

DG506A/507A

16-Channel and Dual 8-Channel CMOS Analog Multiplexers

FEATURES

- TTL & CMOS Direct Control Over Military Temperature Range
- Low Power (30 mW typ.)
- Break-Before-Make Switching
- ESD Protection > ± 2500 V
- 44 V Power Supply Rating

BENEFITS

- Easily Interfaced
- Reduced Power Consumption
- Reduced System Crosstalk
- Environmentally Rugged

APPLICATIONS

- Communication Systems
- Multiplexing Reference Signals
- Data Acquisition Systems
- Audio Signal Routing and Multiplexing

DESCRIPTION

DG506A/507A are 16- and dual 8-channel analog multiplexers, respectively, designed for selecting 1 of 16 (or 8) analog input signals and connecting it to a common output or, conversely, routing an analog signal to 1 of 16 (or 8) output loads. Break-before-make switching action protects against momentary shorting of the input signals.

The DG506A, a 16-channel single-ended analog multiplexer, is designed to connect 1 of 16 inputs to a common output as determined by a 4-bit binary address (A_0, A_1, A_2, A_3). DG507A, a dual 8-channel analog multiplexer, is designed to connect 1 of 8 dual inputs to a common dual output as determined by its 3 bit binary address (A_0, A_1, A_2) logic.

A channel in the ON state conducts current equally well in both directions (bi-directional switches). In the OFF state each channel blocks voltages up to the power supply rails, normally 30 V peak-to-peak. An enable (EN) function allows the user to reset the multiplexer/demultiplexer to all switches OFF. All control inputs, address (A_X) and enable (EN) are TTL or CMOS compatible over the full specified operating temperature range.

DG506A/507A are designed in the Siliconix PLUS-40 process, which includes improved ESD protection up to 2500 V for ruggedness. An epitaxial layer prevents latch up.

Both DG506A and DG507A are available in dual-in-line ceramic and plastic packages, and are specified for operation over the military, A suffix (-55 to 125°C), industrial, D suffix (-40 to 85°C), and commercial, C suffix (0 to 70°C), temperature ranges.

For applications requiring address data latching, the DG528/DG529 is recommended. For wideband/video routing and multiplexing applications, the DG536 is recommended.

PIN CONFIGURATION

DG506A/507A

SPECIFICATIONS^a (Cont'd)

NOTES:

- Refer to PROCESS OPTION FLOWCHART for additional information.
- The algebraic convention whereby the most negative value is a minimum and the most positive a maximum, is used in this data sheet.
- Guaranteed by design, not subject to production test.
- Typical values are for DESIGN AID ONLY, not guaranteed nor subject to production testing.
- Sequence each switch ON.
- $\Delta r_{DS(ON)} = \left(\frac{r_{DS(ON)MAX} - r_{DS(ON)MIN}}{r_{DS(ON)AVE}} \right)$
- $I_{D(ON)}$ is leakage from driver into "ON" switch.
- Signals on S_X , D_X or IN_X exceeding V_+ or V_- will be clamped by internal diodes. Limit forward diode current to maximum current ratings.
- OFF isolation = $20 \log \frac{V_D}{V_S}$, V_S = input to "OFF" switch, V_D = output due to V_S .
- Room = 25°C, Cold and Hot = as determined by the operating temperature suffix.

TYPICAL CHARACTERISTICS

TYPICAL CHARACTERISTICS (Cont'd)

* Leakage currents in this region are determined by extrapolation. Attempts to measure in production are limited by the ability to control humidity and leakages pin to pin below the dew point (where water condenses).

APPLICATION HINTS*

V + Positive Supply Voltage (V)	V - Negative Supply Voltage (V)	Logic Input Voltage V _{INH} Min/V _{INL} Max (V)	V _S or V _D Analog Voltage Range (V)
15**	-15	2.4/0.8	-15 to 15
12	-12	2.4/0.8	-12 to 12
10	-10	2.4/0.6	-10 to 10
8***	-8	2.4/0.4	-8 to 8

* Application Hints are for DESIGN AID ONLY, not guaranteed and not subject to production testing.

** Specifications chart based on $V_+ = +15\text{ V}$, $V_- = -15\text{ V}$.

*** Operation below ± 8 V is not recommended due to the shift in $V_{INL(MAX)}$.

Overvoltage Protection

A very convenient form of overvoltage protection consists of adding two small signal diodes (1N4148, 1N914 type) in series with the supply pins (see Figure 5). This arrangement effectively blocks the flow of reverse currents. It also floats the supply pin above or below the normal V^+ or V^- value. In this case the overvoltage signal actually becomes the power supply of the IC. From the point of view of the chip, nothing has changed, as long as the difference between V_S and the V^- rail doesn't exceed +44 V. The addition of these diodes will reduce the analog signal range to 1 V below V^+ and 1 V above V^- , but it preserves the low channel resistance and low leakage characteristics.
