

8-Channel Analog Multiplexer with Cascadable Serial Interface

FEATURES

- Low R_{ON} : 45Ω
- Single 2.7V to $\pm 5V$ Supply Operation
- Low Charge Injection
- Serial Digital Interface
- Analog Inputs May Extend to Supply Rails
- Low Leakage: $\pm 5nA$ Max
- Guaranteed Break-Before-Make
- TTL/CMOS Compatible for All Digital Inputs
- Cascadable to Allow Additional Channels
- Can Be Used as a Demultiplexer

APPLICATIONS

- Data Acquisition Systems
- Communication Systems
- Signal Multiplexing/Demultiplexing

DESCRIPTION

The LTC[®]1391 is a high performance CMOS 8-to-1 analog multiplexer. It features a serial digital interface that allows several LTC1391s to be daisy-chained together, increasing the number of MUX channels available using a single digital port.

The LTC1391 features a typical R_{ON} of 45Ω , a typical switch leakage of $50pA$ and guaranteed break-before-make operation. Charge injection is $\pm 10pC$ maximum. All digital inputs are TTL and CMOS compatible when operated from single or dual supplies. The inputs can withstand $100mA$ fault current.

The LTC1391 is available in 16-pin PDIP, SSOP and narrow SO packages. For applications requiring 2-way serial data transmission, see the LTC1390 data sheet.

 LTC and LT are registered trademarks of Linear Technology Corporation.

PIN FUNCTIONS

S0, S1, S2, S3, S4, S5, S6, S7 (Pins 1, 2, 3, 4, 5, 6, 7, 8): Analog Multiplexer Inputs.

GND (Pin 9): Digital Ground. Connect to system ground.

CLK (Pin 10): System Clock (TTL/CMOS Compatible). The clock synchronizes the channel selection bits and the serial data transfer from D_{IN} to D_{OUT} .

$\overline{\text{CS}}$ (Pin 11): Channel Select Input (TTL/CMOS Compatible). A logic high on this input enables the LTC1391 to read in the channel selection bits and allows digital data transfer from D_{IN} to D_{OUT} . A logic low on this input puts D_{OUT} into three-state and enables the selected channel for analog signal transmission.

D_{IN} (Pin 12): Digital Input (TTL/CMOS Compatible). Input for the channel selection bits.

D_{OUT} (Pin 13): Digital Output (TTL/CMOS Compatible). Output from the internal shift register.

V^- (Pin 14): Negative Supply. For $\pm 5\text{V}$ dual supply applications, $|V^-|$ should not exceed $|V^+|$ by more than 20% for proper channel selection.

D (Pin 15): Analog Multiplexer Output.

V^+ (Pin 16): Positive Supply.

APPLICATIONS INFORMATION

Multiplexer Operation

Figure 1 shows the block diagram of the components within the LTC1391 required for MUX operation. The LTC1391 uses D_{IN} to select the active channel and the chip select input, $\overline{CS}$, to switch on the selected channel as shown in Figure 2.

When $\overline{CS}$ is high, the input data on the D_{IN} pin is latched into the 4-bit shift register on the rising clock edge. The input data consists of the “EN” bit and a string of three bits for channel selection. If “EN” bit is logic high as illustrated in the first input data sequence, it enables the selected channel. After the clocking in of the last channel selection bit B0, the $\overline{CS}$ pin must be pulled low before the next rising clock edge to ensure correct operation. Once $\overline{CS}$ is pulled low, the previously selected channel is switched off to ensure a break-before-make interval. After a delay of t_{ON} , the selected channel is switched on allowing signal transmission. The selected channel remains on until the next falling edge of $\overline{CS}$. After a delay of t_{OFF} , the LTC1391 terminates the analog signal transmission and allows the

Figure 1. Simplified Block Diagram of the MUX Operation

selection of next channel. If the “EN” bit is logic low, as illustrated in the second data sequence, it disables all channels and there will be no analog signal transmission. Table 1 shows the various bit combinations for channel selection.

Table 1. Logic Table for Channel Selection

ACTIVE CHANNEL	EN	B2	B1	B0
All Off	0	X	X	X
S0	1	0	0	0
S1	1	0	0	1
S2	1	0	1	0
S3	1	0	1	1
S4	1	1	0	0
S5	1	1	0	1
S6	1	1	1	0
S7	1	1	1	1

Digital Data Transfer Operation

The block diagram of Figure 3 shows the components within the LTC1391 required for serial data transfer. When $\overline{CS}$ is held high, data is fed into the 4-bit shift register and then shifted to D_{OUT} . Data appears at D_{OUT} after the fourth rising edge of the clock as shown in Figure 4. The last four

Figure 3. Simplified Block Diagram of the Digital Data Transfer Operation

Figure 2. Multiplexer Operation

sn1391 1391fas

APPLICATIONS INFORMATION

bits clocked into the LTC1391 shift register before $\overline{\text{CS}}$ is taken low select the MUX channel that is turned on. This allows a series of devices, with the D_{OUT} of one device connected to the D_{IN} of the next device, to be programmed with a single data stream.

Figure 4. Digital Data Transfer Operation

Multiplexer Expansion

Several LTC1391s can be daisy-chained to expand the number of multiplexer inputs. No additional interface ports are required for the expansion. Figure 5 shows two LTC1391s connected at their analog outputs to form a 16-to-1 multiplexer at the input to an LTC1400 A/D converter.

To ensure that only one channel is switched on at any one time, two sets of channel selection bits are needed for DATA as shown in Figure 6. The first data sequence is used to switch off one MUX and the second data sequence is used to select one channel from the other MUX or vice versa. In other words, if bit "ENA" is high and bit "ENB" is low, one channel of MUX A is switched on and all channels of MUX B are switched off. If bit "ENA" is low and bit "ENB" is high, all channels at MUX A are switched off and one channel of MUX B is switched on. Care should be taken to ensure that only one LTC1391 is enabled at any one time to prevent two channels from being enabled simultaneously.
