin 3): Noninverting Input. Connects a $1M\Omega$ resistor to the op amp's noninverting input. Designed to permit high voltage operation.

V⁻ (Pin 4): Negative Power Supply. Can be either ground (in single supply applications) or a negative voltage (in split supply applications).

GAIN2 (Pin 5): Gain = 10 Select Input. Configures the amplifier for a gain of 10 when connected to the GAIN1 pin. The gain is equal to one when both GAIN2 and GAIN1 are open. See Applications section for additional functions.

OUT (Pin 6): Output. $V_{OUT} = G \cdot (V_{+IN} - V_{-IN}) + V_{REF}$, in the basic configuration.

V⁺ (Pin 7): Positive Power Supply. Can range from 2.7V to 36V above the V⁻ voltage.

GAIN1 (Pin 8): Gain = 10 Select Input. Configures the amplifier for a gain of 10 when connected to the GAIN2 pin. The gain is equal to one when both GAIN1 and GAIN2 are open. See Applications section for additional functions.

APPLICATIONS INFORMATION

Primary Features

The LT1990 is a complete gain-block solution for high input common mode voltage applications, incorporating a low power precision operational amplifier providing rail-to-rail output swing along with on-chip precision thin-film resistors for high accuracy. The Block Diagram shows the internal architecture of the part. The on-chip resistors form a modified difference amplifier including a reference port for introducing offset or other additive waveforms. With pin-strapping alone either unity gain or gain of 10 is produced with high precision. The resistor network is designed to produce internal common-mode voltage division of 27 so that a very large input range is available compared to the power supply voltage(s) used by the LT1990 itself. The LT1990 is ideally suited to situations where relatively small signals need to be extracted from high voltage circuits, as is the case in many current monitoring instrumentation applications for example. With the ability to accept a range of input voltages well outside the limits of the local power rails and its greater than $1\text{M}\Omega$ input impedances, development of precision low power over-the-top and under-the-bottom instrumentation designs is greatly simplified with the LT1990 single chip solution over conventional discrete implementations.

Classic Difference Amplifier

Used in the basic difference amplifier topology where the gain G is pin-strap configurable to be unity or ten, the following relationship is realized:

$$V_O = G \cdot (V_{+IN} - V_{-IN}) + V_{REF}$$

To operate in unity gain, the GAIN1 and GAIN2 pins are left disconnected. For $G = 10$ operation, the GAIN1 and GAIN2 pins are simply connected together or tied to a common potential such as ground or V^- .

The input common mode range capability is up to $\pm 250\text{V}$, governed by the following relationships:

For $G = 1$ and $G = 10$ where GAIN1 and GAIN2 are only tied together (not grounded, etc):

$$V_{CM+} \leq 27 \cdot V^+ - 26 \cdot V_{REF} - 23$$

$$V_{CM-} \geq 27 \cdot V^- - 26 \cdot V_{REF} + 27$$

For $G = 10$ where GAIN1 and GAIN2 are tied to a common potential V_{GAIN} :

$$V_{CM+} \leq 27 \cdot V^+ - 26 \cdot V_{REF} - 23 - V_{GAIN}$$

$$V_{CM-} \geq 27 \cdot V^- - 26 \cdot V_{REF} + 27 - V_{GAIN}$$

For split supplies over about $\pm 11\text{V}$, the full $\pm 250\text{V}$ common mode range is normally available (with V_{REF} a small fraction of the supply). With lower supply voltages, an appropriate selection of V_{REF} can tailor the input common mode range to a specific requirement. As an example, the following low supply voltage scenarios are readily implemented with the LT1990:

Supply	V_{REF}	V_{CM} Range
+3V	1.25V	-5V to 25V (e.g. 12V automotive environment)
+5V	1.25V	-5V to 80V (e.g. 42V automotive environment)
+5V	4.00V	-77V to 8V (e.g. telecom environment; use downward signaling)

Configuring Other Gains

An intermediate gain G ranging between 1 and 10 may be produced by placing an adjustable resistance between the GAIN1 and GAIN2 pins according to the following nominal relationship:

$$R_{GAIN} \approx (180\text{k}/(G - 1)) - 20\text{k}$$

While the expression is exact, the value is approximate because the absolute resistance of the internal network could vary on a unit-to-unit basis by as much as $\pm 30\%$ from the nominal figures and the external gain resistance is required to accommodate that deviation. Once adjusted, however, the gain stability is excellent by virtue of the $-30\text{ppm}/^\circ\text{C}$ typical temperature coefficient offered by the on-chip thin-film resistor process.

Preserving and Enhancing Common Mode Rejection

The basic difference amplifier topology of the LT1990 requires that source impedances seen by the input pins $+IN$ and $-IN$, should be matched to within a few tens of ohms to avoid increasing common mode induced errors beyond the basic production limits of the part. Known source imbalances beyond that level should be compensated for by the addition of series resistance to the lower-

APPLICATIONS INFORMATION

impedance source. Also the source impedance of a signal connected to the REF pin must be on the order of a few ohms or less to preserve the high accuracy of the LT1990.

While the LT1990 comes from the factory with an excellent CMRR, some precision applications with a large applied common mode voltage may require a method to trim out residual common mode error. This is easily accomplished by adding series resistance to each input, +IN and -IN, such that an adjustable resistance difference of $\pm 1\text{k}\Omega$ is provided. This is most easily realized by adding a fixed $1\text{k}\Omega$ in series with one of the inputs, and a $2\text{k}\Omega$ trimmer in series with the other as shown in Figure 1. The trim range of this configuration is $\pm 0.1\%$ for the internal gain resistor matching, so a much more finely resolved correction is available using the LT1990 than is realizable with ordinary discrete solutions. In applications where the input common mode voltage is relatively constant and large (perhaps at or beyond the supply range), this same configuration can be treated as an offset adjustment.

Figure 1. Optional CMRR Trim

Dual Differential-Input Arithmetic Block

The internal resistor network topology of the LT1990 allows the GAIN1 and GAIN2 pins to be used as another differential input in addition to the normal +IN and -IN port. This can be a very useful function for implementing servo-loop differential error amplifiers, for example. In this mode of operation, the output is governed by the following relationship:

$$V_O = 10 \cdot (V_{+IN} - V_{-IN} + V_{GAIN2} - V_{GAIN1}) + V_{REF}$$

Unlike the main inputs, the GAIN1 and GAIN2 pins are clamped by substrate diodes and ESD structures, thus the operating voltage range of these pins is limited to $V^- - 0.2\text{V}$ to $V^+ + 36\text{V}$. If the GAIN inputs are brought beyond the operating input range, care must be taken to limit the input currents to less than 10mA to prevent damage to the device. Also, since the gain setting resistors associated with the GAIN1 and GAIN2 inputs are in the $10\text{k}\Omega$ area, low source impedances are particularly important to preserve the precision of the LT1990.

This dual differential input mode of operation is used in the circuit as shown in Figure 2.

This circuit is a high efficiency H-bridge driver that is PWM modulated to provide a controlled current to an electro-magnet coil. Since the common mode voltage of the current sense resistor R_S varies with operating current and the coil properties, a differential feedback is required. In this application, it was desirable to allow the control input to utilize the wide common mode range port (+IN and -IN) so that constraints on input referencing are eliminated. The GAIN1 and GAIN2 pins always operate within the supply range and both ports operate with a gain of 10 to develop the loop error. The LTC1923 provides the loop integrator and PWM functions of the servo.

PACKAGE DESCRIPTION

S8 Package 8-Lead Plastic Small Outline (Narrow .150 Inch) (Reference LTC DWG # 05-08-1610)

- NOTE:
1. DIMENSIONS IN $\frac{\text{INCHES}}{\text{MILLIMETERS}}$
2. DRAWING NOT TO SCALE
3. THESE DIMENSIONS DO NOT INCLUDE MOLD FLASH OR PROTRUSIONS.
MOLD FLASH OR PROTRUSIONS SHALL NOT EXCEED .006" (0.15mm)

S08 0303

TYPICAL APPLICATION

Telecom Supply Current Monitor

Selectable Gain Amplifier

Bidirectional Controlled Current Source

Boosted Bidirectional Controlled Current Source
