Jameco Part Number 1748740

FEATURES

- Two RS232 Transceivers or One RS485 Transceiver
- Operates from a Single 5V Supply
- Guaranteed Receiver Output with Inputs Floating or Shorted to Ground
- Logic Selectable Fast/Slow RS485 Driver Slew Rate
- Low Supply Current: 7mA Typical
- 5 μ A Supply Current in Shutdown
- Self-Testing Capability in Loopback Mode
- Separate Driver and Receiver Enable Controls
- Driver Maintains High Impedance in Three-State, Shutdown or with Power Off
- Receiver Inputs Can Withstand $\pm 25V$

APPLICATIONS

- Point-of-Sale Terminals
- Software Selectable Multiprotocol Interface Ports
- Low Power RS485/RS422/RS232/EIA562 Interface
- Cable Repeaters
- Level Translators

DESCRIPTION

The LTC[®]1387 is a low power reconfigurable CMOS bidirectional transceiver. It can be configured as an RS485 differential port or as two RS232 single-ended ports. An onboard charge pump uses four $0.1\mu\text{F}$ capacitors to generate boosted positive and negative supplies, allowing the RS232 drivers to meet $\pm 5\text{V}$ output swing requirements with only a single 5V supply. A shutdown mode reduces the I_{CC} supply current to $5\mu\text{A}$.

The RS232 transceivers are in full compliance with RS232 specification. The RS485 transceiver is in full compliance with RS485 and RS422 specifications. The RS485 receiver assumes a known output state when the inputs are floating or shorted to ground. All interface drivers feature short-circuit and thermal shutdown protection. An enable pin allows RS485 driver outputs to be forced into high impedance which is maintained even when the outputs are forced beyond supply rails or the power is off. A loop back mode allows the driver outputs to be connected back to the receiver inputs for diagnostic self-test.

The LTC1387 is available in 20-pin plastic SSOP and SW packages.

L, LTC and LT are registered trademarks of Linear Technology Corporation.

TYPICAL APPLICATION

ABSOLUTE MAXIMUM RATINGS

(Note 1)

Supply Voltage (V_{CC}) 6.5V

Input Voltage

Drivers $-0.3V$ to $(V_{CC} + 0.3V)$

Receivers $-25V$ to $25V$

485/232, ON, DXEN

RXEN, SLEW $-0.3V$ to $(V_{CC} + 0.3V)$

Output Voltage

Drivers $-18V$ to $18V$

Receivers $-0.3V$ to $(V_{CC} + 0.3V)$

Short-Circuit Duration

Output Indefinite

V_{DD} , V_{EE} , $C1^+$, $C1^-$, $C2^+$, $C2^-$ 30 sec

Operating Temperature Range

LTC1387C $0^{\circ}C$ to $70^{\circ}C$

LTC1387I $-40^{\circ}C$ to $85^{\circ}C$

Storage Temperature Range $-65^{\circ}C$ to $150^{\circ}C$

Lead Temperature (Soldering, 10 sec) $300^{\circ}C$

The ● denotes specifications which apply over the full operating temperature range.

Note 1: Absolute Maximum Ratings are those values beyond which the life of the device may be impaired.

Note 2: All currents into device pins are positive; all currents out of device pins are negative. All voltages are referenced to device ground unless otherwise specified.

Note 3: All typicals are given at $V_{CC} = 5\text{V}$, $C1 = C2 = C3 = C4 = 0.1\mu\text{F}$ and $T_A = 25^\circ\text{C}$.

Note 4: Short-circuit current for RS485 driver output low state folds back above V_{CC} . Peak current occurs around $V_0 = 3\text{V}$.

Note 5: SLEW includes an internal pull-up in RS485 mode.

PIN FUNCTIONS

C1⁺ (Pin 1): Commutating Capacitor C1 Positive Terminal. Requires an external $0.1\mu\text{F}$ capacitor between Pins 1 and 2.

C1⁻ (Pin 2): Commutating Capacitor C1 Negative Terminal.

V_{DD} (Pin 3): Charge Pump Positive Supply Output. Requires an external $0.1\mu\text{F}$ capacitor to ground.

A (Pin 4): Receiver Input A. Inverting input of RS232 receiver A in RS232 mode; inverting RS485 receiver input in RS485 mode.

B (Pin 5): Receiver Input B. Inverting input of RS232 receiver B in RS232 mode; noninverting RS485 receiver input in RS485 mode.

Y (Pin 6): Driver Output Y. Inverting RS232 driver Y output in RS232 mode; inverting RS485 driver output in RS485 mode.

Z (Pin 7): Driver Output Z. Inverting RS232 driver Z output in RS232 mode; noninverting RS485 driver output in RS485 mode.

PIN FUNCTIONS

485/232 (Pin 8): Interface Mode Select Input. A low logic input enables two RS232 drivers and two RS232 receivers. A high input enables the RS485 driver and the RS485 receiver.

DXEN (Pin 9): Driver Enable Input. A high logic input enables the drivers and a low logic input disables the drivers. When disabled, all driver outputs are in high impedance

GND (Pin 10): Ground.

V_{EE} (Pin 11): Charge Pump Negative Supply Output. Requires an external 0.1 μ F capacitor to ground.

RXEN (Pin 12): Receiver Enable Input. A high logic input enables the receivers and a low logic input disables the receivers. When disabled, all receiver outputs are in high impedance.

ON (Pin 13): A high logic level at ON input keeps the charge pump active regardless of the state of the DXEN and RXEN inputs. When the charge pump is active, the drivers and receivers can be enabled or disabled without waiting for charge pump stabilization time (typically 100 μ s with 0.1 μ F capacitors). A low logic state at the ON, DXEN and RXEN inputs will put the transceiver and charge pump in shutdown mode and reduces I_{CC} to 5 μ A. Whenever the transceiver is activated from shutdown, the charge pump should be allowed to stabilize before data transmission. When DXEN and RXEN are high and ON is low, the charge pump, drivers and receivers are all active and the driver outputs are internally looped back to the inputs of the receiver. The three control inputs ON, DXEN and RXEN can

be configured for one-, two- or three-wire control: one-wire mode – all three inputs connected together; two-wire mode – inputs ON and RXEN connected to one wire, DXEN a separate wire; three-wire mode – separate wires to each input. See the Function Tables.

D_Z/SLEW (Pin 14): Driver Z or Slew Input. In RS232 mode, this pin is the driver Z input. In RS485 mode, this pin controls the slew rate of the RS485 driver. With the SLEW pin high, the RS485 driver runs at maximum (fast) slew rate and can transmit signals up to 5MBd. With the SLEW pin low, the RS485 driver runs with reduced (slow) slew rate to control reflections with improperly terminated cables. In slow mode, the RS485 driver can support data rates up to 150kBd. This SLEW pin has internal 5 μ A pull-up during RS485 mode.

D_Y (Pin 15): Driver Y Input. Input Y in RS232 mode; the differential driver input in RS485 mode.

R_B (Pin 16): Receiver B Output. Output B in RS232 mode; output is high impedance in RS485 mode.

R_A (Pin 17): Receiver A Output. Output A in RS232 mode; the differential receiver output in RS485 mode.

V_{CC} (Pin 18): Positive Supply. 4.75V \leq V_{CC} \leq 5.25V. Requires an external 0.1 μ F bypass capacitor to ground.

C2⁻ (Pin 19): Commutating Capacitor C2 Negative Terminal. Requires an external 0.1 μ F capacitor between Pins 19 and 20.

C2⁺ (Pin 20): Commutating Capacitor C2 Positive Terminal.

APPLICATIONS INFORMATION

Basic Theory of Operating

The LTC1387 is a single 5V supply, single-port logic reconfigurable RS485/RS232 transceiver with an onboard charge pump. The interface port offers a flexible combination of an RS485 driver and an RS485 receiver or two RS232 drivers and two RS232 receivers. The RS485 transceiver and the RS232 transceivers are designed to share the same I/O pins. A logic input 485/232 controls the selection between RS485 and RS232 transceiver modes. The RS485 transceiver supports both RS485 and RS422 standards, whereas the RS232 transceivers support both RS232 and EIA562 standards. With four additional control inputs: ON, DXEN, RXEN and SLEW, the LTC1387 can easily be reconfigured via software to adapt to various communication needs including a one-signal-line RS232 I/O mode. Four examples of interface port connections are shown in Figures 13 through 16.

Both the interface drivers and the receivers feature three-state outputs. Driver outputs are forced into high impedance when the driver is disabled, in the shutdown mode or with the power off. The driver outputs can be forced beyond power supply levels without damage up to $\pm 18V$. The receiver inputs can withstand $\pm 25V$ without damage. The receiver input resistance is typically 24k in RS485 mode, shutdown mode or power off but drops to 5k in RS232 mode.

In RS485 mode, the DXEN and RXEN control the three-state outputs of the driver and receiver respectively. The SLEW input is active during RS485 mode and the logic level controls the differential driver slew rate. This pin has an internal $5\mu\text{A}$ pull-up current source during the RS485 mode. A high logic selects fast differential driver slew rate and a low logic selects slow slew rate. In slow slew mode, the maximum signal bandwidth is reduced, minimizing

APPLICATIONS INFORMATION

EMI and signal reflection problems. Slow slew rate systems can often use improperly terminated or even unterminated cables with acceptable results. The RS485 differential input receiver features an offset input threshold of -80mV at 0V common mode voltage. This allows the receiver output to have a known High output state when the inputs are open or shorted. The receiver also features an input hysteresis of 40mV . The charge pump can be kept active regardless of the state of DXEN and RXEN pins by keeping the ON pin High. This improves the receiver response time by removing the $100\mu\text{s}$ charge pump start-up time.

In RS232 mode, the drivers and receivers can be selected from the Function Tables with control inputs ON, RXEN and DXEN. The receivers feature a typical 0.6V input hysteresis.

All the interface driver outputs are fault protected by a current limiting and thermal shutdown circuit. The thermal shutdown circuit disables both the RS232 and RS485 driver outputs when the die temperature reaches 150°C . The thermal shutdown circuit reenables the drivers when the die temperature cools to 135°C .

A loopback mode enables internal connections from driver outputs to receiver inputs for self-test. The driver outputs are not isolated from the external loads during loopback.

The charge pump generates boosted positive voltage V_{DD} and negative voltage V_{EE} for true RS232 levels from a single 5V V_{CC} supply. The charge pump requires four $0.1\mu\text{F}$ capacitors.

PACKAGE DESCRIPTION

Dimensions in inches (millimeters) unless otherwise noted.

G Package 20-Lead Plastic SSOP (5.3mm)

(Reference LTC DWG # 05-08-1640)

SW Package 20-Lead Plastic Small Outline (Wide 0.300) (LTC DWG # 05-08-1620)

RELATED PARTS

| PART NUMBER | DESCRIPTION | COMMENTS |
|-------------------------|---------------------------------------|--|
| LTC485 | Low Power RS485 Interface Transceiver | Single 5V Supply, Wide Common Mode Range |
| LT [®] 1137A | Low Power RS232 Transceiver | ±15kV IEC-1000-4-2 ESD Protection, Three Drivers, Five Receivers |
| LTC1320 | AppleTalk [®] Transceiver | AppleTalk/LocalTalk [®] Compliant |
| LTC1321/LTC1322/LTC1335 | RS232/EIA562/RS485 Transceivers | Configurable |
| LTC1323 | Single 5V AppleTalk Transceiver | AppleTalk /LocalTalk Compliant 10kV ESD |
| LTC1334 | Single Supply RS232/RS485 Transceiver | Single 5V Supply, Configurable |
| LTC1347 | 5V Low Power RS232 Transceiver | Three Drivers/Five Receivers, Five Receivers Alive in Shutdown |
