

Rad-hard 550 MHz low noise operational amplifier

Datasheet - production data

- SEL immune at 110 MeV.cm²/mg
- SET characterized

Applications

- Space data acquisition systems
- Aerospace instrumentation
- Harsh environments
- ADC drivers

Description

The RHF350, RHF350A device is a current feedback, single operational amplifier that uses very high-speed complementary technology to provide a bandwidth of up to 550 MHz while drawing only 4 mA of quiescent current. With a slew rate of 940 V/μs and an output stage optimized for driving a standard 100 Ω load, this circuit is highly suitable for applications where speed and power-saving are the main requirements. The RHF350 is mounted in a Flat-8 hermetic package with 3 mm leads (Flat-8S) and the RHF350A is mounted in a Flat-8 hermetic package with 8 mm leads (Flat-8).

Features

- Bandwidth: 550 MHz (unity gain)
- Quiescent current 4 mA
- Slew rate: 940 V/μs
- Input noise: 1.5 nV/√ Hz
- Distortion: SFDR = -66 dBc (10 MHz, 1 V_{pp})
- 2.8 V_{pp} minimum output swing on a 100 Ω load for a 5 V supply
- 5 V power supply
- ELDRS free up to 300 krad

1 Pin description

Figure 1: Pin connections of Ceramic Flat-8S and Ceramic Flat-8 (top view)

1. In the case of the Ceramic Flat-8, the upper metallic lid is electrically connected to pin 5

2 Absolute maximum ratings and operating conditions

Table 2: Absolute maximum ratings

Symbol	Parameter		Value	Unit
V _{CC}	Supply voltage (voltage difference between -V _{CC} and V _{CC} pins) ⁽¹⁾		6	V
V _{id}	Differential input voltage ⁽²⁾		±0.5	
V _{in}	Input voltage range ⁽³⁾		±2.5	
T _{stg}	Storage temperature		-65 to 150	°C
T _j	Maximum junction temperature		150	
R _{thja}	Thermal resistance junction to ambient area		150	°C/W
R _{thjc}	Thermal resistance junction to case		22	
P _{max}	Maximum power dissipation ⁽⁴⁾ (at T _{amb} = 25 °C) for T _j = 150 °C		830	mW
ESD	HBM: human body model ⁽⁵⁾	Pins 1, 4, 5, 6, 7 and 8	2	kV
		Pins 2 and 3	0.5	
	MM: machine model ⁽⁶⁾	Pins 1, 4, 5, 6, 7 and 8	200	V
		Pins 2 and 3	60	
	CDM: charged device model ⁽⁷⁾	Pins 1, 4, 5, 6, 7 and 8	1.5	kV
		Pins 2 and 3	1.5	
	Latch-up immunity		200	mA

Notes:

⁽¹⁾All voltage values are measured with respect to the ground pin.

⁽²⁾The differential voltage is the non-inverting input terminal with respect to the inverting input terminal.

⁽³⁾The magnitude of the input and output voltage must never exceed $V_{CC} + 0.3\text{ V}$.

⁽⁴⁾Short-circuits can cause excessive heating. Destructive dissipation can result from short circuits on amplifiers.

⁽⁵⁾Human body model: a 100 pF capacitor is charged to the specified voltage, then discharged through a 1.5 kΩ resistor between two pins of the device. This is done for all couples of connected pin combinations while the other pins are floating.

⁽⁶⁾This is a minimum value. Machine model: a 200 pF capacitor is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor $< 5\text{ }\Omega$). This is done for all couples of connected pin combinations while the other pins are floating.

⁽⁷⁾Charged device model: all pins and package are charged together to the specified voltage and then discharged directly to ground through only one pin. This is done for all pins.

Table 3: Operating conditions

Symbol	Parameter	Value	Unit
V _{CC}	Supply voltage	4.5 to 5.5	V
V _{icm}	Common-mode input voltage	-V _{CC} + 1.5 V to V _{CC} - 1.5 V	
T _{amb}	Operating free-air temperature range ⁽¹⁾	-55 to 125	°C

Notes:

⁽¹⁾T_j must never exceed 150 °C. $P = (T_j - T_{amb}) / R_{thja} = (T_j - T_{case}) / R_{thjc}$ where P is the power that the RHF350, RHF350A must dissipate in the application.

5 Radiations

5.1 Introduction

Table 6 summarizes the radiation performance of the RHF350, RHF350A.

Table 6: Radiations

Type	Features		Value	Unit
TID	High-dose rate		300	krad
	Low-dose rate		300	
	ELDRS		300	
Heavy ions	SEL immunity (at 125 °C) up to:		110	MeV.cm ² /mg
	SET characterized	Inverting	LET _{th} = 19	MeV.cm ² /mg
			$\sigma = 4.00\text{E-}06$	cm ² /device
		Non-inverting	LET _{th} = 18	MeV.cm ² /mg
			$\sigma = 2.00\text{E-}06$	cm ² /device
		Subtracting	LET _{th} = 1	MeV.cm ² /mg
			$\sigma = 6.00\text{E-}04$	cm ² /device

5.2 Total ionizing dose (TID)

The products guaranteed in radiation within the RHA QML-V system fully comply with the MIL-STD-883 test method 1019 specification.

The RHF350, RHF350A is RHA QML-V qualified, and is tested and characterized in full compliance with the MIL-STD-883 specification. It uses a mixed bipolar and CMOS technology and is tested both below 10 mrad/s (low dose rate) and between 50 and 300 rad/s (high dose rate).

- The ELDRS characterization is performed in qualification only on both biased and unbiased parts, on a sample of ten units from two different wafer lots.
- Each wafer lot is tested at high-dose rate only, in the worst bias case condition, based on the results obtained during the initial qualification.

5.3 Heavy ions

The heavy ion trials are performed on qualification lots only. No additional test is performed.

6 Device description and operation

6.1 Power supply considerations

Correct power supply bypassing is very important for optimizing the performance of the device in high-frequency ranges. The bypass capacitors should be placed as close as possible to the IC pins to improve high-frequency bypassing. A capacitor greater than $1\ \mu\text{F}$ is necessary to minimize the distortion. For better quality bypassing, a capacitor of $10\ \text{nF}$ can be added, which should also be placed as close as possible to the IC pins. The bypass capacitors must be incorporated for both the negative and positive supply.

Figure 25: Circuit for power supply bypassing

6.1.1 Single power supply

If you use a single-supply system, biasing is necessary to obtain a positive output dynamic range between the 0 V and V_{CC} supply rails. Considering the values of V_{OH} and V_{OL} , the amplifier provides an output swing from 0.9 V to 4.1 V on a 100 Ω load.

The amplifier must be biased with a mid-supply (nominally $V_{CC}/2$) in order to maintain the DC component of the signal at this value. Several options are possible to provide this bias supply, such as a virtual ground using an operational amplifier or a two-resistance divider (which is the cheapest solution). A high resistance value is required to limit the current consumption. On the other hand, the current must be high enough to bias the non-inverting input of the amplifier. If we consider this bias current (35 μ A maximum) as 1 % of the current through the resistance divider, two resistances of 750 Ω can be used to maintain a stable mid-supply.

The input provides a high-pass filter with a break frequency below 10 Hz, which is necessary to remove the original 0 V DC component of the input signal and to set it at $V_{CC}/2$.

Figure 26 illustrates a 5 V single power supply configuration.

A capacitor C_G is added in the gain network to ensure a unity gain at low frequencies to keep the right DC component at the output. C_G contributes to a high-pass filter with R_{fb}/R_G and its value is calculated with regard to the cut-off frequency of this low-pass filter.

Figure 26: Circuit for 5 V single supply

6.2 Noise measurements

The noise model is shown in [Figure 27](#).

- eN : input voltage noise of the amplifier
- iNn : negative input current noise of the amplifier
- iNp : positive input current noise of the amplifier

Figure 27: Noise model

The thermal noise of a resistance R is:

$$\sqrt{4kTR \Delta F}$$

Where ΔF is the specified bandwidth, and k is the Boltzmann's constant, equal to $1,374 \cdot 10^{-23} \text{ J/}^\circ\text{K}$. T is the temperature ($^\circ\text{K}$).

On a 1 Hz bandwidth the thermal noise is reduced to:

$$\sqrt{4kTR}$$

The output noise eNo is calculated using the superposition theorem. However, eNo is not the simple sum of all noise sources but rather the square root of the sum of the square of each noise source, as shown in [Equation 1](#).

Equation 1

$$eNo = \sqrt{V1^2 + V2^2 + V3^2 + V4^2 + V5^2 + V6^2}$$

Equation 2

$$eNo^2 = eN^2 \cdot g^2 + iNn^2 \cdot R2^2 + iNp^2 \cdot R3^2 \cdot g^2 + \frac{R2^2}{R1} \cdot 4kTR1 + 4kTR2 + 1 \cdot \frac{R2^2}{R1} \cdot 4kTR3$$

The input noise of the instrumentation must be extracted from the measured noise value. The real output noise value of the driver is shown in [Equation 3](#).

Equation 3

$$eNo = \sqrt{(Measured)^2 - (instrumentation)^2}$$

The input noise is called **equivalent input noise** because it is not directly measured but is evaluated from the measurement of the output divided by the closed loop gain (eNo/g).

After simplification of the fourth and fifth terms of [Equation 2](#), you obtain [Equation 4](#).

Equation 4

$$eNo^2 = eN^2 \cdot g^2 + iNn^2 \cdot R2^2 + iNp^2 \cdot R3^2 \cdot g^2 + g \cdot 4kTR2 + 1 \cdot \frac{R2^2}{R1} \cdot 4kTR3$$

6.2.1 Measurement of the input voltage noise eN

Assuming a short-circuit on the non-inverting input ($R3 = 0$), from [Equation 4](#) you can derive [Equation 5](#).

Equation 5

$$eNo = \sqrt{eN^2 \cdot g^2 + iNn^2 \cdot R2^2 + g \cdot 4kTR2}$$

To easily extract the value of eN, the resistance R2 must be as low as possible. On the other hand, the gain must be high enough. $R3 = 0$ and gain (g) = 100.

6.2.2 Measurement of the negative input current noise iNn

To measure the negative input current noise iNn, R3 is set to zero and [Equation 5](#) is used. This time, the gain must be lower in order to decrease the thermal noise contribution. $R3 = 0$ and gain (g) = 10.

6.2.3 Measurement of the positive input current noise iNp

To extract iNp from [Equation 3](#), a resistance R3 is connected to the non-inverting input. The value of R3 must be selected so that its thermal noise contribution is as low as possible against the iNp contribution. $R3 = 100 \Omega$ and gain (g) = 10.

6.3 Intermodulation distortion product

The non-ideal output of the amplifier can be described by the following series of equations.

$$V_{out} = C_0 + C_1 V_{in} + C_2 V_{in}^2 + \dots + C_n V_{in}^n$$

Where the input is $V_{in} = A \sin \omega t$, C_0 is the DC component, $C_1(V_{in})$ is the fundamental and C_n is the amplitude of the harmonics of the output signal V_{out} .

A one-frequency (one-tone) input signal contributes to harmonic distortion. A two-tone input signal contributes to harmonic distortion and to the intermodulation product.

The study of the intermodulation and distortion for a two-tone input signal is the first step in characterizing the driving capability of multi-tone input signals.

In this case:

$$V_{in} = A \sin \omega_1 t + A \sin \omega_2 t$$

Therefore:

$$V_{out} = C_0 + C_1 (A \sin \omega_1 t + A \sin \omega_2 t) + C_2 (A \sin \omega_1 t + A \sin \omega_2 t)^2 + C_n (A \sin \omega_1 t + A \sin \omega_2 t)^n$$

From this expression, we can extract the distortion terms and the intermodulation terms from a single sine wave.

- Second-order intermodulation terms IM2 by the frequencies $(\omega_1 - \omega_2)$ and $(\omega_1 + \omega_2)$ with an amplitude of $C_2 A^2$.
- Third-order intermodulation terms IM3 by the frequencies $(2\omega_1 - \omega_2)$, $(2\omega_1 + \omega_2)$, $(-\omega_1 + 2\omega_2)$ and $(\omega_1 + 2\omega_2)$ with an amplitude of $(3/4)C_3 A^3$.

The intermodulation product of the driver is measured by using the driver as a mixer in a summing amplifier configuration ([Figure 28](#)). In this way, the non-linearity problem of an external mixing device is avoided.

Figure 28: Inverting summing amplifier

6.4 Bias of an inverting amplifier

A resistance is necessary to achieve good input biasing, such as resistance R shown in [Figure 29](#).

The value of this resistance is calculated from the negative and positive input bias current. The aim is to compensate for the offset bias current, which can affect the input offset voltage and the output DC component. Assuming I_{ib-} , I_{ib+} , R_{in} , R_{fb} and a 0 V output, the resistance R is:

$$R = \frac{R_{in} \cdot R_{fb}}{R_{in} + R_{fb}}$$

Figure 29: Compensation of the input bias current

6.5 Active filtering

Figure 30: Low-pass active filtering, Sallen-Key

From the resistors R_{fb} and R_g it is possible to directly calculate the gain of the filter in a classic non-inverting amplification configuration.

$$A_V = g = 1 + \frac{R_{fb}}{R_g}$$

The response of the system is assumed to be:

$$T_{j\omega} = \frac{V_{outj\omega}}{V_{inj\omega}} = \frac{g}{1 + 2\zeta \frac{j\omega}{\omega_c} + \frac{(j\omega)^2}{\omega_c^2}}$$

The cut-off frequency is not gain-dependent and so becomes:

$$\omega_c = \frac{1}{\sqrt{R_1 R_2 C_1 C_2}}$$

The damping factor is calculated using the following expression.

$$\zeta = \frac{1}{2} \omega_c (C_1 R_1 + C_1 R_2 + C_2 R_1 - C_1 R_1 g)$$

The higher the gain, the more sensitive the damping factor. When the gain is higher than 1, it is preferable to use very stable resistor and capacitor values. In the case of $R_1 = R_2 = R$:

$$\zeta = \frac{2C_2 - C_1 \frac{R_{fb}}{R_g}}{2\sqrt{C_1 C_2}}$$

Due to a limited selection of capacitor values in comparison with the resistors, you can set $C_1 = C_2 = C$, so that:

$$\zeta = \frac{2R_2 - R_1 \frac{R_{fb}}{R_g}}{2\sqrt{R_1 R_2}}$$

7 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: **www.st.com**. ECOPACK® is an ST trademark.

7.1 Ceramic Flat-8S package information

Figure 31: Ceramic Flat-8S package outline

The upper metallic lid is not electrically connected to any pins, nor to the IC die inside the package. Connecting unused pins or metal lid to ground or to the power supply will not affect the electrical characteristics.

Notes:

⁽¹⁾Specific marking only. Complete marking includes the following:

- SMD pin (as indicated in above table)
- ST logo
- Date code (date the package was sealed) in YYWWA (year, week, and lot index of week)
- QML logo (Q or V)
- Country of origin (FR = France).

Contact your ST sales office for information regarding the specific conditions for products in die form and QML-Q versions.

9 Other information

9.1 Date code

The date code is structured as shown below:

- EM xyywwz
 - QML-V yywwz
- where:
- x (EM only) = 3 and the assembly location is Rennes, France
 - yy = last two digits of the year
 - ww = week digits
 - z = lot index in the week
