Ext Mem Buffer 0 Address	EBA0	29 bits	W1[28:0]	1st double buffer destination address for RGB and Y:U:V (Y pointer) formats. This parameter must not be changed if the corresponding channel is enabled. The actual physical address value is divided by 8 (i.e. this parameter includes bits [31:3] of the actual address)

Table continues on the next page...

Table 37-14. Channel Parameters Memory for non-interleaved (continued)

Ext Mem Buffer 1 Address	EBA1	29 bits	W1[57:29]	2nd double buffer destination address for RGB and Y:U:V (Y pointer) formats. This parameter must not be changed if the corresponding channel is enabled. The actual physical address value is divided by 8 (i.e. this parameter includes bits [31:3] of the actual address)
Interlace Offset	ILO	20 bits	W1[77:58]	2nd double buffer destination address for RGB and Y:U:V (Y pointer) formats. An interlaced data stored in the memory can be read as a consecutive progressive only if FW*BPP is a multiplication of 8. The actual physical address value is divided by 8 (i.e. this parameter includes bits [22:3] of the actual address). For YUV420 formats, the ILO is relevant only to the Y component as the U and V components do not exist for the even lines. This value is signed
Number of Pixels in Whole Burst Access	NPB	7 bits	W1[84:78]	Number of pixels per burst access. The following are valid numbers of pixels in a memory burst access according to the BPP parameter: NPB 0000111 = 08 pixels in each burst 0001111 = 16 pixels in each burst ..... 0111111 = 64 pixels in each burst Range: 16BPP => 1 -> 32 pixels (for YUV444 NI) 08BPP => 1 -> 64 pixels (For YUV420 NI/PI and YUV422 NI/PI) In NI/PI formats the NPB has to be a multiplication of 8
Pixel Format Select	PFS	4 bits	W1[88:85]	4'h0 = non-interleaved 4:4:4 4'h1 = non-interleaved 4:2:2 4'h2 = non-interleaved 4:2:0 4'h3 = partial interleaved 4:2:2 4'h4 = partial interleaved 4:2:0 4'h5 to 4'hF = NA
Alpha Used	ALU	1 bit	W1[89]	1 = the alpha associated with the data of this channel resides on another channel (separate buffer) 0 = the alpha associated with the data of this channel resides along with the pixel data (same buffer) The corresponding alpha channel must be enabled to assure correct behavior.

Table continues on the next page...

Table 37-14. Channel Parameters Memory for non-interleaved (continued)

Alpha Channel Mapping	ALBM	2 bits	W1[92:90]	Alpha channel mapping - This parameter is a pointer to a buffer in the ATC memory. This parameter is relevant only to data channels that are associated with a separate alpha buffer (like graphic plane channels). The parameter should be programmed on the data channels' ALBM. Setting this parameter to any other channel has no meaning. See Table 37-12 for exact ALBM mapping.
AXI Id	ID	2 bits	W1[94:93]	AXI protocol id
Threshold	TH	7 bits	W1[101:95]	0000000 = 32 lines 0000001 = 64 lines ..... 1111111 = 4096 lines
Stride Line	SLY	14 bits	W1[115:102]	Address vertical scaling factor in bytes for memory access. Also number of maximum bytes in the "Y" component row according to memory limitations. SLY 00000000000000 = 00001 bytes 00000000000001 = 00002 bytes ..... 11111111111111 = 16384 bytes
Width3	WID3	3 bits	W1[127:125]	Fourth color component size of the input-unpacking/ output-packing pixel. WID3 000 = 1 bits 001 = 2 bits ..... 111 = 8 bits As this is a non-interleaved format, this field is relevant only to the alpha associated with this pixel channel.
Stride Line	SLUV	14 bits	W1[141:128]	Address vertical scaling factor in bytes for memory access. Also number of maximum bytes in the "U" or "V" component row according to memory limitations. SLUV 00000000000000 = 00001 bytes 00000000000001 = 00002 bytes ..... 11111111111111 = 16384 bytes
Conditional Read Enable	CRE	1 bit	W1[149:149]	This bit enables the conditional read feature.

37.4.2.10.2 CPMEM's words' structure for interleaved mode

The table below describes the CPMEM's words' structure for interleaved mode. Each CPMEM word consist of 160 bits. The bits that are not listed in the table below are reserved bits

Table 37-15. Channel Parameters Memory for interleaved

Name	Mnemonic	Size	Location	Description
Word 0				
XV Virtual Coordinate	XV	10 bits	W0[9:0]	Variable coordinates for determining next block address. {X1,Y1} and {X2,Y2} coordinates will be determined according to {XV,YV} upon restart of channel. These coordinates are used for Y:U:V (Y pointer) and RGB formats.
YV Virtual Coordinate	YV	9 bits	W0[18:10]	
YB inner Block Coordinate	XB	13 bits	W0[31:19]	Variable coordinates for determining address within the block. These coordinates are used for Y:U:V (Y pointer) and RGB formats. Need 24 bits for 2D transfer support.
XB inner Block Coordinate	YB	12 bits	W0[43:32]	
New Sub Block	NSB_B	1 bit	W0[44]	This bit determines if the next value for {XB,YB} should be taken from {XB,YB} saved in channel parameter memory or from new {x1,y1}/{x2,y2}.
Current Field	CF	1 bit	W0[45]	CF = 0 Current field is even CF = 1 Current field is odd
Scroll X counter	SX	12 bits	W0[57:46]	Holds the temporary count for the Scroll X in between frame For interleaved YUV4:2:2 formats the SX should be a multiple of 2.
Scroll Y counter	SY	11 bits	W0[68:58]	Holds the temporary count for the Scroll Y in between frame
Number of Scroll	NS	10 bits	W0[78:69]	This variable holds the total number of Scrolls
Scroll Delta X	SDX	7 bits	W0[85:79]	Frame start row offset, compared to last frame. SDX 0000000 = 00 pixels 0000001 = 01 pixels 0000010 = 02 pixels ..... 1111110 = 126 pixels 1111111 = 127 pixels For interleaved YUV4:2:2 formats the SDX should be a multiple of 2.

Table continues on the next page...

Table 37-15. Channel Parameters Memory for interleaved (continued)

Scroll Max	SM	10 bits	W0[95:86]	Frame maximum row and column increment offset in frame. SM 0000000000 = 0001 0000000001 = 0002 ..... 1111111111 = 1024
Scrolling Configuration	SCC	1 bit	W0[96]	Determines if scrolling will continue from zero when NS counter has reached SM or stop at the current value for SX and SY for the next frames to come. SCC 0 => Scrolling will stop at NS = SM 1 => Scrolling will start from "0" at NS = SM
Scrolling Enable	SCE	1 bit	W0[97]	SCE = 0 Scrolling disable SCE = 1 Scrolling enable
Scroll Delta Y	SDY	7 bits	W0[104:98]	Frame start column offset, compared to last frame. SDY 0000000 = 00 pixels 0000001 = 01 pixels 0000010 = 02 pixels ..... 1111110 = 30 pixels 1111111 = 127 pixels
Scroll Horizontal Direction	SDRX	1 bit	W0[105]	Determines if the next frame will move right or left compared to the current frame. SDRX 0 => Next frame will be right of current 1 => Next frame will be left of current
Scroll Vertical Direction	SDRY	1 bit	W0[106]	Determines if the next frame will move down or up compared to the current frame. SDRY 0 => Next frame will be down of current 1 => Next frame will be up of current
Bits Per Pixel	BPP	3 bits	W0[109:107]	3'h0 = 32 Bits per pixel 3'h1 = 24 Bits per pixel 3'h2 = 18 Bits per pixel

Table continues on the next page...

Table 37-15. Channel Parameters Memory for interleaved (continued)

				3'h3 = 16 Bits per pixel 3'h4 = 12 Bits per pixel 3'h5 = 08 Bits per pixel 3'h6 = 04 Bits per pixel
Decode Address Select	DEC_SEL	2 bits	W0[111:110]	Upon 4BPP, selects between two look-up tables DEC_SEL 00 = addresses 0 to 15 01 = addresses 64 to 79 10 = addresses 128 to 143 11 = addresses 192 to 207
Access Dimension	DIM	1 bit	W0[112]	DIM = 0 Access Dimension is 2d DIM = 1 Access Dimension is 1d
Scan Order	SO	1 bit	W0[113]	SO = 0 Scan order is progressive SO = 1 Scan order is interlaced
Band Mode	BNDM	3 bits	W0[116:114]	BNDM = 000 bands disable. BNDM = 001 bands enable. Band height = 4 lines. BNDM = 010 bands enable. Band height = 8 lines. BNDM = 011 bands enable. Band height = 16 lines. BNDM = 100 bands enable. Band height = 32 lines. BNDM = 101 bands enable. Band height = 64 lines. BNDM = 110 bands enable. Band height = 128 lines. BNDM = 111 bands enable. Band height = 256 When working in band mode, the channel's corresponding IDMAC_BNDM_EN bit has to be set.
Block Mode	BM	2 bits	W0[118:117]	BM = 00 block mode disable. BW = FW, BH = FH BM = 01 block mode enable. BW = 8, BH = 8 BM = 10 block mode enable. BW = 16, BH = 16 (this mode is reserved for future use) BM = 11 not used
Rotation	ROT	1 bit	W0[119]	ROT = 0 -> No rotation ROT = 1 -> 90 degree rotation clockwise

Table continues on the next page...

Table 37-15. Channel Parameters Memory for interleaved (continued)

Horizontal Flip	HF	1 bit	W0[120]	HF = 0 -> No flip HF = 1 -> Horizontal flip enable
Vertical Flip	VF	1 bit	W0[121]	VF = 0 -> No flip VF = 1 -> Vertical flip enable
Threshold Enable	THE	1 bit	W0[122]	THE = 0 -> Threshold disable THE = 1 -> Threshold flip enable
Conditional Access Polarity	CAP	1 bit	W0[123]	CAP = 0 -> If conditional bit in CM register is low skip the access CAP = 1 -> If conditional bit in CM register is high skip the access
Conditional Access Enable	CAE	1 bit	W0[124]	CAE = 0 -> Conditional access disable CAE = 1 -> Conditional access enable
Frame Width	FW	13 bits	W0[137:125]	Number of pixels in one row, of the channel frame. FW 0000000000000 = 0001 pixels 0000000000001 = 0002 pixels ..... 1111111111111 = 8192 pixels For interleaved YUV4:2:2 formats the FW should be a multiple of 2.
Frame Height	FH	12 bits	W0[149:138]	Number of pixels in one column, of the channel frame. FH 000000000000 = 0001 line 000000000001 = 0002 lines ..... 111111111111 = 4096 lines
End of Line interrupt	EOLI	1 bit	W0[150]	End of line interrupt enable. The end of line indication is asserted once the last data of the line has been written. 1 - generate an end of line interrupt 0 - no affect
Word 1				
Ext Mem Buffer 0 Address	EBA0	29 bits	W1[28:0]	1st double buffer destination address for RGB and Y:U:V (Y pointer) formats. This parameter must not be changed if the corresponding channel is enabled.The actual physical address value is divided by 8 (i.e. this parameter includes bits [31:3] of the actual address)

Table continues on the next page...

Select SX SY Set	SXYS	1 bit	W1[148:148]	This bit selects between the settings on: SC_CORD and SC_CORD1
Conditional Read Enable	CRE	1 bit	W1[149:149]	This bit enables the conditional read feature.
Decode Address Select bit[2]	DEC_SEL2	1 bit	W1[150:150]	This field is reserved

1. Y1U1Y2V1 means byte0 = bits [7:0] =Y1; byte1 = bits [15:8] =U1; byte2 = bits [23:16] =Y2; byte3 = bits [31:24] = V1
2. Y2U1Y1V1 means byte0 =Y2; byte1 =U1; byte2 =Y1; byte3 = V1
3. U1Y1V1Y2 means byte0 =U1; byte1 =Y1; byte2 =V1; byte3 = Y2
4. U1Y2V1Y1 means byte0 =U1; byte1 =Y2; byte2 =V1;byte3 = Y1

37.4.2.10.3 Accessing the CPMEM for programming

Each IDMAC's channel's parameters are located on 2 CPMEM entries. Each Entry is 160 bit. The CPMEM is memory mapped and is accessible via the AHB bus. The AHB bus's accesses are 32bit wide. A CPMEM entry is composed of 5x32bit words. The next CPMEM entry starts at the next 8x32bit words (0x0, 0x20,0x40, etc.).

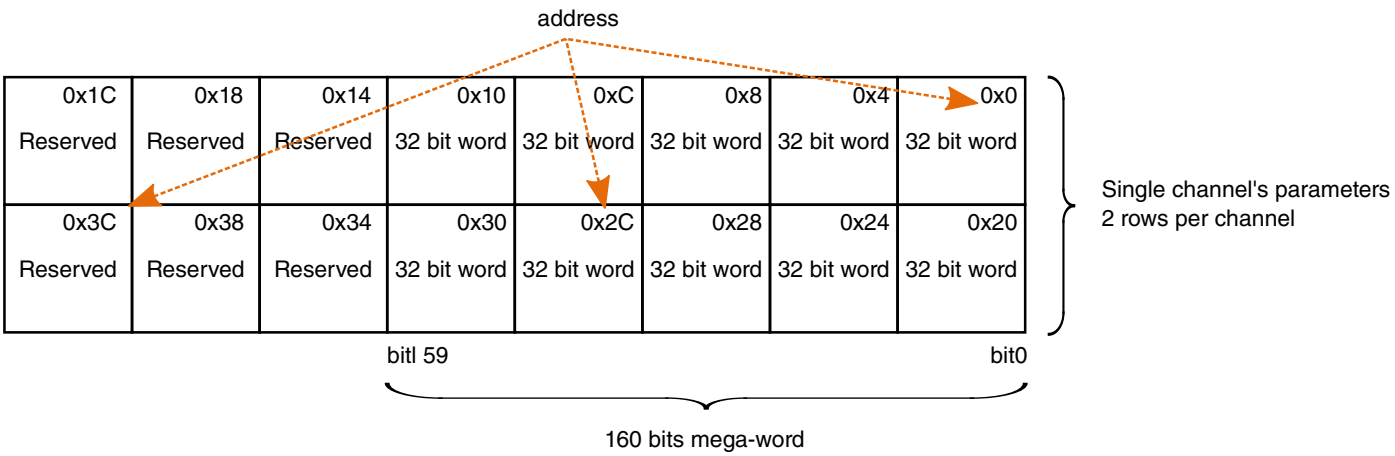

Figure 37-11. CPMEM's word structure

37.4.2.10.4 Alternate IDMAC settings

Some of the IDMAC channels support alternate flow. This means that a physical IDMAC channel can use alternate set of parameters. Switching between the flows is controlled by the CM.

The primary flow the IDMAC's settings are read from the channel's corresponding entry in the CPMEM. The alternate settings can be stored in another entry on the CPMEM. The pointer to the alternate entry on the CPMEM is stored on the physical channel's corresponding IDMAC_SUB_ADDR parameters.

37.4.2.11 IDMAC's modes of operation

37.4.2.11.1 Rotation modes

Rotation is performed by the IDMAC and the Rotation unit inside the IC.

The frame is partitioned into 8X8 pixels blocks. The IC reorders the pixels within a block. The IDMAC reorders the block. The reordering is done according to the ROT, VF & HF parameters in the CPMEM.

The following diagram illustrate various options for reordering of blocks.

- ROTATE means that the ROT bit is set
- HORIZONTAL means that the HF bit is set
- VERTICAL means that the VF bit is set

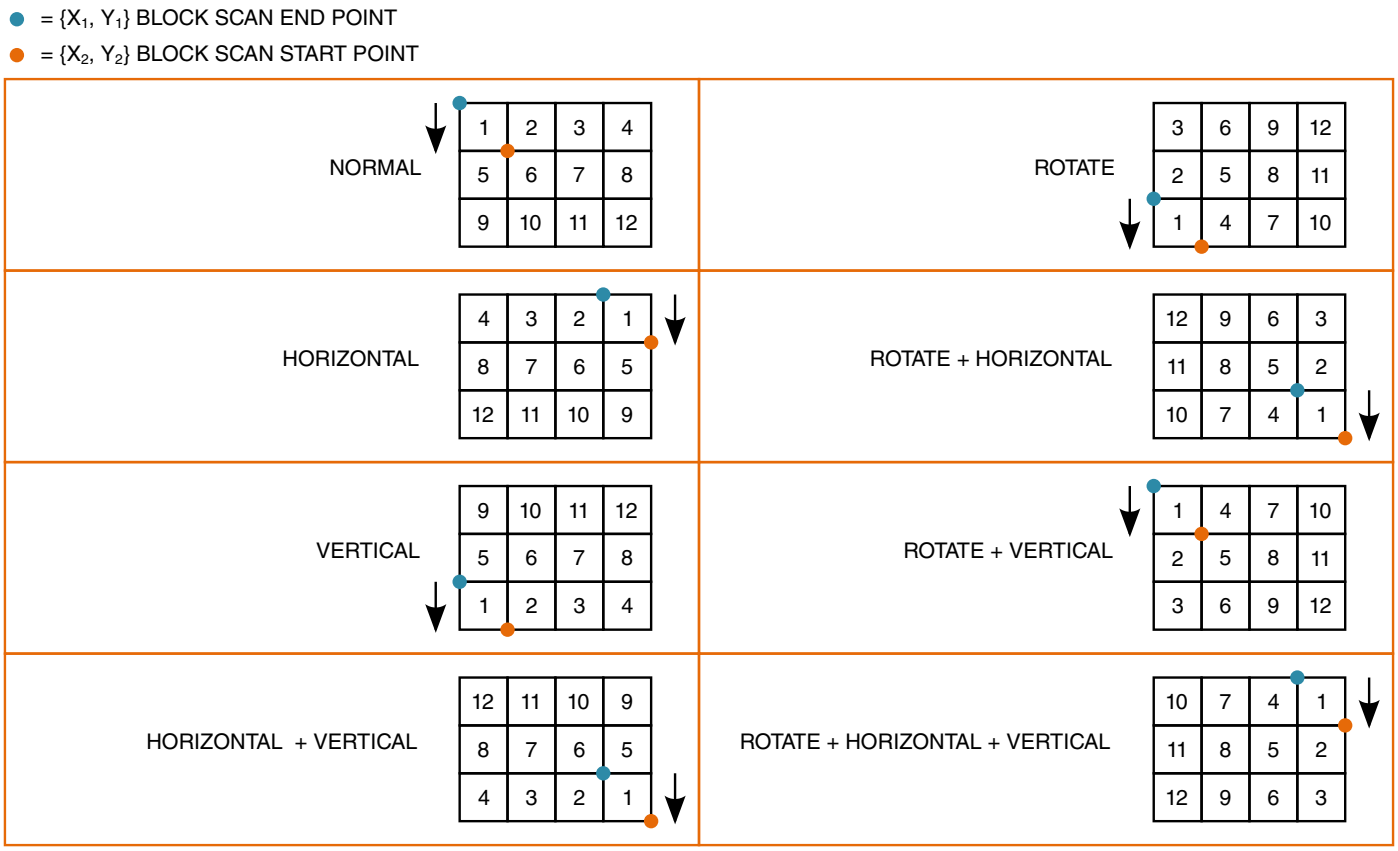

Figure 37-12. Rotation options

37.4.2.11.2 Frame size

The IPU supports various non-interleaved modes; the Frame Height (FH) and Frame Width (FW).

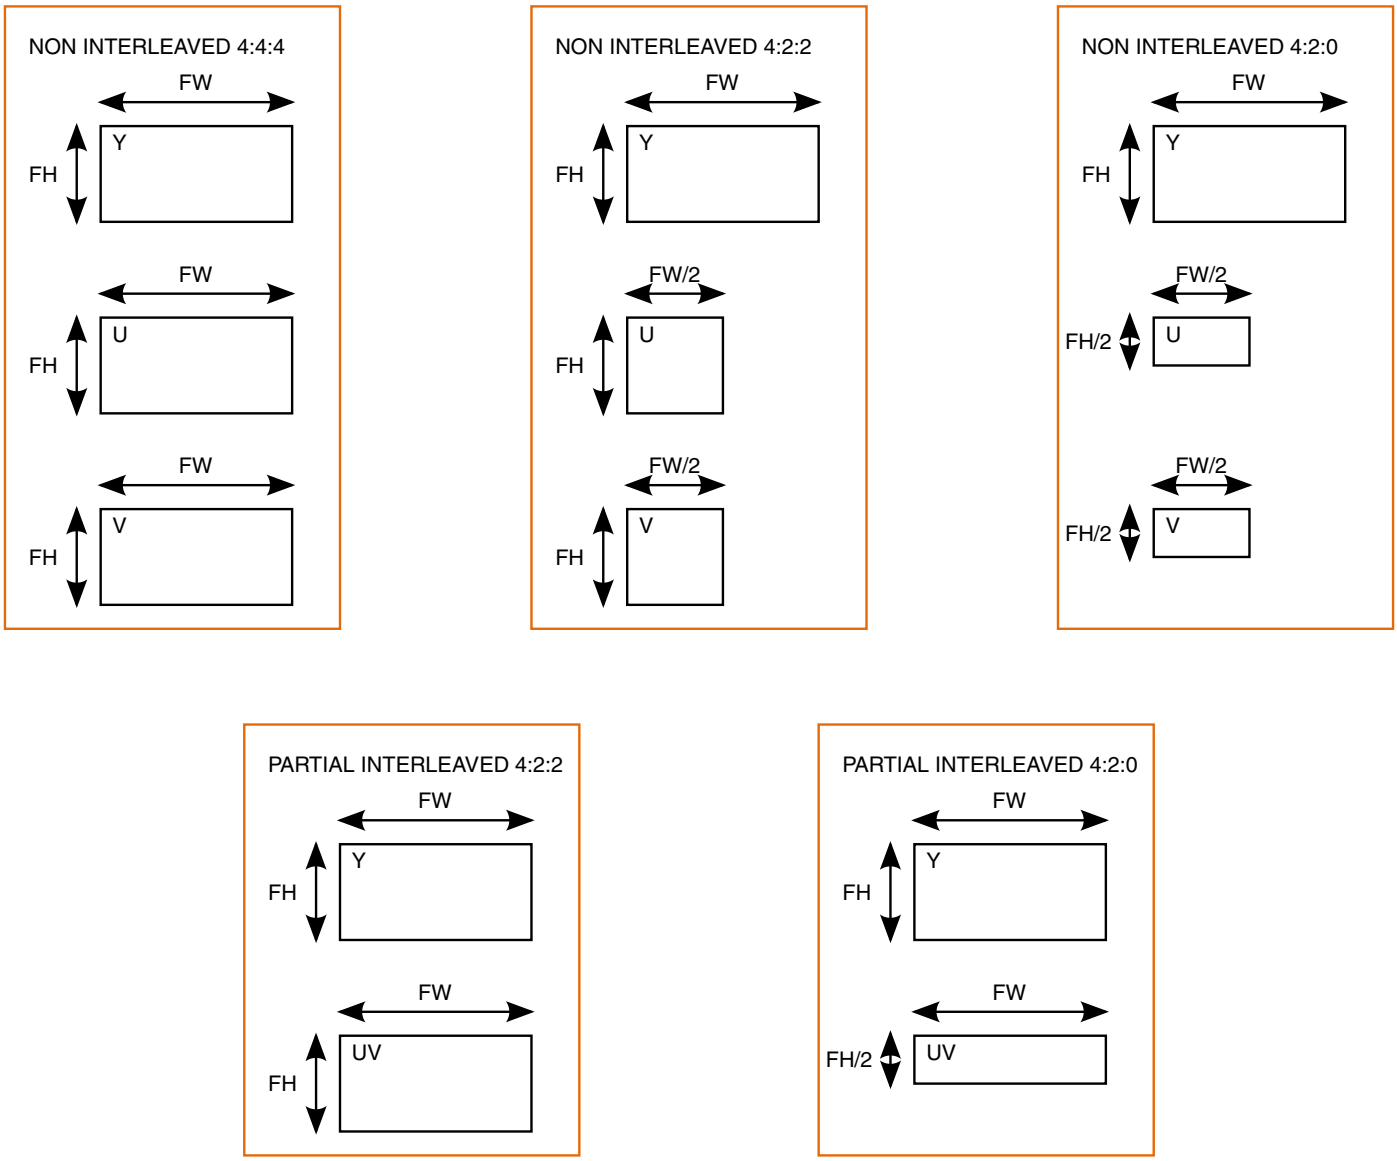

Figure 37-13. Frame size in various modes

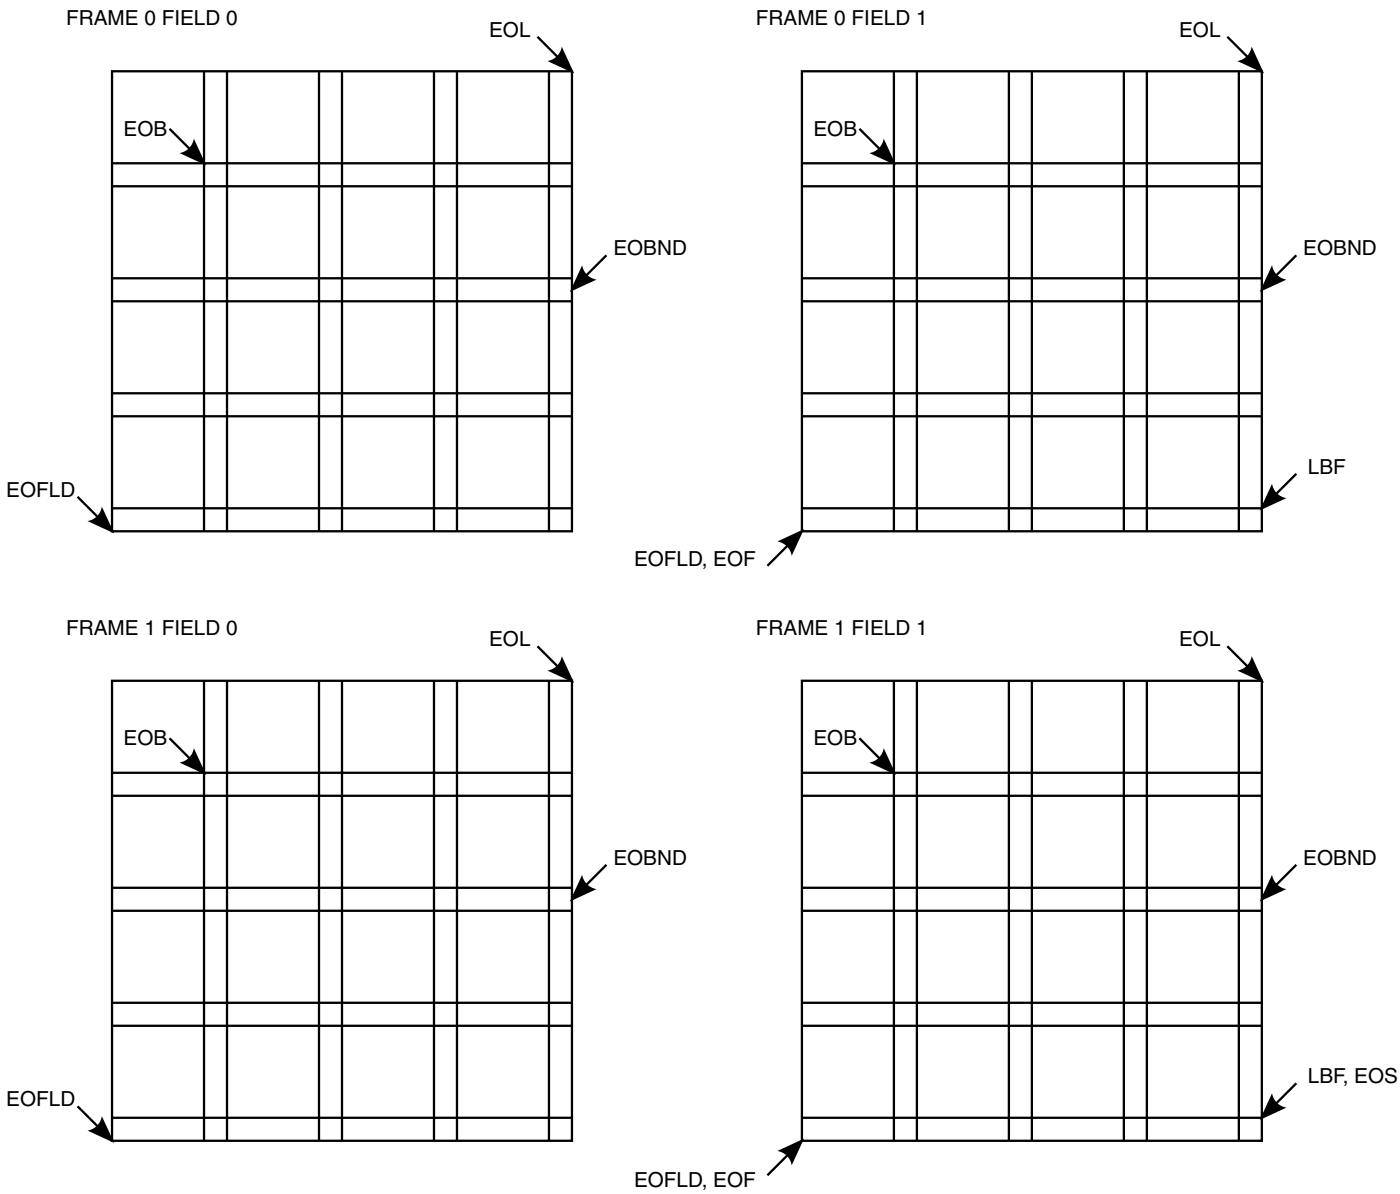

Figure 37-14. Frame's controls

37.4.2.12 IDMAC's restriction

The data must be received from the system's memory through the AXIR interface ("read" direction) "in-order" within a single burst. The entire burst can occur "out-of-order."

37.4.2.13 IDMAC's Endianness support

Byte Endianness - only LE (little endian) is supported

Pixel Endianness - both LE & BE are supported, only for read direction (only 4 BPP case is meaningful, supported only for the "read" direction)

37.4.2.14 IDMAC's internal events

Some of the IDMAC's internal signals can be used for monitor the progress of flows. These bits can be polled by software. Some of these bits can be used to trigger an interrupt or an SDMA event.

The following table describes the available events and their meaning

Table 37-16. IDMAC's internal events

IDMAC event's type	Monitored on	Event's meaning
end of frame	IDMAC_EOF	This is the channel's end of frame indication. This indication is asserted once the entire frame was read/written via the IDMAC. This indication is normally used as an interrupt or SDMA event
new frame acknowledge	IDMAC_NFACK	This indication means that the IDMAC acknowledge the new frame's request from the module. It can be used to track the starting point of a flow or a frame.
new frame before end of frame error	IDMAC_NFB4EOF_ERR	This error indication may indicate on data lost. This indication is asserted when a new frame starts before the completion of the previous frame. For example if a real time input (from camera) was not written properly to the memory due to FIFO full condition.
end of scroll	IDMAC_EOS	end of scroll; This indication is asserted when the scroll counter finished counting its pre defined value
end of band	IDMAC_EOBND	This is the end of band indication. Any time IDMAC complete reading/writing a band it will assert this indication. This is useful to manually control a flow via channels working in band mode.
treshold	IDMAC_TH	Threshold crossing indication. The treshold is defined according to the TH parameter in the IDMAC.
channel busy	IDMAC_CH_BUSY	This signal is asserted when a channel is between NFACK event to EOF event. Negation of these indications is one of the conditions for low power modes handshake.

37.4.3 Camera Sensor Interface (CSI)

The IPU has 2 identical camera sensor interfaces (CSI). The CSI description below refers to a single CSI.

37.4.3.1 CSI Block Diagram

The CSI consists of synchronizer, interface logic, Data packing unit and Sensor Interface Control.

The CSI is controlled via the peripheral bus registers. All programming parameters for the CSI are double buffered with synchronous change at the frame start.

The CSI gets data from the sensor, synchronizes the data and the control signals to the IPU clock (HSP_CLK), and transfer it according to configuration of DATA_DEST register to one or more of the following: IC, SMFC.

This figure shows the CSI Block Diagram.

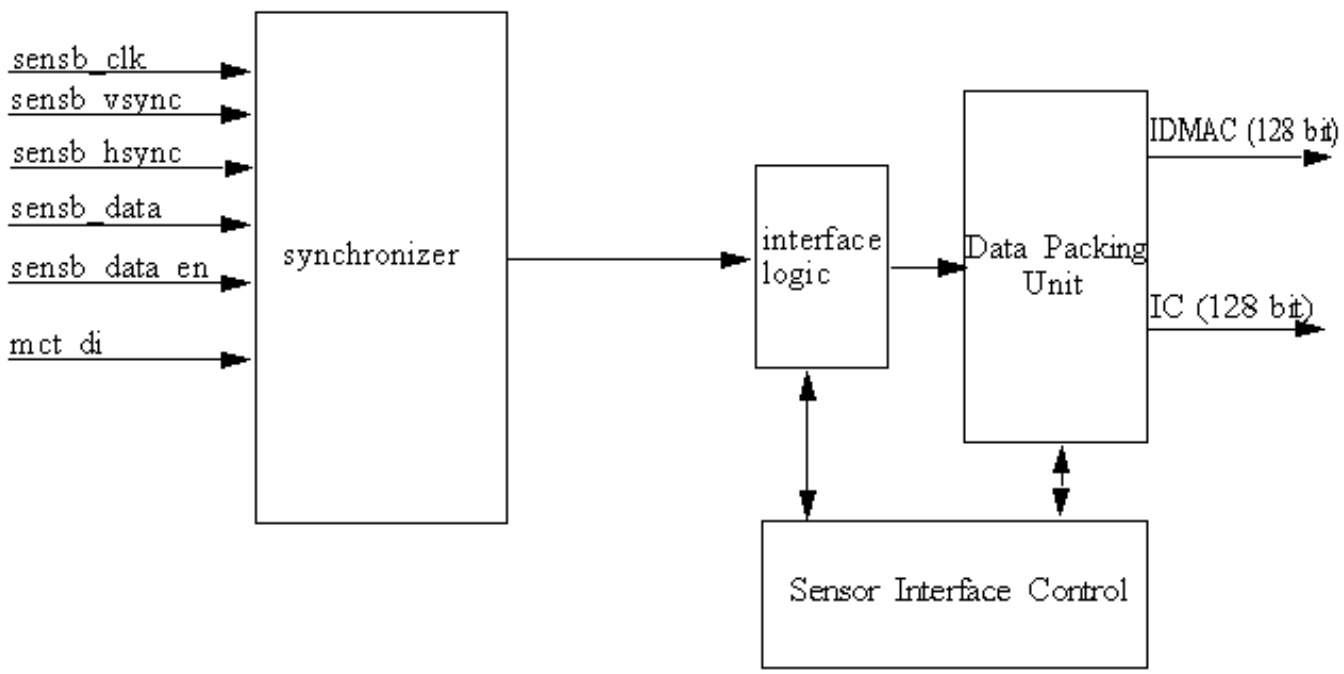

Figure 37-15. CSI Block Diagram

37.4.3.2 CSI Interface

CSI supports two types of interfaces. The interface is determined via the DATA_SOURCE register.

37.4.3.2.1 Parallel Interface

In parallel interface a single value arrives in each clock, except when working in BT.1120 mode, in which two values arrive in each cycle. Each value can be 8-16 bit wide according to configuration of DATA_WIDTH. If DATA_WIDTH is configured to N, then 20-N LSB bits are ignored.

CSI can work with several data formats according to SENS_DATA_FORMAT configuration. In case the data format is YUV, the output of the CSI is always YUV444 (even if the data arrives in YUV422 format).

The polarity of the inputs can be configured using the registers SENS_PIX_CLK_POL, DATA_POL, HSYNC_POL and VSYNC_POL.

37.4.3.2.2 High-speed serial interface - MIPI (Mobile Industry Processor Interface).

In MIPI interface two values arrive in each cycle. Each value is 8 bit wide, which means 16 MSB bits of the data bus input are treated, while 4 LSB bits are ignored.

When working in this mode, the CSI can handle up to 4 streams of data. Each stream is identified with DI (data identifier) that includes the virtual channel and the data type of this stream. Each stream that is handled is defined in registers MIPI_DI0-3. Only the main stream (MIPI_DI0) can be sent to all destination units while the other streams are sent only to the SMFC as generic data.

In this mode SENS_DATA_FORMAT and DATA_WIDTH registers are ignored, since this information is coming to the CSI via the MCT_DI bus.

37.4.3.3 Test Mode

When TEST_GEN_MODE register is configured to 1, the TEST MODE which is a debugging mode, is operated.

The CSI generates the frame by itself and sends it to one of the destination units. The sent frame is a chess board composed of black and configured color squares. The configured color is set with the registers PG_B_VALUE, PG_G_VALUE and PG_R_VALUE. The data can be sent in different frequencies according to the configuration of DIV_RATIO register.

CSI Test Mode requires the following CSIx_SENS_CONF settings:

CSIx_EXT_VSYNC = 0x1 (External VSYNC mode)

CSIx_DATA_WIDTH = 0x1 (8 bits per color)

CSIx_SENS_DATA_FORMAT = 0x0 (Full RGB or YUV444)

CSIx_PACK_TIGHT = 0x0

CSIx_SENS_PRTCL = 0x1 (Non-gated clock sensor timing/data mode)

CSIx_SENS_PIX_CLK_POL = 0x1 Pixel clock is inverted before applied to internal circuitry

CSIx_DATA_POL = 0x0 (Data lines are directly applied to internal circuitry.)

CSIx_HSYNC_POL = 0x0 (HSYNC is directly applied to internal circuitry)

CSIx_VSYNC_POL = 0x0 (VSYNC is directly applied to internal circuitry)

37.4.3.4 Sensor Image Frame Relations

The figure found here illustrates the generalized relations between image frames produced by a sensor and accepted by the CSI.

Generally, four frame definitions exist. The virtual frame A starts with the VSYNC signal. After vertical blanking starts frame B. The HSYNC signal indicates boundaries of the frame B. The frame B includes both the active sensor frame C and horizontal blanking intervals. A size of the blanking intervals depends on sensor type and programming. The size of the frame sent by the sensor (the actual pixels) has to be configured in the registers SENS_FRM_WIDTH and SENS_FRM_HEIGHT. The CSI selects a window (the frame D) inside the frame C by skipping rows and columns according to parameters defined in registers HSC, VSC, ACT_FRM_HEIGHT and ACT_FRM_WIDTH. frame D is sent to the rest of the IPU.

NOTE

The following limitation must exist:

SENS_FRM_HEIGHT >= VSC + ACT_FRM_HEIGHT

SENS_FRM_WIDTH >= HSC + ACT_FRM_WIDTH

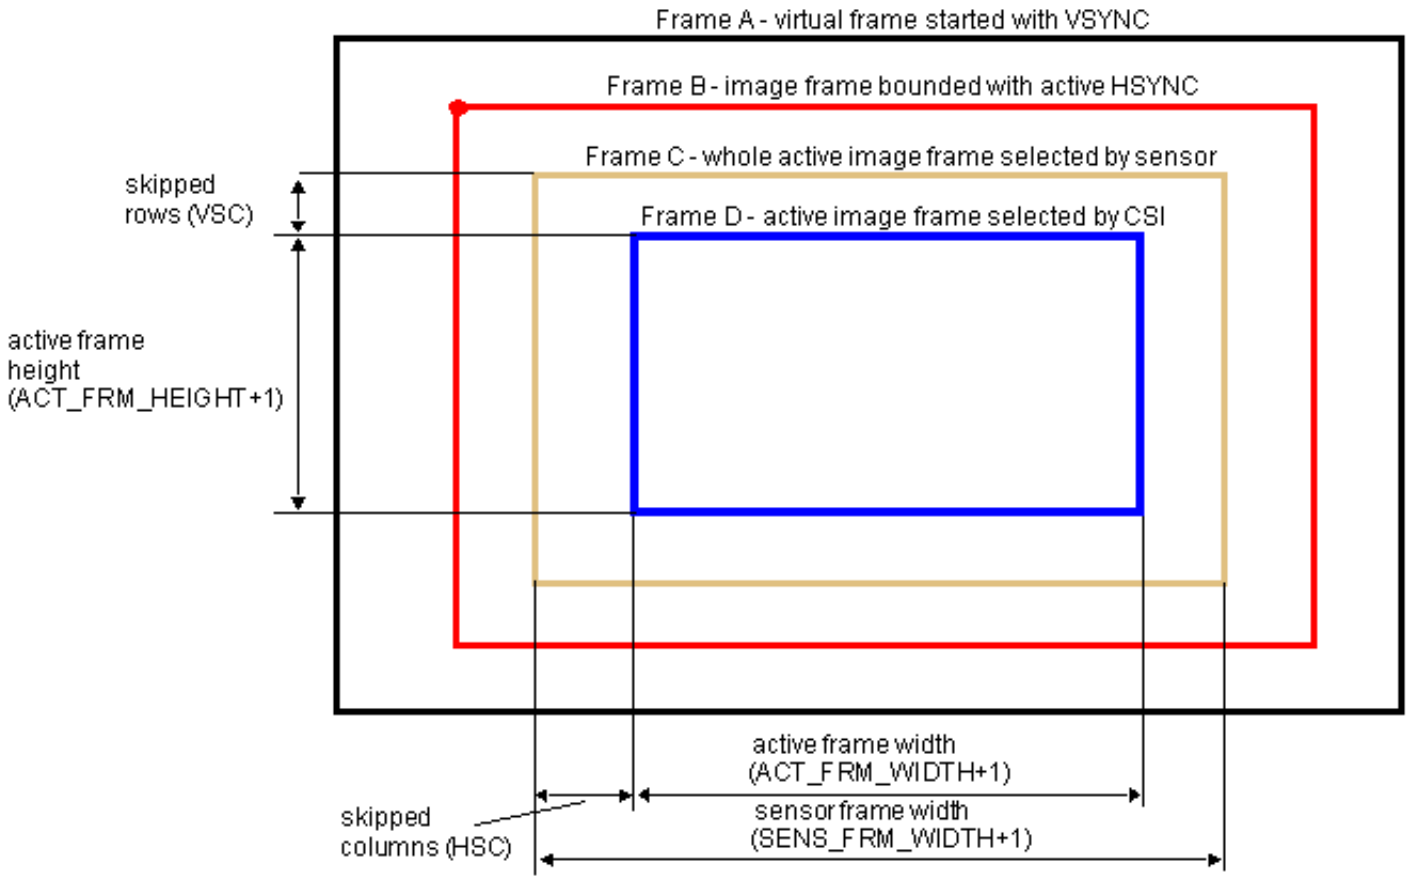

Figure 37-16. Sensor Image Frames

37.4.3.5 Companding

Companding is performed as follows:

input: 10-bit unsigned number.In case that component's size is bigger than 10 bit, 10 MSB bits are taken. In case that component's size is less than 10 bit, color extraction is performed.

First step: shift:

x-> clip(x + offset, 0, 1023)

where the offset is a 10 bit signed number that is configured in CPD_OFFSET1 and CPD_OFFSET2 registers.

second step - piecewise-linear map:

y = Min[255, (y1[k]+(((x-x1[k])*slope[k])>>6 + 1))>>1]

where:

- the input range 0..1023 is partitioned to 16 equal segments: x1[k] .. x1[k+1] - 1 where x1[k] = 0, 64, 128, 192, 256, .. . 960.

- The linear map, in each segment, is characterized by y1[k] (9-bit unsigned number) and slope[k] (8-bit unsigned number).

Each destination unit can get the data after being companded depending on the configuration of CPD register. If this register is configured to 3'h0, the compander units are disable in order to save power. Parameters of the companding are equal for all destinations and can be set in the CPD registers.

2 companding units are located in the CSI. This is because when working in MIPI orBT. 1120 modes 2 components arrive in each cycle and the companding for each 2 components has to be in parallel. When CSI works in other mode, only one compander is needed, so the other one is disabled to save power.

37.4.3.6 Timing/Data mode protocols

CSI can work in several timing/data mode protocols, according to SENS_PRTCL configuration.

37.4.3.6.1 Gated Mode

In this mode, VSYNC is asserted at the beginning frame. HSYNC is asserted at the beginning of a row and remains asserted until the end of the row. The sensor clock is ticking all the time.

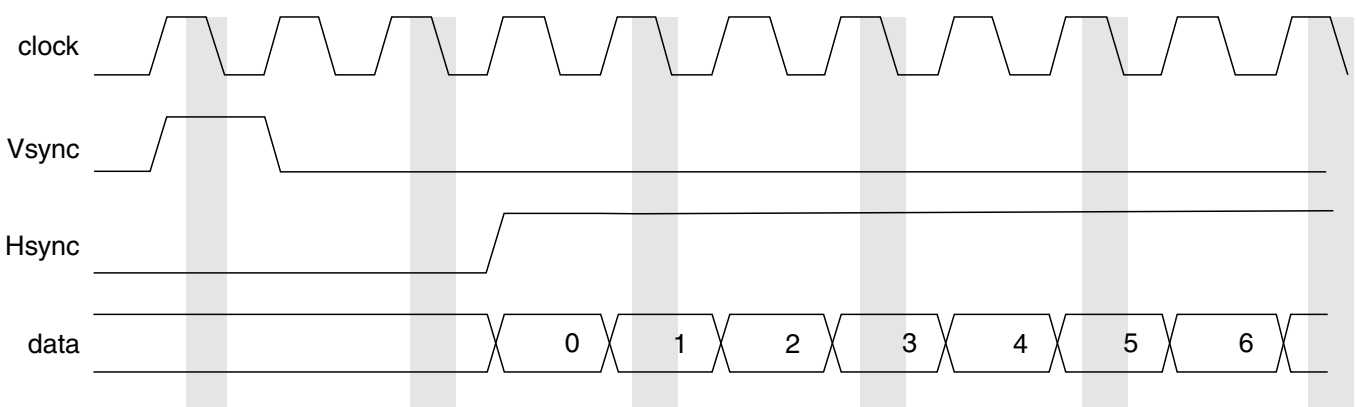

Figure 37-17. gated mode

37.4.3.6.2 Non-Gated Mode

In this mode VSYNC is used to indicate beginning of a frame. Sensor clock is ticking only when data is valid. HSYNC is not used.

When working with MIPI, the non-gated mode should be configured.

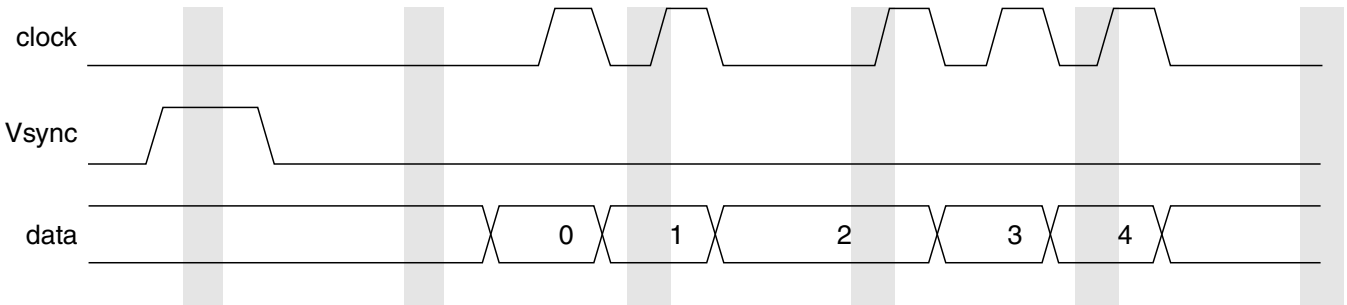

Figure 37-18. non-gated mode

37.4.3.6.3 BT.656 mode

In this mode the CSI works in compliance with recommendation ITU-R BT.656. The timing reference signals (frame start, frame end, line start, line end) are embedded in the data bus input. Each timing reference signal consists of a four word sequence. The first three words are fixed and configured in the CCIR_PRECOM register. The fourth word contains information defining field, the state of field blanking and the state of line blanking. these states are configured in registers CCIR_CODE_1 (for field 0) and CCIR_CODE_2 (for field 1).

In this mode in each cycle one value of data arrives

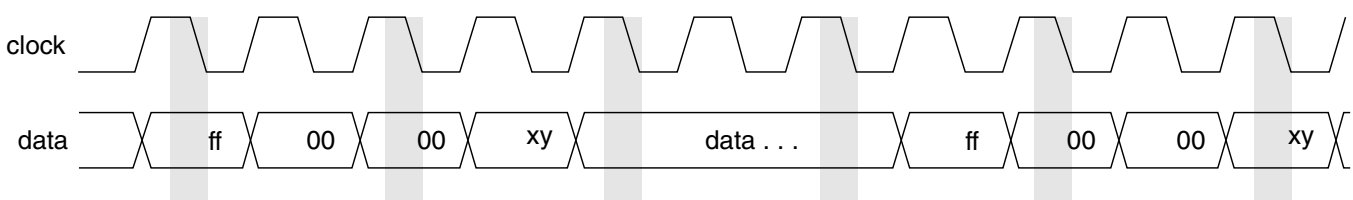

Figure 37-19. BT.656 mode

In this diagram the first three words are 0xff, 0x00, 0x00. The fourth word is XY and it includes the timing reference.

37.4.3.6.4 BT.1120 mode

In this mode the CSI works in compliance with recommendation ITU-R BT.1120. The timing reference signals (frame start, frame end, line start, line end) are embedded in the data bus input. Each timing reference signal consists of a four word sequence. The first three words are fixed and configured in the CCIR_PRECOM register. The fourth word contains information defining field, the state of field blanking and the state of line blanking. these states are configured in registers CCIR_CODE_1 (for field 0) and CCIR_CODE_2 (for field 1).

In this mode, the CSI can also work in DDR mode - data arrives on every edge of the clock. In addition, in each cycle two value of data arrive.

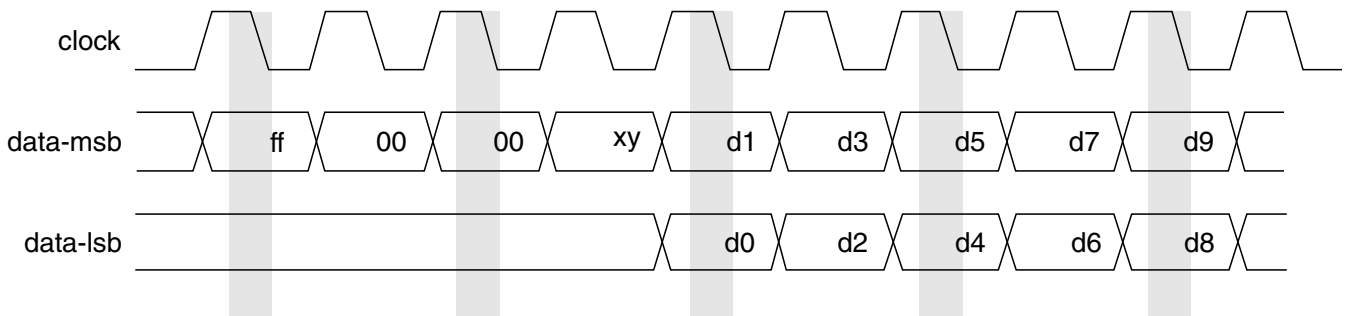

Figure 37-20. BT.1120 mode - SDR mode

In the above diagram each data arrives with the positive edge of the clock.

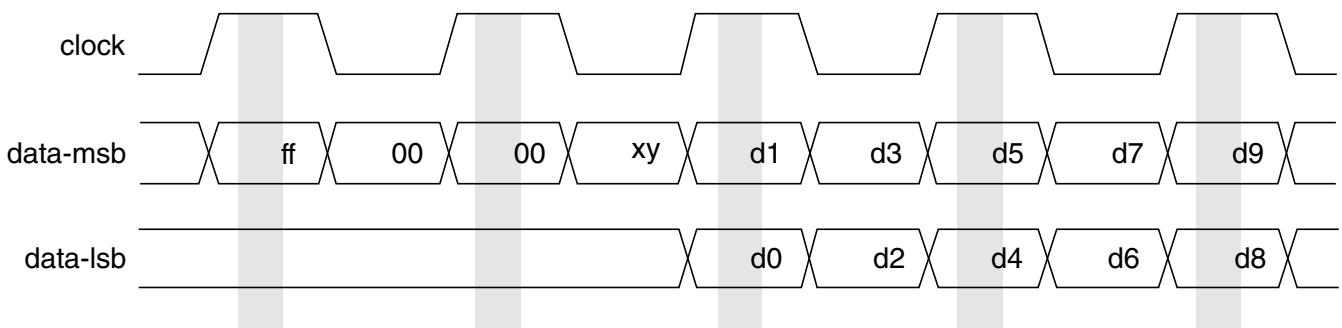

Figure 37-21. BT.1120 mode - DDR mode

In the above diagram, data arrives in the positive edge and the negative edge of the clock.

37.4.3.7 Packing to memory

The data bus output to the SMFC is 128-bit.

The following table shows the how the CSI performs the packing before sending the data to the SMFC.

The data bus output to the SMFC is 128-bit. The following table shows the how the CSI performs the packing before sending the data to the SMFC.

Table 37-17. Packing Unit

data format	component size	companded	regular packing	tight packing
Bayer, Generic data, JPEG	8	{8DC[1] ,8DC,8DC,...,8DC}	{8D,8D,8D,...,8D[2] }	NA
	9-16	{8DC,8DC,8DC,...,8DC}	{16DE[3] ,16DE,...,16DE}	NA
RGB, YUV	8	{8DC,8DC,8DC,8R}	{8D,8D,8D,8R}	NA
	9-10	{8DC,8DC,8DC,8R}	{16DE,16DE,16DE,16R[4] }	{10DE,10DE,10DE,2R}
	11-16	{8DC,8DC,8DC,8R}	{16DE,16DE,16DE,16R}	{10DT[5] ,10DT,10DT,2R}

1. DC - data after being companded
2. D - data arrived from sensor.
3. DE - data after being extended.
4. R- reserved bits
5. DT - data after being truncated.

The tight packing functionality is enabled when PACK_TIGHT register is set. It is only used when data format is RGB or YUV and the data width is bigger than 8.

37.4.3.8 Skipping frames

Some of the frames that are sent to the SMFC can be skipped. Skipped frames are ignore by the CSI and are not sent to the corresponding unit.

Using SKIP_SMFC and MAX_RATIO_SKIP_SMFC registers the user can define the frames for the SMFC that will be skipped.

37.4.3.9 16 bit camera support

Devices that support 16 bit data bus can be connected to the CSI. This can be done in one of the following ways.

16 bit YUV422

In this mode the CSI receives 2 components per cycle. The CSI is programmed to accept the data as 16 bit generic data. The captured data will be stored in the memory through the SMFC. The IDMAC needs to be programmed to store 16bit generic data. When the data is read back from the memory for further processing in the IPU it will be read as YUV422 data.

16 bit RGB as generic data

In this mode the CSI receives 3 components per cycle. If the external device is 24bit - the user can get connect a 16 bit sample of it (such as RGB565) The CSI is programmed to accept the data as 16 bit generic data. The captured data will be stored in the memory through the SMFC. The IDMAC needs to be programmed to store 16bit generic data. When the data is read back from the memory for further processing in the IPU it will be read as 16 bit RGB data. The IDMAC's mapping unit will be used to remap the 16 bit data to the internal 24bpp RGB format In this mode on the fly processing is can't be performed. The data has to be sent to the memory first and then further processed by the IPU.

16 bit RGB565

This is the only mode that allows on the fly processing of 16 bit data. In this mode the CSI is programmed to receive 16 bit generic data. In this mode the interface is restricted to be in "non-gated mode" and the CSI#_DATA_SOURCE bit has to be set If the external device is 24bit - the user can connect a 16 bit sample of it (RGB565 format). The IPU has to be configured in the same way as the case of CSI#_SENS_DATA_FORMAT=RGB565

37.4.3.10 CSI Restrictions

The frequency of the sensor clock must not be greater than the IPU clock (HSP_CLK)

SENS_FRM_HEIGHT >= VSC + ACT_FRM_HEIGHT

SENS_FRM_WIDTH >= HSC + ACT_FRM_WIDTH

37.4.4 Sensor Multi FIFO Controller (SMFC)

The Sensor Multifile Controller used as buffer between CSI and IDMAC. Two masters (CSIs) can be connected to SMFC. Both masters can be active simultaneously.

Each master can send up to 4 frames, distinguished by csi_id bus. The frame can be mapped to one of four IDMAC channels via SMFC mapping registers. Each DMA channel have dedicated FIFO.

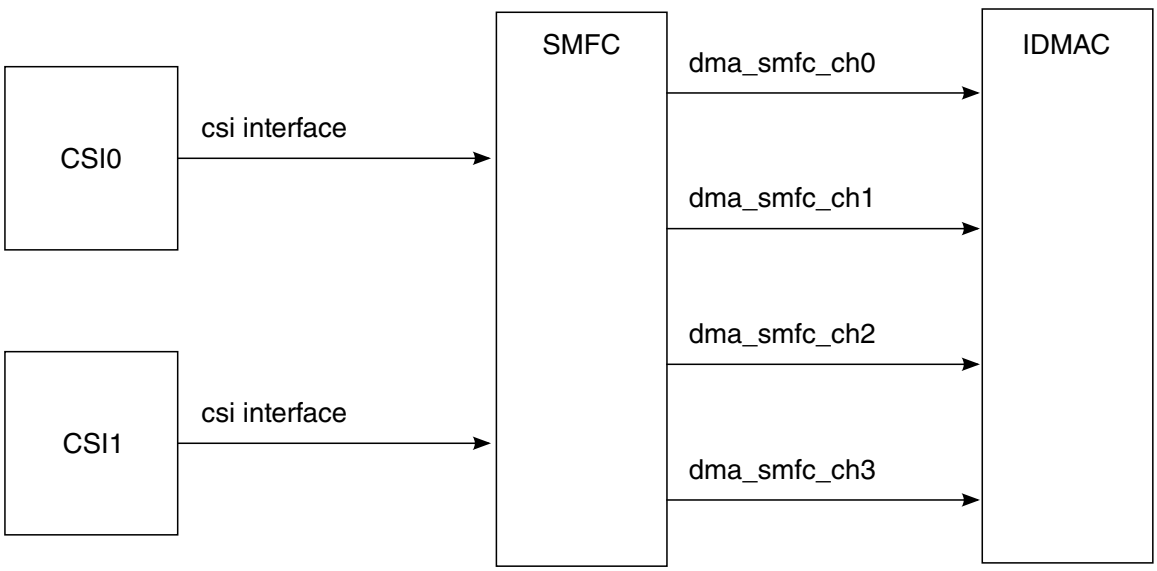

Figure 37-22. SMFC data flow

37.4.4.1 SMFC's Features

- Support two CSI masters and four DMA channels
- Automatic FIFO size calculation

37.4.4.2 SMFC's Functional description

SMFC supports up to four DMA channels. Each channel has a dedicated FIFO controller, as shown in the following figure. Sampled data and frame ID are kept in the buffers until the buffer is selected by Round Robin Priority Mechanism. Then, the content of ID buffer is compared to CH#_MAP bits and the corresponding FIFO controller is activated. As a result, the content of the buffer is copied to the RAM. The wptr and the "base" are used to calculate the location in the RAM. The rptr are following after wptr during dma_active signal, initiated by DMA.

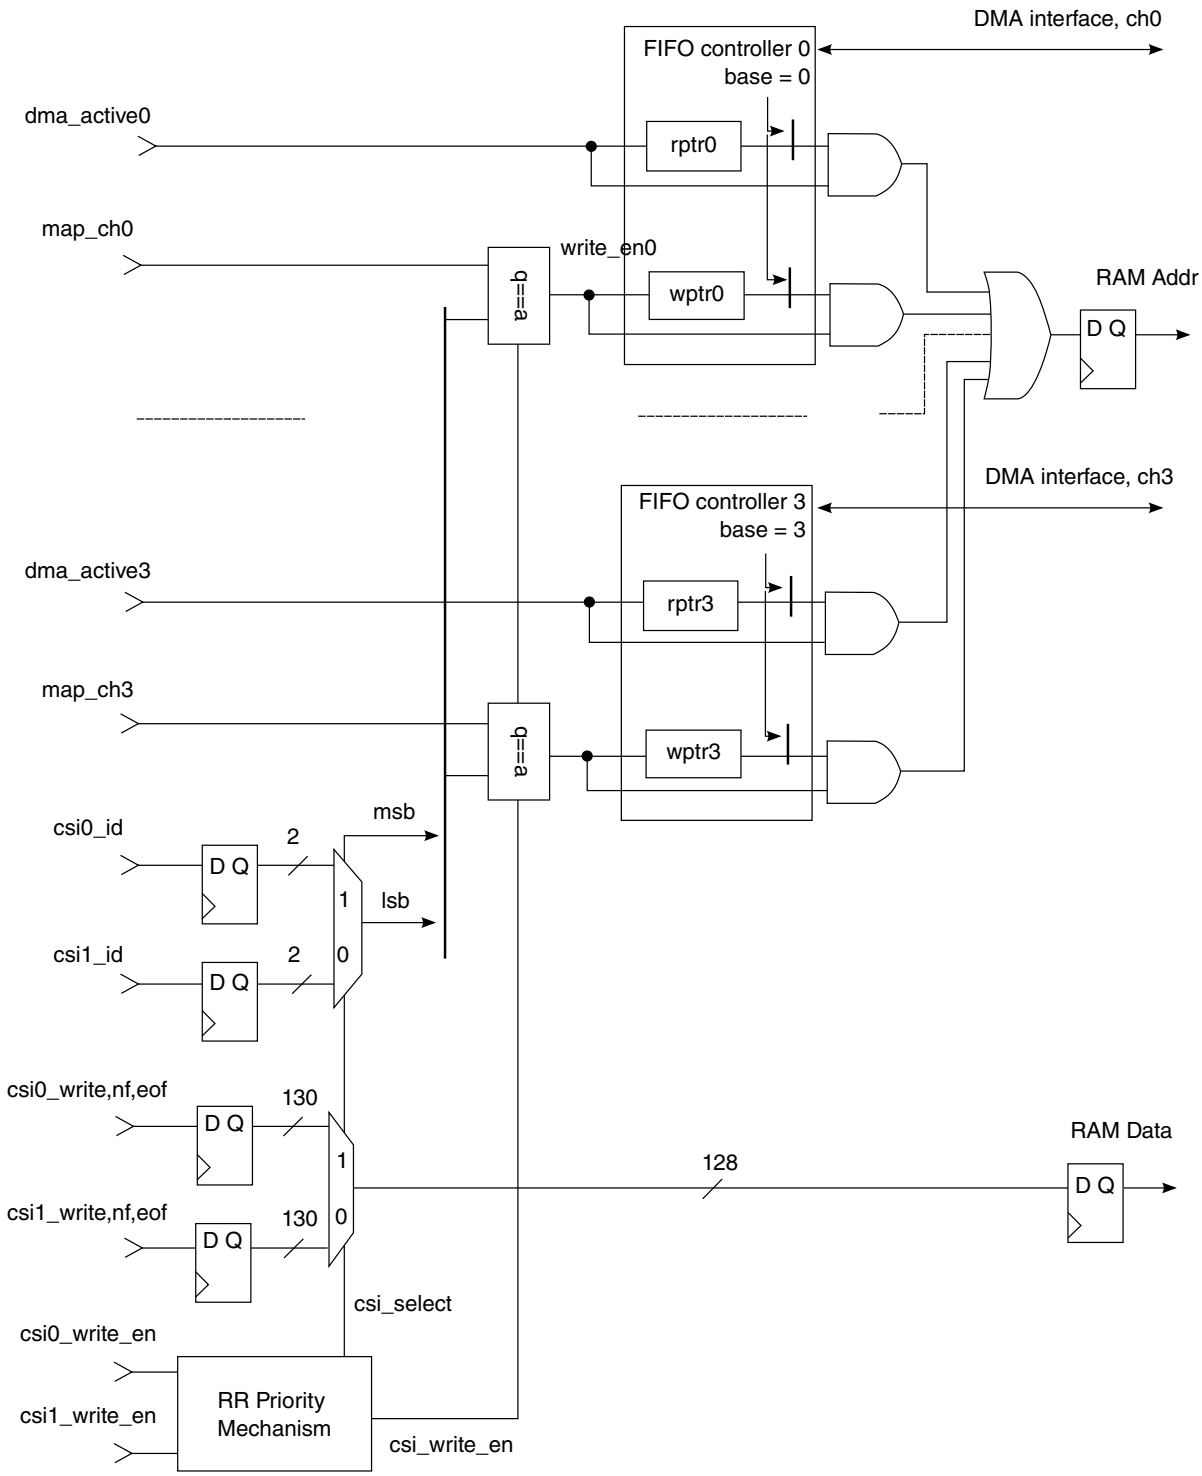

Figure 37-23. Sensor Multi FIFO Controller

Four FIFOs are implemented with single RAM due to the fact that the channels can't be active simultaneously. The memory space of SMFC is divided into four equal sectors. Each FIFO has a fixed base address - "base". The "base" used as MSB for corresponding pointer in order to calculate absolute address of the RAM. FIFO size of channels 1 and 3 are fixed and is equal to size of one sector. FIFO size of channels 0 and 2 depend from other channels as shown in the table below. Other configurations are not allowed.

Table 37-18. FIFO Channels

Number of DMA channels required	enable/disable of channels 3,2,1,0	FIFO size (sectors) per channels 3,2,1,0
1	0 0 0 1	0 0 0 4
2	0 1 0 1	0 2 0 2
3	1 1 0 1	1 1 0 2
4	1 1 1 1	1 1 1 1

NOTE

Channels should not be enabled after activation of channel 0 or/and channel This can cause to overlapping of FIFO areas and other malfunctions.

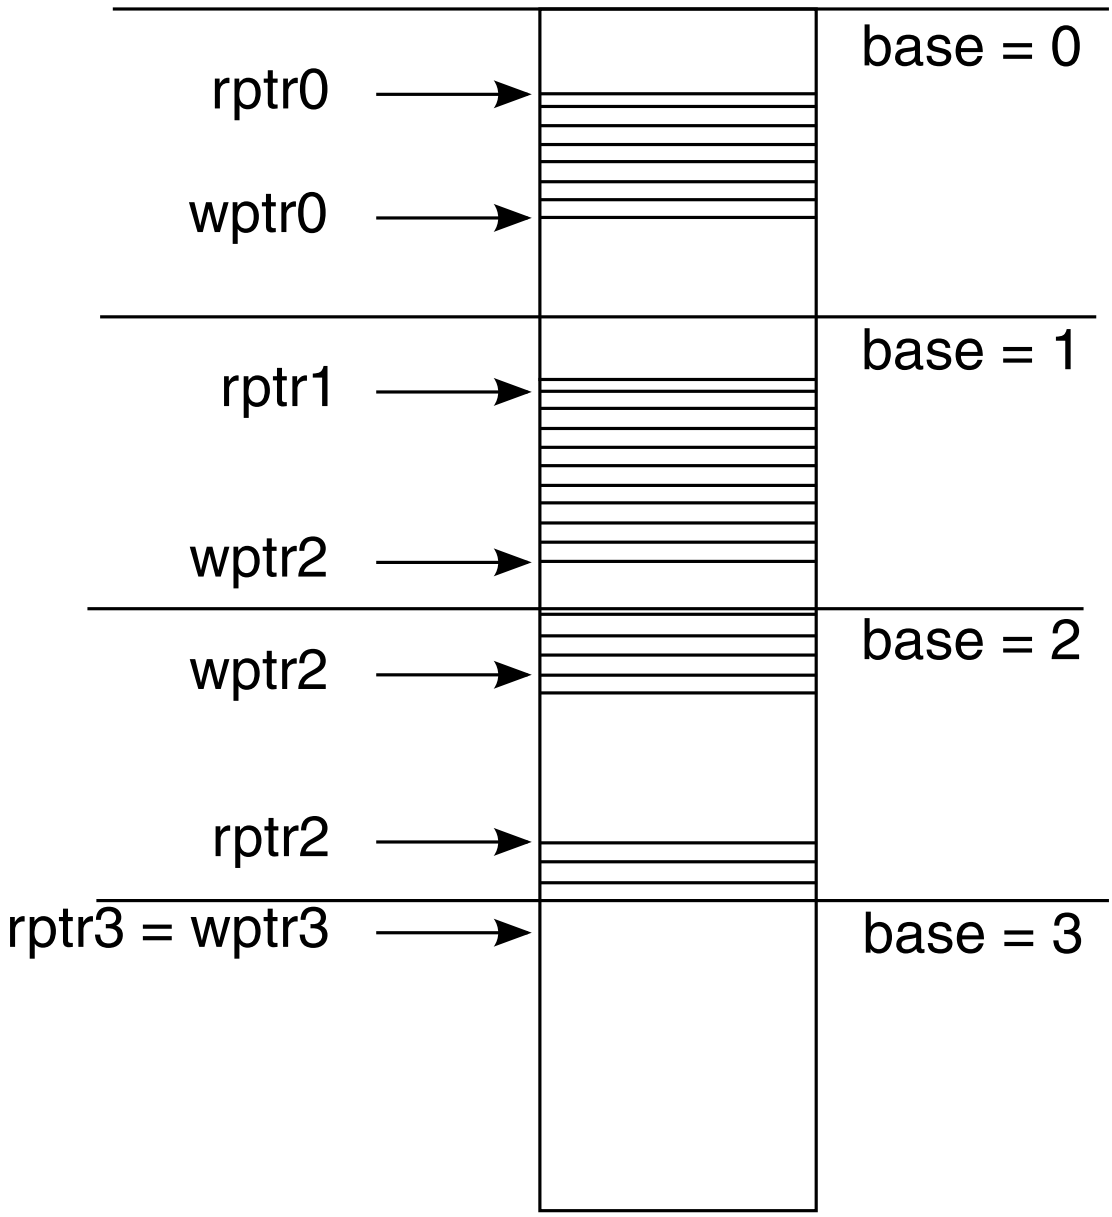

Figure 37-24. SMFC memory map when DMA channels 3,2,1,0 are enabled

37.4.4.2.1 SMFC Master interface.

SMFC Master interface is shown in the following figure.

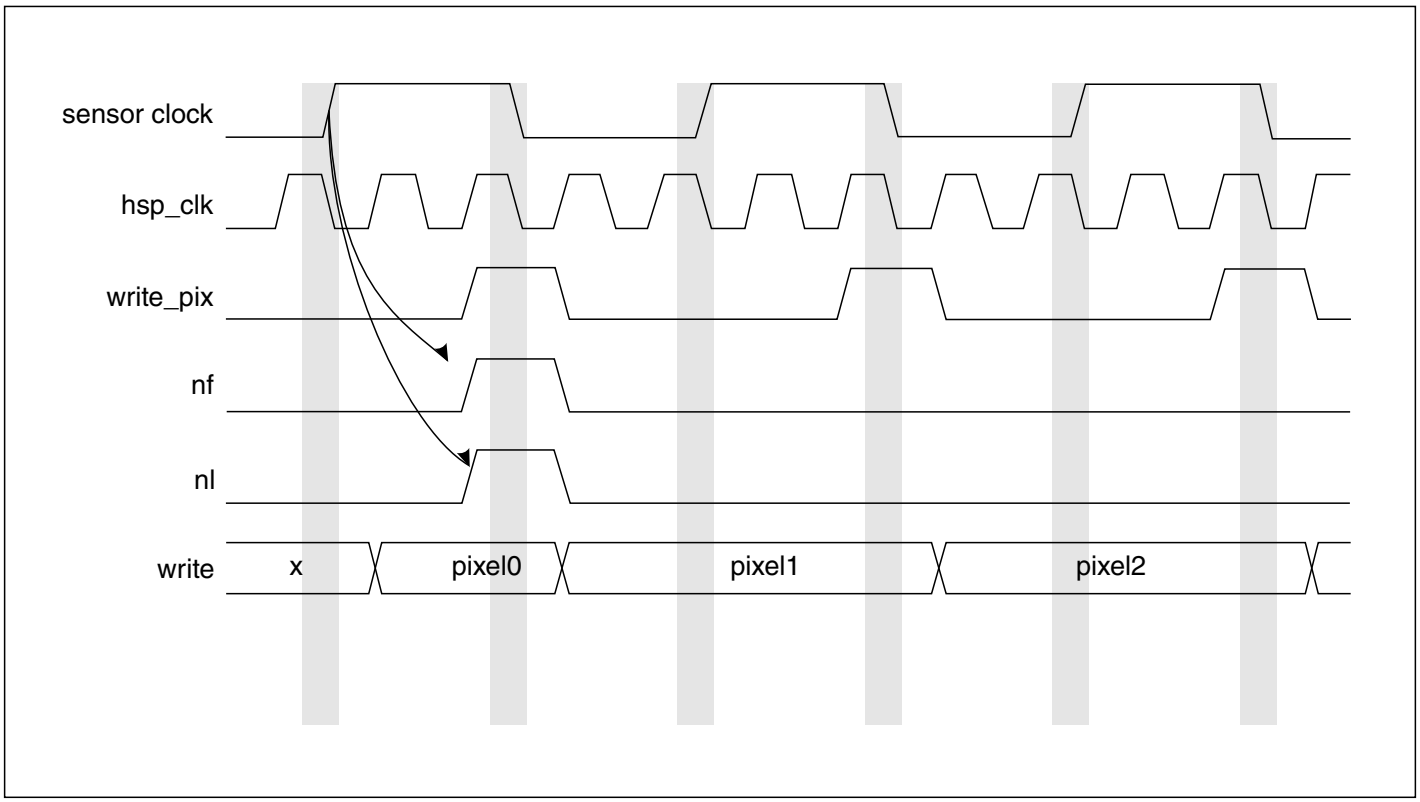

Figure 37-25. Timing diagram of SMFC slave interface

Sensor clock can be asynchronous to IPU clock (hsp_clk). The CSI synchronize data arrived from the sensor to hsp_clk. The csi_write signal indicates when data on csi_pix bus can be sampled by hsp_clk clock.

37.4.4.2.2 Restrictions

1. DMA channels should not be enabled after activation of channel 0 or/and channel 2. This can cause to overlapping of FIFO area and other malfunctions.
2. Watermark set value should be greater than watermark clear value.
3. One frame should not be mapped to few DMA channel.

37.4.5 Image Converter

37.4.5.1 IC Block Diagram

The IC contains three processing sections: downsizing, main processing and rotation.

The block is controlled via the peripheral bus registers. Some processing parameters should be written by the ARM core to the Task Parameter Memory. Writing to the memory is performed via the AHB bus.

The IC Block Diagram is shown in the following figure.

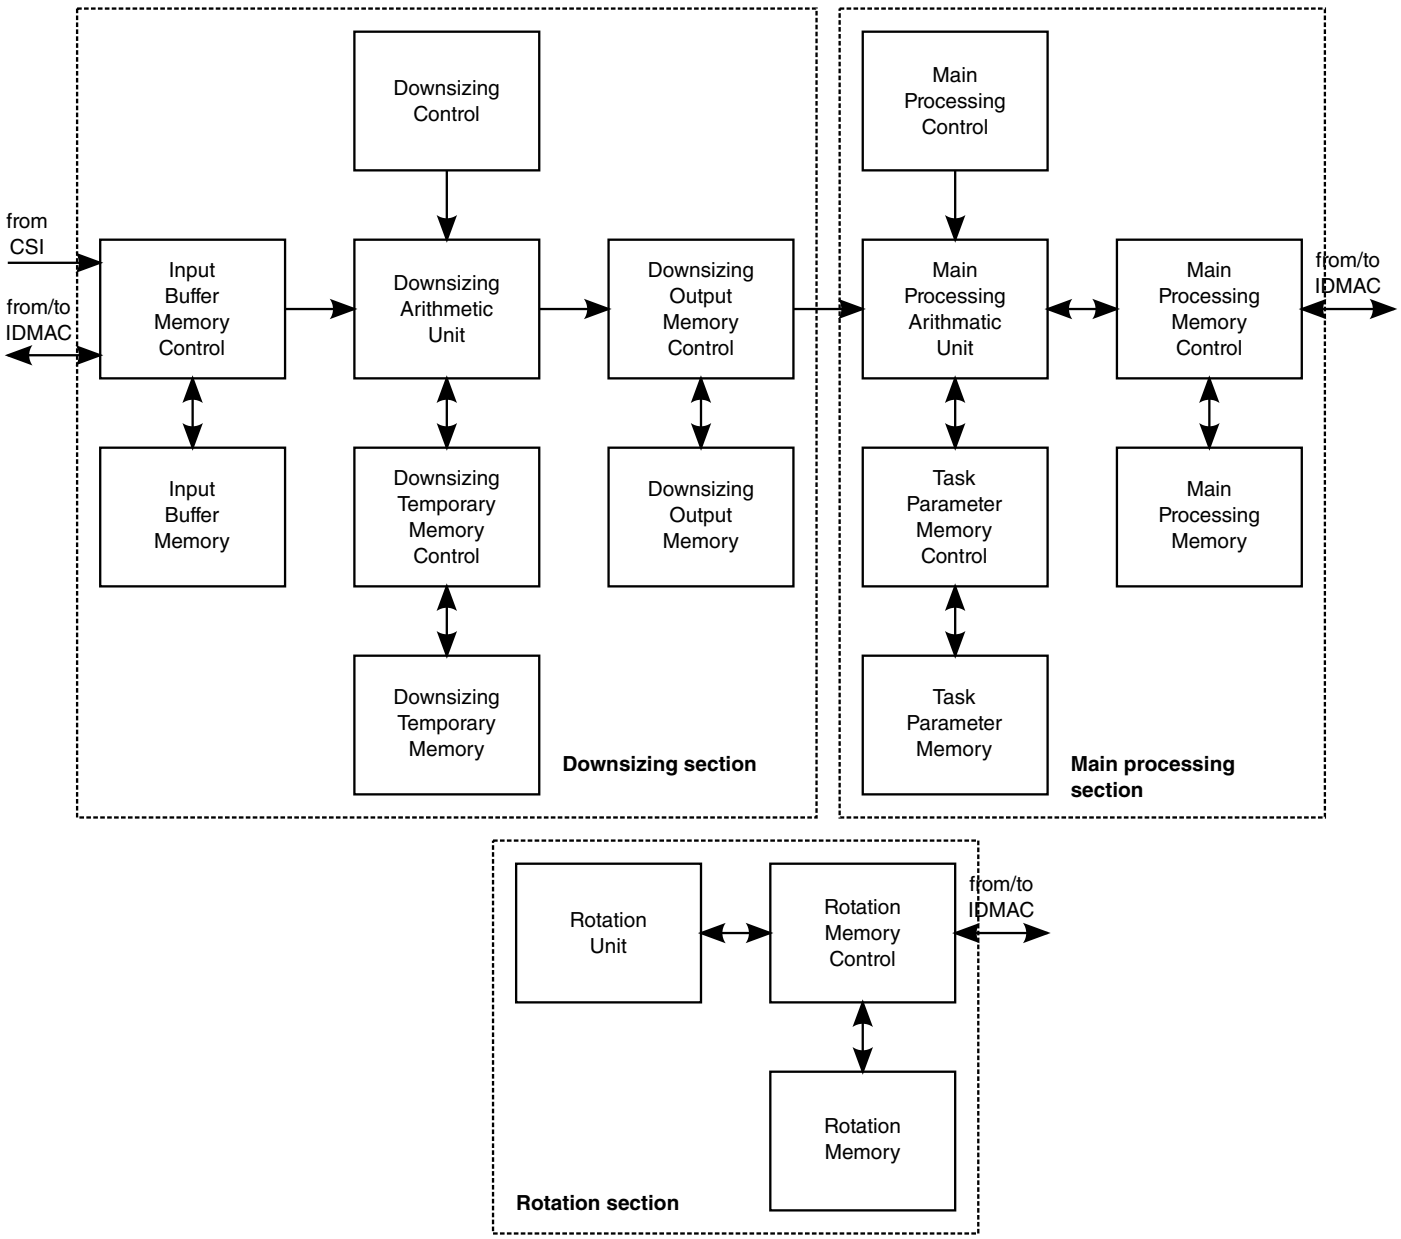

Figure 37-26. IC Block Diagram

37.4.5.2 Processing tasks

Each of the three processing sections performs up to three processing tasks with time sharing:

1. Preprocessing task for encoding.
2. Preprocessing task for displaying image from sensor (viewfinder).

3. Postprocessing task.

The tasks are performed by single hardware. The ARM platform configures each task before enabling it.

Tasks switching is transparent for the ARM platform. The time unit for task switching in the downsizing section corresponds to a processing time of one burst of eight pixels, in the main processing section - to a processing time of one image line, in the rotation section - to a processing time of one image frame.

All three tasks include similar operations controlled by commands. Task configuring consists in definition of commands for each task, as described in the following table.

Table 37-19. Task Commands

Command code	Command	Processing unit	Command parameters	Description
EN	Task Enable	DSU, MPU		Task will enabled from next frame. Task 1 is preprocessing for encoding. Task 2 is preprocessing for viewfinder. Task 3 is postprocessing.
	Downsizing	DSU	Downsizing ratio (GCR)	Downsizing ratio 1:1, 2:1, 4:1
	Resizing	MPU	Resizing ratio (GCR)	Resizing ratio from 2:1 to 1:M Resizing ratio = N:M; M =2^13; N = floor(M*(SI-1)/(SO-1)); SI - input size; SO - output size
CSC1	Color space conversion 1	MPU	Color conversion coefficients and offsets (TPM)	Color conversion matrix 1
GLOB_A	Global alpha	MPU		Used only for Task 2 and Task 3
CMB	Combining	MPU		Combining video with graphics. Used only for Task2 and Task3.

The ARM platform writes the commands to the IC_CONF Register. Because there is no double buffering for all the IC parameters, the ARM platform must disable a task before changing its parameters. After being disabled, the task is still allowed to complete its current frame execution. At frame finish, the IPU sends an interrupt to the ARM platform indicating that the ARM platform can change task parameters. The ARM platform enables the task again and task execution is resumed from start of the next frame.

37.4.5.3 Downsizing Section

The sensor data from the CSI is written into a FIFO located in the Input Buffer Memory. Depending on programmed processing flow, the FIFO data can be sent to the system memory via the IDMAC or straight forward to the Downsizing Unit.

In the first case, the data is processed by the ARM platform and returned by the IDMAC to another FIFO located in the Input Buffer Memory.

For postprocessing, the IDMAC transfers a data from the system memory to the third FIFO. The data is read by the Downsizing Unit when the postprocessing is performed.

Each or three FIFOs has 128 pages. Each page can store one burst of 2 or 4 words which corresponds to 8 or 16 pixels. The size of the burst is defined according to the channel's corresponding CB#_BURST_SIZE bit. The memory word width is 128 bits. Each memory word contains color components of four adjacent pixels or 16 bytes of generic data (e.g. Bayer). Access to the FIFOs is controlled by the Input Buffer Memory Control.

The Downsizing Unit performs averaging and decimation of image pixels both in horizontal and vertical directions according to the following equations:

$$HP_{R,c} = \frac{1}{DS_R_H} \sum_{k=0}^{DS_R_H-1} IP_{r+k,c}$$

$$VP_{R,C} = \frac{1}{DS_R_V} \sum_{l=0}^{DS_R_V-1} HP_{R,c+l}$$

where IPr,c - the input pixel, HPR,c - the pixel after horizontal downsizing, VPR,C - the pixel after vertical downsizing, DS_R_H and DS_R_V - the horizontal and vertical downsizing ratios according to the IC_PRP_ENC_RSC, IC_PRP_VF_RSC and IC_PP_RSC Registers. The final calculation result is rounded to 8 bits.

Each of three downsizing tasks processes the data by bursts of 8 pixels. Normally, the current task runs until emptying the corresponding input FIFO. After finishing burst processing, the Downsizing Unit may switch between the current task and another task with higher priority, if the Input Buffer Memory has received a burst for this new task.

Averaging is performed firstly in the horizontal direction. All color components of a pixel are processed in parallel. After horizontal averaging has finished for a single output pixel, the new pixel value is added to the corresponding pixel value of a temporary row derived from previous averaging steps. This provides vertical averaging of the pixels. The temporary row is stored in the Downsizing Temporary Memory. The memory word width matches one accumulated pixel width (36 bits). There are three temporary rows stored in this memory - one per downsizing task.

After vertical averaging has been finished, the output row is written to the Downsizing Output Memory. The memory word of 48 bits includes two output pixels. For each task, the memory has a double buffer of one row. When the Downsizing Unit fills the foreground part of the double buffer, the Main Processing Unit takes pair or pixels from the background part. After the new downsized row has been ready, the foreground and background memory pointers are swapped.

37.4.5.4 Main Processing Section

The Main Processing Unit reads pairs of pixels from the Downsizing Output Memory background part. It processes the complete pixel row for the current task and after that switches to another task if the input data for this new task is ready.

For each task, the Main Processing Unit is able to perform the following sequence of operations:

1. Horizontal flipping the image (optional) performed with reading from the Downsizing Output Memory. Flipping is enabled via the VF, HF & ROT parameters of the corresponding DMA channels (Table 37-14 and Table 37-15) responsible for output of the task results. The preprocessing task for encoding uses the VF, HF & ROT parameters from IDMAC channel #20, the preprocessing task for viewfinder - from the IDMAC channel #21, the postprocessing task - from the IDMAC channel #22.
2. Horizontal resizing by bilinear interpolation between two adjacent pixels received from the Downsizing Output Memory according to the equation:

$$HP_{R,c} = IP_{r,c} + RS_C_H \cdot (IP_{r+1,c} - IP_{r,c})$$

where RS_C_H - the current horizontal resizing coefficient. The calculation result is rounded to 8 bits. The resizing coefficient is calculated as

$$RS_C_H = \left(\sum_{k=0}^{R-1} RS_R_H \right) \bmod(8196)$$

where RS_R_H - the horizontal resizing ratio from the IC_PRP_ENC_RSC, IC_PRP_VF_RSC and IC_PP_RSC Registers. The RS_R_H parameter is equal to a numerator N of the resizing ratio N:M with M =2^13.

The resulting row of the horizontal resizing is stored in the Task Parameter Memory.

3. Vertical resizing by bilinear interpolation between the current and previous results of horizontal resizing. Both current and previous results of horizontal resizing is stored in the Task Parameter Memory. Resizing is accomplished according to the equation:

$$VP_{R,C} = HP_{R,c} + RS_C_V \cdot (HP_{R,c+1} - HP_{R,c})$$

where RS_C_V - the current vertical resizing coefficient. The calculation result is rounded to 8 bits. The resizing coefficient is calculated as

$$RS_C_V = \left(\sum_{k=0}^{C-1} RS_R_V \right) \bmod(8196)$$

where RS_R_V - the horizontal resizing ratio from the IC_PRP_ENC_RSC, IC_PRP_VF_RSC and IC_PP_RSC Registers. The RS_R_V parameter is equal to a numerator N of the resizing ratio N:M with M =2^13.

At completion of vertical resizing, this row is updated - the current result of horizontal resizing replaces the previous one.

4. First color space conversion YUV to RGB or RGB to YUV with the conversion matrix CSC1. The conversion matrix coefficients are programmable. They are stored in the Task Parameter Memory. The conversion equations are:

$$Z_0 = 2^{SCALE-1} \cdot (X_0 \cdot C_{00} + X_1 \cdot C_{01} + X_2 \cdot C_{02} + A_0)$$
$$Z_1 = 2^{SCALE-1} \cdot (X_0 \cdot C_{10} + X_1 \cdot C_{11} + X_2 \cdot C_{12} + A_1)$$
$$Z_2 = 2^{SCALE-1} \cdot (X_0 \cdot C_{20} + X_1 \cdot C_{21} + X_2 \cdot C_{22} + A_2)$$

where for YUV to RGB: X_0=Y, X_1=U, X_2=V, Z_0=R, Z_1=G, Z_2=B, for RGB to YUV: X_0=R, X_1=G, X_2=B, Z_0=Y, Z_1=U, Z_2=V.

All the parameters of the conversion matrix are written by the ARM platform to the Task Parameter Memory (IC Task Parameter Memory). The final calculation result is limited according to the SAT_MODE parameter and rounded to 8 bits.

5. Combining video with graphics. There are the following combining options:
   - local alpha blending,
   - global alpha blending,
   - use of key color.

   If both alpha blending and color keying are enabled, color keying has higher priority (graphic pixels of the key color are fully transparent independently on the alpha value).

   Combining mode is selected via the IC_CONF Register. The combining equation is:

$$OP = IGP \cdot \alpha + IVP \cdot (1 - \alpha)$$

   where IGP - an input graphics pixel, IVP - an input video pixel, α=(A+floor(A/128))/256 - an alpha value, A - a global or local transparency parameter. The global A is written in the IC_CMBP_1 Register, the local A arrives together with the graphics pixel.

   A graphics pixel becomes transparent when color keying is enabled and a pixel color matches a key color (independently on an alpha parameter).

   The graphics data is read from a FIFO located in the Main Processing Memory. The FIFO contains 32 pages of size of 8 pixels. The size of the burst is defined according to the channel's corresponding CB#_BURST_SIZE bit. The graphics pixel format in the FIFO is RGB or RGBA or YUV 4:4:4 or YUVA. The graphics data is loaded by the IDMAC to the FIFO from the system memory.

All the operation are executed by an unified processing unit sequentially. Steps 1 and 2 cannot be interrupted by another task. All other steps can be interrupted by a task with higher priority if an input row is ready for this task. Preprocessing tasks priority is higher than postprocessing task priority.

The processing unit consists of three identical parts for each color component. All three color components are processed in parallel. Each of the processing operations can be enabled or disabled by an appropriate command according to.

The processing results are written to an output FIFO located in the Main Processing Output Memory row-by-row. The FIFO contains 32 pages, each page can include one burst of 8 or 16 pixels. The size of the burst is defined according to the channel's corresponding CB#_BURST_SIZE bit. The IDMAC transfers the output bursts to the system memory or to the display via DMFC (Channel 21only). The Main Processing Memory contains three buffers for each tasks: the temporary row buffer, the graphics FIFO and the output FIFO. Each memory word (128 bits) stores 4 adjacent pixels in formats RGB or RGBA or YUV 4:4:4.

37.4.5.5 Rotation Section

The rotation section includes the Rotation Memory, which stores an input rectangular block of 8x8 pixels and an output FIFO containing four pages of 8 pixels each one. The Rotation Memory word width corresponds to four adjacent pixels - 96 bits. The input block is loaded to the memory by the IDMAC like to a FIFO.

The Rotation Unit rewrites pixels from the input block to the output FIFO with corresponding relocation of a pixel inside the block. Rotation and/or left/right flipping and/or up/down flipping are enabled separately for each of three tasks. Configuring the rotation and flipping options is performed via the VF, HF & ROT parameters of the corresponding DMA channels (Table 37-14 and Table 37-15) responsible for task data input. The preprocessing task for encoding uses the VF, HF & ROT parameters from the IDMAC channel #45, the preprocessing task for viewfinder - from the IDMAC channel #46, the postprocessing task - from the IDMAC channel #47.

Rotation and flip options are shown in the following table.

Table 37-20. Rotation and Flip Options

ROT	FLR	FUD	Image
0	0	0	

Table continues on the next page...

Table 37-20. Rotation and Flip Options (continued)

ROT	FLR	FUD	Image
0	0	1	
0	1	0	
0	1	1	
1	0	0	
1	0	1	

Table continues on the next page...

Table 37-20. Rotation and Flip Options (continued)

ROT	FLR	FUD	Image
1	1	0	
1	1	1	

After finishing the rotation task, the IDMAC returns the output FIFO content to the system memory. When writing to the system memory, the IDMAC changes a location of the block relative to an input block location in order to provide proper rotation of the whole frame. Rotation tasks switching is performed after completion of rotation of the whole frame.

37.4.5.6 IC Task Parameter Memory

The following table presents IC task parameter memory details.

Table 37-21. IC Parameters

Address[1]	Word[2]	Parameter	Field	Description

1. The address documented in this table is the relative address within the TPM. This is the address that should be accessed when writing or reading from this memory via the AHB bus.
2. Each word is aligned to 64 bit accessible via the AHB bus in 2 separate 32bit accesses.
3. s - sign position, x - binary digit position

37.4.5.7 IC's DMA channels

The table below mas the IDMAC channels of the IC and the IRT to the corresponding tasks.

The IC's channel name is the name of the channel at IC level. The IC channel name is referred on the IC's programming model.

Table 37-22. IC's DMA Channels

IDMAC's channel number	IC's channel name	Read/ Write	Source	Destination	Processing Flow Purpose
20	CB0	Write	IC ENC	Memory	Preprocessing data from IC (encoding task) to memory
21	CB1	Write	IC VF	Memory/DMFC	Preprocessing data from IC (viewfinder task) to memory; This channel can be configured to send the data directly to the DMFC. This is done by programming the ic_dmfc_sel bit.
22	CB2	Write	IC PP	Memory	Postprocessing data from IC to memory

Table continues on the next page...

Table 37-22. IC's DMA Channels (continued)

IDMAC's channel number	IC's channel name	Read/ Write	Source	Destination	Processing Flow Purpose
14	CB3	Read	Memory	IC VF	Graphics data for combining (viewfinder task)
15	CB4	Read	Memory	IC PP	Graphics data for combining (post-processing task)
11	CB5	Read	Memory	IC PP	Postprocessing data from memory
12	CB6	Read	Memory	IC VF	Preprocessing data from sensor stored in memory (for example Bayer)
5	CB7	Write	IC	Memory	Direct data from IC (sensor data) to memory
48	CB8	Write	ENC ROT	Memory	Preprocessing data after rotation (encoding task)
49	CB9	Write	VF ROT	Memory	Preprocessing data after rotation (viewfinder task)
45	CB10	Read	Memory	ENC ROT	Preprocessing data for rotation (encoding task)
46	CB11	Read	Memory	VF ROT	Preprocessing data for rotation (viewfinder task)
50	CB12	Write	PP ROT	Memory	Postprocessing data after rotation
47	CB13	Read	Memory	PP ROT	Postprocessing data for rotation

37.4.5.8 IC restrictions

- The input's frame width to the IC must be a multiplication of 8 pixels
- When performing resizing the frame width must be multiple of burst size - 8 or 16 pixels as defined by CB#_BURST_16 parameter.

37.4.5.9 IC bridge

The IC sub-block utilizes a single memory to serve read and write channels. These memories are the IBM, RM and MPM. The IDMAC has separate mechanism to handle read and write channels. As a result, a contention between read and write channels may occur on each one of the memories. In order to resolve the contention, an IC bridge sub-block is connected between the channels associated with this memory.

The bridge prioritizes a read channel over a write channel. In order to avoid starvation of the write channels, the user can limit the maximum consecutive requests of the same channel that will be served. The limitation is done by programming the memory's corresponding <>_brdg_max_rq field.

37.4.6 Display port

The display port handles all the IPU features targeted for controlling and sending data to the display. The display port consists of 4 modules.

DC - a display controller,

DP - a display processor,

DMFC - a display multi-FIFO controller

DI - a display interface. The DI is instantiated twice to provide two symmetrical display interfaces.

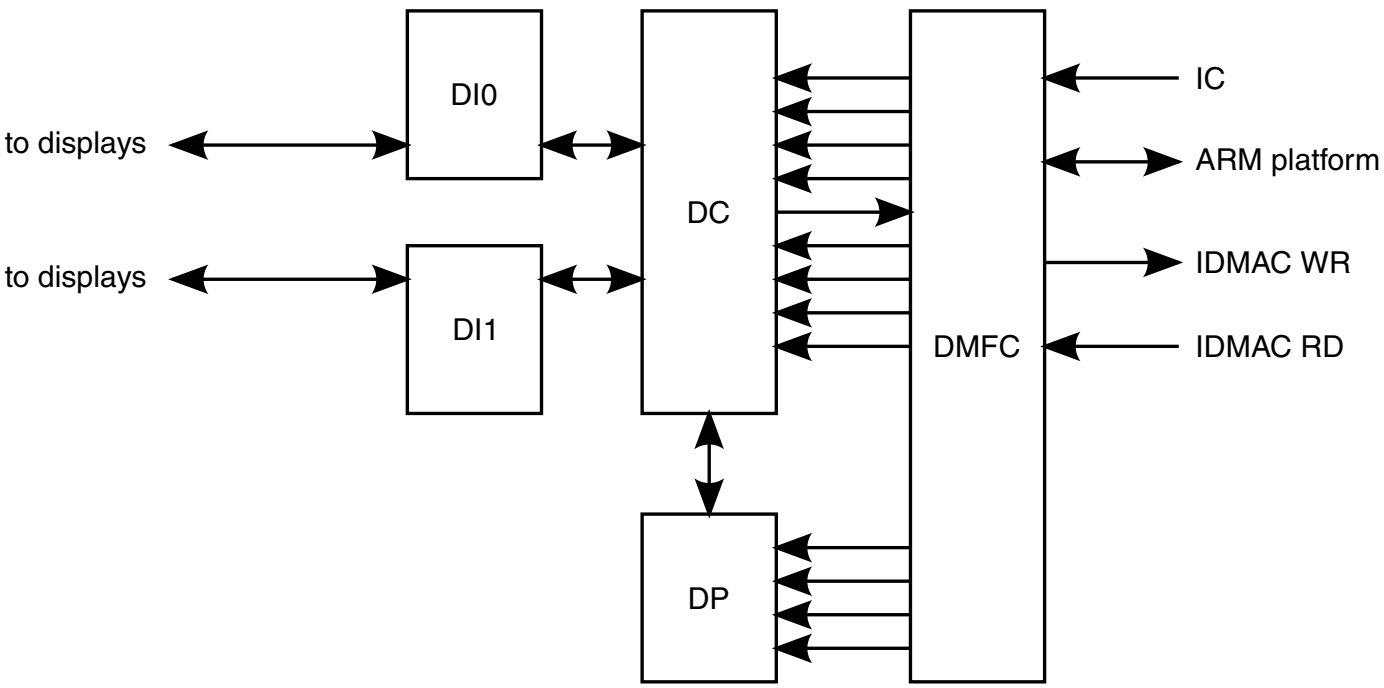

Figure 37-27. The display port

37.4.6.1 Display ports channels

The display port send data to the display over several channels. The data source may be the system's memory (via the IDMAC) the IC block and the ARM platform. The display port can read data from the display and send it to the ARM platform or IDMAC.

The data is routed over channels. The table below maps the IDMAC channels to DMFC, DC, DP channels and describes each channel.

Table 37-23. Display port channels

IDMAC's channel number	Display port's destination	DMFC channel number	DC channel number	Corresponding alpha channel	channel usage
21	DC	Programmable using dmfc_ic_in_port	Programmable using dmfc_ic_in_port	NA	This channel is coming from the IC module. When data is coming from the IC, the IC channel replaces one of the IDMAC's channels connected to the DMFC. When the IC_DMFC_SEL bit is set the output of the IC is routed to the DMFC. This channel can be routed to the DC channels 1,2,5B,5F,6B,6F. Routing this channel to the DC channel is done with the dmfc_ic_in_port bits. The DC's channel allocated to the IC channel can't be used for data coming from other source.
23	DP	5B	5	51	This channel is for the DP's primary flow. When a single plane is used, the data should be sent over this channel. When 2 planes are combined in this flow, the second plane should come on channel 27.
24	DP	6B	6	52	This channel is for the DP's secondary flow. When a single plane is used, the data should be sent over this channel. When 2 planes are combined in this flow, the second plane should come on channel 29.
27	DP	5F	5	31	This channel is for the DP's main flow. When a single plane is used, the data should be sent over channel 23 and this channel should not be used. When 2 planes are combined in this flow, one plane should come on channel 23 and the other plane on this channel.
28	DC	1	1	NA	This channel can serve sync and async flows. When channel 28 is connected to DI0, channel 23 must be connected to DI1 even if ch23 is not used. This is done by programming the PROG_DISP_ID_5 field
29	DP	6F	6	33	This channel is for the DP's secondary flow. When a single plane is used, the data should be sent over channel 24 and this channel should not be used. When 2 planes are combined in this flow, one plane should come on channel 24 and the other plane on this channel.
40	DC	0	0	NA	This is a read channel
41	DC	2	2	NA	This channel can serve only async flow
42	DC	1C		NA	Command stream. See Display port's restrictions
43	DC	2C		NA	Command stream. See Display port's restrictions
44	DC	3		NA	Mask channel. This mask channel can be associated with channel 23 or channel 28

37.4.6.2 Supported display interfaces

- The display port has 2 DI interfaces. Each interface can handle up to 3 displays.

- The total number of supported displays is 4.
- Each DI can handle up to 2 async interface - only one of them can be serial interface.
- Each DI can handle one synchronous interface. Asynchronous displays that are accessed in synchronous mode are considered synchronous interface.

37.4.6.2.1 Synchronous Interfaces

The DI supports the following synchronous display interfaces.

1. Synchronous generic interfaces to TFT dumb displays or RGB interfaces of smart displays.
2. Synchronous interfaces to Sharp displays.
3. Synchronous interfaces to TV encoders:
   - PAL
   - NTSC

   TV interfaces can operate in progressive or interlaced modes.
4. Synchronous interface to a graphic accelerator
5. BT.656
6. BT.1120

   BT.1120 and BT.655 support

   BT.1120 and BT.656 are supported. Only video data is supported, sending data during blanking intervals is not supported. The component size is always 8 bit.

37.4.6.2.2 Asynchronous Parallel Interfaces

The DI has a flexible asynchronous interface. The interface include 2 chip selects (CS) and 7 general purpose control signals.

The user can decide which of the 7 signals will be associated to each one of the asynchronous displays (up to 2 displays per DI). The using can configured some of the control signals to be shared by more than one display.

37.4.6.3 Display port's bandwidth

When the IPU clock (HSP_CLK) is equal to 264Mhz, the peak bandwidth supported by the display port is as follows

For on chip devices (like on chip MIPI-DPI bridge)

- 240 Mega-Accesses/Sec if the DI clock is derived from an external to IPU source (like another PLL)
- 264 Mega-Accesses/Sec if the DI clock is derived from the IPU clock (HSP_CLK)

For off chip devices (Like an external LCD)

- 170 Mega-Accesses/Sec if the DI clock is derived from an external to IPU source (like another PLL)
- 180 Mega-Accesses/Sec if the DI clock is derived from the IPU clock (HSP_CLK)

An access can be a pixel, component or generic data.

37.4.6.4 Display Dual Mode

This mode is useful for smart display with synchronous interface. The data is sent to the display only when the data has changed or when the display processor's settings are changed. The physical interface to this display has synchronous interface's characteristics.

37.4.6.5 Display Errors

There are a few types of errors that may impact the image sent to the display. The IPU provides some automatic mechanisms, which allow the system to overcome these errors.

37.4.6.5.1 Data starvation errors

These types of errors may happen for synchronous displays if the data is ready at the DI to be sent to the display at the time point it is required. This anomaly may happen if the system is very loaded and the IDMAC was not able to read data from the external memory and provide it to the DMFC.

Frame boundary errors

In case that a new frame should be sent to the display but the data of the previous frame was not sent completely, the IPU will reset the display modules and flush the internal buffers, as the IPU expects that the new frame indication will be triggered at least 2 lines (blanking interval) before the actual data is to be sent. The should recover and be ready with the data of the new frame within the blanking interval period.

Error within a frame

In case that a pixel was missed within a frame i.e. the pixel did not arrived to the DI on time. The IPU has 2 ways to handle the situation. The mode is selected by configuring the DI#_ERR_TREATMENT bit.

Redo the last access. The IPU will keep sending the last access to the display. The IPU will drop any pixel that arrive till the end of the line. If the data of the next line arrives correctly the IPU will continue working normally as overcame the problem. In case that the data of the next line is also incorrect the IPU will perform the same procedure as described on frame boundary errors.

Freeze the clock. In this mode, the IPU freezes the clock sent to the display till the correct data arrives. In order to avoid a case where the clock is frozen forever and the system is stuck: when the clock is frozen, a watchdog timer starts counting. When the timer completed counting the IPU will perform the same procedure as described on frame boundary errors. The number of cycles to be counted by the watchdog timer is defined according to the DI#_WATCHDOG_MODE bits.

37.4.6.5.2 Anti tearing errors

In case of anti tearing errors, the IPU indicates about the error by asserting the corresponding DC_TEARING_ERR_# bit.

See also Antitearing control.

37.4.6.6 Display port's restrictions

- In case where 2 synchronous flows are used and additional asynchronous flow via DP is used. The asynchronous flow via DP can be targeted to the same DI that the synchronous flow via DP is targeted.
- There are only 2 command channels (42 and 43). Command channels are associated with data channels (24,28,41).
  - When channel 28 is associated with a command, the command stream will come from channel 42
  - When channel 41 is associated with a command, the command stream will come from channel 43
  - Channel 24 can be associated with a command stream only if channel 28 or channel 41 do not use a command stream. If channel 28 is not associated with a command stream then channel 24 can be associated with channel 42. If channel 41 is not associated with a command stream and channel 28 is associated with a command stream then channel 24 can be associated with channel 43.

- A channel that uses an alternate flow, cannot be associated with a command stream (ch. 24 or ch. 41)
- In case of a synchronous display using external clock, The DI where the synchronous display is connected to can be connected to another async display. But, it can support only the write direction. Read via the asynchronous interface cannot be performed if this DI uses external clock

37.4.7 DC - Display Controller

IPU handles few display flows supporting few displays.

The IPU's flows' data sources can be the ARM platform, the system's memory, a camera or an external device connected on the display's port such as an external graphic accelerator.

The data's destination can be any device connected on one of the DI ports.

The DC controls the flows coming to and from the DI port. The DC manages the flows, decides which flows are currently active and when each flow is activated. The arbitrates between the active flows, gets the data from the predefined source and distribute it to the correct DI.

The DC's core is the microcode. The microcode contains a set of routine. A routine is built of a set of commands stored in the template's (microcode) memory. For each event (like new frame, end of frame etc.) a specific routine is executed. The user writes the routines and map them to a specific events. The routine contains instructions to the DC about the way of handling the data/address/commands associated with the display. The routine may contain information about the data's mapping, about waveform's characteristics, and more.

The figure below shows the micro architecture diagram for the DC block

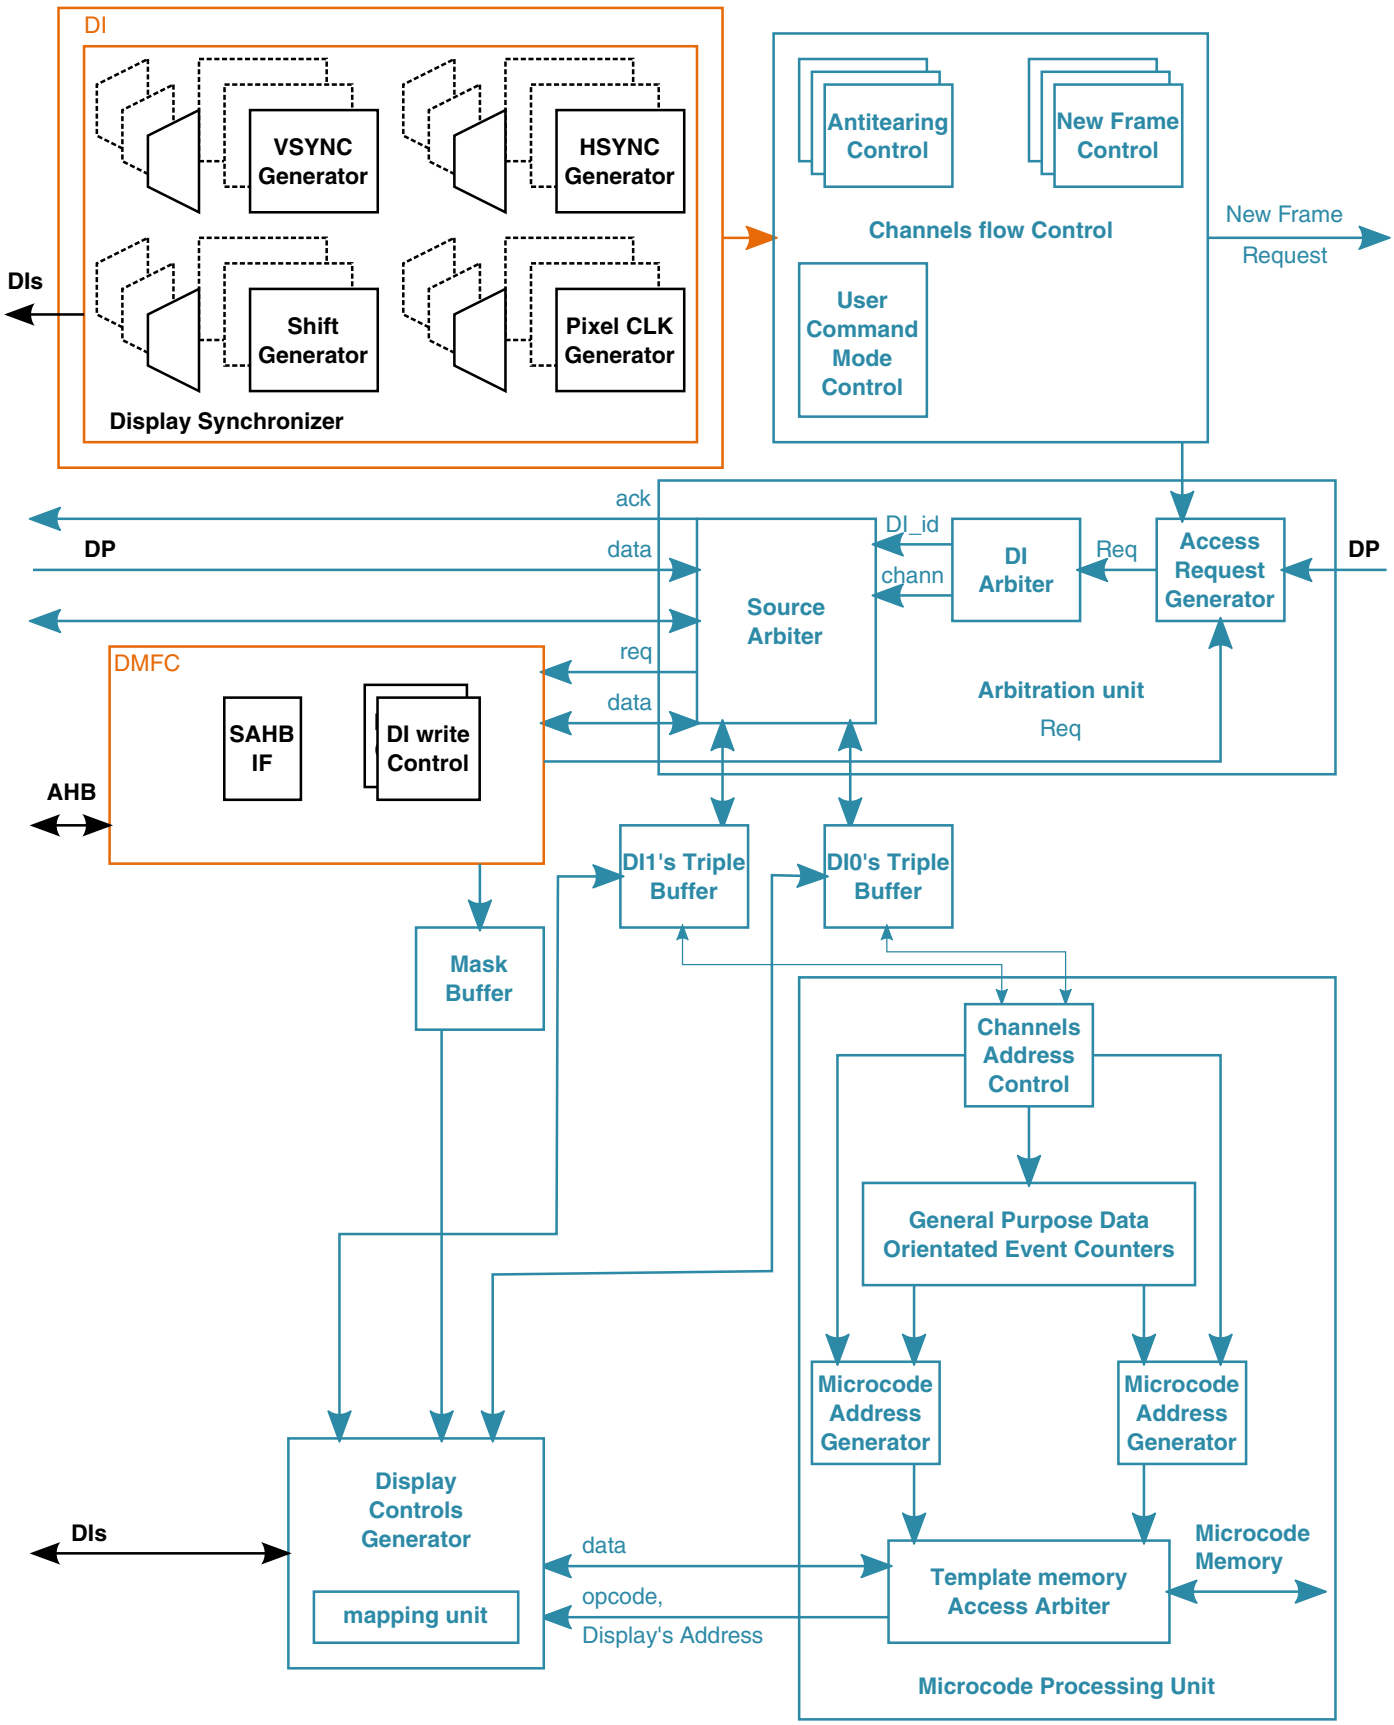

Figure 37-28. DC - Display Controller Block Diagram

37.4.7.1 Channels flow control

37.4.7.1.1 New Frame control

The channels flow control schedules the flows handled by the DC

For asynchronous flows the scheduling is done according to a request coming from the Frame Synchronization Unit (FSU) on the control sub-block (CM).

For synchronous flows the scheduling is done according to a trigger that is generated by a timer located on the one of the display's interface blocks (DI)

37.4.7.1.2 Antitearing control

Anti tearing mechanism uses a signal indicating on a display's refresh of a frame.

The supported tearing elimination triggers can be:

- An internally generated VSYNC signal
- A VSYNC signal generated by the display. The data source is the memory.
- A VSYNC signal coming from the CSI

The DC has the capability to avoid image tearing. For asynchronous flows where the source of the data is the system's memory or postprocessing, the DC monitors the position of a display's refresh pointer. Writing to the display is started only after crossing the window start point by the display refresh pointer. After that, writing to the display is allowed only when a write pointer does not advance beyond the refresh pointer. To provide anti-tearing mode, a window start time (in rows) must be defined in the PROG_START_TIME_1, PROG_START_TIME_2, PROG_START_TIME_5, PROG_START_TIME_6 registers for the corresponding channels.

The antitearing mechanism is limited to a case where only asynchronous flows are handle via the target DI.

In the case when tearing cannot be avoided (when the refresh rate is too high and the refresh pointer overtakes the write pointer after full refresh cycle), an error interrupt is generated. Tearing elimination mode can be disabled via the PROG_CHAN_TYP field for the corresponding channel.

37.4.7.1.3 User command mode control

A user may prepare in the system's memory a buffer that holds commends to be sent to the external device. The command buffer includes the same amount of lines as the data buffer. The line of commands are sent to the display line by line. A line of data is sent following each line of commands. This mode is activated by programming the PROG_CHAN_TYP of the corresponding channel.

The structure of the command is as follows:

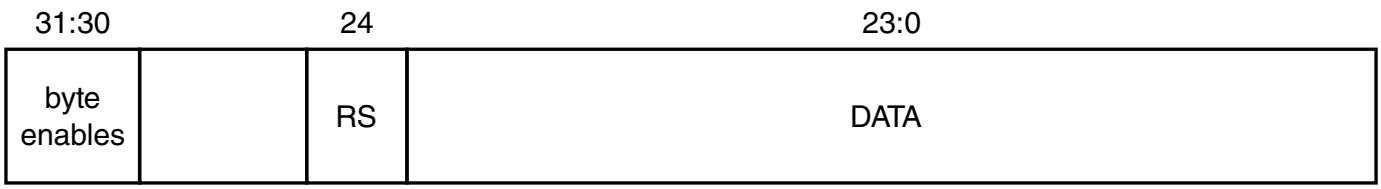

Figure 37-29. Structure of a command word

37.4.7.2 Arbitration Unit

This unit arbitrates the requests coming from the DMFC and from the DP and sends them to corresponding DI.

37.4.7.2.1 Access request generator

The requests coming from the DMFC or DP are sorted according to the target DI and then served according to a hard coded priority. The priority order is Sync flow, ARM platform access, IDMAC's Async flows.

37.4.7.2.2 DI arbiter

This units arbitrates between the DIs. The priority is hard coded. The priority order is Sync flow, ARM platform access, IDMAC's Async flows.

In case of 2 simultaneous requests to different DIs with the same priority the requests are served in a Round-Robin fashion. In case of 2 simultaneous Sync flow requests to different DI, the user can bypass the Round Robin mechanism and prioritize one DI on the other according to the SYNC_PRIORITY_1 & SYNC_PRIORITY_5 bits. Setting low priority to both of these channels is forbidden.

37.4.7.2.3 Source arbiter

Once the source of the request to be served was selected and the target DI was chosen, this unit routes the request and all the signals, associated with it, to the correct triple buffer and to the correct source of the data.

37.4.7.3 Microcode processing unit

The main control unit of the DC is the Microcode processing unit (MPU).

The data coming to the DC may be associated with some additional information like new frame, new line, new address etc. The information is processed in the MPU. The MPU executes the associated routine. The routine includes a set of instructions of the actions to be performed by the DC and DI.

37.4.7.3.1 Channels address control

This unit controls the display's address for each channel. This unit is responsible for defining the next address to be accessed (by incrementing or jumping). Stores special events flags (like EOF, EOL etc.). Based on the display's address and the special events, the type of the routines to be executed is defined.

37.4.7.3.2 General purpose Data oriented events counters

A user may define up to 4 general purpose events. The events are triggered by a standard event (NF, NL). The standard event restarts a counter, when the counter completes counting the user's general purpose event is asserted. This event activates a routine like any other events

37.4.7.3.3 Microcode address generator

This unit calculates the physical address of the template memory where the event associated routine resides. In addition, these unit arbitrates between simultaneous events and select the event to be served.

The arbitration is done according to a user defined priority. The priority of each event is set according to the #_CHAN_PRIORITY_CHAN_# bits of each channel. There are 2 modes of arbitration:

- Serving all the pending events according to the priority
- Serving only the highest priority event while ignoring all the other events

The arbitration mode is defined according to the CHAN_MASK_DEFAULT bit of each channel.

37.4.7.3.4 Template's Memory Access Arbiter

This unit gets memory access requests from the 2 microcode address generator units and arbitrates between them in a Round Robin fashion. In case that only one of the requests belongs to a synchronous flow, this request is selected.

37.4.7.4 DC's Template structure

The template memory contains 256 template words. Each template word is a 42 bits words. Accessing a template word require 2 accesses (32bit each).

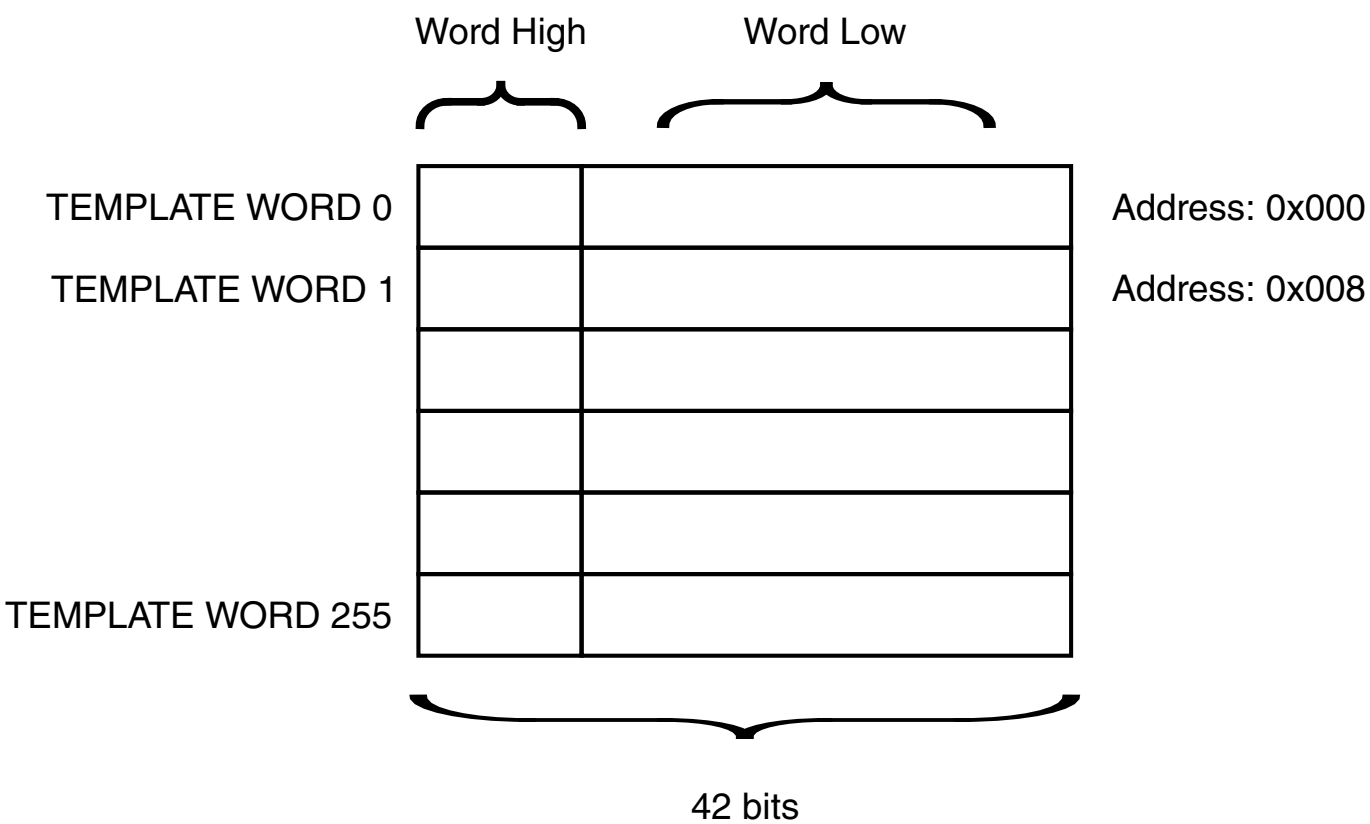

Figure 37-30. Template's structure

37.4.7.4.1 DC template's memory map

DC template's fields description

Table 37-25. DC template's fields description

Field	Description
STOP	Stop bit - This bit should be set in order to indicate that the current command is the last command of the routine
OPCODE	The command's code
OPERAND	The command's operand - for some of the commands this field can hold a parameter associated with the command
MAPPING	The MAPPING field holds a pointer to a register holding 3 fields: MAPPING_PNTR_BYTE0_X, MAPPING_PNTR_BYTE1_X, MAPPING_PNTR_BYTE2_X. This pointers point to sets of OFFSET and MASK parameters that define the mapping scheme. MAPPING = 0 means that mapping is disabled. The value in this field should be incremented by 1 to get the correct X pointer value In order to point to MAPPING_PNTR_BYTE2_0, MAPPING_PNTR_BYTE1_0, MAPPING_PNTR_BYTE0_0 the user should write 1 to the MAPPING field
WAVEFORM	For data oriented output pins. The IPU has 4 waveform generator units. The IPU holds 12 sets of waveforms' configuration registers called DI0_DW_GEN_<i> and DI1_DW_GEN_<i>

Table continues on the next page...

Table 37-25. DC template's fields description (continued)

Field	Description
	The WAVEFORM field defines which one of the 12 waveforms' configuration registers is used. The DI1_DW_GEN_X register holds a pointer to one of the 4 waveform generators units for each of the data oriented pins. 0 - The waveform of the data oriented output pins is not affected 1 -Points to DI0_DW_GEN_0 or DI1_DW_GEN_0 2 - Points to DI0_DW_GEN_1 or DI1_DW_GEN_1 ... 12 - Points to DI0_DW_GEN_11 or DI1_DW_GEN_11
GLUELOGIC	For signals generated by waveform generator #3; This field provides extra flexibility on the signals waveform
	GLUELOGIC[6] - This bit defines if we are in clock mode (1) or CS mode(0). 1- clock mode When the command is related to the display clock's pin then only if we are in clock mode, GLUELOGIC[5:4] are valid. 0- CS mode When the command is related to the CS pin then only if we are in CS mode, GLUELOGIC[3:0] are valid.
	GLUELOGIC[5:4] - clock mode settings 00 - Freeze the display clock following the execution of the current command 01 - Freeze the display clock before the execution of the next command to be executed 10 - Enable (unfreeze) the display clock following the execution of the current command 11 - Enable (unfreeze) the display clock before the execution of the next command to be executed
	GLUELOGIC[3] - CS mode settings 1 - Once the signal is asserted then it remains asserted (high or low according to the polarity) 0 - No impact on the waveform
	GLUELOGIC[2] - CS mode settings 1 - Once the signal is negated then it remains negated (high or low according to the polarity) 0 - No impact on the waveform
	GLUELOGIC[1] - CS mode settings 1- The current waveform can be attached to the previous waveform. If the previous waveform was asserted and the current waveform start asserted the two waveforms will be attached so the signals' waveforms will be consecutive. This impact the behavior of the previous waveform. This can be done only if GLUELOGIC[0] of the previous waveform is set to 1 0 - No impact on the waveform
	GLUELOGIC[0] - CS mode settings 1 - this bit allows the next waveform to be attached to the current waveform.
SYNC	The data associated with this command should be synchronized to the DI's one of gen_time_sync generators' output. 0000 - No sync. The data is sent without any synchronization to any event 0001 - Sync with unit #1 0010 - Sync with unit #2 ...

Table 37-25. DC template's fields description

Field	Description
	1010 - Sync with unit #10 1011 - 1111 Reserved

DC template's command description

The diagram below illustrates the command processing flow. The command is being fetched from the microcode memory. The Opcode is decoded. According to the decoding several controls are sent to the processing unit. In addition the processing unit gets the pixel's data and the display's address. The processed data/ address is stored in an internal register. There are 2 types of commands

HOLD - In this type of commands the data/address is stored in the register and not sent to the DI. The data/address is held in the register for further processing in the following commands.

WRITE - In this type of commands the data/address is stored in the register and also sent to the DI.

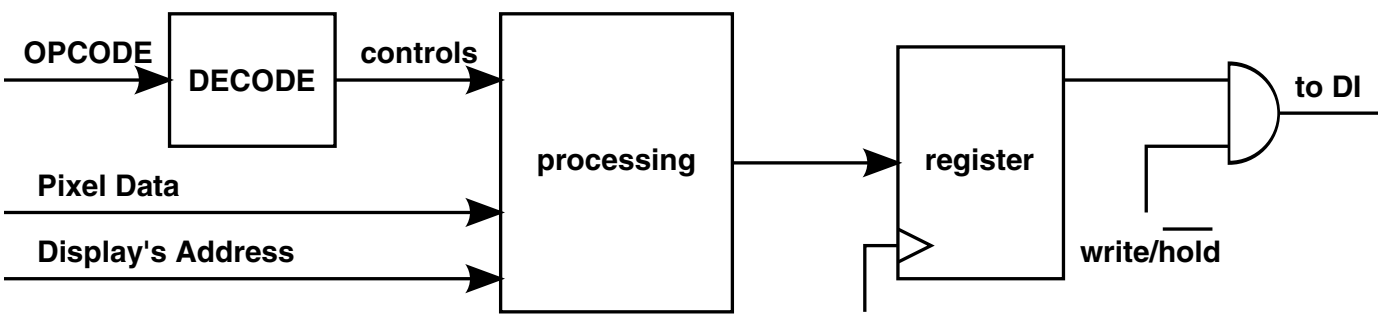

Figure 37-31. Opcode processing

The table below describes the DC's Commands.

Table 37-26. DC template's commands description

| Command | COMMAND[41:0] | | |

Table 37-26. DC template's commands description (continued)

Command	COMMAND[41:0]																																														
	41	40	39	38	37	36	35	34	33	32	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				
WRG	S	0	1	DATA																								WAVEFORM				GLUELOGIC							SYNC							
	Write 24bit word to the DI and Hold the word in register. DATA is a general purpose data to be written.																																														
	41	40	39	38	37	36	35	34	33	32	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

	HOLD_MICROCODE_ADDRESS - hold operand in special Microcode address register 0. This register is used to store a pointer in the microcode to be used by the BMA command ADDRESS is a microcode address in the microcode memory defined by the user.
	41 40 39 38 37 36 35 34 33 32 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
HMA1	S 0 0 0 1 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 ADDRESS 0 0 0 0 0
	HOLD_MICROCODE_ADDRESS - hold operand in special Microcode address register 1. This register is used to store a pointer in the microcode to be used by the BMA command ADDRESS is a microcode address in the microcode memory defined by the user.
	41 40 39 38 37 36 35 34 33 32 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
BMA	S 0 0 1 1 LF AF 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 N 0 0 SYNC
	BRANCH_MICROCODE_ADDRESS jump to Microcode address which is stored at an internal Microcode address register. The branch will be done to the ADDRESS stored with the HMA/HMA1 command. The BMA command manages the repeat cycles by one of the auto decrement counters (internal counters), the counter's id is defined by LF-bit (0/1) The N operand defines the N-number of routine's repetitions. In case of N=0. The BMA command functions as a JUMP command. As long as the internal counter didn't reached its predefined value, the microcode will branch to the pre defined address stored by the HMA/HMA1 commands. Selecting between HMA and HMA1 is done by the AF bit (it is calculated according to the "1 - AF" value). - That's the subroutine's microcode start address When the counter reached its predefined value, the microcode will branch to the pre defined address stored by the HMA/HMA1 commands. Selecting between HMA and HMA1 is done by the AF bit (it is calculated according to the "AF" value). - That's the subroutine's microcode return address BMA synchronization (SYNC field): The BMA command can be used for context switching between 2-channels. When switching between flows the user can run a routine for a new channel, which actually affects the previous flow. This feature is useful when a new flow breaks the current flow (post command for example): SYNC is used for display_id selection // 0 0 0 - current display // 0 0 1 - previous display // 1 0 0 - display 0 // 1 0 1 - display 1 // 1 1 0 - display 2 // 1 1 1 - display 3

37.4.7.5 Display controls' generator

This unit generates the control signals associated with the data that are sent to the DI block.

37.4.7.5.1 Bus Mapping Unit

The Bus Mapping Unit is responsible for programmable mapping of the input data and commands to the display interface format and vice versa. Address mapping is done by this unit as well (programmable via micro code).

The internal DI format for data and commands is a 24-bits word divided into three byte components (eight zeroes are added to MSB for 16-bits words from the DC). This word can be output or input in one, two, three or four cycles of the display clock.

The word coming from the memory is a 32bit word. The mapping operation is done on 24 bits only. The 24 bit are selected from the received 32 bit according to the W_SIZE_# field. The 24 bit input word is partitioned to a 3 bytes (3X8bits). Each byte can be mapped to any position at the 24bit output word. The exact position is set according to the MD_MASK & MD_OFFSET fields.

The MAPPING_PNTR_BYTE0_X, MAPPING_PNTR_BYTE1_X, MAPPING_PNTR_BYTE2_X fields holds the pointers for the MD_MASK & MD_OFFSET for each byte.

The MAPPING field holds a pointer to a register holding 3 fields: MAPPING_PNTR_BYTE0_X, MAPPING_PNTR_BYTE1_X, MAPPING_PNTR_BYTE2_X.

0 - no mapping i.e. 32 bits are sent as is.

1 - points to MAPPING_PNTR_BYTE0_0, MAPPING_PNTR_BYTE1_0, MAPPING_PNTR_BYTE2_0

2 - points to MAPPING_PNTR_BYTE0_1, MAPPING_PNTR_BYTE1_1, MAPPING_PNTR_BYTE2_1

...

30 - points to MAPPING_PNTR_BYTE0_29, MAPPING_PNTR_BYTE1_29, MAPPING_PNTR_BYTE2_29

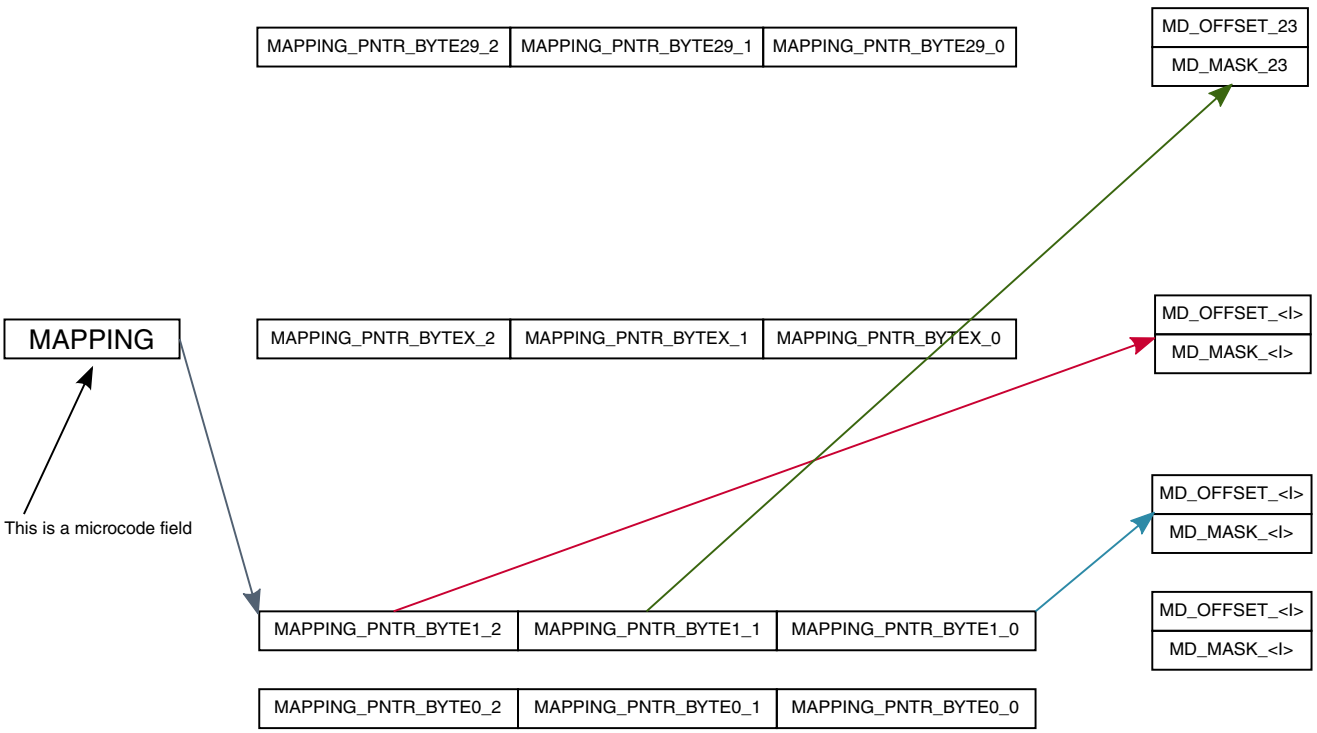

Figure 37-32. Mapping scheme

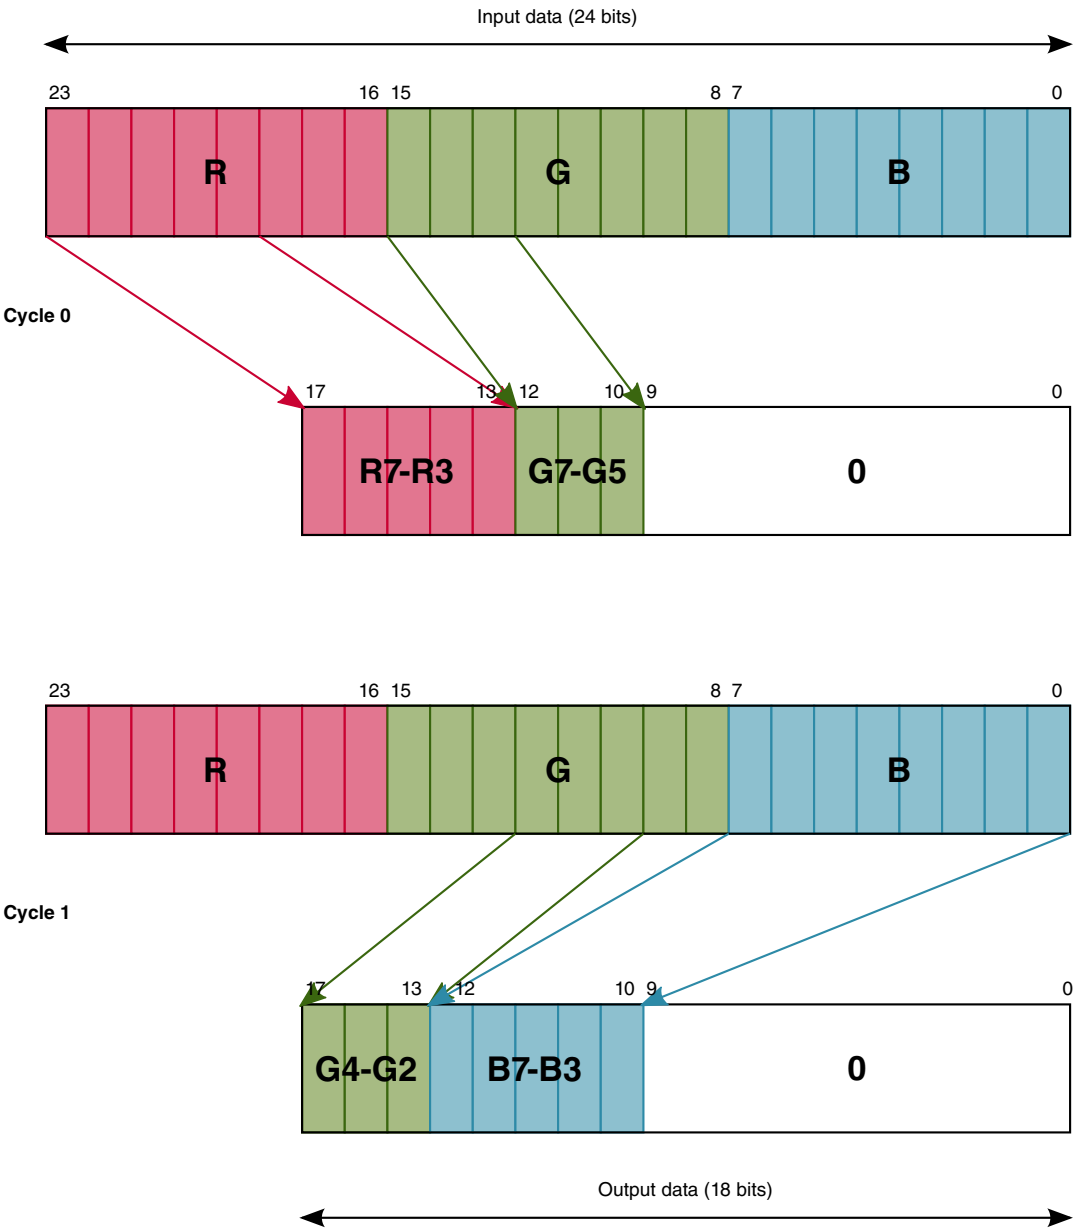
The mapping rule written in each of the Registers defines two types of parameters for the specific byte component and display:

1. Offsets of the byte component MSB relative to the output word LSB. Because the offsets can change dynamically, they are defined separately for the display clock cycles zero, one and two.
2. Numbers of the display clock cycles at which every bit of the byte component should be valid on the display bus. There are eight such 2-bit numbers in the Register.

Figure 37-33 presents an example of programming data packing for one of displays. Cycle 0 and Cycle1 in the diagram represent two separate atomic operations performed by the microcode template.



Cycle 0

MD_OFFSET_[R] - 0x11; MD_MASK_[R] - 0xF8

MD_OFFSET_[G] - 0xC; MD_MASK_[G] - 0xE0

MD_OFFSET[B] = 0x0; MD_MASK_[B] = 0x0

Cycle 1

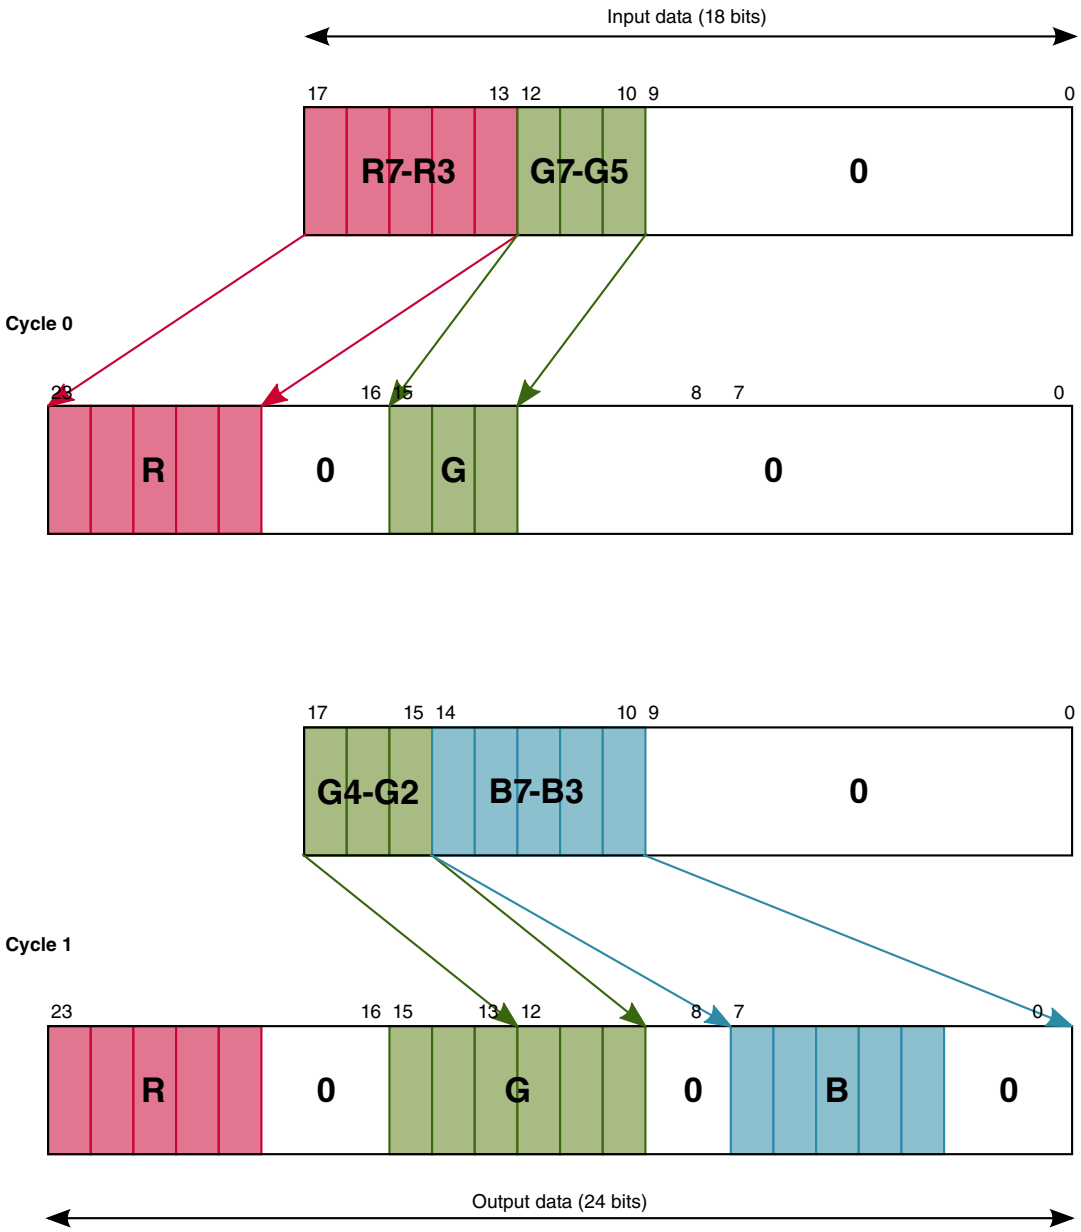
MD_OFFSET_[R] = 0x0; MD_MASK_[R] = 0x0

MD_OFFSET_[G] = 0x14; MD_MASK_[G] = 0x1C

MD_OFFSET_[B] = 0XE; MD_MASK_[B] = 0xF8

Figure 37-33. Example of Data Packing for Writing Data to the Display

The following figure presents an example of programming data packing for one of displays. Cycle 0 and Cycle1 in the diagram represent two separate atomic operations performed by the microcode template.



Cycle 0

MD_OFFSET_[R] - 0x11; MD_MASK_[R] - 0xF8

MD_OFFSET_[G] - 0xC; MD_MASK_[G] - 0xE0

MD_OFFSET[B] = 0x0; MD_MASK_[B] = 0x0

Cycle 1

MD_OFFSET_[R] = 0x0; MD_MASK_[R] = 0x0

MD_OFFSET_[G] = 0x14; MD_MASK_[G] = 0x1C

MD_OFFSET_[B] = 0XE; MD_MASK_[B] = 0xF8

Figure 37-34. Example of Data Unpacking for Reading Data from the Display

The same packing/unpacking registers are used for parallel and serial interface.

37.4.8 DMFC - Display Multi FIFO Controller

The following figure shows the block diagram for the DMFC block.

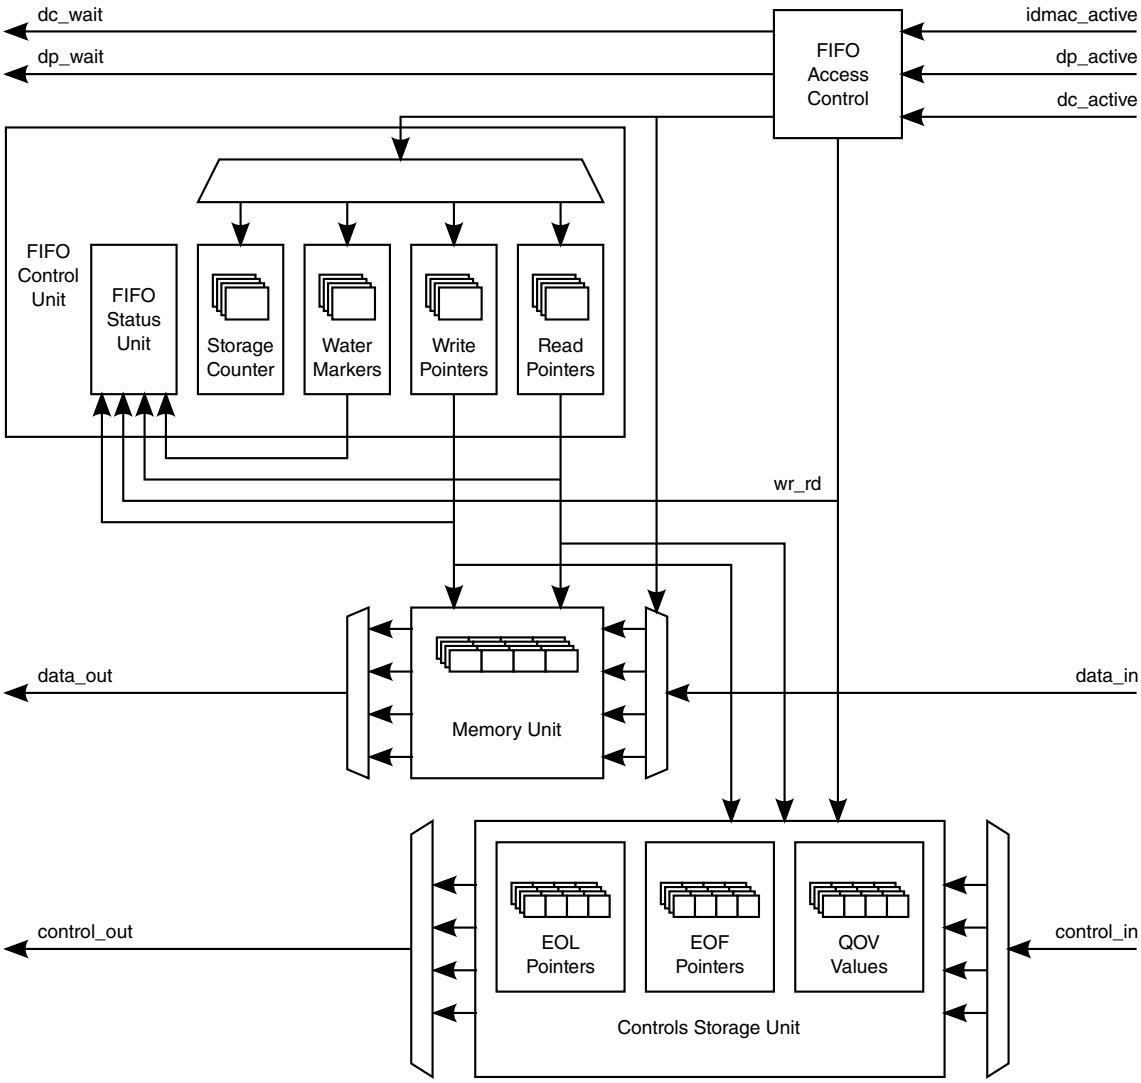


Figure 37-35. Display Multi Fifo Controller Block Diagram

The Display Multi Fifo Control manages Multi channels FIFOs. The DMFC serves the following clients:

- IDMAC - both read and write
- DP - read only
- DC - both read and write

- IC - write only
- AHB - both read and write

The DP and the DC read channels are physically attached to an IDMAC or an IC channel. As the IC has only one output channel connected to the DMFC. When the input is coming from the IC it replaces a channel that was physically attached to the IDMAC. The DMFC uses a single physical memory that serves the DP and DC read channels. The AHB accesses to the DC and the DC's write channel (read from display) use a separate physical memory.

The DMFC's write FIFO is built of 1024 entries of 128-bits each.

37.4.8.1 DP and DC read channels

Each one of the DP and the DC read (read from memory) channels is physically attached to an IDMAC read channel. A portion of the physical memory is allocated for each channel. The DMFC arbitrates between channels according to a predefined priority.

The DMFC controls each of the FIFOs

- Assert a request any time there's available place on the FIFO.
- Make sure that there's available place on the FIFO to accept the coming data.
- Optionally assert a watermark indication to avoid starvation

37.4.8.1.1 FIFO allocation to channels

The physical memory is partitioned to 8 segments. For each channel the user has to define the start address at a segment's boundary using the DMFC_ST_ADDR parameter.

The size of the FIFO allocated to a channel is defined by the DMFC_FIFO_SIZE parameter. The user must allocate the FIFO and avoid overlapping between FIFOs.

The DMFC hold few special indications like EOF, EOL, EOFILD. The most important one is end of line (EOL). If the size of the FIFO is shorter than or equal to the IDMAC line's length (FW) than no special restrictions on the DMFC usage.

If the size of the FIFO is greater than the IDMAC line's length (FW) than the user has to be aware to the following restriction for each channel.

The DMFC has two operation modes which are distinguished by the wait4eot bit. For each channel the DMFC can store a maximum number of EOL indication. The maximum number of EOL indications of EOL is given in the table below.

Table 37-27. DMFC's number of EOL indications

IDMAC's Channel	Maximum lines on the FIFO
23	Up to 3 lines
27	Up to 2 lines
28	Up to 2 lines
Other	Up to 1 line

If the use case is that the number of EOL indications cannot exceed the maximum number of EOL indications than the user should have the wait4eot cleared.

If the use case is that the number of EOL indication can exceed the maximum number of EOL indications than the user should have the wait4eot set.

Having the wait4eot bit set has performance impact as the DMFC analyzes the data prior to sending it to the destination. In addition the DMFC cannot utilize the entire FIFO allocated to this channel.

The user need to specify the burst size of the IDMAC by setting the DMFC_BURST_SIZE field. This field must match the IDMAC settings. In case that the IDMAC's burst size is not a power-of-2 number, the value of this field should be rounded up to the nearest power-of-2 number. The burst size must not be greater than the FIFO's size.

37.4.8.1.2 Arbitration between channels

The arbitration between channels is fully hardware controlled. IDMAC has the highest priority. Then the synchronous channels. Then the asynchronous channels.

37.4.8.1.3 Watermark

The DMFC can generate a water mark signal for each channel. The watermark signal is sent to the IDMAC and dynamically increases the channels priority on the IDMAC's arbitration.

The watermark feature is enabled by the DMFC_WM_EN bit. The FIFO is partitioned to bursts. The user can set the watermark level at a burst boundary.

The watermark signal is set when the number of bursts on the FIFO + the number of already requested burst is smaller than the value specified on DMFC_WM_SET bit.

The watermark signal is cleared when the number of bursts on the FIFO + the number of already requested burst is greater than the value specified on DMFC_WM_CLR bit.

DMFC_WM_SET must be smaller than DMFC_WM_CLR.

37.4.8.2 IC interface

One of the IDMAC channels can be replaced by a flow coming from the IC using the DMFC_IC_IN_PORT. The user has to provide the IC's setting to the DMFC by programming the DMFC_IC_FRAME_WIDTH_RD, DMFC_IC_FRAME_HEIGHT_RD and DMFC_IC_FRAME_PPW_C fields. The burst size of the channel coming from the IC should always be programmed to 4 words.

37.4.8.3 DC write channel and AHB accesses

The second physical memory of the DMFC serves the

- IDMAC write channel (read from display)
- 2 AHB channels that can be read or write

The IDMAC write channel is programmed using the DMFC_RD_CHAN register in a similar way to the DC and DP read channels described above. The user has to provide the frame width and height for this channel and the pixel per word parameter.

The AHB channels are used from accesses via the AHB port to the display. The accesses are distributed between channels according to the MCU_T parameter.

37.4.9 DP - Display Processor

The display processor processes the image prior to sending it to the display. The main task performed by the DP is combining between 2 planes.

The DP has 2 input FIFOs holding the data of full plane and the partial plane. In addition the DP performs some image enhancement functions like gamma correction, Color space conversion including Gamut mapping.

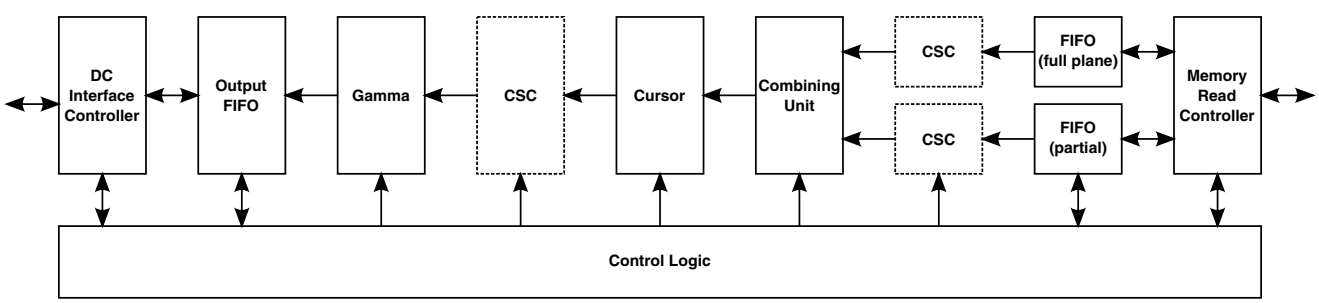

Figure 37-36. DP Micro architecture diagram

37.4.9.1 The DP programming model

The DP supports 3 flows. One sync flow and 2 Async flows. The DP holds 3 sets of registers. one set for each flow. Hence when referring to a register in this section the information is applicable to all the 3 sets. for example when referring to DP_COM_CONF, the information is applicable to DP_COM_CONF_SYNC, DP_COM_CONF_ASYNC0 and DP_COM_CONF_ASYNC1.

37.4.9.2 Displayed Planes

The following figure shows the planes displayed on a display.

There are full and partial planes. The partial plane's position is defined relatively to the upper left corner of the full plane (FGXP and FGYP parameters on the corresponding IPU_DP_FG_POS register). The size of the partial and full planes is defined on the corresponding IDMAC's channels' FW and FH parameters. The cursor position and parameters are set in the DP_CUR_POS register.

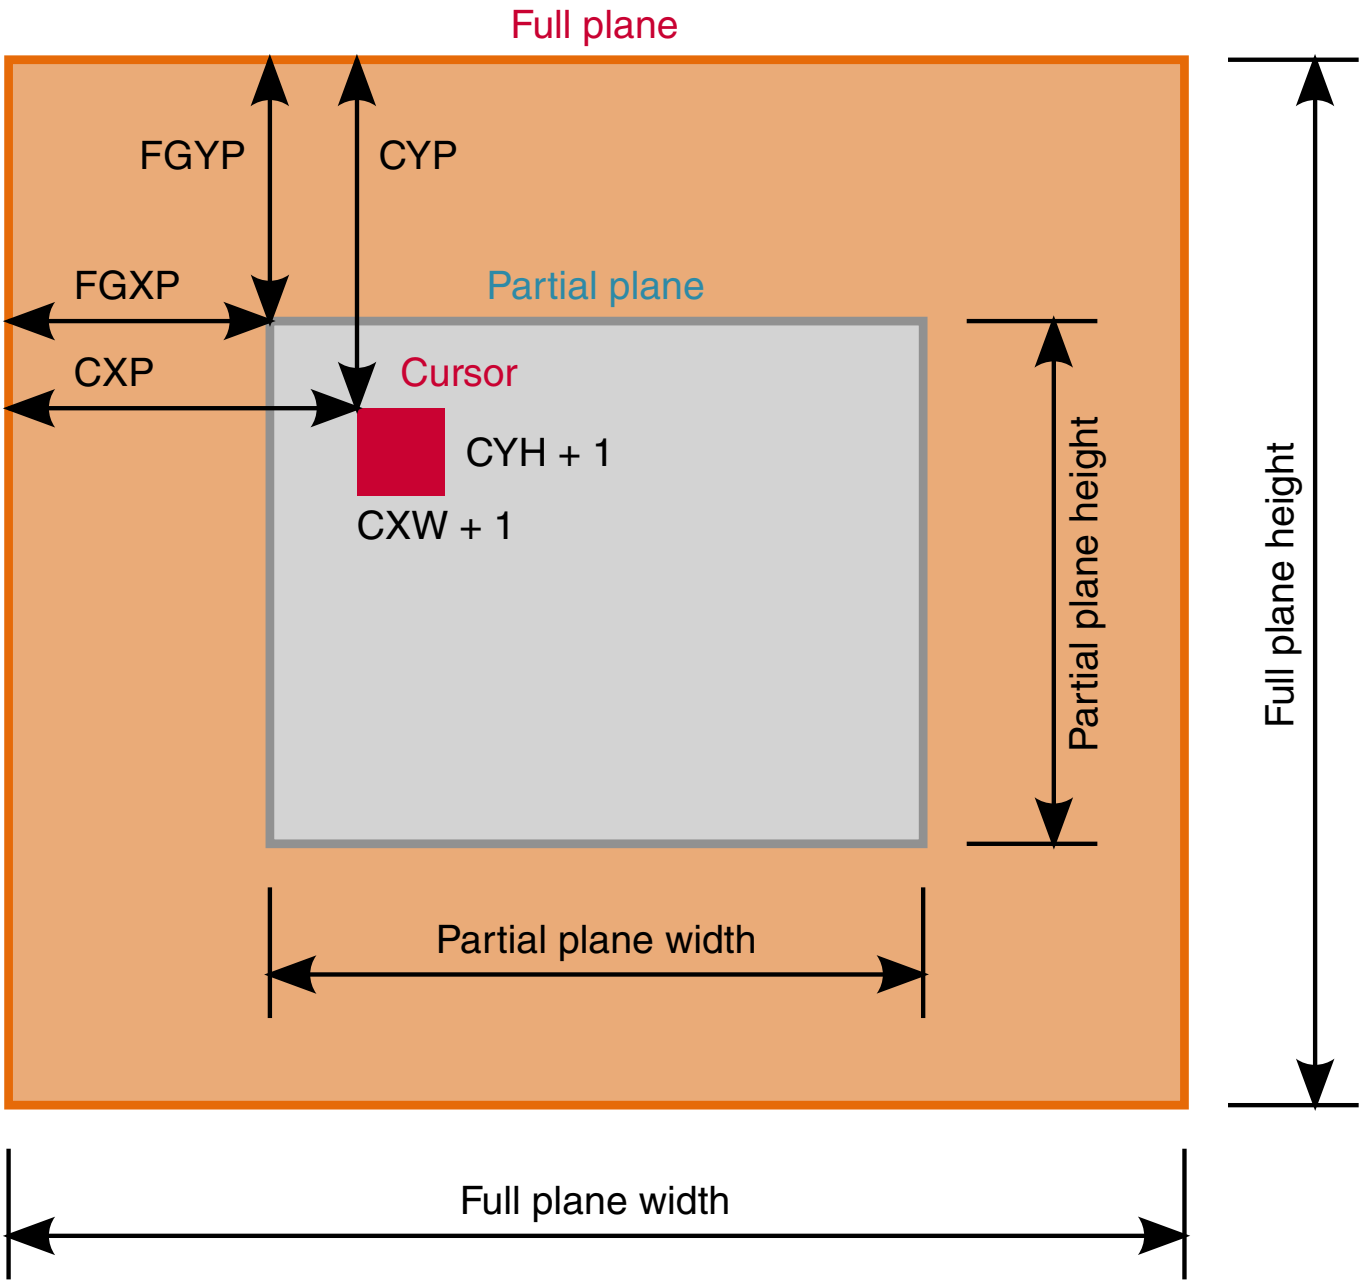

Figure 37-37. Displayed Planes

37.4.9.3 Combining Unit

The Combining Unit performs combining between the full and the partial planes. Each one of the planes may be graphics or video plane.

There are the following combining options:

- local alpha blending,
- global alpha blending,
- use of key color.
- order of the planes (full is presented over the partial plane and vice versa)

Combining mode is selected via the DP_COM_CONF Register. The combining equation is:

OP = BG*(1 - a) + FG*a

Where BG and FG are 2 input pixels; The DP_GWSEL bit defines if the BG is the pixel coming from the full plane or the partial plane.

a= (A+floor(A/128))/256 - an alpha value

A - a global or local transparency parameter.

The global A is written in the DP_GWAV field, the local A arrives together with the pixel.

A pixel becomes transparent when color keying is enabled and a pixel color matches a key color (independently on an alpha parameter). The color keying is defined on:DP_GWCKR, DP_GWCKG, DP_GWCKB

Combining takes 1 cycle per pixel. The Combining Unit outputs 24-bit words in the RGB/YUV format.

37.4.9.4 Cursor Generator

The Combining Unit output is passes through the Cursor Generator. The cursor's size and position are set via the DP_CUR_POS Register, a cursor color - via the DP_CUR_MAP Register. Different logic functions of combining the cursor with the image are supported as defined by the DP_COC field.

The cursor can be blinking. The blinking mechanism resides on the display controller sub-block. The blinking parameters are defined on the DC_BK_EN and DC_BKDVIV fields.

37.4.9.5 Color Space Conversion unit - CSC

The DP can get 2 input pixels from 2 different color spaces (YUV or RGB) and convert one of them to a common color space (YUV or RGB). In addition the 2 inputs can be of the same color space where the result is converted to another color space (YUV or RGB).

The DP has a single CSC unit that can be placed on one of 3 locations:

- At the output of one of the 2 input FIFOs
- At the output of the cursor generator.

Placing is done according to the DP_CSC_DEF field.

The color conversion implements a 3x3 matrix multiplication between the full RGB pixels and the color conversion constants, in order to obtain a YCC format image.

The conversion formula is:

x -> Clip(Round(S* 2^E)), S=Ax+B

where

A is a 3x3-dimensional matrix of weights, each a 10-bit signed number with 8 fractional digits

$$A = \begin{bmatrix} CSC_A0 & CSC_A1 & CSC_A2 \\ CSC_A3 & CSC_A4 & CSC_A5 \\ CSC_A6 & CSC_A7 & CSC_A8 \end{bmatrix}$$

B is a 3-dimensional vector of offsets, each a 14-bit signed number with 2 fractional digits

$$B = \begin{bmatrix} CSC_B0 & CSC_B1 & CSC_B2 \end{bmatrix}$$

S is a 3 dimensional vector of sums, each a 16-bit signed number with 4 fractional digits

S=Ax+B

E is an exponent, assuming one of the following values: -1,0,1,2 (allowing weights up to 8). The CSC_S parameters are encoded by 2 bits, please refer to the CSC_S parameter description.

$$E = [CSC_S0\ CSC_S1\ CSC_S2]$$

A more explicit formula:

S[i] = (sum(A[i][j]*In[j]) >> 4) + (B[i] << 2) + (1 << (3-E[i]))

Out[i] = Clip(S[i] >> 4-E[i])

Where Clip() performs clipping to the range 0..255 (either per-component clipping or more sophisticated clipping that preserves the hue of the pixel)

37.4.9.5.1 Gamut mapping

When the color transformation produces colors outside the allowed range, they must be mapped back. This is called gamut mapping. The DP supports 2 clipping algorithms. (controlled by GAMUT_SAT_EN bit)

Hue preserving clipping algorithm is suitable only for RGB components. For YUV components, the per-component clipping algorithm is used.

Per component Clipping

This mapping is performed by clipping each of the components independently to its allowed range of values (the final value being uint8):

•Y: to 0..255 or 16..235 according to the SAT_MODE bit

•U/V: to 0.255 or 16..240 according to the SAT_MODE bit

Hue Preserving Clipping

Hue Preserving clipping is done in the following way

•First stage - eliminating negative values

```
N = min(R,G,B)
if (N<0) X-> X-N, where X=R,G,B
```

•At this stage, all components are non-negative and the MSB's beyond d=11 bits are ignored (assumed 0).

•Second stage - eliminating large values

```
M = max(R,G,B) (d-bit integer)
if (M>255)
```

```
M' = M >> (m-7), where m=8..d-1 is the index of the most-significant non-zero
bit in M
D' = Ceil(256*255/M') = 256..510 (since M' = 128..255)
Ceil(x) = the smallest integer which is not smaller than x
Implemented by a hard-wired 128x9-bit LUT
X -> min(255, (X*D')>>(m+1)), where X=R,G,B (8x9 multiplier)
else
X -> X
```

37.4.9.6 Gamma correction

The DP includes a gamma correction function. It is approximated by the piece-wise polynomial:

gammar = GAMMA_C<i> + ((R[4:0] * GAMMA_S<i>) >> 4 + 1)>>1

Where R is the input red component, that's a 9 bit input composed pixel_in*2+pixel_in[7].

Single approximation slope is used for Gamma Correction of red, green and blue color components. However the Gamma Correction block instantiated three times since processing for color components should be done in parallel. The gamma transform is also available for changing the contrast of the luminance component only.

The required Gamma correction slope for a specific display should by provided by the display manufacture. This information can be provided in various forms, as graph or formula. The gamma correction input pixel level (Gin) should be normalized to a maximum of 383. The gamma correction output pixel level (Gout) should be normalized to a maximum of 255. Then a following data should be collected:

Table 37-28. Gamma correction values

Gin	Gout
0	Gout0
2	Gout1
4	Gout2
8	Gout3
16	Gout4
32	Gout5
64	Gout6
96	Gout7
128	Gout8
160	Gout9
192	Gout10
224	Gout11
256	Gout12

Table continues on the next page...

Table 37-28. Gamma correction values (continued)

Gin	Gout
288	Gout13
320	Gout14
352	Gout15

Based on the table above the values of DP_GAMMA_S_SYNC<i> and DP_GAMMA_C_SYNC<i> fields for gamma correction control registers are calculated as following:

Table 37-29. Gamma correction values

i	DP_GAMMA_C_SYNC<i>	DP_GAMMA_S_SYNC<i>
0	Gout0	16*(Gout1-Gout0)
1	2*Gout1-Gout2	16*(Gout2-Gout1)
2	2*Gout2-Gout3	8*(Gout3-Gout2)
3	2*Gout3-Gout4	4*(Gout4-Gout3)

15	Gout15	255-Gout15

37.4.9.7 DC interface

The DC interface unit performs 2 tasks.

- Starts the flow via the DP by getting a request from the DC and once the DP is ready send the new frame request to the IDMAC.
- Control the DP's output FIFO and send the data to the DC using an handshake mechanism.

37.4.9.8 DP's flows management

The DP can manage up to 3 flows: one synchronous flow and 2 asynchronous flows. However the DP can handle only one flow simultaneously. The DP has an automatic mechanism to control and switch between flows.

The DP's highest priority flow is the sync flow. An async flow can be executed during the blanking interval of the sync flow. An async flow can be stopped in order to serve the sync flow. The sync flow cannot be broken. The DP holds 3 sets of registers, one set for each flow. The registers are located in the SRM memory. According to the flow that needs to be executed the correct set of registers is loaded to the DP.

The figure below illustrates the flow management done by the DP.

A flow starts when a request from the DC arrives and the internal pipe is empty. For sync flows, the full frame NF (new frame) indication arrives immediately. In case that a partial frame is also used the NF indication will be sent one row before the row that the partial plane is actually positioned.

In case of ASYNC flow the DP first check if the previous async flow was broken. If yes, the DP restores the last settings of the previous flow. If this is a new async flow the DP will first reload the flow's parameters from the SRM. In case that a partial frame is also used the NF indication will be sent one row before the row that the partial plane is actually positioned.

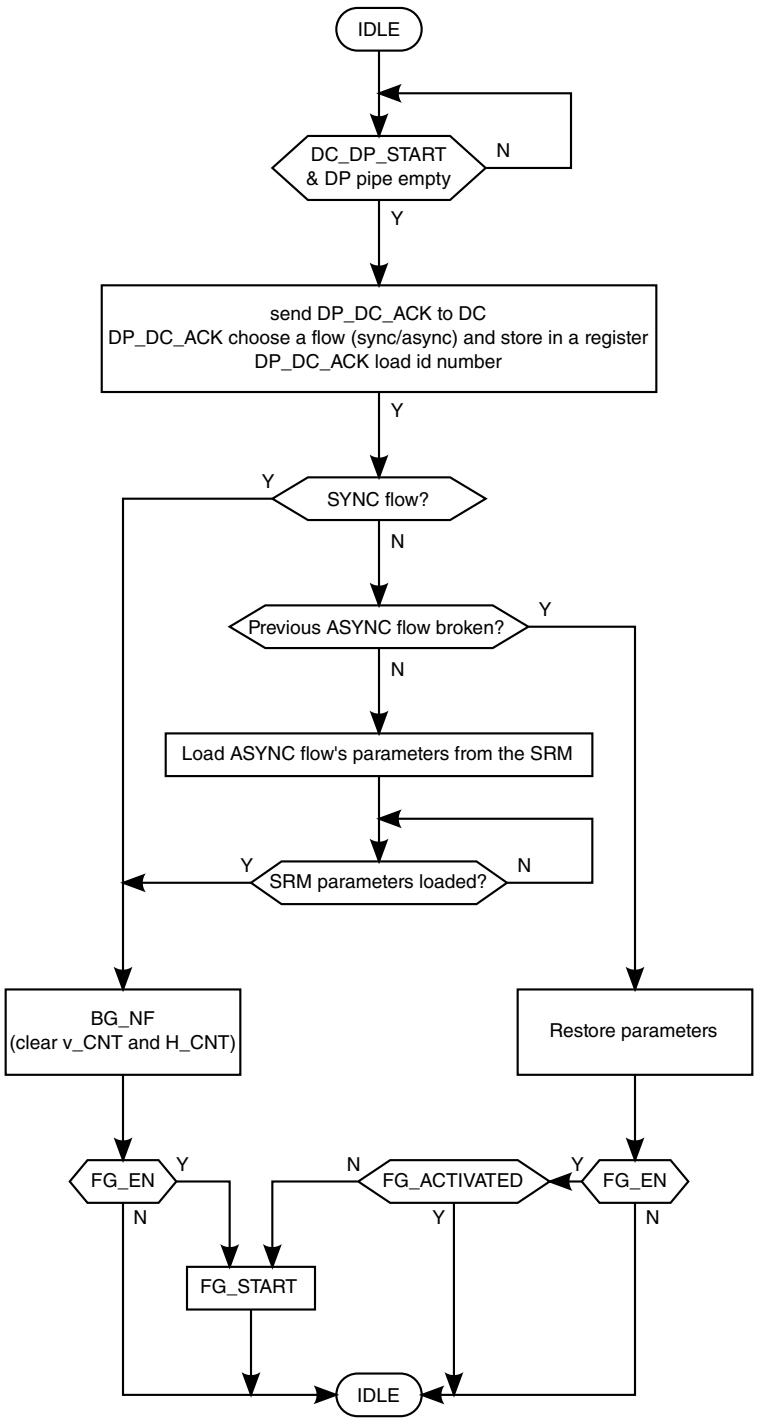

Figure 37-38. DP flow management chart

37.4.9.9 DP debug unit

The DP supports synchronous and asynchronous flows using the same hardware. The asynchronous flow can be broken by the synchronous flow. The DP's debug unit provides the ability to know on which row exactly the async flow has been broken. This is done by providing an interrupt (with DP_DEBUG_CNT register) and providing row status flags (on DP_DEBUG_STAT register).

As the async flow can broken multiple times within a specific frame The user can control the breaking point the issues the debug event by programming BRAKE_CNT field.

37.4.9.10 Restriction

When both full and partial planes are processed, the full plane's minimal frame width is 13 pixels.

The Minimum frame height supported by the DP is 2 lines.

37.4.10 Display Interface (DI)

The DI provides arbitrates access to up to three displays with time multiplexing. It converts a data from the DC or the ARM platform (low level access for serial interface only) to a format suitable for the specific display interface.

The DI generates display clocks and other display control signals with programmable timings. The DI outputs data to or inputs from parallel and/or serial interfaces.

This block generates all the control signals sent to the display. The DC sends to the DI; the data for the display and a set of control signals. The controls coming from the DC are used in order to generate the control signals sent to the display. One exception is serial low level access (LLA), where the DC is bypassed and the data is coming directly from the ARM platform. The figure below is the DI's block diagram.

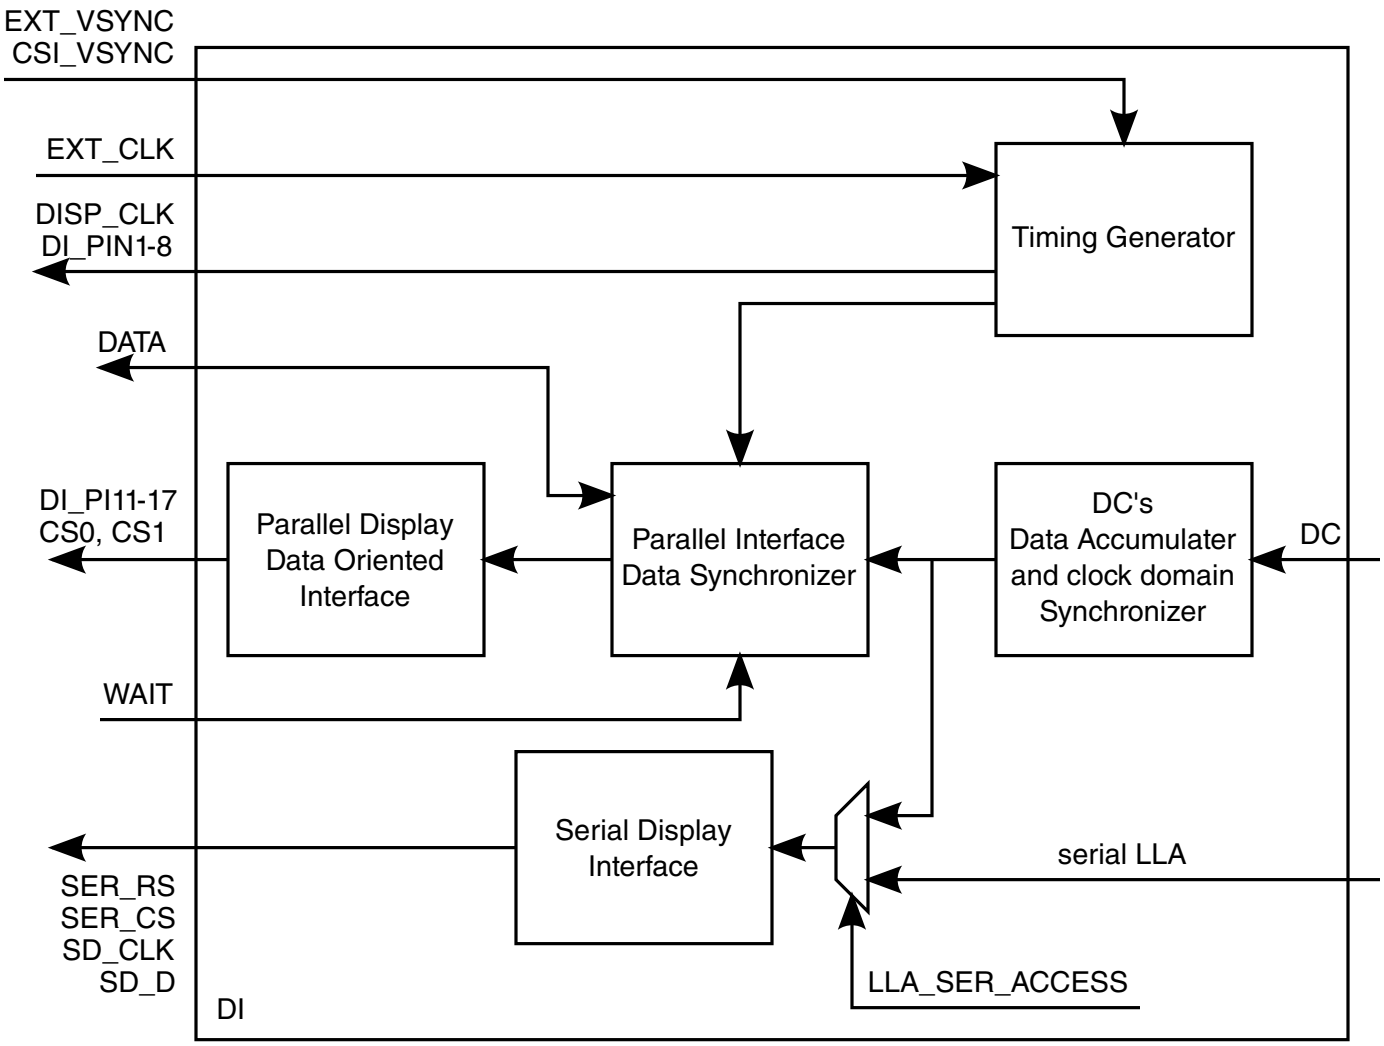

Figure 37-39. DI's block diagram

NOTE

The Serial Display Interface is not supported on this product.

The display interface includes 2 groups of control signals:

- Time oriented signals - These type of signals are generated according to the DI's internal timers. These are free running signals that change their state according to a pre-defined waveform. For example VSYNC, HSYNC, display's clock (pixel clock) etc.
- Data oriented signals - The DC may add markers to data sent to the DI. These markers are used to indicate a specific attribute of the data (for example: end-of-line, end-of-frame, chip-select etc.). The marker coming from the DC triggers a specific waveform of one or more signals on the display's interface. The specific waveform will be seen on the bus along with the associated data. The markers may be synced to

a time oriented signal. For example: attach the end-of-frame signal to the next VSYNC.

37.4.10.1 DC interface, data accumulator and clock domain synchronizer

The data accumulator is the DI's input buffer. It receives the data from the DC along with a set of control signals. The data accumulator receives the data from the DC's clock domain and synchronize it to the DI's clock domain.

37.4.10.2 Parallel interface data synchronizer and data oriented interface

The data accumulated in the DI's input buffer will be sent to the display according to the DI's internal events. Each event is generated by a counter. A tag is attached to each data by the DC's microcode using the SYNC field in the DC's microcode. The tag selects the event that the data will be synced to.

Once the corresponding event is generated, the data will be sent to the display. A data can be a pixel or a component (part of a pixel).The data synchronization occurs separately for each component. For asynchronous displays the tag will be equal to 0 i.e. the data is not synchronized to any event. The data will be sent out of the buffer immediately.

37.4.10.3 Timing generator

The timing generator is used for generating the waveforms' of each pin of the display's interface.

The timing generator is built of 10 counters. One counter functions as a time base This timer is called the BASE TIMER (BS). The other 9 counters are used in order to generate the control signals' waveforms. The last counter (counter #9) is special see Counter number 9.

The DI clock can be derived from IPU's clock (HSP_CLK) or from an external source (via the DIn_DISP_CLK - ipp_di_#_ext_clk pin). The clock's source is statically selected by configuring the DI#_CLK_EXT bit.

Figure 37-41 illustrates the main parameters of a waveform. A waveform's segment is built of 5 parameters. Each segment can be has 2 phase "ACTIVE PHASE" and "OFFSET PHASE".

- TIMEBASE - this is the base timer (fundamental timebase); all the other parameters are derived from this timer. The timebase is generated by counting DI clock cycles. The amount of cycles is defined according to DI#_DISP_CLK_PERIOD. This field defines the Display interface clock period, This parameter contains an integer part (bits 11:4) and a fractional part (bits 3:0). It defines a fractional division ratio of the Di's source clock for generation of the display's interface clock. The timebase is generated from edge aligned pulses of the DI clock. The user can delay the timebase starting point by defining an offset to the timebase. This is done by configuring the DI#_DISP_CLK_OFFSET field. The offset is calculated from the point where the DI is enabled to the point where the timebase starts ticking. The display clock waveform is generated between 2 edges of the timebase. The waveform is defined according to the DI#_DISP_CLK_UP and DI#_DISP_CLK_DOWN. Each pin has a specific timebase that is derived from the fundamental timebase. The following figure illustrates the relations between the TIMEBASE and the DI's clock

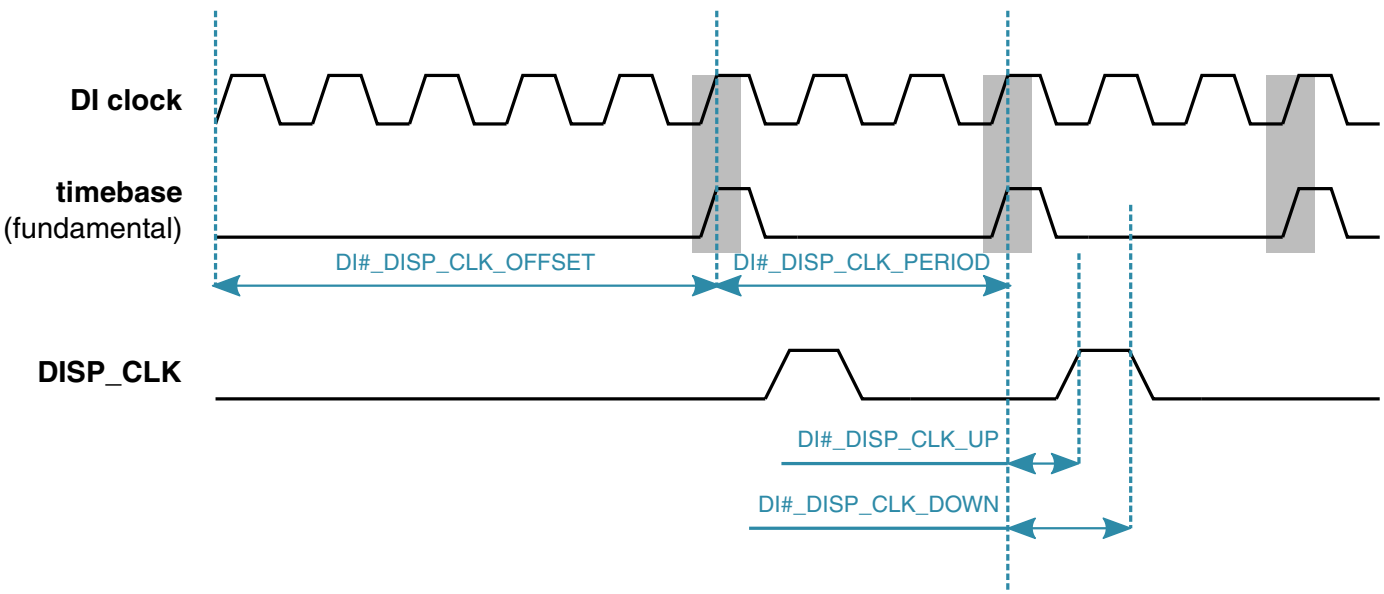

Figure 37-40. Timebase, DI's clock and display's clock relations

- OFFSET - this parameter defines when the length of the "OFFSET PHASE" it is defined by di#_offset_value_<N> field, where N is the counter's index.
- STEP - This parameter defines the length of the "ACTIVE PHASE"; it is defined by the di#_step_repeat_<N> field, where N is the counter's index. If the counter is in auto reload mode (di#_cnt_auto_reload_<N> bit is set) then the counter will be automatically reloaded forever. The value of di#_step_repeat_<N> is ignored in that case.

- RUN - The "ACTIVE PHASE" is partitioned to several "RUN sections"; this parameter defines the length of the "RUN section"; it is defined by the di#_run_value_m1_<N> field, where N is the counter's index.
- UP - Each "RUN section" contains the waveform of a single pulse. This parameter defines the offset from the beginning of the "RUN section" to the assertion of the signal; it is defined by the di#_cnt_up_<N> field, where N is the counter's index.
- DOWN - This parameter defines the offset from the beginning of the "RUN section" to the negation of the signal; it is defined by the di#_cnt_down_<N> field, where N is the counter's index. In case where DOWN < UP the waveform will have a 50% duty cycle.

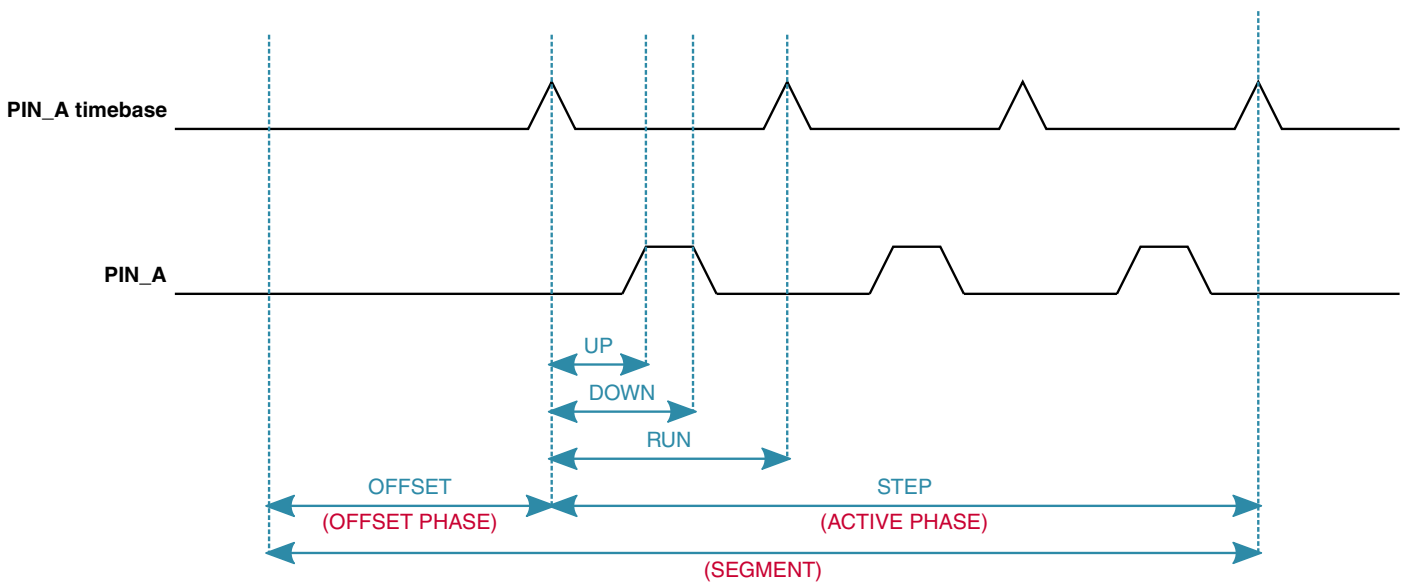

Figure 37-41. DI waveform's main parameters

37.4.10.3.1 Waveform concatenation

The DI provides the ability to derive the waveform from the fundamental timebase or from another PIN. In that case, one pin's waveform is used as another pin's timebase.

The following figure provides an example. PIN_A and PIN_C are derived from the fundamental timebase. However, PIN_B is derived from PIN_A's wavefore. The trigger is selected by DI#_RUN_RESOLUTION_<N>, where <N> is the index of the counter. A counter can be triggered by a counter with lowered index. For example: counter #5 can be triggered by counter #3 but can't be triggered by counter #7.

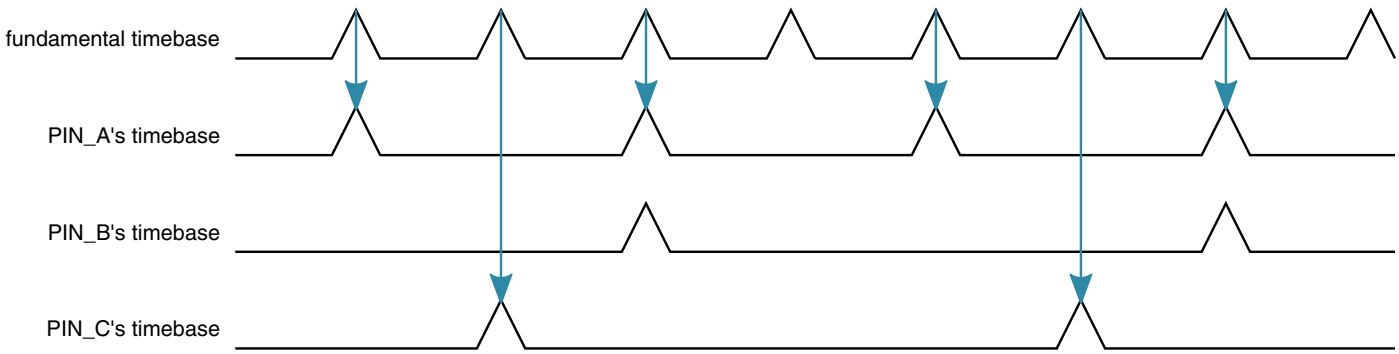

Figure 37-42. DI pins - Waveform's time bases concatenation

37.4.10.3.2 The basic counter

The DI has 9 counters. A counter is built of 3 units: timebase generator, waveform generator and polarity generator.

Figure 37-43 illustrates the counter's structure.

The timebase generator

The timebase generator gets 3 triggers. Clear, offset and run trigger. The Clear is the trigger that resets the counter. It is selected by programming the DI#_CNT_CLR_SEL_<N>.

The Offset trigger is the trigger used for counting the OFFSET_PHASE. The user can select the source of the trigger by programming the DI#_OFFSET_RESOLUTION_<N>. The offset's value is defined by programming the DI#_OFFSET_VALUE_<N>

The RUN trigger is the trigger used for counting the RUN period. The user can select the source of the trigger by programming the DI#_RUN_RESOLUTION_<N>. The RUN's value is defined by programming the DI#_RUN_VALUE_<N>

The timebase generator counts according to the DI_CLK or according to another counter's output. In order to use a source different than DI_CLK, the user should set the POLARITY_GEN_EN bits to 01.

Waveform generator

This unit generates the waveform. It gets the values of RUN, UP, DOWN and STEP and build the waveform accordingly. The waveform is counted according to the signal generated by the timebase generator.

Polarity generator

The waveform's polarity is controlled by 2 units. The static polarity is changed according to the POLARITY_<#> bit of each pin. This bit defines if the waveform of the pin is active high or active low.

The other unit controlling the polarity is the polarity generator. This unit is enabled by setting the POLARITY_GEN_EN[1] to 1. The polarity generator has 2 modes: "toggle mode" and "normal polarity mode". The mode is defined according to POLARITY_GEN_EN[0].

- Normal polarity mode - In this mode the polarity is changed according to 2 other counters. The counter selected by POLARITY_TRIGGER_SEL define the sampling point. The counter selected by POLARITY_CLR_SEL defines the polarity value. At the sampling point the polarity value is defined. The current polarity value defines the current polarity of the waveform.
- Toggle mode - In this mode, the output of the timebase generator's output causes the polarity to toggle. Any tick of the timebase generator inverts the polarity. When this mode is enabled the ticks generated by the counter selected by POLARITY_TRIGGER_SEL initialize the polarity generator and the timebase generator causes the polarity to toggle.

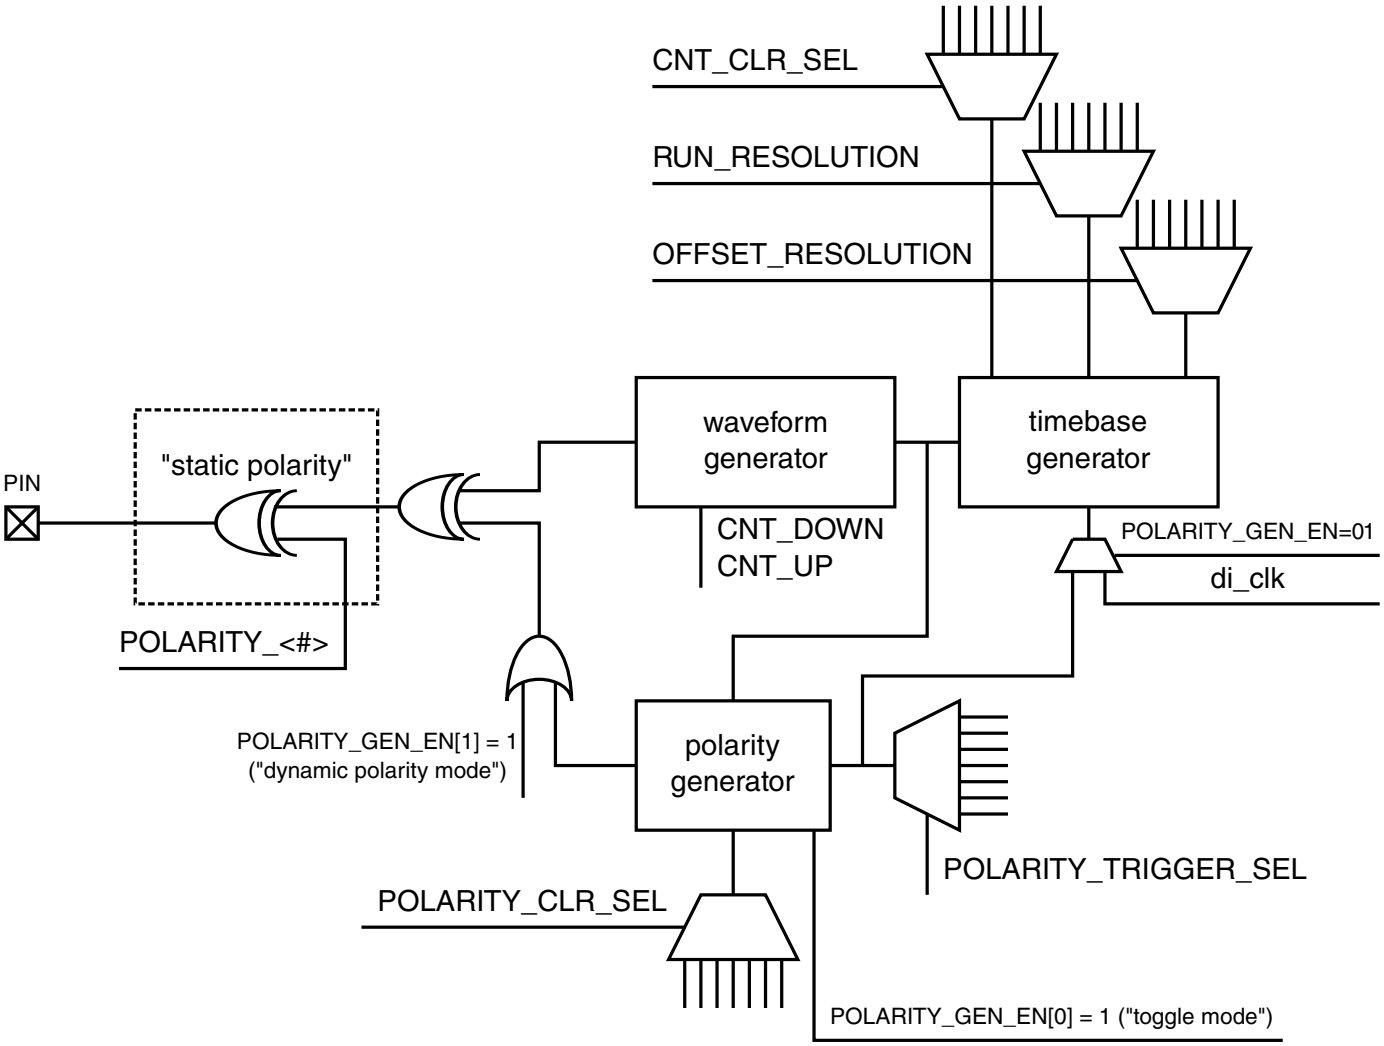

Figure 37-43. DI's counter's structure

The following figure provides an example for waveform generation using different trigger sources. The waveform is generated for PIN_D. PIN_D counter is cleared by the PIN_C's timebase. The offset period is calculated by counting cycles of PIN_B's timebase. The RUN period is calculated by counting cycles of PIN_A's timebase. The UP and DOWN periods of the waveform are calculated by counting cycles of PIN_D's timebase.

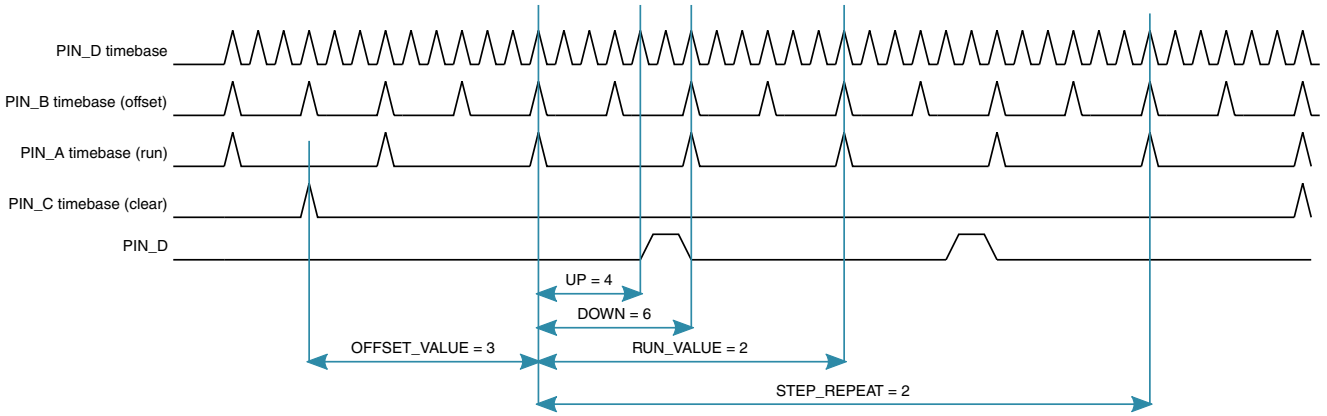

Figure 37-44. Clear, offset and run triggers and values - Example

37.4.10.3.3 Counter number 9

The last counter (counter #9) is an auxiliary counter and it is not used for generating a waveform for a specific pin. It can be used in order to attach another waveform to an existing one.

The user define the waveform for a specific pin (main pin). The user defines the auxiliary waveform using counter #9. The 2 waveforms are logically ORed. The combined waveform will be routed to the main pin. The main waveform that this counter is attached to is defined according to DI#_GENTIME_SEL_9.

The tag of counter #9 can be generated from counter #9 or from the main waveform. This is selected according to the DI#_TAG_SEL_9.

37.4.10.3.4 DI's active window

The DI provides an alternative way to define the synchronous display setting by using an active window and thus, needs to program less counters. The synchronous display's active window is a rectangle on the display where IPU sends data. It is set by programming the parameters defined on DI#_AW0 and DI#_AW1 registers.

The following figure illustrates the different parameters defining the active window. The display's vertical and horizontal position are defined according to counters. The DI#_AW_HCOUNT_SEL selects the counter which the horizontal position is calculated according to. DI#_AW_VCOUNT_SEL selects the counter which the vertical position is calculated according to. The Active data is sent according to a trigger. DI#_AW_TRIG_SEL selects the counter which calculates this trigger. This trigger usually functions as a data enable signal.

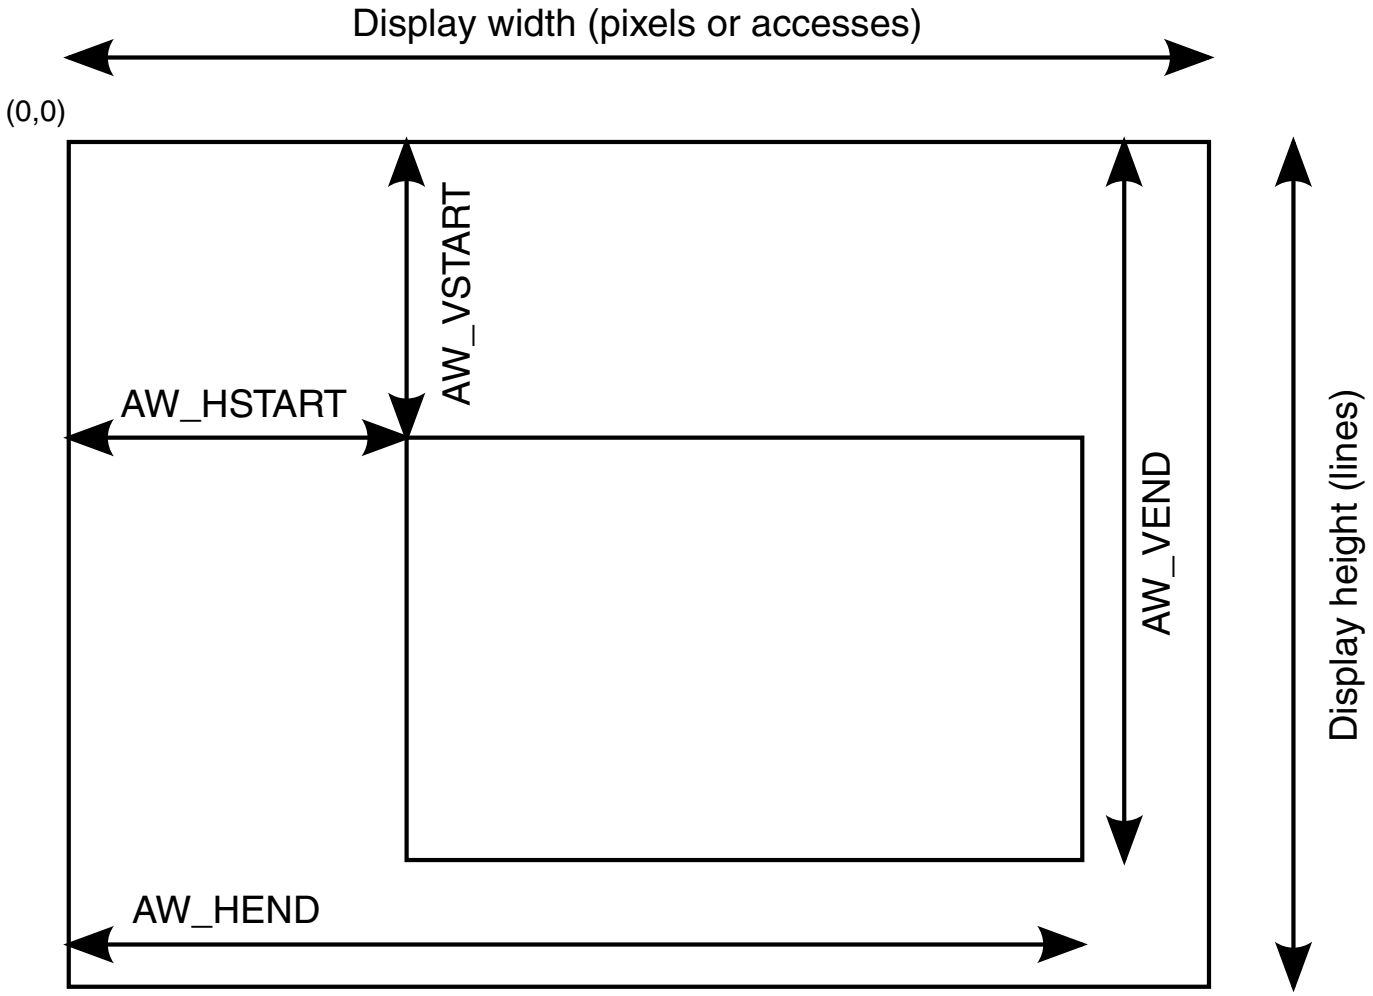

Figure 37-45. DI's Active Window

37.4.10.4 Waveform settings for asynchronous interface pins

The DI provides 8 signals that are used for asynchronous interface. These signals are PIN11 through PIN17 (ipp_di_#_pin_11 through ipp_di_0_pin_17) and the CS (ipp_di_0_do_dispb_d0_cs).

The DI holds 12 wave set quartets. Each quartet includes 4 registers (DI#_DW_SET<j>_<i>). Each DW_SET register holds the UP and DOWN values of the waveform. The DW_SET register is selected in the following way. The WAVEFORM field in the DC template is a pointer that points to one of the 12 quartets. In addition the WAVEFORM field points to one of 12 DI#_DW_GEN_<i> registers. The DI#_DW_GEN_<i> holds 9 pointers. The pointers are 2 bits field that points to one of the registers from the DI#_DW_SET<j>_<i> quartet. Each one of the 8 pointers in the

DI#_DW_GEN_<i> registers is related to a specific pin of the DI's asynchronous interface. The following figure illustrates the relations between the registers controlling the asynchronous interface's signals.

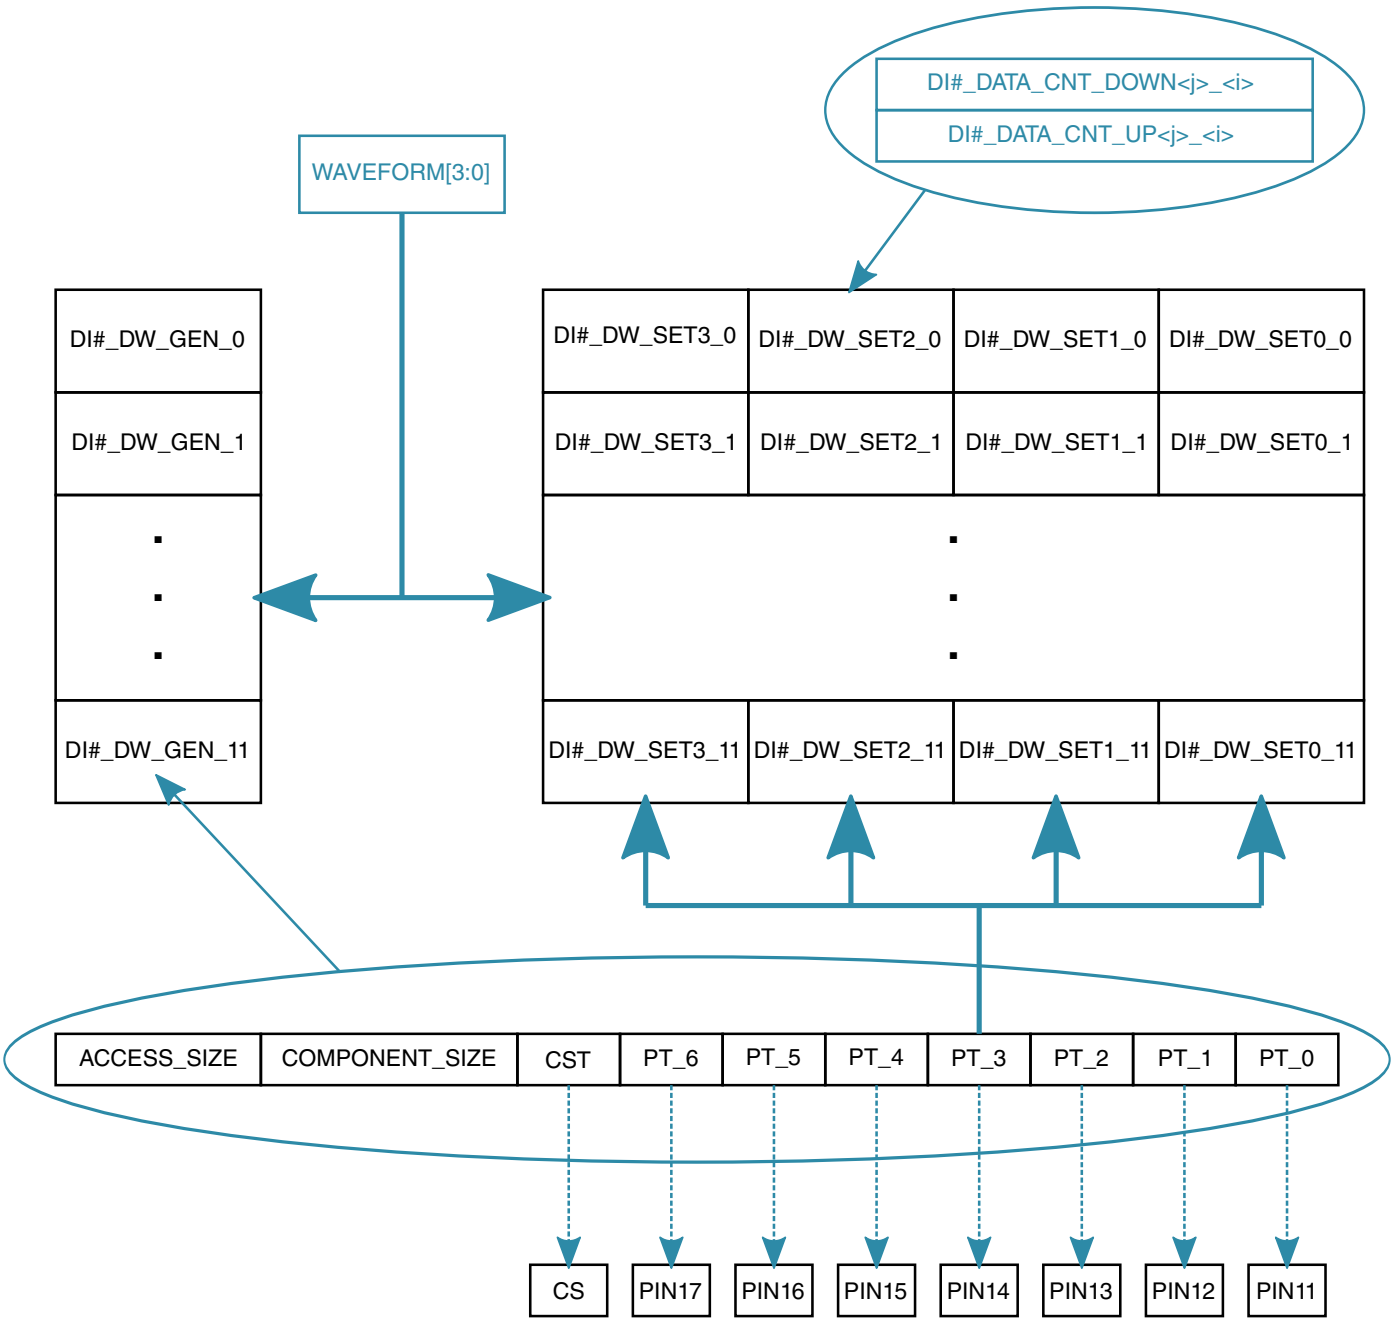

Figure 37-46. Waveform settings for asynchronous interface pins - parallel interface

The DI#_DW_GEN_<i> register includes the data's waveform settings as well. ACCESS_SIZE defines the amount of DI clock cycles that a pixel is valid on the bus. When generic data is sent, this field defines the amount of cycles that the generic data is

valid on the bus. A pixel may be broken into few components. The COMPONNENT_SIZE field defines the amount of cycles that each component is valid on the bus.

The COMPONNENT_SIZE is always smaller or equal to ACCESS_SIZE. For synchronous interface COMPONNENT_SIZE is always equal to ACCESS_SIZE. In case that there's a need for some gap between one type of accesses to another having the COMPONNENT_SIZE smaller than ACCESS_SIZE can be useful (for example read after write accesses that require some gap between them).

37.4.10.5 Low Level Access - LLA

LLA is a ARM platform direct access to the display. For parallel displays the DI's behavior for LLA is the same as any other access to a parallel display. For serial displays the DI allows a DI arbitration bypass. This is done if the DI#_LLA_SER_ACCESS bit is set.

In that case there is a direct access from the DMFC to the DI which bypasses the DC allowing simultaneous access to both serial and parallel interfaces. When DI#_LLA_SER_ACCESS bit is set, the user must not do any other kind of accesses to the serial interface except LLA. When DI#_LLA_SER_ACCESS bit is set the corresponding DI#_WAIT4SERIAL must be clear.

37.4.10.6 Using a mask channel

The IPU is able to provide the windowing function on displays that have data enable control. This is achieved by masking of some screen regions according to a 1-bit/pixel mask read from the memory via IDMAC through channel #44.

When the mask value is zero, the pixel is not displayed. This feature can be used for dual-port smart displays.

37.4.11 Video De Interlacing or Combining Block (VDIC)

The Video De-Interlacer as well as the Combiner have two operation modes:

- De-interlacing: converts an interlaced video stream to progressive order.
- Combining: combines two video/graphics planes and a background color.

The Video De-interlace block (VDIC) deinterlaces standard interlaced video to produce progressive video, that is used for upsizing to HD formats or for display on progressive displays. For VDIC operation three fields are necessary F(n-1),F(n),F(n+1). The F(n-1) field arrived through CSI interface in real time mode or through channel 1 and then stored in FIFO1. The F(n) arrived through channel 2. At least three lines of F(n) are stored in Line Store memory. The F(n+1) arrived through channel 3 and stored in FIFO3. FIFO controllers read data from FIFOs and then data aligned in pixels buffers. From the buffers the data arrived to Line Padding Controller (LPC). The LPC padding missing line at the beginning and end of the frame. The DeInterlacing sub-block (DI) perform the processing. Then data send to IC sub-block for processing or for transferring to external memory.

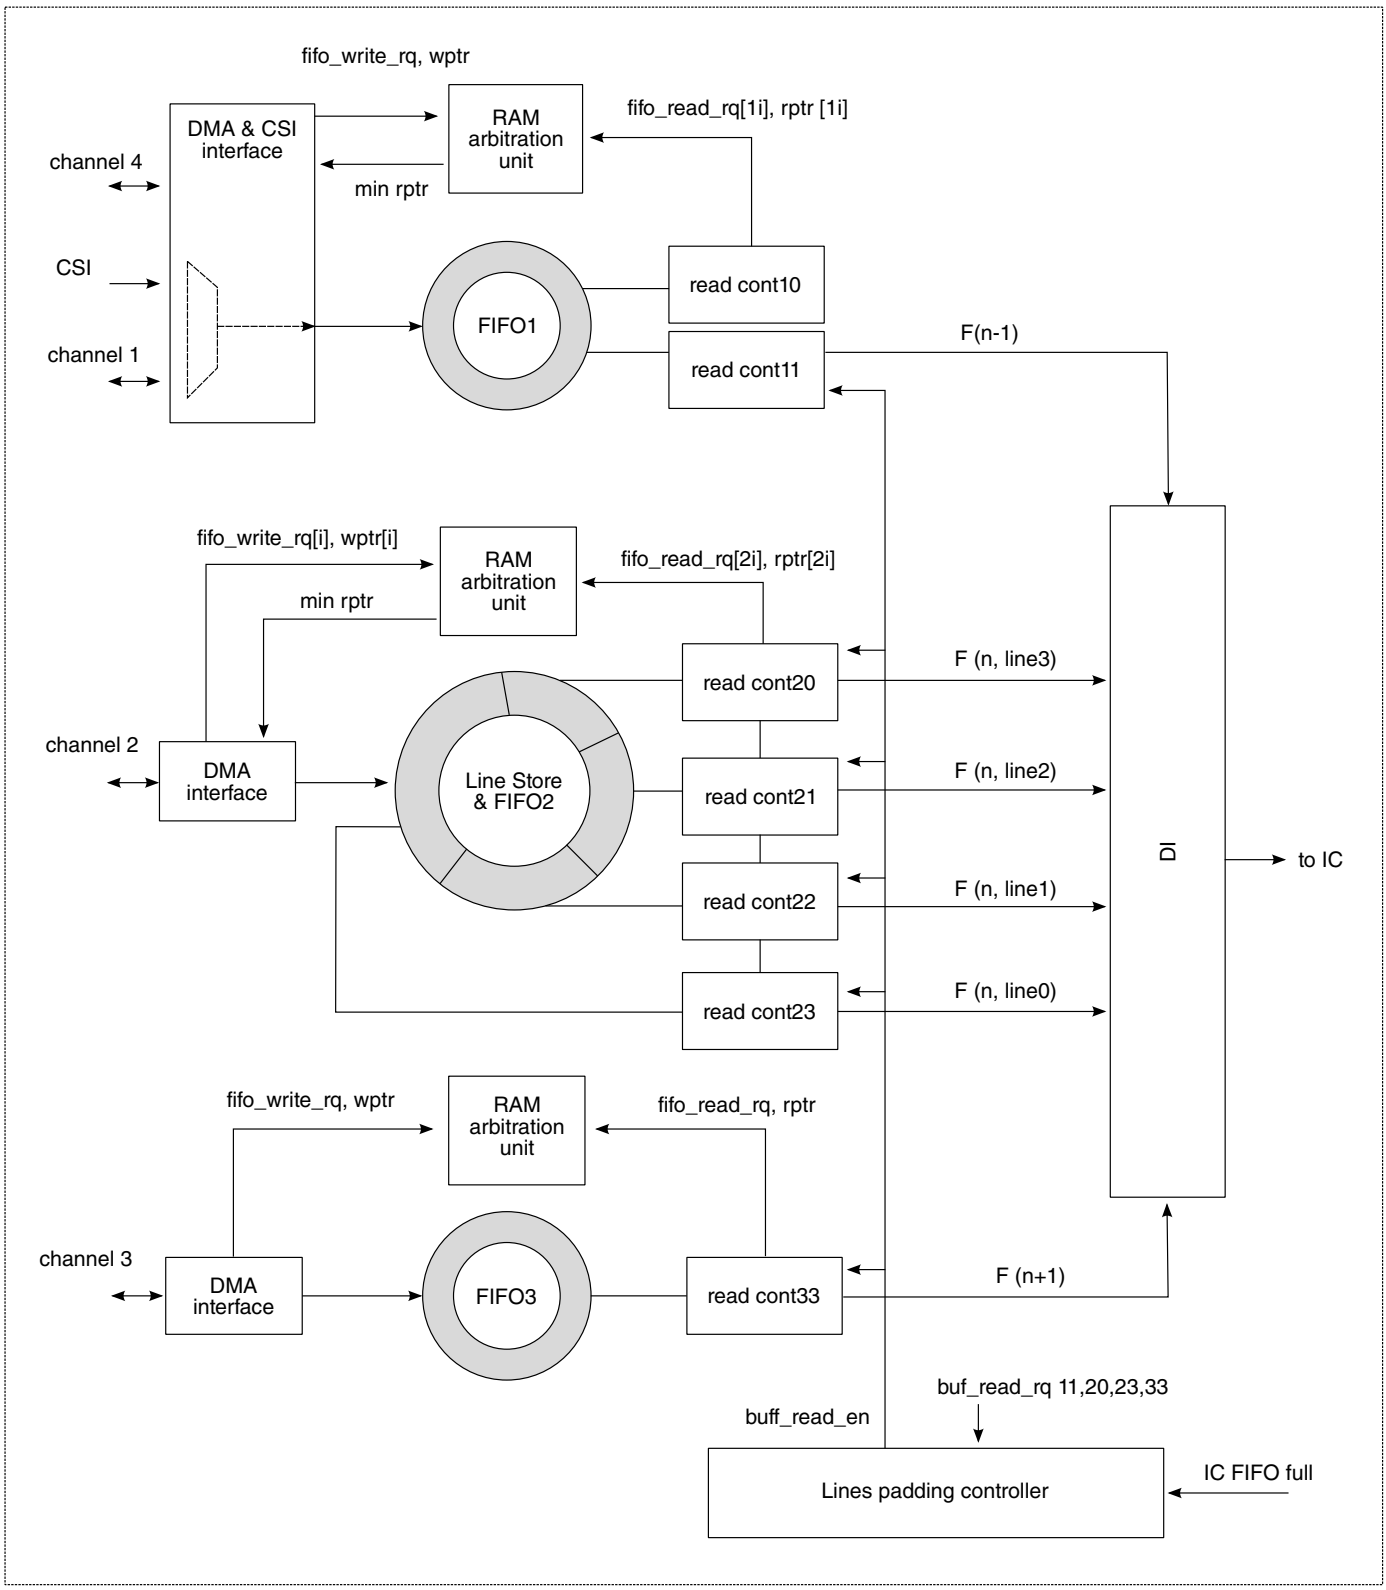

Figure 37-47. VDIC Block Diagram

37.4.11.1 VDIC Features

Key features of the VDIC block include:

- Deintarlacing
  - maximum horizontal resolution 968 pixels
  - maximum pixel rate 75100MP/s
  - Support YUV422 and YUV420 formats
- CSI FIFO mode
- Combining

37.4.11.2 De interlacer (DI) sub-block

The block diagram of the DI block is shown in figure below.

Pipelining is inserted at all stages, so that the design may run at a fast clock speed, if needed.

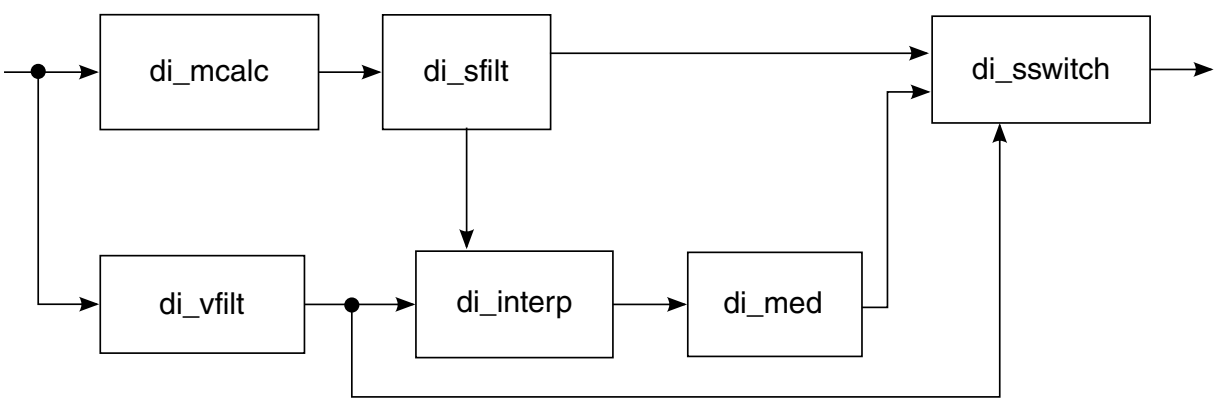

Figure 37-48. DI block diagram

37.4.11.2.1 Vertical Filter Block (di_vfilt)

The di_vfilt block performs spatial vertical filtering of pixels.

It is a four tap vertical filter:

vfilt_out = (-3.0*pix1 + 19.0*pix2 + 19.0*pix3 - 3.0*pix4)/32.0

Where pix1, pix2, pix3, pix4 are four pixels in same horizontal location on four consecutive lines of a field.

vfilt_out is pixel being predicted (between pix2 and pix3)

37.4.11.2.2 Motion Calculator Block (di_mcalc)

The mcalc block estimates the amount of motion for any given pixel by looking at pixel values in current, previous and next fields.

The generic formula used to calculate the estimated motion is:

m = SAT(Ks*(|e-w|/(|e-w|+|n-s|+SPA_DETAIL)))

- Where, n is the pixel above the pixel being predicted
- s is the pixel below the pixel being predicted
- e is the pixel in previous field at same spatial location as the pixel being predicted
- w is the pixel in next field at same spatial location as the pixel being predicted
- m is motion estimation for the pixel being predicted (range from 0 to 1)
- Ks is slope control and decides how quickly the algorithm switches from no motion (m=0) to full motion (m=1)
- SPA_DETAIL is a constant (50) that is added to |n-s|.
- SAT() is saturate at 1 function

The motion calculator block is simplified in a certain respect, by removing the need for a divider, while providing a degree of flexibility. The main motivators for this are the following observations:

1. the above equation defines a set of curves based on the value of |n-s|, but the curves are fairly closely spaced, so that using a granularity of 8 in |n-s| to define specific curves to use gives pretty much the same quality of picture as using all of the curves; and once |n-s| reaches about 120, the effect of an increased |n-s| value is hard to observe
2. once |e-w| gets to about 15, the motion is usually saturated to a value of 1

Based on the above observations, the motion calculator is now implemented with the use of two "ROM"s, using the 4 LSBs of |e-w| and bits 6:3 of |n-s|.

The motion calculator has 3 modes of operation. These modes are defined by the VDI_MOT_SEL field. In case that the user has an information about the motion (For example SW analyzing motion vectors provided by a video decoder) he can select one of the modes listed below. Changing the value of the VDI_MOT_SEL has an affect only on the next frame.

- When VDI_MOT_SEL==2'b01, m_calc is 0 (no motion - use weave)

- When VDI_MOT_SEL==2'b10, We assume high motion and use min(15,delta_t).
- When VDI_MOT_SEL==2'b00, We assume low motion and use sat([0,15],delta_t-8) (delta_t-8 is signed operation).

37.4.11.2.3 Spatial Motion Filter (di_sfilt)

The di_sfilt block spreads motion signal over five pixels:

Mspread = MAX(m3, (0.5*m1 + m2 + m3 + m4 + 0.5*m5)/4.0)

- Where, m3 is motion estimate for current pixel
- m2 is motion estimate for previous pixel
- m4 is motion estimate for next pixel
- m1 is motion estimate for pixel before previous pixel
- m5 is motion estimate for pixel after next pixel

37.4.11.2.4 Interpolated Pixel Calculator Block (di_interp)

The di_interp block uses the motion estimated by the di_sfilt block and computes an interpolated pixel that is weighted sum of the surrounding four pixels (n, s, e, w).

The block performs the following calculations:

```
          if (Mspread <= 0.5) {
i = (1-2*Mspread)*(e+w)/2 + 2*Mspread*vfilt_out
} else {
          i = vfilt_out
}
```

Where, i is the interpolated pixel

n, s, e, w are surrounding pixels as explained earlier

37.4.11.2.5 Median Filter Block (di_med)

The di_med block performs a 5-point median of n, s, e, w and i pixels.

It should be noted that the median required here is not a true 5-point, but can be implemented more efficiently as a 3-point median:

med = MEDIAN(min(max(n,s),max(e,w)), max(min(n,s),min(e,w)), i)

37.4.11.2.6 Soft Switch Block (di_sswitch)

The final output of the deinterlacer is a blend of the median value and the vertical filter, assuming that the pixel data n,s are uncorrelated with the pixel data e,w. By uncorrelated, we mean (max(n,s) < min(e,w)) or (min(n,s) > max(e,w)).

```
          if (Mspread <= 0.5 || not(F)) {
pix_out =    med
} else { /* Mspread > 0.5 */
pix_out = (1-2*(Mspread-0.5))*med + 2*(Mspread-0.5)*vfilt_out
}
```

37.4.11.3 DMA only Mode

In DMA only mode the data is coming from IDMAC only.

37.4.11.4 Real Time Mode

In Real Time Mode the F(n-1) are coming from CSI. The CSI write to FIFO1. The DI sub-block read F(n-1) from processing. In addition IDMAC read the field from FIFO1 and store in external memory. Then stored frames are used as F(n) and F(n+1).

37.4.11.5 CSI only Mode

In CSI only mode VDIC do not perform any processing and used as FIFO only. The data arrived from CSI written to FIFO1. The IDMAC read data from the FIFO1. The FIFO3 and Line store memory are not used. The ID sub-blocks are turned OFF. The CSI only mode can be used as alternative to SMFC, when appropriate.

37.4.11.6 Using Combining in the VDIC

As an alternate function to the de interacing function, the VDIC can perform combining of two planes.

- Both planes have to be at the same color space.
- Overlaying of a single plane over a unified background is supported.
- The planes can be at a different sizes - one plane can be smaller than the other.
- Combining requires a single cycle per output pixel.
- Alpha blending (global or local) is supported.
- Color keying is supported.

The plane's location and size is programmable as shown in the following figure.

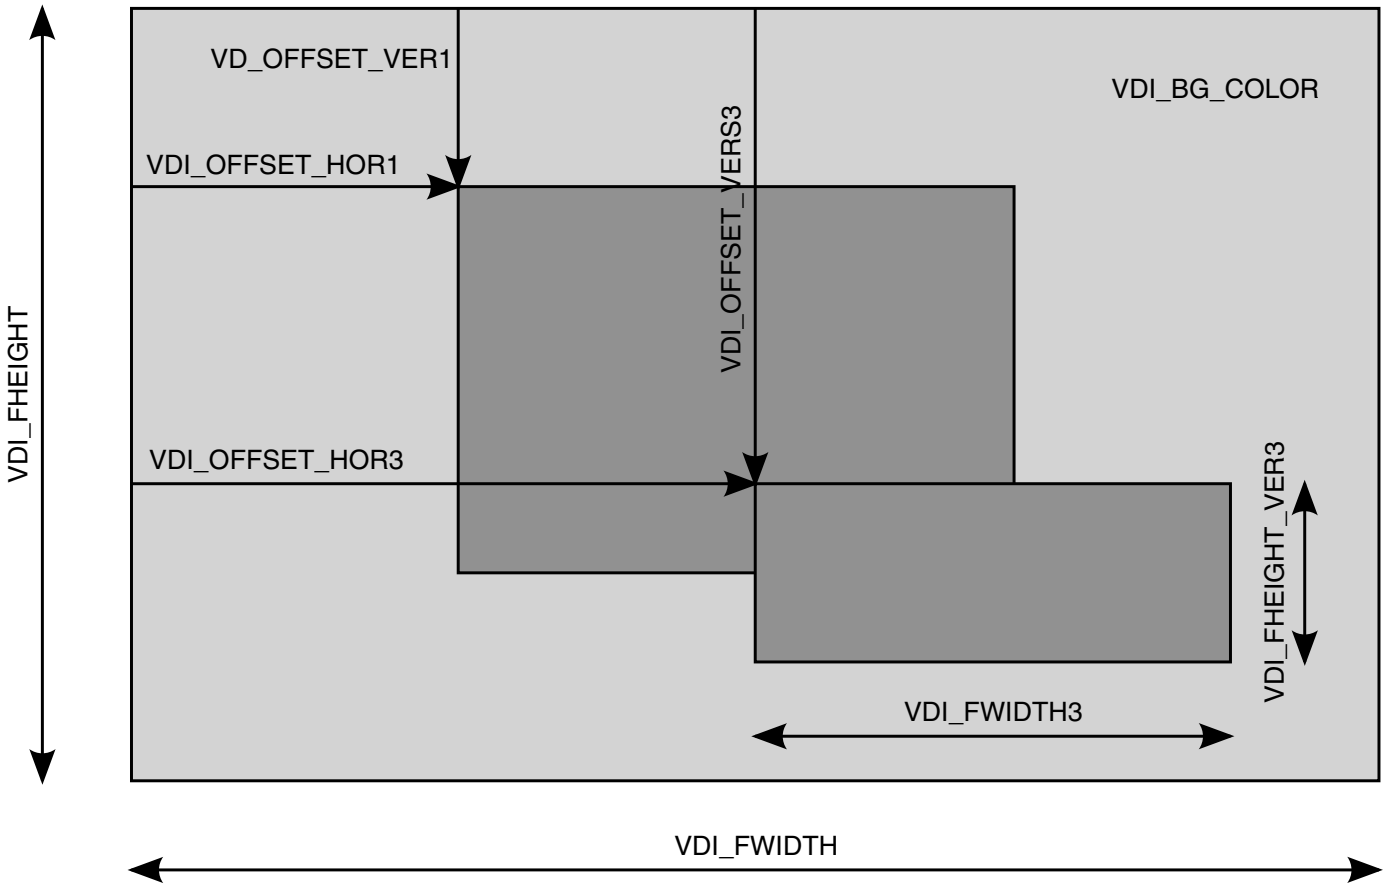

Figure 37-49. The relations between planes of the combining unit

When local alpha is used it should be arrived through channel3 of the VDIC.

The combining equation is:

OP = BG*(1 - alpha) + FG*alpha

Where "OP" is output pixel, "FG" is input pixel of foreground plan arrived thought channel3, BG is input pixel of background plan arrived thought channel1, "alpha" is global or local transparency.

37.4.11.7 VDIC Restrictions

- Maximum output pixel rate is 100 MP/s.
- The output pixel format (YUV422 or YUV420) are equal to input format.
- The VDIC can perform combining or de interlacing. It cannnot perform both functions at the same time.

37.4.12 Control Module (CM)

37.4.12.1 Block Diagram

The CM Block Diagram is shown in the figure below.

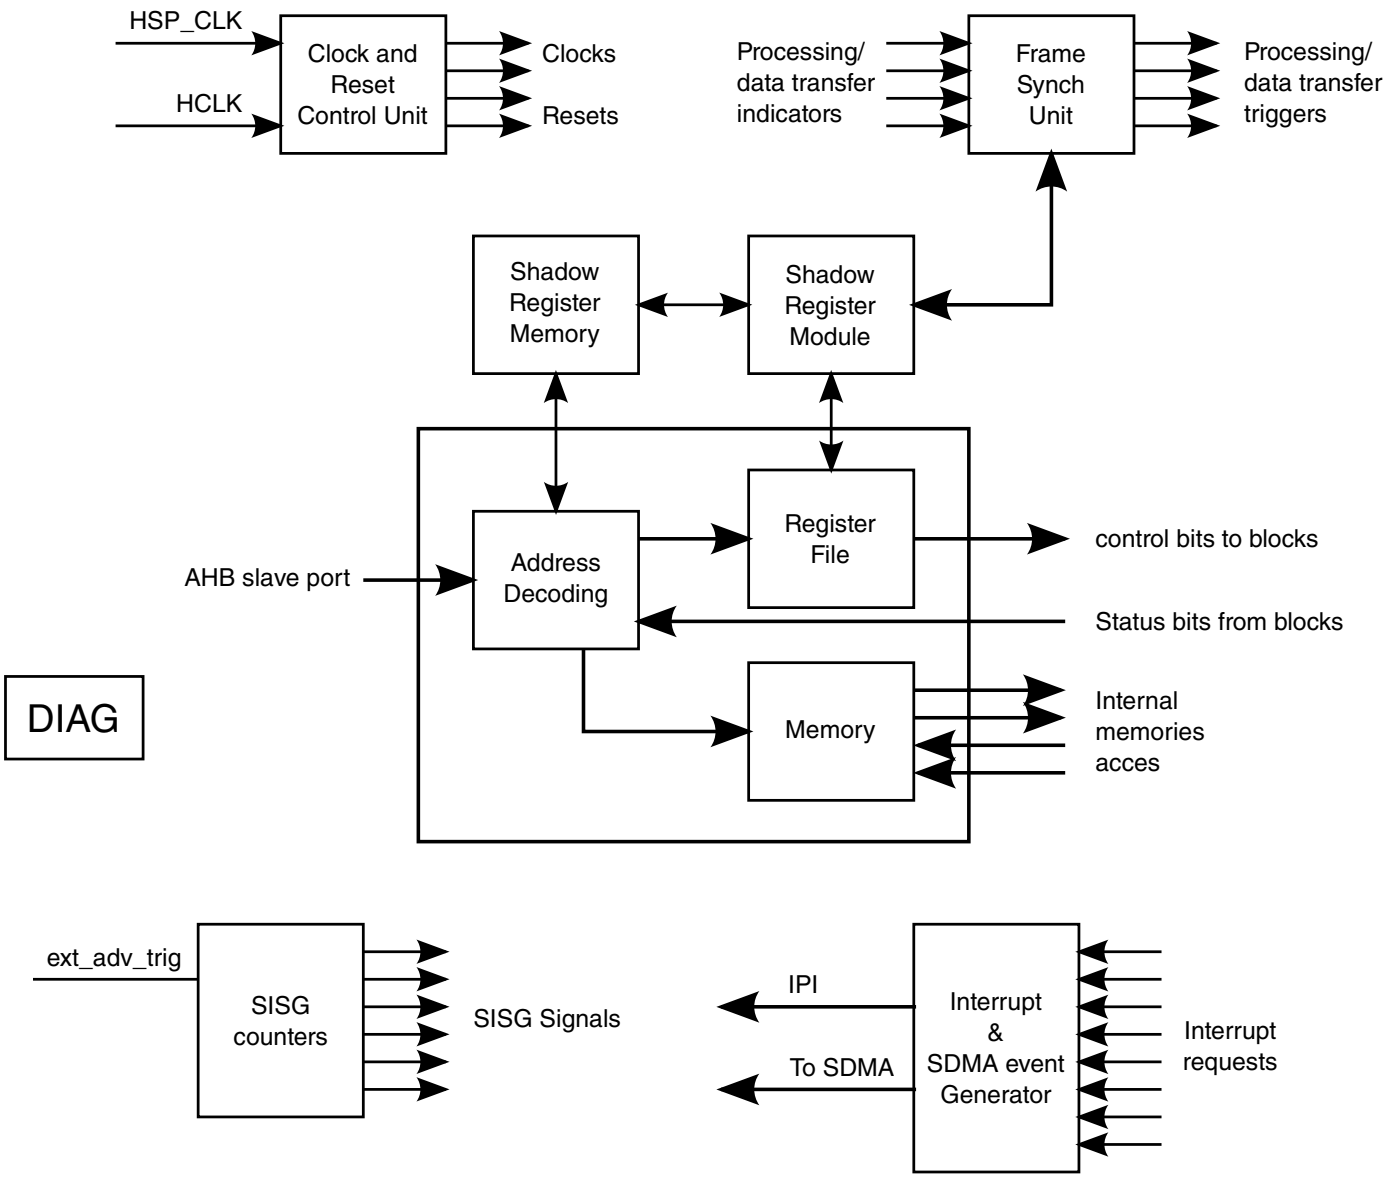

Figure 37-50. CM Block Diagram

The CM consists of the Frame Synchronization Unit (FSU), the Interrupt Generator (IG), the General Configuration Registers (GCR), the Clock and Reset Control Unit (CRCU) and the Shadow Registers Block (SRM).

37.4.12.2 Frame Synchronization Unit

This section details the frame synchronization unit.

37.4.12.2.1 General Description

The FSU provides synchronization of tasks performed by different IPU sub-blocks and ARM platform tasks. This allows to build complex processing flows which are performed automatically (without ARM platform involvement in synchronization of the IPU's tasks).

The FSU supports double buffering of image frames stored in the external memory and allows chaining IPU processing flows in automatic mode.

37.4.12.2.2 Frame Synchronization Flow

1. Initialization

   The ARM platform initializes all the parameters for a task by writing to the GCR and to the parameters memories of each IPU sub-blocks. The initialization must occur before the ARM platform enables the task.

2. Enabling

   After the initialization step has been completed, the ARM platform enables the task by setting its enable bit in an appropriate register.

3. Triggering

   After the task is enabled, the FSU waits for triggering signal. The triggering signals is a combination of the enable bit and the buffer ready signal which can be driven by the ARM platform (DMA_CH_BUF<0/1>_RDY_<#>) and/or by the preceding task (IDMAC_EOF_# or Frame Complete signal from the DC).

   The trigger causes the FSU to invoke the relevant unit to start by assertion of the NEW_FRM_RDY signal. In some cases triggering occurs at the enabling step (when the enable bit is the trigger for the task).

4. Operating

   The triggering step cause the task to move to active mode, this is the operating step. In this step, the FSU monitors the synchronization signals from ARM platform, IDMAC and the corresponding processing units, and controls the units operation. The FSU also controls the IDMAC buffer toggling when double buffer page flipping is used.

The FSU checks at end of each frame if the next frame can be served. If the answer is yes, the FSU stays in active mode with re-sending the <TASK>_NEW_FRM_RDY signal and updating the relevant flags (e.g. DMA<BL>_<#>_CUR_BUF and DMA<BL>_<#>_BUF_RDY). If the answer is no, the FSU moves to pause mode and pauses the task waiting until the next frame can be served.

5. Disabling

   When the task is disabled by the ARM platform (by negating the enable bit), it moves back to non-active mode.

37.4.12.2.3 FSU's fundamentals

Trigger source select

A flow is triggered by a trigger. The trigger may be asserted manually by the ARM platform or may be a result of the completion of the preceding task. Trigger's source select choose the source of the trigger. The trigger means that the data is ready to be processed by the sub-blocks. The trigger source select is defined by the corresponding SRC_SEL bits of the block or task.

Trigger destination select

A block or task that process data needs to know that the following task in the chain is ready to receive the processed data. The user needs to specify what is the destination of the processed data. This is done by setting the corresponding DEST_SEL bits of the block or task.

Double buffering

The IPU supports double buffering in the system's memory. When a flow is processed frame by frame the first frame will be read from one location (BUF0) in the memory, the next frame will be read from another location in the memory (BUF1). The location in the memory of the buffers is defined by the EBA0 and EBA1 parameters of the corresponding channel in the CPMEM. The IDMAC use the correct buffer according to the DMA_CH_CUR_BUF_# signal. The FSU automatically toggles the DMA_CH_CUR_BUF_# to point on the correct buffer to be used by the channel. In order to work in double buffer mode the corresponding DMA_CH_DB_MODE_SEL_# needs to be set.

Alternative flow

Some of the IPU sub-blocks can handle 2 flows via them one is the main flow and the other is the alt flow. In order to support an alternate flow via the same sub-block an alternative configuration should be used by the sub-block. This includes

- Alternate registers including an alternative sub-block's setup - this is handled by the SRM
- Alternate IDMAC settings: parameters in the CPMEM, separate alpha
- Alternate SRC_SEL as the source of the trigger may come from a different function.
- Alternate FSU settings (CUR_BUF, BUF_RDY, DB_MODE_SEL)
- Some of the display sub-blocks alternate settings are handled by programming an alternative set of registers.

The FSU handles the switch to the alternate flow, it controls the update of the alternate configuration and send the appropriate signals to other sub-blocks in the IPU indicating about a need to switch to the alternate configuration.

Once a frame is completed there is a chance that there are 2 buffers ready. One is the next buffer of the current flow and the other is the a buffer in an alternate flow. The FSU will automatically select between the next buffer to handle in a round-robin fashion.

IPU task chaining - Single flow

The diagram below illustrates task chaining in the In this example a single flow is handled

The Frames are coming from the same camera sub-block. The frames are handled frame by Frame. The first frame arriving Frame0 is stored in BUF0 of the "INPUT BUFFER". Once the Frame0 is ready in BUF0, the processing sub-block is triggered and data is read from BUF0 to the processing sub-block. In the meantime, Frame1 coming from the camera is written to BUF1 of the "INPUT BUFFER". The processing sub-block processes the data and stores the first frame on BUF0 of the "OUTPUT BUFFER". Once the processing is done and the frame is ready, the display sub-block is triggered to pick the data and send it to the display. The processing sub-block will start working on the next frame once the data is ready in the "INPUT_BUFFER" and there's a free buffer in the "OUTPUT_BUFFER".

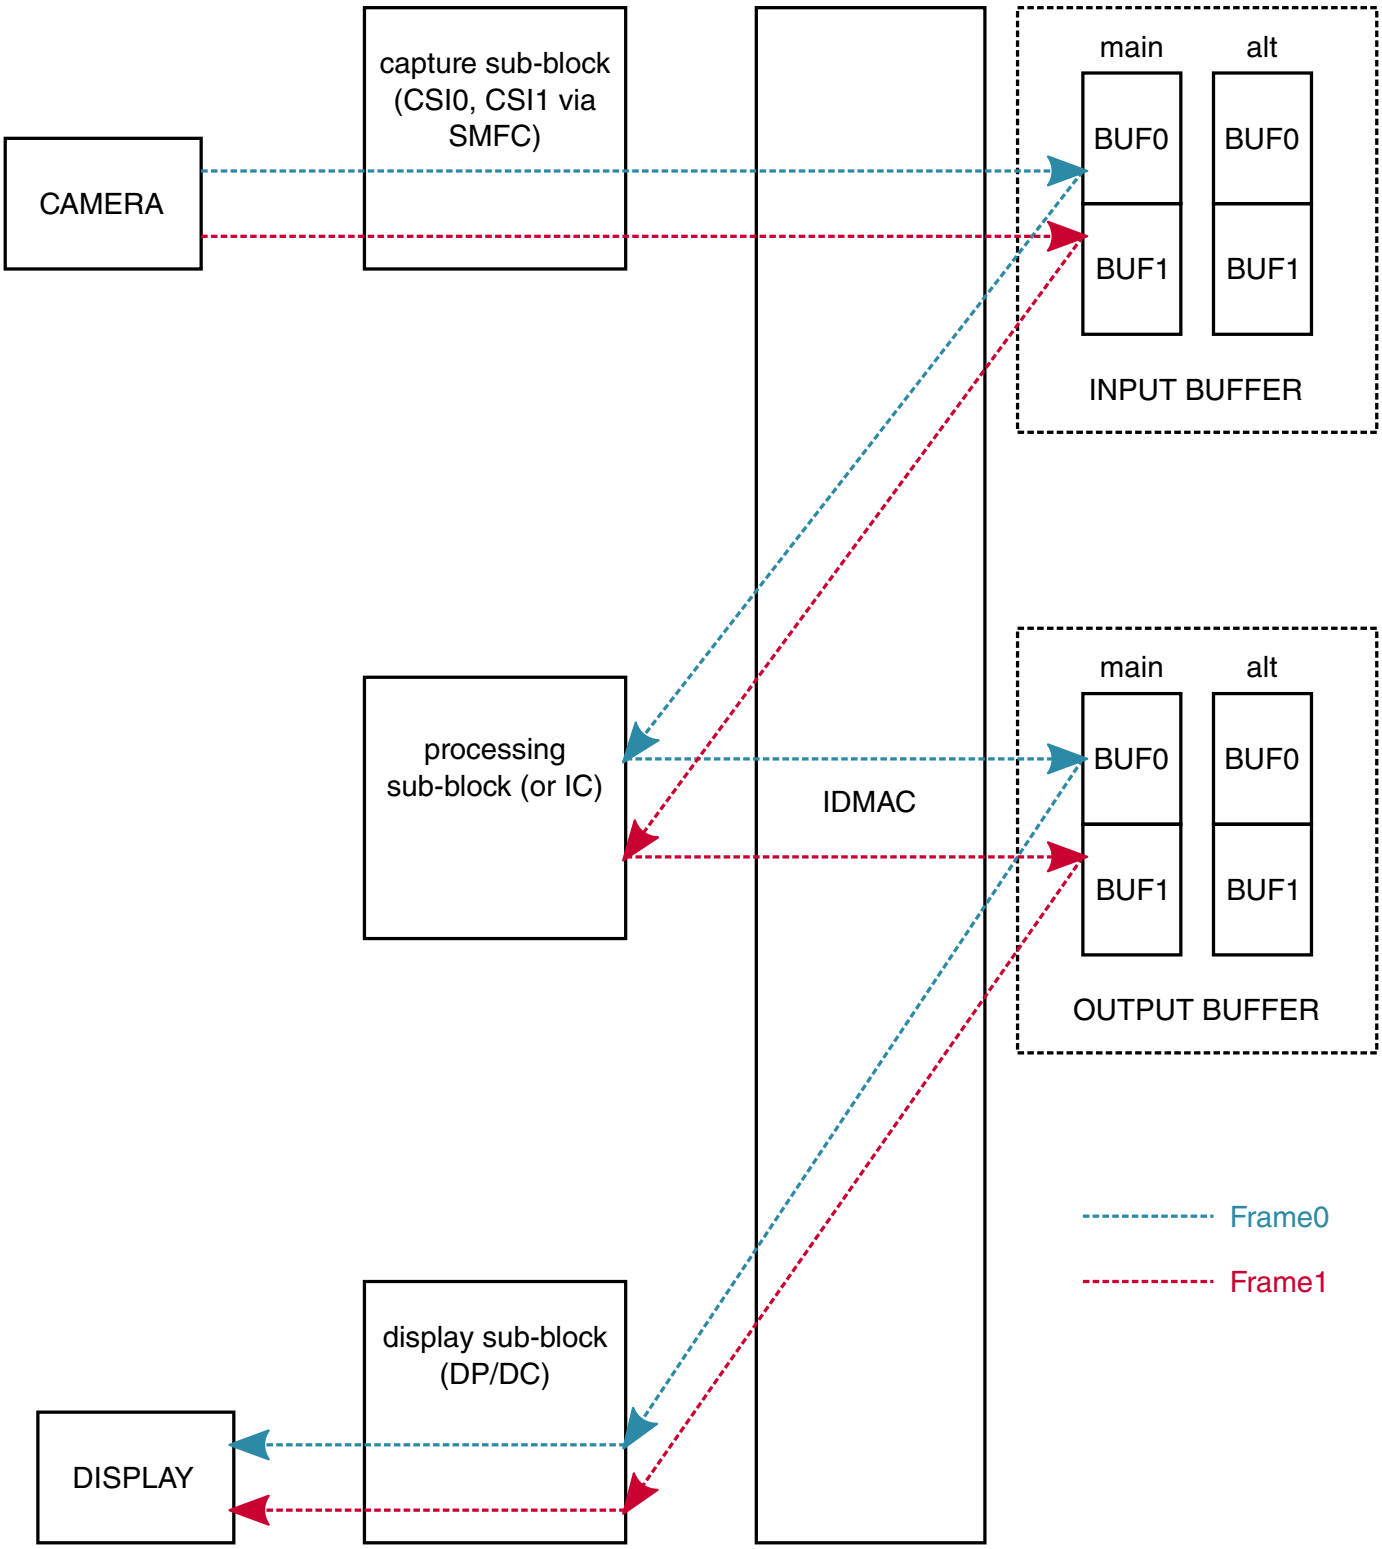

Figure 37-51. IPU tasks' chaining illustration - single flow

IPU task chaining - double flow

The diagram below illustrates task chaining in the In this example double flow is handled. In addition to the flow described on the previous example, another flow is handled via the display sub-blocks. In that case the DC will handle 2 flows. Once sending Frame0 to the display is complete, the FSU will decide in whether to handle Frame1 or Frame0_ALT. The decision is made according the readiness of the other buffers in the memory, in case of 2 ready buffers (main flow and alternate) the FSU will switch between them in a round robin fashion.

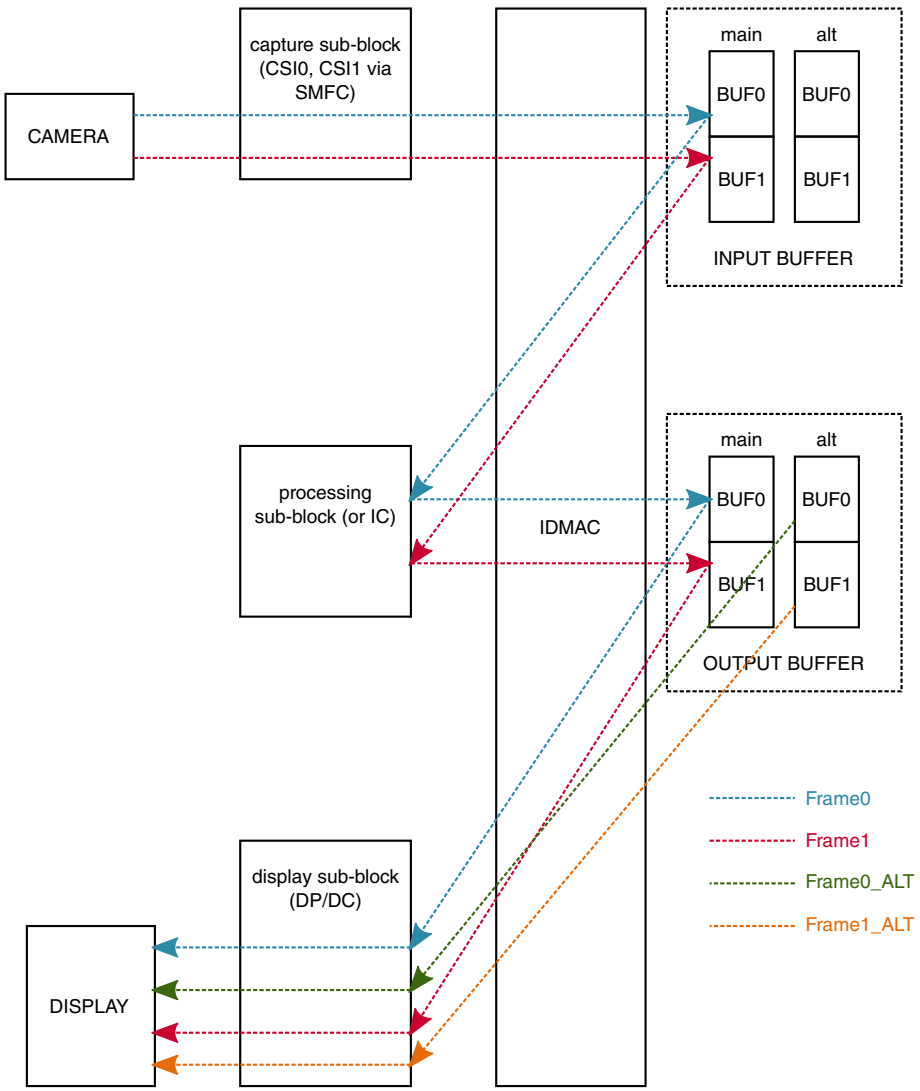

Figure 37-52. IPU tasks' chaining illustration - double flow

37.4.12.2.4 IPU main flows

IPU's flows can be partitioned into 5 groups.

- CF - capture flows

- PF - processing flows
- SF - synchronous display flows
- AF - Asynchronous display flows
- DF - Direct flow from IC to the display

Tasks from different groups can be chained as illustrated below.

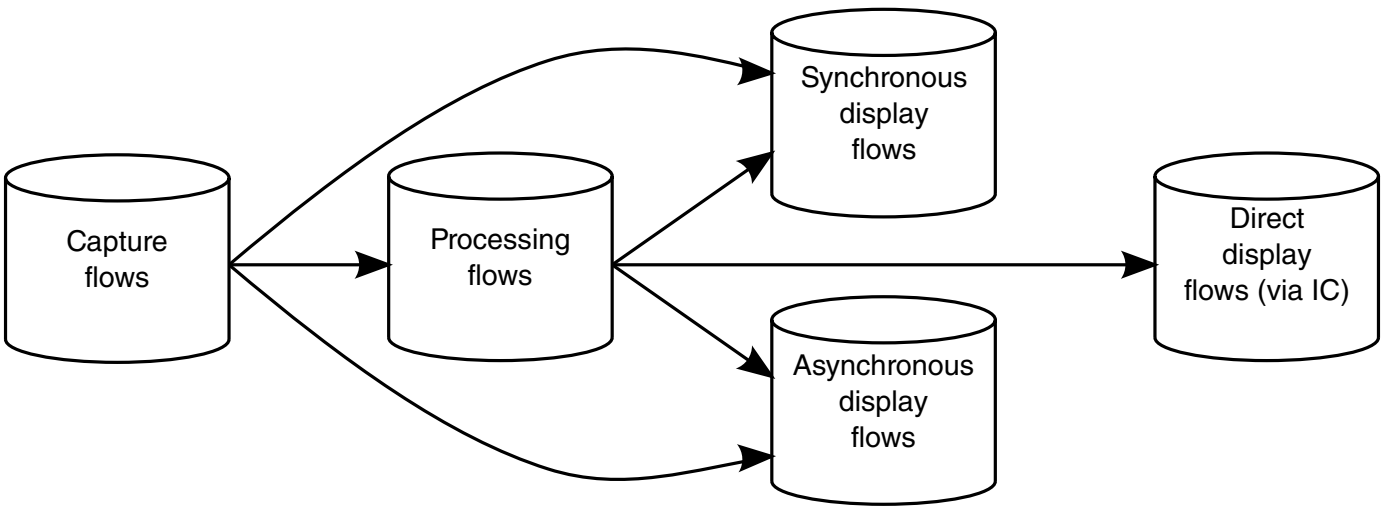

Figure 37-53. IPU task flows chaining

The tables below describe the most important use cases of chaining the IPU tasks. The tables show the main task for each group.

The physical DMA channel is the DMA channel that is used for the main flow - this is the IDMAC channel that is physically connected to the block - the CPMEM parameters should be configured according to the physical channel number. In case of an alternate flow then an alternate entry in the CPMEM should be configured as well

The following table describes capturing flows where data is captured from the sensor and sent to the memory without processing. This flows can be chained to the processing and display flows described on: Table 37-31, Table 37-32, Table 37-33 and on Table 37-34.

Table 37-30. IPU's capture flows

	Flow	Tasks chain	Physical DMA Channels		
			Video Input	Other Input	Output
	Capturing image from sensor and storing it in the memory (via SMFC) without processing	CSI0 or CSI1 --> SMFC --> MEM	---	---	IDMAC_CH_0 IDMAC_CH_1 IDMAC_CH_2 IDMAC_CH_3

Table continues on the next page...

Table 37-30. IPU's capture flows (continued)

	Flow	Tasks chain	Physical DMA Channels		
			Video Input	Other Input	Output
	Capturing image from sensor and storing it in the memory (via IC) without processing	CSI0 or CSI1 --> MEM	---	---	IDMAC_CH_5
	Capturing interlaced input and storing it in the memory (via VDIC) while performing video de-interlacing in the VDIC.	CSI0 or CSI1 -> VDIC --> MEM		IDMAC_CH_9 IDMAC_CH_10	IDMAC_CH_5 IDMAC_CH_13
		Interlaced input coming from one of the CSIs is sent to the memory without processing via channel #13. In addition 2 more inputs are read from the memory via channels 9 and 10. The processed image is written to the memory via ch 5 in progressive scan mode.			

NOTE

Register IPUx_SMFC_MAP is used to map CSI0 and CSI1 inputs to one of the four IDMAC channels. See Sensor Multi FIFO Controller (SMFC) for additional information.

The following table describe processing flows via the IC . This flows can start from the memory, can be chained to a capturing flow described on Table 37-30. The target of this flow can be chained to the display flows described on Table 37-32 and on Table 37-33.

Table 37-31. IPU's Processing flows

	Flow	Tasks chain	Physical DMA Channels		
			Video Input	Other Input	Output
	Preprocessing image from sensor for encoding	CSI0 or CSI1 --> SMFC --> MEM	---	---	IDMAC_CH_0 IDMAC_CH_1 IDMAC_CH_2 IDMAC_CH_3
		MEM --> IC (PRP ENC) --> MEM	IDMAC_CH_12	---	IDMAC_CH_20

	Reading data from asynchronous display	DC --> MEM	---	---	IDMAC_CH_40

The table below describes direct flows via the IC. These are processing flows via the IC where the output is sent directly to the DMFC. Direct camera to display flow is possible when the frame rate of the source and the destination is the same (typically the target display will be asynchronous display, where the display is updated at the rate of the source). From that point, any of the display flows described on Table 37-32 and on Table 37-33 can be chained.

Table 37-34. IPU direct flows to the display via the IC

		Interlaced input coming from one of the CSIs is sent to the memory without processing via channel #13. In addition 2 more inputs are read from the memory via channels 9 and 10. The processed image is sent to the IC for further processing then it is sent to the display			

37.4.12.2.5 Sub-Frame Double-Buffering (Band Mode)

Page-flip double buffering is performed using full-frame buffers.

In addition IPU supports also page-flip double buffering using smaller buffers, each containing 4/8/16/32/64/128/256 rows of pixels. This allows the use of internal memory for buffering.

This mode can be supported by the following modifications (relative to full-frame buffers):

The address in system memory is generated by the same formula, but inserting the full row number, only k LSB's (for a band of 2^k rows) are inserted (e.g. [2:0] for 8 rows).

Page flip is triggered at the end of each band (when the k LSB's are all 1) and not only at the end of the frame. This flip may be accompanied by an ARM/SDMA interrupt, if synchronization with other modules (e.g. VPU or ARM) is needed.

The channels that can work in this mode are controlled by the corresponding IDMAC_BNDM_EN_<i>

bit. The BNDM parameter of the corresponding IDMAC channel has to be set as well.

37.4.12.2.6 Automatic Window Refresh

By programming the <>_SRC_SEL bits of the corresponding flow to autoref mode, automatic refresh of a window on the smart display is enabled. This means that the flow is triggered any time the refresh counter completes its counting. The refresh period is defined via the AUTOREF_PER field (the time unit is 2^{17} periods of the HSP_CLK clock).

The actual value of refresh period is equal to:

$T_{HSP}*2^{17}$ *(AUTO_REF_PER+1).

37.4.12.2.7 IPU VDOA synchronization

IPU can interact to a companion block called VDOA.

VDOA (Video Data Order Adapter) is used to re-order video data from the "tiled" order used by the VPU to the conventional raster-scan order needed by the IPU.

The VDOA can transfer its output to the IPU through internal memory, containing a band double buffer.

This tight double-buffering synchronization is performed without MCU involvement, using dedicated signals between the VDOA and IPU and the same protocol as used between two IPU DMA channels.

VDOA notifies the IPU which is the current band to read. IPU notifies the VDOA when the current band is read.

This synchronization is supported for VDI and IC(PP). The target destination of the VDOA data is defined by VDOA_DEST_SEL parameter. The PP_SRC_SEL or VDI_SRC_SEL has to be programmed as well to select VDOA as the source of the task.

For more details about IDMAC's band mode support Sub-Frame Double-Buffering (Band Mode).

The IPU settings and the VDOA settings has to be the same. In particular

- The band height defined at the IPU and at the VDOA must match
- The Number of Frames used by the VDI as defined by the VDI_MOT_SEL has to match the VDOA settings.

37.4.12.3 Interrupt Generator

The IG produces two interrupts to the ARM platform - the functional interrupt and the error interrupt. All of the interrupts are maskable.

The following table describes the functional interrupts.

Table 37-35. Functional Interrupts Summary

Location	Sub-blocks	Interrupt status bit name	Description
IPU_INT_STAT_1[0]	IDMAC	IDMAC_EOF_0	-
IPU_INT_STAT_1[1]	IDMAC	IDMAC_EOF_1	-
IPU_INT_STAT_1[2]	IDMAC	IDMAC_EOF_2	-
IPU_INT_STAT_1[3]	IDMAC	IDMAC_EOF_3	-
IPU_INT_STAT_1[5]	IDMAC	IDMAC_EOF_5	-
IPU_INT_STAT_1[11]	IDMAC	IDMAC_EOF_11	-

The table below describes the error interrupts. The panic column indicates if this signal is part of the logic generating the ipu_panic signal. The ipu_panic signal can be used for indicating about errors that are result of data rate problems. Such problems may be a result of the IPU running in slower clock then required by the use case. This signal can be used in order to indicate the system that the IPU can't handle the desired data rate. In that case the system may need to increase the clock to the IPU or simplify the use case.

37.4.12.4 SDMA event generator

The IPU provides an SDMA event signal that can be used as trigger to the SoC's SDMA. IPU routes an internal event to the SDMA event signal. The internal event causing the assertion of the SDMA signal is enabled by setting the corresponding bit on the SDMA_EVENT_# registers.

The user is allowed to enable multiple events. When one of these events occurs the ipu_sdma_event signal will be asserted. Similar to interrupts, the ipu_sdma_event signal is cleared by writing one to the corresponding bit in the INT_STAT_# registers.

It is not recommended to use the same internal event for a simultaneous generation of an interrupt signal and an SDMA event. This will require special software care when clearing the corresponding bit in the INT_STAT_# registers.

37.4.12.5 General Configuration Registers

The GCR contains a set of control/status/data registers. It provides IPU interface to the AHB slave bus.

The HCLK rate is equal to the HSP_CLK rate. The detail description of the registers is found in the Programmable Registers section.

37.4.12.6 Shadow Registers Module (SRM)

IPU supports frame by frame task switching. This means that a sub-block can handle a frame with one configuration and handle the following frame with different configuration. Changing the configuration is done by updating the sub-block's parameters.

In order to allow automatic flow without a need of the SW to update all the parameters at the frame boundaries. A Register of a sub-block that has the shadowing capabilities has a shadow register file that resides in the Shadow Register Memory.

The sub-blocks supporting this function may use it in one of the following ways:

37.4.12.6.1 Switching between 2 flows

Upon request from the FSU the SRM switches between the registers and the content in the Shadow Register Memory. When a sub-block uses one of the configuration SW, it is allowed to update the parameters in the memory. This is normally used when 2 flows are supported via one module.

- The current flow's configuration is stored in the module's registers
- The alternate flow configuration is stored in the SRM.
- When switching between flows the current flow's configuration is stored in the SRM. The alternate flow's configuration is written to the module's registers. When the alternate flow ends the configurations are swapped again.

This process is fully controlled by the FSU

37.4.12.6.2 Updating parameters between frames

This mode is used when the user needs to update the parameters of the current task being processed by the module. The updates can't affect the frame that is currently being processed. The update is effective only on the next frame. The SRM performs the parameters update only when there's a specific request by the user.

- The current frame's configuration is stored in the sub-block's registers
- The next frame's configuration is stored in the SRM.
- On frame's boundary the SRM reads the new configuration from the SRM and writes it to the sub-block's registers. The old configuration is lost.

37.4.12.6.3 Updating the memory

In order to avoid data coherency problems, the user should set a flag indicating that he is currently updating the memory region of a specific sub-block. When the flag is set the SRM will not attempt to replace the parameters relevant to the specific sub-block currently being updated by the user.

The user should clear this flag when he completes the update, and the parameters are ready to be used.

The flag is the corresponding **SRM_MODE** field for each sub-block. This field controls the SRM logic that handles the sub-blocks registers

- 00 - ARM platform is allowed to access the sub-block's region in the RAM; The automatic swapping mechanism is disabled.
- 01 - The SRM logic is controlled by the FSU. The update will be done of the next frame.
- 10 - The SRM logic is controlled by the FSU. Registers are swapped continuously frame by frame
- 11 - Update now. The SRM is controlled by the ARM platform. The Register will be update now

Each sub-block uses the SRM mechanism according to the sub-block's behavior, the table below summarizes the SRM support for each sub-block

Table 37-37. SRM support per Sub-block

Sub-block	Switching between 2 flows support	Updating parameters between frames	Comment
CSI1, CSI0	NO	YES	SRM_MODE can be 00 or 01. The update will happen only once. When set to 01: after the update the state machine is automatically moved to 00 mode. It is recommended to make sure that the first frame has started by polling the corresponding NFACK bit before setting the SRM_MODE
DI1, DI0	NO	YES	DI0, DI1 parameters are needed when clock change is performed (Clock Change procedure). SRM_MODE can be 00 or 01. The update will happen only once. When set to 01: after the update the state machine is automatically moved to 00 mode
DC	YES	NO	SRM_MODE can be 00 or 10.
DP	YES	NO	SRM_MODE can be 00, 10 or 11. When set to 11: after the update the state machine is automatically moved to 10 mode

Table 37-37. SRM support per Sub-block

Sub-block	Switching between 2 flows support	Updating parameters between frames	Comment
			10 is not supported for SYNC flows

In order to update parameters the user should monitor the SRM_BUSY bit of the corresponding sub-block. When the SRM is not busy the user should set the **SRM_MODE to 00. The user will now update the register file in the memory. When done the user should switch the SRM_MODE field to the desired mode.**

37.4.12.6.4 SRM priority

The SRM updates the registers according to a pre defined priority. The priority is set according to the SRM_PRI bits of each sub-block. The user must set a unique value for each sub-block.

37.4.12.6.5 SRM entries mapping

The table below maps any IPU register to an address in the SRM. The registers marked as NONE do not have an SRM entry

PG column indicates if this register is saved during power gating mode

LPSR column indicates if this register is swapped during low power screen refresh mode (LPSR)

Table 37-38. IPU SRM entries mapping

Register's name	Register's address	SRM entry	PG	LPSR

37.4.12.7 Memory Access Unit

The Memory Access Unit (MA) supports ARM platform access to the IPU internal memories.

Some of the IPU internal memories are memory mapped. This unit handles accessing these memories. The table below describe the accessible memories and their limitations.

Table 37-39. Internal Memories Access Support and Limitations

Memory	Function	Support and Limitations
lut	IDMAC's look up table	Accessible only when All the IDMAC channels that use the LUT are disabled
cpmem	IDMAC's Channel parameter Memory	This memory can be accessed while tasks are enabled. Must be configured before enabling processing tasks.

Table continues on the next page...

Table 37-39. Internal Memories Access Support and Limitations (continued)

Memory	Function	Support and Limitations
		IDMAC channel parameters must not be changed in the CPM when the corresponding DMA channel is enabled excluding the base addresses (EBA0 and EBA1). One of these parameters can be changed during channel operation if it relates to the non-active double buffer.
tpm	IC's task parameter memory	Must be configured before enabling processing tasks. This memory can be accessed while tasks are enabled. IC task parameters must not be changed in the TPM when the corresponding task is active.
dc_template	DC's template memory	Can be configured before enabling tasks. Must not be accessed while operation. Both read and write access to the DC's template memory are forbidden when there is any enabled channel which can use the template

37.4.12.8 SISG - Still Image Synchronization Generator

The IPU incudes a "Still Image Synchronization Generator" (SISG), providing time-sensitive control signals synchronizing the image sensor with camera peripherals, such as a flash lamp and a mechanical shutter.

The SISG is implemented using a single time base counter, and six Time Compare Units - as described in the following figure.

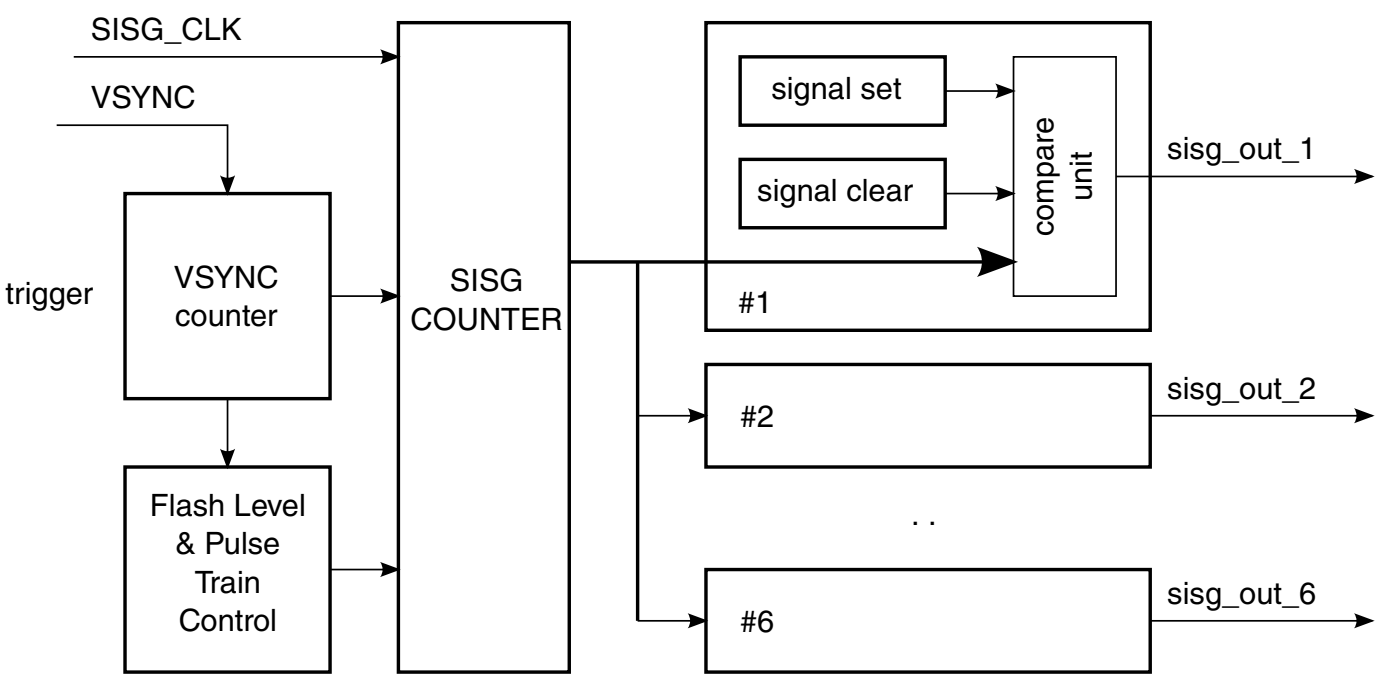

Figure 37-54. Still Image Signal Generator

The SISG inputs are:

- Activation trigger
- VSYNC: the frame-boundary signal from the sensor

The SISG is activated by one of the following triggers:

- The ARM platform by setting the MCU_ACTV_TRIG bit
- A signal generated by an appropriate short packet received through the MIPI/CSI-2 I/F
- An external signal (GPIO pin)

Upon activation, the counter is reset and then there are the following two possibilities:

- Counting starts immediately
- Counting start is delayed until one of the next 7 VSYNC signals (programmable via the NO_OF_VSYNC bits)

During the counting period, the SISG can generate up to 6 output strobes:

- Each strobe can be individually enabled or disabled and has a programmable polarity
- The edges of the strobes are generated at specified counter values - to achieve pixel-level resolution - as specified by programmable SISG_SET& SISG_CLR time tag registers
- The clock has 25 bits, to allow strobe generation during a time period of up to two 12M pixel frames

The SISG can repeat the above sequence for up to 32 cycles (this is provided to generate a train of flash pulses, for anti-red-eye or for measurements in low-light conditions). The repetition is implemented by resetting the counter, which can be triggered by one of the following events:

- A VSYNC signal
- A pre-defined value reached by the counter

After the last sequence, when the counter reaches its maximal value, it stops counting and the SISG remains in idle mode until the next activation.

37.4.12.9 Clock Change procedure

The IPU supports dynamic clock rate changes.

Types of change:

- DVFS transitions: frequent, initiated by the SoC's power modes controller (GPC) and the SoC's clock controller module (CCM)
- Other: infrequent, initiated by SW.

IPU may have on-going activities at this stage.

The display interface clocks may either change or remain unchanged. During screen refresh, the display clock would typically not change. During asynchronous access, it may be appropriate to change also the display interface clock. The choice between these options would be made in advance by the user

If the IPU display interface uses the external clock (DI0_DISP_CLK - ipp_di_0_ext_clk or DI1_DISP_CLK - ipp_di_1_ext_clk) source, it remains unchanged. A change in the rate of this clock is performed fully by SW, without the special HW support described below. In particular, the SW may have to stop explicitly any interaction with the display (e.g. screen refresh) before performing the change.

The user is responsible to make sure that the lowest planned clock (in DVFS transitions) is still high enough to support the expected activities (e.g. data rate through the display bus)

The procedure below describes the IPU handshaking with the CCM.

1. The user prepares 2 sets of clock modes CLOCK_MODE_0 is the default clock mode, CLOCK_MODE_1 is the alternate clock mode. The IPU toggles between these two settings following the next assertion of ipg_clk_change_rq. If the user sets the SRM_CLOCK_CHANGE_MODE bit then he should also prepare the registers in the SRM for each of the DIs. These registers include all the DI settings adjusted to the new clock.
2. CCM asserts the ipg_clk_change_rq signal when a clock change is needed
3. The CM calculates the new clock frequency and send it to the DI (signals are di0_clk_freq, and di1_clk_freq). These signals should be sent to the DI only after getting the di_clk_change_ack signal from the DIs. The values of this field could be.
    - 00 - 1/4 of full frequency
    - 01 - 1/2 of full frequency
    - 10 - full frequency
    - 11 - illegal
4. The CM sends a cm_clk_change_rq signal to the DIs.
5. The DI stops the clock to the display (freeze mode) according to DI0_CLOCK_STOP_MODE & DI1_CLOCK_STOP_MODE bits. If the DI is disable, the ACK from the DI is not needed and the CM will assume that the DI sent an ACK.
6. Once the clock to the display is stopped, the DI sends a signal to the CM called di_clk_change_ack
7. The CM wait for the clock change signals from both of the DIs
8. If the SRM_CLOCK_CHANGE_MODE bit is set the CM should read the new DI settings from the SRM and override the previous DI settings. Then the CM clears the SRM_CLOCK_CHANGE_MODE bit

9. Once the above is complete the CM asserts the ipg_clk_change_ack signal to the CCM
10. The CM sends the signals di0_clk_freq, and di1_clk_freq to the DIs.
11. The CCM will negate the cm_clk_change_rq
12. The CCM will now change the clocks
13. When the new clock arrives the ipu_clk_changed signal will be asserted.
14. The state machine on each DI will now move out of freeze mode and continue working with the new clock.

37.4.12.10 Low Power Modes

IPU supports the following low power modes.

- STOP: on this mode the clock to the IPU is stopped
- LPSR: low power screen refresh.The clock to the IPU is changed to a slower frequency, the IPU performs only screen refresh.

The user should not request LPSR. at the same time. This case is not supported and the results are not predictable.

The CCM may assert one of the 2 signals: stop_clk_at_stop_req OR stop_clk_at_wait_req

The IPU OR them internally as there's no difference between them with regards to IPU's behavior.

In all these modes the clock to the IPU is going to be stopped (assertion of stop_clk_at_stop_req).

IPU should complete all his tasks:

- CSIs complete transferring the last frame. Wait for csi_busy = 0
- IDMAC completes all the flows (all CH_BUSY = 0)
- All the flows in the FSU are complete. New ones do not start.
- CM sends stop request to the DIs
- Once the DI sent all the data to the display, it asserts an ACK signal

Only when all the above occurs, the CM can assert an internal signal called "IPU_IDLE"

IPU_IDLE is the starting point for any of the low power modes.

Note that if the VDIC was in use prior to entrance the low power mode the viewfinder task of the IC will be in WAIT_FOR_READY state (the task's status is reflected in the VF_TSTAT field). The user will need to manually switch that task to IDLE. This is done by performing the following steps:

- Wait for EOF of the viewfinder output channel (IDMAC_EOF_21)
- Set RSW_EN bit
- resume one frame via the viewfinder task.
- Disable the VDI and IC and the corresponding IDMAC channels

37.4.12.10.1 STOP Mode

In this mode the IPU sends the ipu_stby_ack after getting to IPU_IDLE state. The CCM will gate off the clock to the IPU.

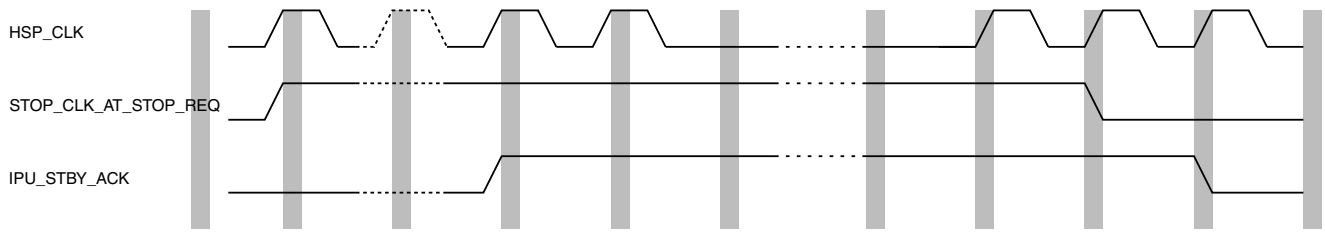

Figure 37-55. Entering and Exiting STOP Mode

Wake up from STOP mode

When the SoC decides to wake up from STOP mode it should:

- Resume the clock to the IPU.
- Negate the stop_clk_at_stop_req or stop_clk_at_wait_req signal.
- The IPU will then negate the ipu_stby_ack signal.
- The IPU will resume screen refresh.

37.4.12.10.2 Low Power Screen Refresh mode - LPSR

In Low Power Screen Refresh mode, the clock to the IPU is changed to a slower frequency, the IPU performs only screen refresh to a single display via the DP (channels 23 & 27).

Preparations

1. The user sets the LPSR_MODE bit indicating that the next assertion of stop_clk_at_stop_req OR stop_clk_at_wait_req activates the LPSR procedure.
2. The user moves the IPU to screen refresh flow. This means that if other tasks are active (flows via CSI or multiple flows to multiple displays) - this tasks needs to be complete and disabled. This is step is fully done by the user (SW). The only flow that remains active is screen refresh to a single display done via the DP (channels 23 & 27)

3. The user stores in the SRM the planned configuration for the sub-blocks involved in the LPSR flow. These configuration will e switched with the active registers' settings on later stage. The relevant sub-blocks are:
   - DI0 & DI1
   - DC
   - DP
   - DMFC
   - IDMAC
   - CM

Entering LPSR

The flow for entering LPSR is the same as stop mode.

1. The IPU follows the same procedure as on STOP mode till getting into IPU_IDLE state.
2. IPU swaps the registers of the relevant blocks with the pre stored content from the SRM. The content of the registers of the current flow is stored in the SRM. The IPU will switch back to this configuration after exiting from LPSR.
3. The IPU sends the ipu_stby_ack
4. The CCM will gate off the clock to the IPU.
5. The CCM will switch to the new clock
6. After changing the clock, the CCM asserts ccm_lpsr_ipu, this signal is synched inside the IPU to the hsp_clk
7. The IPU will resume screen refresh with the new settings.

Exit from LPSR

1. The CCM negates ccm_lpsr_ipu
2. The CM sends standby request to the DI
3. The DI should complete processing the current frame and stop the clock to the display and send an acknowledge signal to the CM.
4. The SRM swaps the registers' configuration. current configuration (LPSR) is saved in the SRM, the previous (original) configuration is stored in the blocks' registers.
5. IPU asserts the ipu_wakeup_ack signal indicating that it is now safe to leave LPSR mode.
6. CCM stops the clocks to IPU
7. CCM resumes the clock to the IPU - This clock is the same clock used prior to entering the LPSR mode.
8. CCM negates the stop_clk_at_stop_req (or stop_clk_at_wait_req)
9. IPU negates the ipu_stby_ack and the ipu_wakeup_ack signals
10. The IPU resumes screen refresh with the original settings.

The diagram below illustrates the procedure for entering and leaving LPSR mode

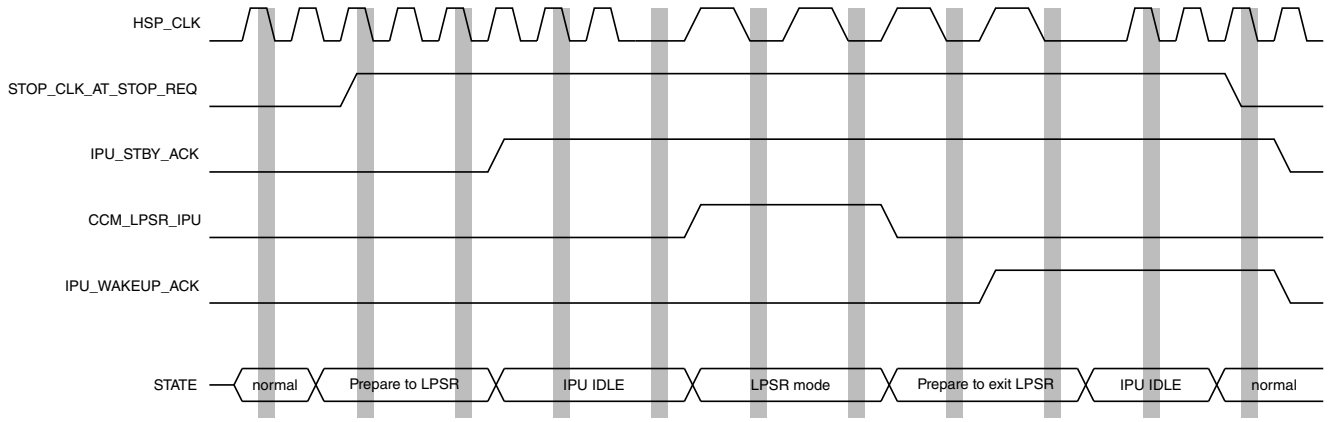

Figure 37-56. Entering and Exiting LPSR mode

37.5 IPU Memory Map/Register Definition

The address space for accesses through the AHB-lite slave port is 4 MB and it is split internally (with 2MB resolution) according to bit [21] of the address. Using the following notation

Address = (IPU_ID[31:25], 1,1,1,MSB[21], LSB[20:0])

the address is used as follows :

1. MSB=0: Low-level access to an external device, with LSB[3:0] = (Lock, CS, RS[1:0])

- LSB[5:4] = RS[1:0] (the address on the display interface)
- LSB[6] = Choice of display's channel (0=channel 8, 1=channel 9)
- LSB[7] = Lock (Lock=1 prevents the use of the display port until the next ARM platform access)

1. MSB=1: access to internal IPU registers, with address LSB

NOTE

The addresses given in the table are relative to the IPU base address defined at SoC's level.

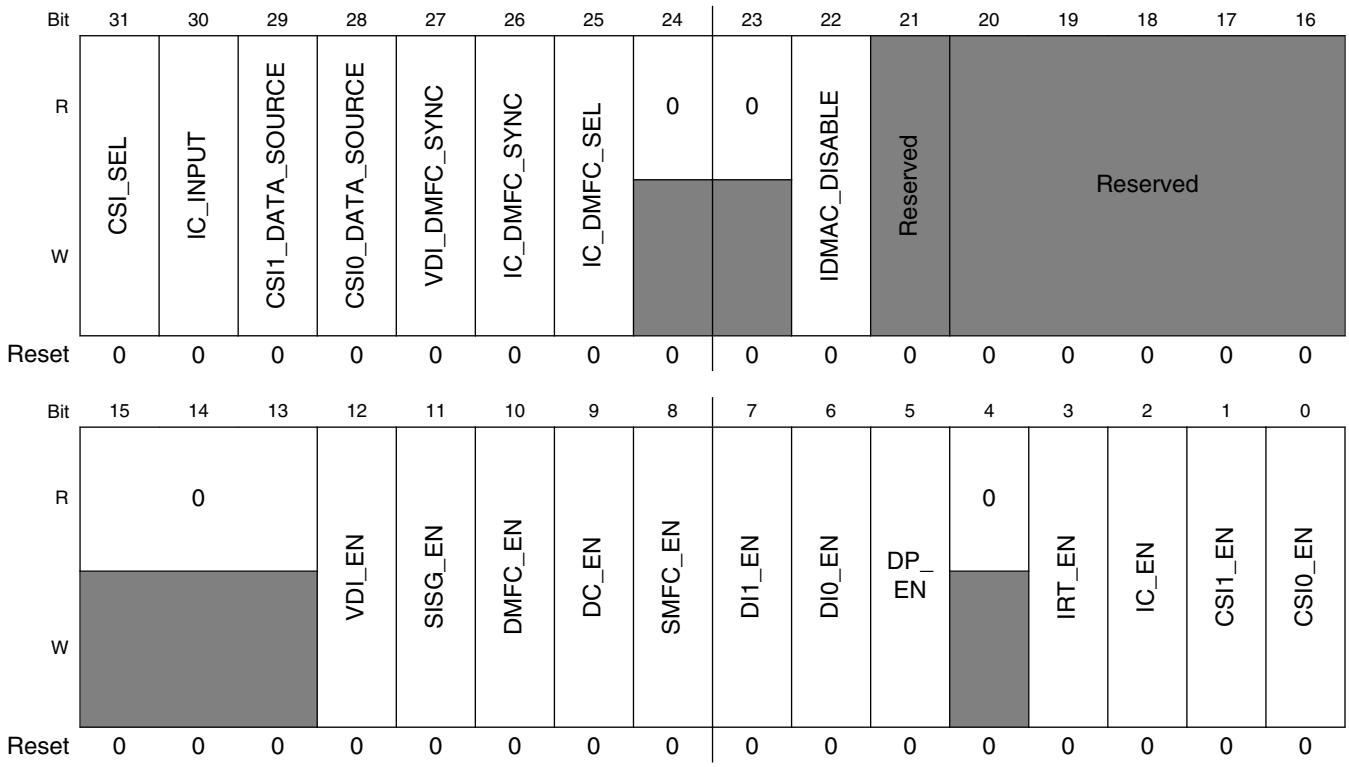
37.5.1 Configuration Register (IPUx_CONF)

Address: Base address + 0h offset



IPUx_CONF field descriptions

Field	Description
31 CSI_SEL	CSI select bit; This bit selects manually between the 2 CSI's. This bit defines which CSI is the input to the IC. This bit is effective only if IC_INPUT is bit cleared 0 CSI0 is selected 1 CSI1 is selected
30 IC_INPUT	IC Input select bit. This bit selects manually between the 2 inputs to the IC 0 CSI0/1 is selected; In order to select between the CSIs use the CSI_SEL bit. 1 VDI
29 CSI1_DATA_ SOURCE	CSI1 data Source This bit selects what is the data source for the CSI1. This is a static mux that should not be changed while CSI1 is working. Data is handles differently if the source is MCT (MIPI) or parallel interface. 0 Parallel interface is connected to CSI1 1 MCT (MIPI) is connected to CSI1
28 CSI0_DATA_ SOURCE	CSI0 data Source This bit selects what is the data source for the CSI0. This is a static mux that should not be changed while CSI0 is working. Data is handles differently if the source is MCT (MIPI) or parallel interface.

Table continues on the next page...

IPUx_CONF field descriptions (continued)

Field	Description
	0 Parallel interface is connected to CSI0 1 MCT (MIPI) is connected to CSI0
27 VDI_DMFC_SYNC	This bit enables the direct path VDIC -> IC_VF -> DMFC for sync flow. If this bit is set IC_DMFC_SEL must be set. 0 the flow is disabled 1 the flow is enabled
26 IC_DMFC_SYNC	IC to DMFC Sync flow This bit defines if the direct flow between IC to DMFC is synchronous or asynchronous 0 async flow 1 Sync flow
25 IC_DMFC_SEL	IC to DMFC select Selects the DMAIC_1 (channel 21) channel's connectivity between the IC and the DMFC 0 DMAIC_1 (channel 21) is routed to the IDMAC 1 DMAIC_1 (channel 21) is routed to DMFC In case DMFC was selected the IDMAC_CH_EN[21] must be clear.
24 Reserved	This read-only field is reserved and always has the value 0.
23 Reserved	This read-only field is reserved and always has the value 0.
22 IDMAC_DISABLE	Image DMA controller (IDMAC) disable bit. This bit allows the user to turn off the clock of the IDMAC if the use case permits it. By default the IDMAC is enabled. 0 IDMAC is enabled 1 IDMAC is disabled
21 -	This field is reserved. Reserved.
20–16 -	This field is reserved. Reserved
15–13 Reserved	This read-only field is reserved and always has the value 0.
12 VDI_EN	VDI enable bit. This bit must be cleared if the ISP_EN bit is set. 0 VDIC is disabled 1 VDIC is enabled
11 SISG_EN	Still Image Synchronization Generator (SISG) Enable bit 0 SISG is disabled 1 SISG is enabled
10 DMFC_EN	Display's Multi FIFO Controller sub-block (DMFC) Enable bit 0 DMFC is disabled 1 DMFC is enabled
9 DC_EN	Display Controller sub-block (DC) Enable bit

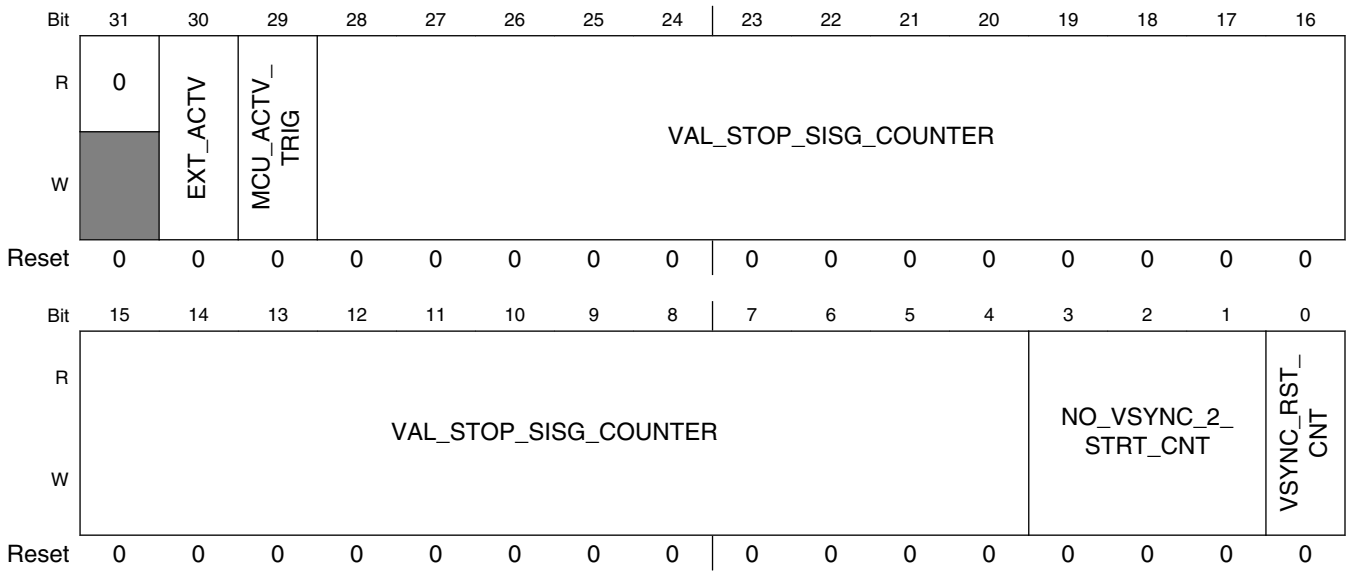
Table continues on the next page...

IPUx_CONF field descriptions (continued)

Field	Description
	0 DC is disabled 1 DC is enabled
8 SMFC_EN	Sensor's Multi FIFO Controller Sub-block (SMFC) Enable bit 0 SMFC is disabled 1 SMFC is enabled
7 DI1_EN	Display Interface Sub-block 1 Enable bit 0 DI1 is disabled 1 DI1 is enabled
6 DI0_EN	Display interface Sub-block 0 Enable bit 0 DI0 is disabled 1 DI0 is enabled
5 DP_EN	Display processor Sub-block Enable bit 0 DP is disabled 1 DP is enabled
4 Reserved	This read-only field is reserved and always has the value 0.
3 IRT_EN	Image Rotation Sub-Block Enable bit 0 IRT is disabled 1 IRT is enabled
2 IC_EN	Image Conversion Sub-Block Enable bit 0 IC is disabled 1 IC is enabled
1 CSI1_EN	Camera Sensor Interface 1 Enable bit 0 CSI1 is disabled 1 CSI1 is enabled
0 CSI0_EN	Camera Sensor Interface 0 Enable bit 0 CSI0 is disabled 1 CSI0 is enabled

37.5.2 SISG Control 0 Register (IPUx_SISG_CTRL0)

Address: Base address + 4h offset

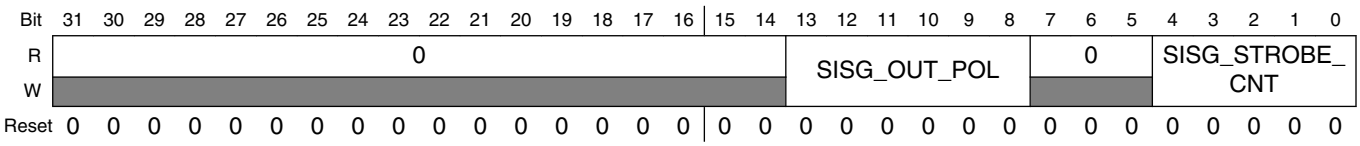


IPUx_SISG_CTRL0 field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30 EXT_ACTV	External Active Define if an external active trigger will start the counters. The external active trigger is an input signal to the IPU called ext_actv_trig
29 MCU_ACTV_TRIG	Reserved, should be cleared.
28–4 VAL_STOP_SISG_COUNTER	SISG Stop Counters value. This is a predefined value that stops the SISG counters. The user should write to this field the N-1 value of the desired value.
3–1 NO_VSYNC_2_STRT_CNT	VSYCs to Start Counter This bits define how many VSYNCs signals will be counter before activating the SISG counters. If set to 0 starts immediately. If set to N (1..7) starts after N VSYNCs.
0 VSYNC_RST_CNT	VSYNC Resets counters Defines if the counters are stooped following VSYNC or when the counters reach a pre defined value (VAL_STOP_SISG_COUNTER) 1 The counters are stopped at VSYNC 0 The counters are stooped when the counters reach the VAL_STOP_SISG_COUNTER value.

37.5.3 SISG Control 1 Register (IPUx_SISG_CTRL1)

Address: Base address + 8h offset

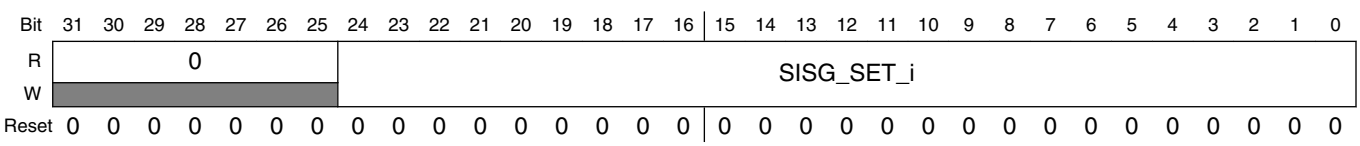


IPUx_SISG_CTRL1 field descriptions

Field	Description
31–14 Reserved	This read-only field is reserved and always has the value 0.
13–8 SISG_OUT_POL	SISG_OUT_POL This bits defines the polarity of the SISG output signals 1 active high 0 active low
7–5 Reserved	This read-only field is reserved and always has the value 0.
SISG_STROBE_CNT	SISG Strobe Count The SISG can repeat the sequence for up to 32 cycles; this is used for generating a train of pulses.

37.5.4 SISG Set<i> Register (IPUx_SISG_SET_i)

Address: Base address + Ch offset



IPUx_SISG_SET_i field descriptions

Field	Description
31–25 Reserved	This read-only field is reserved and always has the value 0.
SISG_SET_i	SISG SET <i> value These bits define the set value of the SISG counter #<i>

37.5.5 SISG Clear <i> Register (IPUx_SISG_CLR_i)

Address: Base address + 24h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0								SISG_CLEAR_i																							
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

IPUx_SISG_CLR_i field descriptions

Field	Description
31–25 Reserved	This read-only field is reserved and always has the value 0.
SISG_CLEAR_i	SISG CLR <i> value These bits define the clear value of the SISG counter #<i>

37.5.6 Interrupt Control Register 1 (IPUx_INT_CTRL_1)

This register contains part of IPU interrupts controls. The controls of EOF (end of frame) of DMA Channels interrupts [31:0] can be found in this register.

Address: Base address + 3Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

IPUx_INT_CTRL_1 field descriptions

Field	Description
31 IDMAC_EOF_EN_31	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
30 Reserved	This read-only field is reserved and always has the value 0. 0 Interrupt is disabled. 1 Interrupt is enabled.
29 IDMAC_EOF_EN_29	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
28 IDMAC_EOF_EN_28	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
27 IDMAC_EOF_EN_27	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
26 IDMAC_EOF_EN_26	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
25 IDMAC_EOF_EN_25	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
24 IDMAC_EOF_EN_24	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
23 IDMAC_EOF_EN_23	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
22 IDMAC_EOF_EN_22	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number.

Table continues on the next page...

IPUx_INT_CTRL_1 field descriptions (continued)

Field	Description
	0 Interrupt is disabled. 1 Interrupt is enabled.
21 IDMAC_EOF_EN_21	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
20 IDMAC_EOF_EN_20	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
19 IDMAC_EOF_EN_19	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
18 IDMAC_EOF_EN_18	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
17 IDMAC_EOF_EN_17	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
16 Reserved	This read-only field is reserved and always has the value 0. 0 Interrupt is disabled. 1 Interrupt is enabled.
15 IDMAC_EOF_EN_15	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
14 IDMAC_EOF_EN_14	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
13 IDMAC_EOF_EN_13	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.

Table continues on the next page...

IPUx_INT_CTRL_1 field descriptions (continued)

Field	Description
12 IDMAC_EOF_EN_12	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
11 IDMAC_EOF_EN_11	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
10 IDMAC_EOF_EN_10	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
9 IDMAC_EOF_EN_9	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
8 IDMAC_EOF_EN_8	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
7–6 Reserved	This read-only field is reserved and always has the value 0. 0 Interrupt is disabled. 1 Interrupt is enabled.
5 IDMAC_EOF_EN_5	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
4 Reserved	This read-only field is reserved and always has the value 0. 0 Interrupt is disabled. 1 Interrupt is enabled.
3 IDMAC_EOF_EN_3	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
2 IDMAC_EOF_EN_2	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number.

Table continues on the next page...

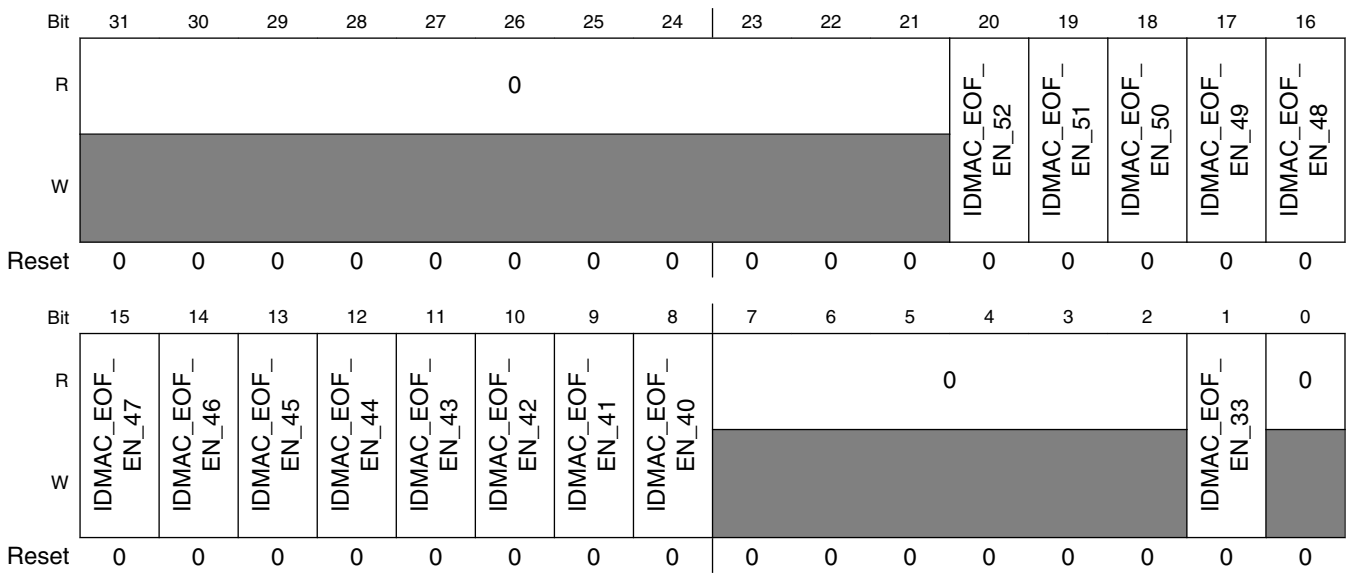
IPUx_INT_CTRL_1 field descriptions (continued)

Field	Description
	0 Interrupt is disabled. 1 Interrupt is enabled.
1 IDMAC_EOF_EN_1	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
0 IDMAC_EOF_EN_0	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.

37.5.7 Interrupt Control Register 2 (IPUx_INT_CTRL_2)

This register contains part of IPU interrupts controls. The controls of EOF (end of frame) of DMA Channels interrupts [63:32] can be found in this register.

Address: Base address + 40h offset



IPUx_INT_CTRL_2 field descriptions

Field	Description
31–21 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

IPUx_INT_CTRL_2 field descriptions (continued)

Field	Description
	0 Interrupt is disabled. 1 Interrupt is enabled.
20 IDMAC_EOF_EN_52	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
19 IDMAC_EOF_EN_51	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
18 IDMAC_EOF_EN_50	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
17 IDMAC_EOF_EN_49	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
16 IDMAC_EOF_EN_48	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
15 IDMAC_EOF_EN_47	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
14 IDMAC_EOF_EN_46	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
13 IDMAC_EOF_EN_45	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
12 IDMAC_EOF_EN_44	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number.

Table continues on the next page...

IPUx_INT_CTRL_2 field descriptions (continued)

Field	Description
	0 Interrupt is disabled. 1 Interrupt is enabled.
11 IDMAC_EOF_EN_43	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
10 IDMAC_EOF_EN_42	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
9 IDMAC_EOF_EN_41	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
8 IDMAC_EOF_EN_40	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
7–2 Reserved	This read-only field is reserved and always has the value 0. 0 Interrupt is disabled. 1 Interrupt is enabled.
1 IDMAC_EOF_EN_33	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
0 Reserved	This read-only field is reserved and always has the value 0. 0 Interrupt is disabled. 1 Interrupt is enabled.

37.5.8 Interrupt Control Register 3 (IPUx_INT_CTRL_3)

This register contains part of IPU interrupts controls. The controls of NFACK (New Frame Ack) of DMA Channels interrupts [31:0] can be found in this register.

Address: Base address + 44h offset

Field	Description
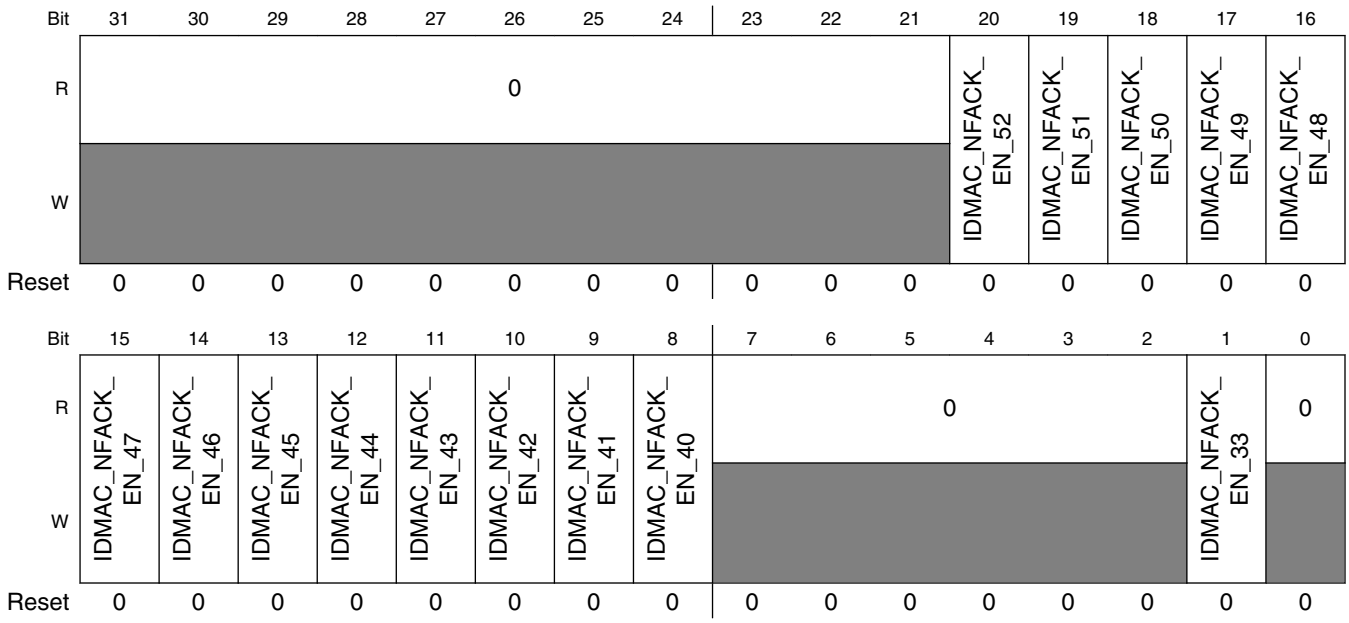
9 IDMAC_NFACK_EN_9	Enable New Frame Ack of Channel interrupt. This bit is the control of New Frame Ack of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
8 IDMAC_NFACK_EN_8	Enable New Frame Ack of Channel interrupt. This bit is the control of New Frame Ack of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
7–6 Reserved	This read-only field is reserved and always has the value 0. 0 Interrupt is disabled. 1 Interrupt is enabled.
5 IDMAC_NFACK_EN_5	Enable New Frame Ack of Channel interrupt. This bit is the control of New Frame Ack of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
4 Reserved	This read-only field is reserved and always has the value 0. 0 Interrupt is disabled. 1 Interrupt is enabled.
3 IDMAC_NFACK_EN_3	Enable New Frame Ack of Channel interrupt. This bit is the control of New Frame Ack of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
2 IDMAC_NFACK_EN_2	Enable New Frame Ack of Channel interrupt. This bit is the control of New Frame Ack of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
1 IDMAC_NFACK_EN_1	Enable New Frame Ack of Channel interrupt. This bit is the control of New Frame Ack of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
0 IDMAC_NFACK_EN_0	Enable New Frame Ack of Channel interrupt. This bit is the control of New Frame Ack of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.

37.5.9 Interrupt Control Register 4 (IPUx_INT_CTRL_4)

This register contains part of IPU interrupts controls. The controls of NFACK (New Frame Ack) of DMA Channels interrupts [63:32] can be found in this register.

Address: Base address + 48h offset



IPUx_INT_CTRL_4 field descriptions

Field	Description
31–21 Reserved	This read-only field is reserved and always has the value 0.
20 IDMAC_NFACK_EN_52	Enable New Frame Ack of Channel interrupt. This bit is the control of New Frame Ack of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
19 IDMAC_NFACK_EN_51	Enable New Frame Ack of Channel interrupt. This bit is the control of New Frame Ack of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
18 IDMAC_NFACK_EN_50	Enable New Frame Ack of Channel interrupt. This bit is the control of New Frame Ack of Channel #n. *n* Indicates the corresponding DMA channel number.

Table continues on the next page...

Field	Description
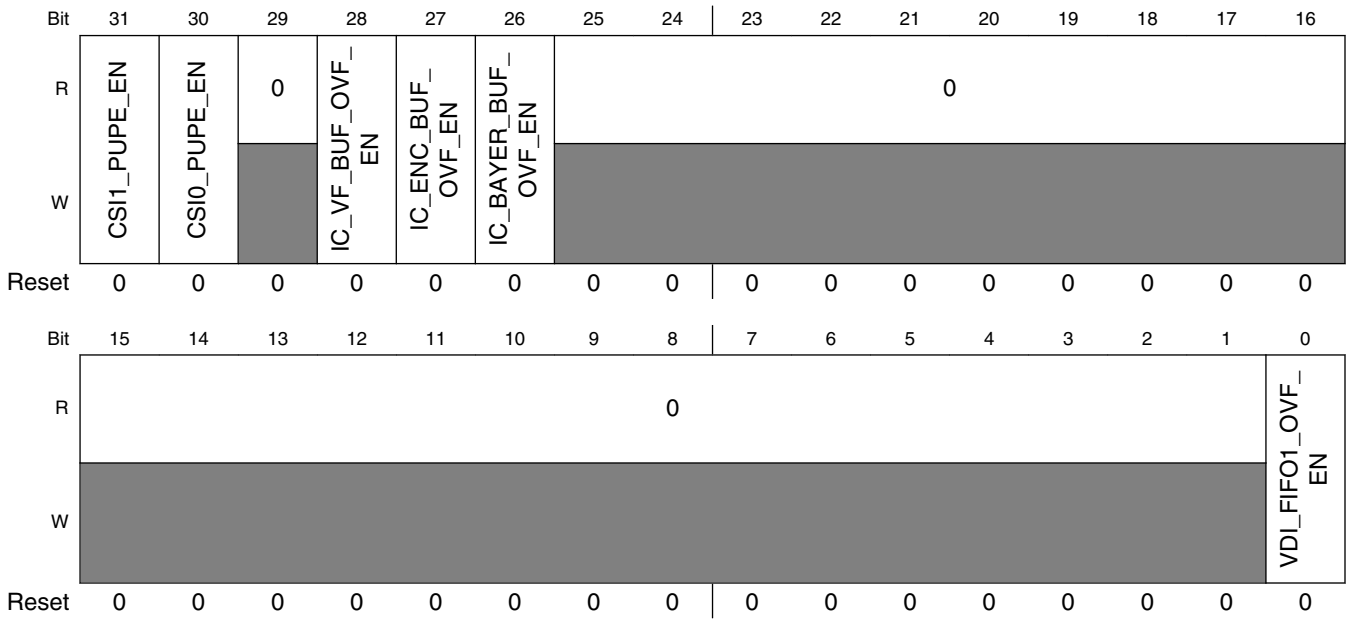
12 IDMAC_EOS_EN_44	End of Scroll of Channel interrupt. This bit is the control of End Of Scroll interrupt of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
11 IDMAC_EOS_EN_43	End of Scroll of Channel interrupt. This bit is the control of End Of Scroll interrupt of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
10 IDMAC_EOS_EN_42	End of Scroll of Channel interrupt. This bit is the control of End Of Scroll interrupt of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
9 IDMAC_EOS_EN_41	End of Scroll of Channel interrupt. This bit is the control of End Of Scroll interrupt of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
8–2 Reserved	This read-only field is reserved and always has the value 0. 0 Interrupt is disabled. 1 Interrupt is enabled.
1 IDMAC_EOS_EN_33	End of Scroll of Channel interrupt. This bit is the control of End Of Scroll interrupt of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
0 Reserved	This read-only field is reserved and always has the value 0. 0 Interrupt is disabled. 1 Interrupt is enabled.

37.5.14 Interrupt Control Register 9 (IPUx_INT_CTRL_9)

This register contains part of IPU interrupts controls. This register controls error interrupt signals coming from different sub-blocks within

Address: Base address + 5Ch offset



IPUx_INT_CTRL_9 field descriptions

Field	Description
31 CSI1_PUPE_EN	CSI1_PUPE_EN - CSI1 parameters update error interrupt enable. This bit enables an interrupt that is a result of an error generated by the CSI1. The error is generated in case where new frame arrived from the CSI1 before the completion of the CSI1's parameters update by the SRM 0 Interrupt is disabled. 1 Interrupt is enabled.
30 CSI0_PUPE_EN	CSI0_PUPE_EN - CSI0 parameters update error interrupt enable. This bit enables an interrupt that is a result of an error generated by the CSI0. The error is generated in case where new frame arrived from the CSI0 before the completion of the CSI0's parameters update by the SRM 0 Interrupt is disabled. 1 Interrupt is enabled.
29 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

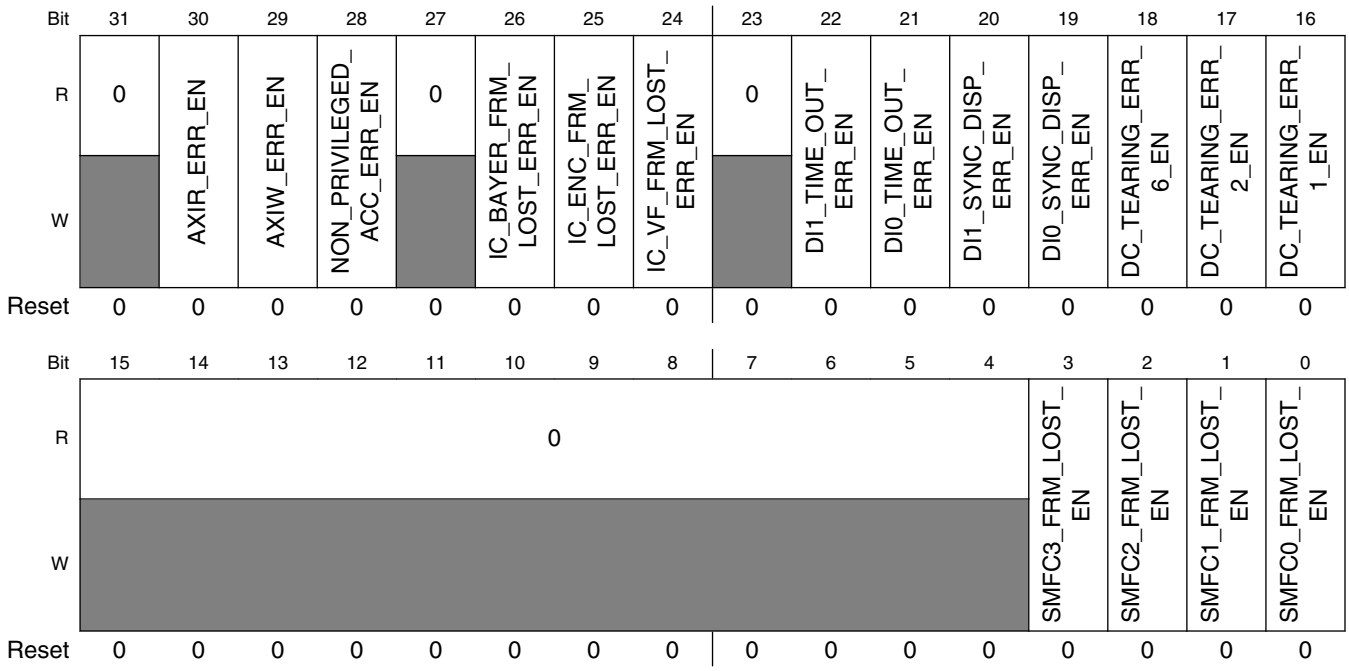
IPUx_INT_CTRL_9 field descriptions (continued)

Field	Description
28 IC_VF_BUF_ OVF_EN	This bit enables an interrupt that is a result of the IC Buffer overflow for view finder coming from the IC. The user needs to write 1 to this bit in order to clear it. 0 Interrupt is disabled. 1 Interrupt is enabled.
27 IC_ENC_BUF_ OVF_EN	This bit enables an interrupt that is a result of the IC Buffer overflow for encoding coming from the IC. The user needs to write 1 to this bit in order to clear it. 0 Interrupt is disabled. 1 Interrupt is enabled.
26 IC_BAYER_ BUF_OVF_EN	This bit enables an interrupt that is a result of the IC Buffer overflow for bayer coming from the IC. The user needs to write 1 to this bit in order to clear it. 0 Interrupt is disabled. 1 Interrupt is enabled.
25–1 Reserved	This read-only field is reserved and always has the value 0.
0 VDI_FIFO1_ OVF_EN	FIFO1 overflow Interrupt1 Enable The VDIC generates FIFO1 overflow interrupt1 when the write pointer of FIFO1 overruns read pointer. 0 Interrupt is disabled. 1 Interrupt is enabled.

37.5.15 Interrupt Control Register 10 (IPUx_INT_CTRL_10)

This register contains part of IPU interrupts controls. This register controls error interrupt signals coming from different modules within

Address: Base address + 60h offset



IPUx_INT_CTRL_10 field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30 AXIR_ERR_EN	This bit enables an interrupt that is a result of AXI read access resulted with error response. 0 Interrupt is disabled. 1 Interrupt is enabled.
29 AXIW_ERR_EN	This bit enables an interrupt that is a result of AXI write access resulted with error response. 0 Interrupt is disabled. 1 Interrupt is enabled.
28 NON_ PRIVILEGED_ ACC_ERR_EN	Non Privileged Access Error interrupt enable. The CPMEM and the DP can be accessed by the ARM platform in privileged mode only HPROT[1] =1. An attempt to access these regions in user mode will issue an interrupt. This bit enables the interrupt. 0 Interrupt is disabled. 1 Interrupt is enabled.

Table continues on the next page...

IPUx_INT_CTRL_10 field descriptions (continued)

Field	Description
27 Reserved	This read-only field is reserved and always has the value 0.
26 IC_BAYER_ FRM_LOST_ ERR_EN	This bit enables an interrupt that is a result of IC's Bayer frame lost. 0 Interrupt is disabled. 1 Interrupt is enabled.
25 IC_ENC_FRM_ LOST_ERR_EN	This bit enables an interrupt that is a result of IC's encoding frame lost. 0 Interrupt is disabled. 1 Interrupt is enabled.
24 IC_VF_FRM_ LOST_ERR_EN	This bit enables an interrupt that is a result of IC's view finder frame lost. 0 Interrupt is disabled. 1 Interrupt is enabled.
23 Reserved	This read-only field is reserved and always has the value 0.
22 DI1_TIME_OUT_ ERR_EN	DI1 time out error interrupt enable This bit enables the interrupt that is a result of a time out error during a read access via DI1 0 Interrupt is disabled. 1 Interrupt is enabled.
21 DI0_TIME_OUT_ ERR_EN	DI0 time outwore interrupt enable This bit enables the interrupt that is a result of a time out error during a read access via DI0 0 Interrupt is disabled. 1 Interrupt is enabled.
20 DI1_SYNC_ DISP_ERR_EN	DI1 Synchronous display error enable This bit enables the interrupt that is a result of an error during access to a synchronous display via DI1 0 Interrupt is disabled. 1 Interrupt is enabled.
19 DI0_SYNC_ DISP_ERR_EN	DI0 Synchronous display error enable This bit enables the interrupt that is a result of an error during access to a synchronous display via DI0 0 Interrupt is disabled. 1 Interrupt is enabled.
18 DC_TEARING_ ERR_6_EN	Tearing Error #6 enable This bit enables the interrupt that is a result of tearing error while the anti tearing mechanism is activated for DC channel 6 0 Interrupt is disabled. 1 Interrupt is enabled.
17 DC_TEARING_ ERR_2_EN	Tearing Error #2 enable This bit enables the interrupt that is a result of tearing error while the anti tearing mechanism is activated for DC channel 2

Table continues on the next page...

IPUx_INT_CTRL_10 field descriptions (continued)

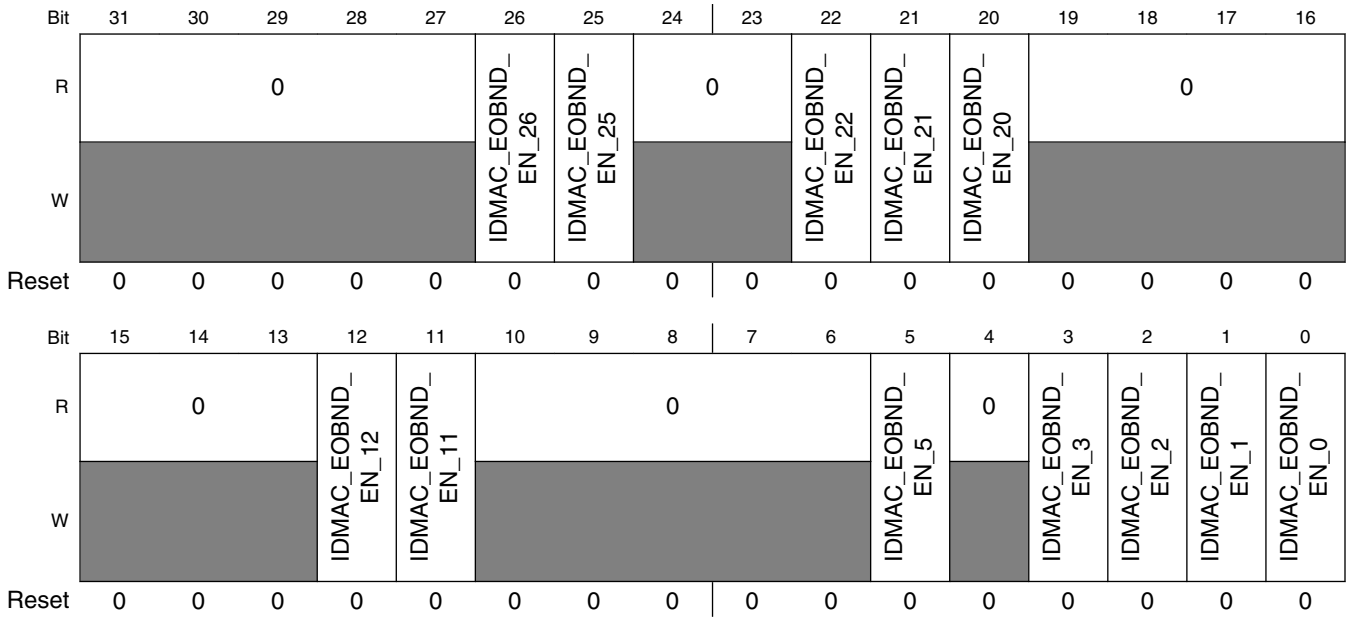
Field	Description
	0 Interrupt is disabled. 1 Interrupt is enabled.
16 DC_TEARING_ERR_1_EN	Tearing Error #1 enable This bit enables the interrupt that is a result of tearing error while the anti tearing mechanism is activated for DC channel 1 0 Interrupt is disabled. 1 Interrupt is enabled.
15–4 Reserved	This read-only field is reserved and always has the value 0.
3 SMFC3_FRM_LOST_EN	Frame Lost of SMFC channel 3 interrupt enable bit This bit enables an interrupt that is a result of a Frame Lost of SMFC channel 3. 0 Interrupt is disabled. 1 Interrupt is enabled.
2 SMFC2_FRM_LOST_EN	Frame Lost of SMFC channel 2 interrupt enable bit This bit enables an interrupt that is a result of a Frame Lost of SMFC channel 2. 0 Interrupt is disabled. 1 Interrupt is enabled.
1 SMFC1_FRM_LOST_EN	Frame Lost of SMFC channel 1 interrupt enable bit This bit enables an interrupt that is a result of a Frame Lost of SMFC channel 1. 0 Interrupt is disabled. 1 Interrupt is enabled.
0 SMFC0_FRM_LOST_EN	Frame Lost of SMFC channel 0 interrupt enable bit This bit enables an interrupt that is a result of a Frame Lost of SMFC channel 0. 0 Interrupt is disabled. 1 Interrupt is enabled.

37.5.16 Interrupt Control Register 11 (IPUx_INT_CTRL_11)

This register contains part of IPU interrupts controls. The controls of the end-of-band indication (EOBND) of DMA Channels interrupts [31:0] can be found in this register.

- Hide VDOA_SYNC for all versions
- Show VDOA_SYNC for IPUv3H version.
- The table below tagged with other settings (like IPU3M_only) should be hidden in IPUv3H version.

Address: Base address + 64h offset



IPU*x*_INT_CTRL_11 field descriptions

Field	Description
31–27 Reserved	This read-only field is reserved and always has the value 0. 0 Interrupt is disabled. 1 Interrupt is enabled.
26 IDMAC_EOBND_EN_26	end-of-band indication of Channel interrupt. This bit is the control of end-of-band interrupt of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
25 IDMAC_EOBND_EN_25	end-of-band indication of Channel interrupt. This bit is the control of end-of-band interrupt of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
24–23 Reserved	This read-only field is reserved and always has the value 0. 0 Interrupt is disabled. 1 Interrupt is enabled.
22 IDMAC_EOBND_EN_22	end-of-band indication of Channel interrupt. This bit is the control of end-of-band interrupt of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
21 IDMAC_EOBND_EN_21	end-of-band indication of Channel interrupt. This bit is the control of end-of-band interrupt of Channel #n. *n* Indicates the corresponding DMA channel number.

Table continues on the next page...

IPUx_INT_CTRL_15 field descriptions

Field	Description
31 DI1_CNT_EN_PRE_8_EN	This bit enables the interrupt that is a result of a trigger generated by counter #8 of DI1 0 Interrupt is disabled. 1 Interrupt is enabled.
30 DI1_CNT_EN_PRE_3_EN	This bit enables the interrupt that is a result of a trigger generated by counter #3 of DI1 0 Interrupt is disabled. 1 Interrupt is enabled.
29 DI1_DISP_CLK_EN_PRE_EN	DI1_DISP_CLK_EN_PRE_EN

Table continues on the next page...

IPUx_INT_CTRL_15 field descriptions (continued)

Field	Description
	0 Interrupt is disabled. 1 Interrupt is enabled.
28 DI0_CNT_EN_PRE_10_EN	This bit enables the interrupt that is a result of a trigger generated by counter #10 of DI0 0 Interrupt is disabled. 1 Interrupt is enabled.
27 DI0_CNT_EN_PRE_9_EN	This bit enables the interrupt that is a result of a trigger generated by counter #9 of DI0 0 Interrupt is disabled. 1 Interrupt is enabled.
26 DI0_CNT_EN_PRE_8_EN	This bit enables the interrupt that is a result of a trigger generated by counter #8 of DI0 0 Interrupt is disabled. 1 Interrupt is enabled.
25 DI0_CNT_EN_PRE_7_EN	This bit enables the interrupt that is a result of a trigger generated by counter #7 of DI0 0 Interrupt is disabled. 1 Interrupt is enabled.
24 DI0_CNT_EN_PRE_6_EN	This bit enables the interrupt that is a result of a trigger generated by counter #6 of DI0 0 Interrupt is disabled. 1 Interrupt is enabled.
23 DI0_CNT_EN_PRE_5_EN	This bit enables the interrupt that is a result of a trigger generated by counter #5 of DI0 0 Interrupt is disabled. 1 Interrupt is enabled.
22 DI0_CNT_EN_PRE_4_EN	This bit enables the interrupt that is a result of a trigger generated by counter #4 of DI0 0 Interrupt is disabled. 1 Interrupt is enabled.
21 DI0_CNT_EN_PRE_3_EN	This bit enables the interrupt that is a result of a trigger generated by counter #3 of DI0 0 Interrupt is disabled. 1 Interrupt is enabled.
20 DI0_CNT_EN_PRE_2_EN	This bit enables the interrupt that is a result of a trigger generated by counter #2 of DI0 0 Interrupt is disabled. 1 Interrupt is enabled.
19 DI0_CNT_EN_PRE_1_EN	This bit enables the interrupt that is a result of a trigger generated by counter #1 of DI0 0 Interrupt is disabled. 1 Interrupt is enabled.
18 DI0_CNT_EN_PRE_0_EN	This bit enables the interrupt that is a result of a trigger generated by counter #0 of DI0 0 Interrupt is disabled. 1 Interrupt is enabled.
17 DC_ASYNC_STOP_EN	This bit enables the interrupt asserted anytime the DP stops an async flow and moves to a sync flow

Table continues on the next page...

IPUx_INT_CTRL_15 field descriptions (continued)

Field	Description
	0 Interrupt is disabled. 1 Interrupt is enabled.
16 DC_DP_START_EN	This bit enables the interrupt asserted anytime the DP start a new sync or async flow or when an async flow is interrupted by a sync flow 0 Interrupt is disabled. 1 Interrupt is enabled.
15 DI_VSYNC_PRE_1_EN	This bit enables the DI1 interrupt indicating of a VSYNC signal asserted 2 rows before the VSYNC sent to the display 0 Interrupt is disabled. 1 Interrupt is enabled.
14 DI_VSYNC_PRE_0_EN	This bit enables the DI0 interrupt indicating of a VSYNC signal asserted 2 rows before the VSYNC sent to the display 0 Interrupt is disabled. 1 Interrupt is enabled.
13 DC_FC_6_EN	This bit enables the DC Frame Complete on channel #6 interrupt 0 Interrupt is disabled. 1 Interrupt is enabled.
12 DC_FC_4_EN	This bit enables the DC Frame Complete on channel #4 interrupt 0 Interrupt is disabled. 1 Interrupt is enabled.
11 DC_FC_3_EN	This bit enables the DC Frame Complete on channel #3 interrupt 0 Interrupt is disabled. 1 Interrupt is enabled.
10 DC_FC_2_EN	This bit enables the DC Frame Complete on channel #2 interrupt 0 Interrupt is disabled. 1 Interrupt is enabled.
9 DC_FC_1_EN	This bit enables they'd Frame Complete on channel #1 interrupt 0 Interrupt is disabled. 1 Interrupt is enabled.
8 DC_FC_0_EN	This bit enables they'd Frame Complete on channel #0 interrupt 0 Interrupt is disabled. 1 Interrupt is enabled.
7 DP_ASF_BRAKE_EN	DP Async Flow Brake enable bit. This bit enables the interrupt that is a result of the async flow brake at the DP 0 Interrupt is disabled. 1 Interrupt is enabled.
6 DP_SF_BRAKE_EN	DP Sync Flow Brake enable bit. This bit enables the interrupt that is a result of the Sync flow brake at the DP

Table continues on the next page...

IPUx_INT_CTRL_15 field descriptions (continued)

Field	Description
	0 Interrupt is disabled. 1 Interrupt is enabled.
5 DP_ASF_END_EN	DP Async Flow End enable bit. This bit enables the interrupt that is a result of the Async flow end at the DP 0 Interrupt is disabled. 1 Interrupt is enabled.
4 DP_ASF_START_EN	DP Async Flow Start enable bit. This bit enables the interrupt that is a result of the Async flow start at the DP 0 Interrupt is disabled. 1 Interrupt is enabled.
3 DP_SF_END_EN	DP Sync Flow End enable bit. This bit enables the interrupt that is a result of the Sync flow end at the DP 0 Interrupt is disabled. 1 Interrupt is enabled.
2 DP_SF_START_EN	DP Sync Flow Start enable bit. This bit enables the interrupt that is a result of the Sync flow start at the DP 0 Interrupt is disabled. 1 Interrupt is enabled.
1 SNOOPING2_INT_EN	IPU snooping 2 interrupt enable bit. This bit enables the interrupt that is a result of the detection of a snooping 2 signal assertion coming to the IPU 0 Interrupt is disabled. 1 Interrupt is enabled.
0 SNOOPING1_INT_EN	IPU snooping 1 interrupt enable bit. This bit enables the interrupt that is a result of the detection of a snooping 1 signal assertion coming to the IPU 0 Interrupt is disabled. 1 Interrupt is enabled.

37.5.21 SDMA Event Control Register 1 (IPUx_SDMA_EVENT_1)

This register contains part of IPU SDMA events controls. The controls of EOF (end of frame) of DMA Channels SDMA events [31:0] can be found in this register.

Address: Base address + 78h offset

IPUx_SDMA_EVENT_1 field descriptions

Field	Description
31 IDMAC_EOF_SDMA_EN_31	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
30 Reserved	This read-only field is reserved and always has the value 0. 0 SDMA event is disabled. 1 SDMA event is enabled.
29 IDMAC_EOF_SDMA_EN_29	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
28 IDMAC_EOF_SDMA_EN_28	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number.

Table continues on the next page...

IPUx_SDMA_EVENT_1 field descriptions (continued)

Field	Description
	0 SDMA event is disabled. 1 SDMA event is enabled.
27 IDMAC_EOF_ SDMA_EN_27	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
26 IDMAC_EOF_ SDMA_EN_26	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
25 IDMAC_EOF_ SDMA_EN_25	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
24 IDMAC_EOF_ SDMA_EN_24	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
23 IDMAC_EOF_ SDMA_EN_23	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
22 IDMAC_EOF_ SDMA_EN_22	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
21 IDMAC_EOF_ SDMA_EN_21	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
20 IDMAC_EOF_ SDMA_EN_20	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
19 IDMAC_EOF_ SDMA_EN_19	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number.

8 IDMAC_NFACK_SDMA_EN_8	Enable New Frame Acknowledge of Channel SDMA event. This bit is the control of New Frame Acknowledge of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
7–6 Reserved	This read-only field is reserved and always has the value 0. 0 SDMA event is disabled. 1 SDMA event is enabled.
5 IDMAC_NFACK_SDMA_EN_5	Enable New Frame Acknowledge of Channel SDMA event. This bit is the control of New Frame Acknowledge of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
4 Reserved	This read-only field is reserved and always has the value 0. 0 SDMA event is disabled. 1 SDMA event is enabled.
3 IDMAC_NFACK_SDMA_EN_3	Enable New Frame Acknowledge of Channel SDMA event. This bit is the control of New Frame Acknowledge of Channel #n. *n* Indicates the corresponding DMA channel number.

Table continues on the next page...

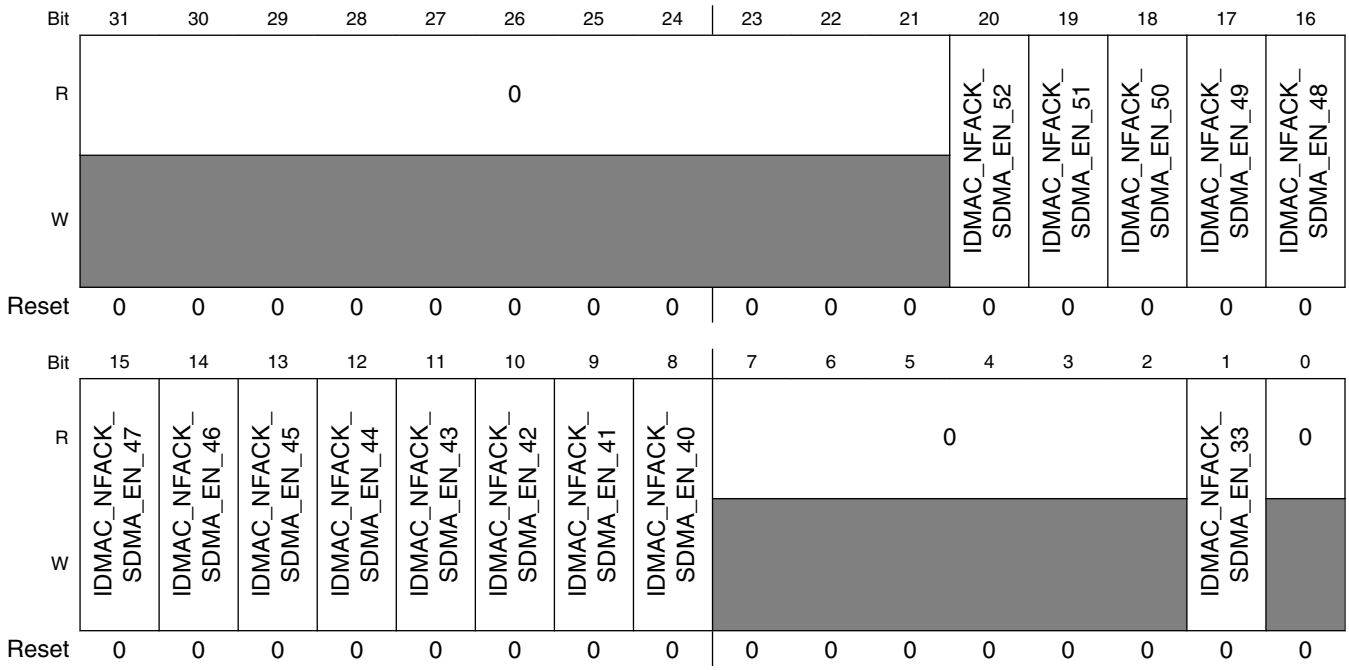
IPUx_SDMA_EVENT_3 field descriptions (continued)

Field	Description
	0 SDMA event is disabled. 1 SDMA event is enabled.
2 IDMAC_NFACK_SDMA_EN_2	Enable New Frame Acknowledge of Channel SDMA event. This bit is the control of New Frame Acknowledge of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
1 IDMAC_NFACK_SDMA_EN_1	Enable New Frame Acknowledge of Channel SDMA event. This bit is the control of New Frame Acknowledge of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
0 IDMAC_NFACK_SDMA_EN_0	Enable New Frame Acknowledge of Channel SDMA event. This bit is the control of New Frame Acknowledge of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.

37.5.24 SDMA Event Control Register 4 (IPUx_SDMA_EVENT_4)

This register contains part of IPU SDMA events controls. The controls of NFACK (New Frame Acknowledge) of DMA Channels SDMA events [63:32] can be found in this register.

Address: Base address + 84h offset



IPUx_SDMA_EVENT_4 field descriptions

Field	Description
31–21 Reserved	This read-only field is reserved and always has the value 0. 0 SDMA event is disabled. 1 SDMA event is enabled.
20 IDMAC_NFACK_SDMA_EN_52	Enable New Frame Acknowledge of Channel SDMA event. This bit is the control of New Frame Acknowledge of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
19 IDMAC_NFACK_SDMA_EN_51	Enable New Frame Acknowledge of Channel SDMA event. This bit is the control of New Frame Acknowledge of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.

Table continues on the next page...

IPUx_SDMA_EVENT_4 field descriptions (continued)

Field	Description
18 IDMAC_NFACK_SDMA_EN_50	Enable New Frame Acknowledge of Channel SDMA event. This bit is the control of New Frame Acknowledge of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
17 IDMAC_NFACK_SDMA_EN_49	Enable New Frame Acknowledge of Channel SDMA event. This bit is the control of New Frame Acknowledge of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
16 IDMAC_NFACK_SDMA_EN_48	Enable New Frame Acknowledge of Channel SDMA event. This bit is the control of New Frame Acknowledge of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
15 IDMAC_NFACK_SDMA_EN_47	Enable New Frame Acknowledge of Channel SDMA event. This bit is the control of New Frame Acknowledge of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
14 IDMAC_NFACK_SDMA_EN_46	Enable New Frame Acknowledge of Channel SDMA event. This bit is the control of New Frame Acknowledge of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
13 IDMAC_NFACK_SDMA_EN_45	Enable New Frame Acknowledge of Channel SDMA event. This bit is the control of New Frame Acknowledge of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
12 IDMAC_NFACK_SDMA_EN_44	Enable New Frame Acknowledge of Channel SDMA event. This bit is the control of New Frame Acknowledge of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
11 IDMAC_NFACK_SDMA_EN_43	Enable New Frame Acknowledge of Channel SDMA event. This bit is the control of New Frame Acknowledge of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.

Table continues on the next page...

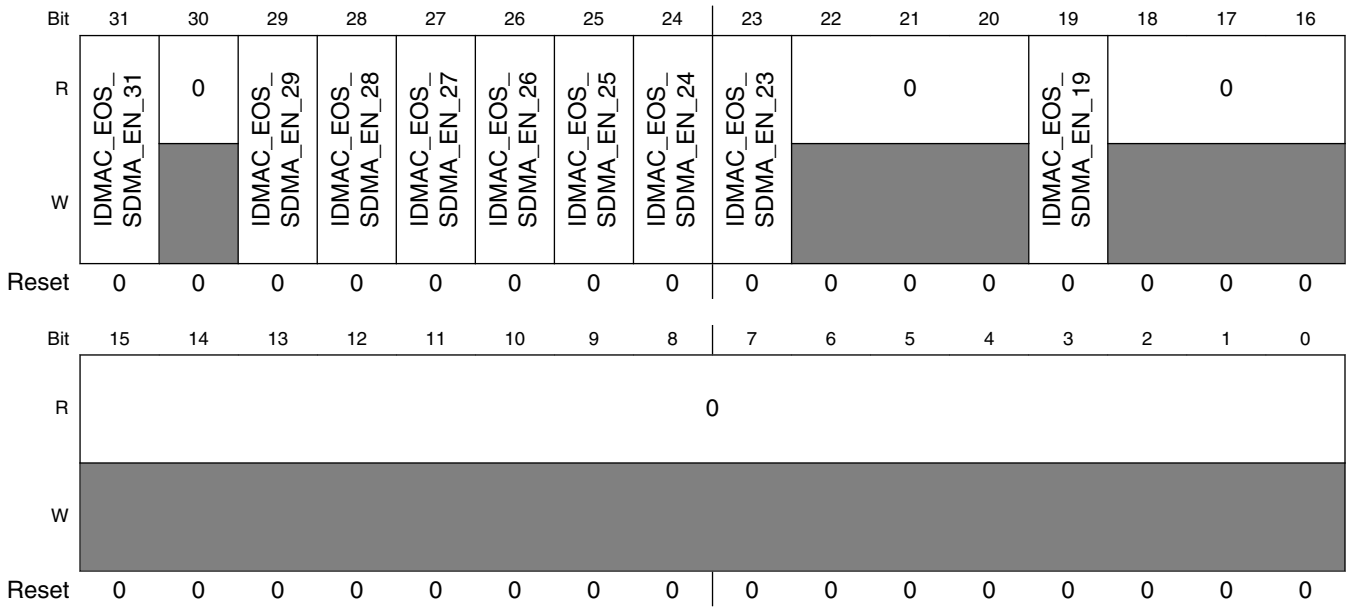
IPUx_SDMA_EVENT_4 field descriptions (continued)

Field	Description
10 IDMAC_NFACK_SDMA_EN_42	Enable New Frame Acknowledge of Channel SDMA event. This bit is the control of New Frame Acknowledge of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
9 IDMAC_NFACK_SDMA_EN_41	Enable New Frame Acknowledge of Channel SDMA event. This bit is the control of New Frame Acknowledge of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
8 IDMAC_NFACK_SDMA_EN_40	Enable New Frame Acknowledge of Channel SDMA event. This bit is the control of New Frame Acknowledge of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
7–2 Reserved	This read-only field is reserved and always has the value 0. 0 SDMA event is disabled. 1 SDMA event is enabled.
1 IDMAC_NFACK_SDMA_EN_33	Enable New Frame Acknowledge of Channel SDMA event. This bit is the control of New Frame Acknowledge of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
0 Reserved	This read-only field is reserved and always has the value 0. 0 SDMA event is disabled. 1 SDMA event is enabled.

37.5.25 SDMA Event Control Register 7 (IPUx_SDMA_EVENT_7)

This register contains part of IPU SDMA events controls. The controls of EOS (End of Scroll) of DMA Channels SDMA events [31:0] can be found in this register.

Address: Base address + 88h offset



IPUx_SDMA_EVENT_7 field descriptions

Field	Description
31 IDMAC_EOS_SDMA_EN_31	Enable End of Scroll of Channel SDMA event. This bit is the control of End Of Scroll of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
30 Reserved	This read-only field is reserved and always has the value 0. 0 SDMA event is disabled. 1 SDMA event is enabled.
29 IDMAC_EOS_SDMA_EN_29	Enable End of Scroll of Channel SDMA event. This bit is the control of End Of Scroll of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
28 IDMAC_EOS_SDMA_EN_28	Enable End of Scroll of Channel SDMA event. This bit is the control of End Of Scroll of Channel #n. *n* Indicates the corresponding DMA channel number.

Table continues on the next page...

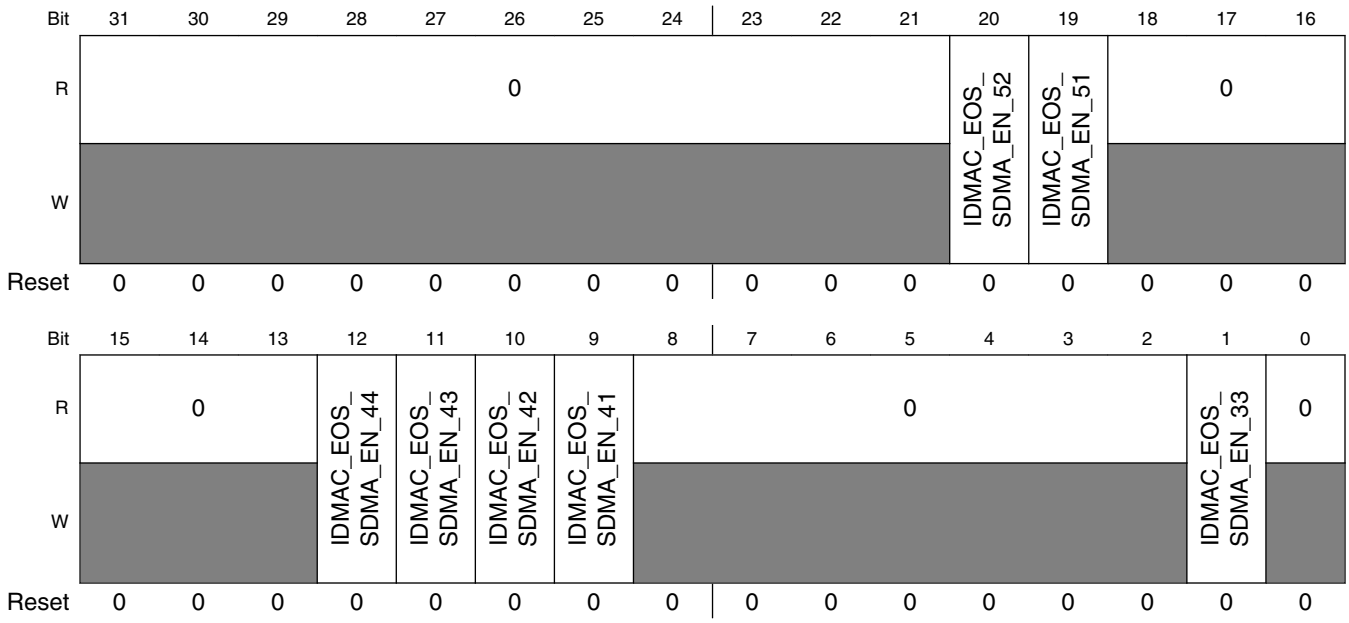
IPUx_SDMA_EVENT_7 field descriptions (continued)

Field	Description
	0 SDMA event is disabled. 1 SDMA event is enabled.
27 IDMAC_EOS_ SDMA_EN_27	Enable End of Scroll of Channel SDMA event. This bit is the control of End Of Scroll of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
26 IDMAC_EOS_ SDMA_EN_26	Enable End of Scroll of Channel SDMA event. This bit is the control of End Of Scroll of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
25 IDMAC_EOS_ SDMA_EN_25	Enable End of Scroll of Channel SDMA event. This bit is the control of End Of Scroll of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
24 IDMAC_EOS_ SDMA_EN_24	Enable End of Scroll of Channel SDMA event. This bit is the control of End Of Scroll of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
23 IDMAC_EOS_ SDMA_EN_23	Enable End of Scroll of Channel SDMA event. This bit is the control of End Of Scroll of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
22–20 Reserved	This read-only field is reserved and always has the value 0. 0 SDMA event is disabled. 1 SDMA event is enabled.
19 IDMAC_EOS_ SDMA_EN_19	Enable End of Scroll of Channel SDMA event. This bit is the control of End Of Scroll of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
Reserved	This read-only field is reserved and always has the value 0. 0 SDMA event is disabled. 1 SDMA event is enabled.

37.5.26 SDMA Event Control Register 8 (IPUx_SDMA_EVENT_8)

This register contains part of IPU SDMA events controls. The controls of EOS (End of Scroll) of DMA Channels SDMA events [63:32] can be found in this register.

Address: Base address + 8Ch offset



IPUx_SDMA_EVENT_8 field descriptions

Field	Description
31–21 Reserved	This read-only field is reserved and always has the value 0. 0 SDMA event is disabled. 1 SDMA event is enabled.
20 IDMAC_EOS_SDMA_EN_52	Enable End of Scroll of Channel SDMA event. This bit is the control of End Of Scroll of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
19 IDMAC_EOS_SDMA_EN_51	Enable End of Scroll of Channel SDMA event. This bit is the control of End Of Scroll of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
18–13 Reserved	This read-only field is reserved and always has the value 0. 0 SDMA event is disabled. 1 SDMA event is enabled.

Table continues on the next page...

IPUx_SDMA_EVENT_8 field descriptions (continued)

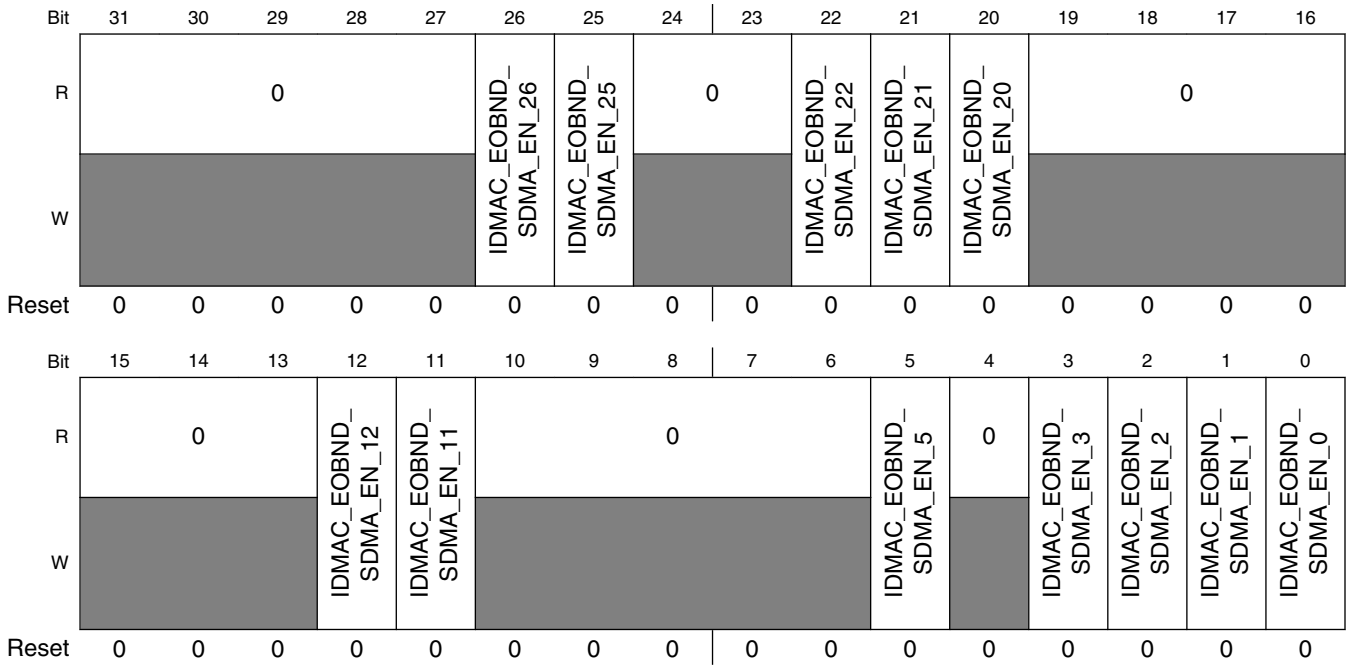
Field	Description
12 IDMAC_EOS_ SDMA_EN_44	Enable End of Scroll of Channel SDMA event. This bit is the control of End Of Scroll of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
11 IDMAC_EOS_ SDMA_EN_43	Enable End of Scroll of Channel SDMA event. This bit is the control of End Of Scroll of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
10 IDMAC_EOS_ SDMA_EN_42	Enable End of Scroll of Channel SDMA event. This bit is the control of End Of Scroll of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
9 IDMAC_EOS_ SDMA_EN_41	Enable End of Scroll of Channel SDMA event. This bit is the control of End Of Scroll of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
8–2 Reserved	This read-only field is reserved and always has the value 0. 0 SDMA event is disabled. 1 SDMA event is enabled.
1 IDMAC_EOS_ SDMA_EN_33	Enable End of Scroll of Channel SDMA event. This bit is the control of End Of Scroll of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
0 Reserved	This read-only field is reserved and always has the value 0. 0 SDMA event is disabled. 1 SDMA event is enabled.

37.5.27 SDMA Event Control Register 11 (IPUx_SDMA_EVENT_11)

This register contains part of IPU SDMA events controls. The controls of EOBND (End of Band) of DMA Channels SDMA events [31:0] can be found in this register.

- Hide VDOA_SYNC for all versions
- Show VDOA_SYNC for IPUv3H version.
- The table below tagged with other settings (like IPU3M_only) should be hidden in IPUv3H version.

Address: Base address + 90h offset



IPUx_SDMA_EVENT_11 field descriptions

Field	Description
31–27 Reserved	This read-only field is reserved and always has the value 0. 0 SDMA event is disabled. 1 SDMA event is enabled.
26 IDMAC_EOBND_SDMA_EN_26	Enable End of Band of Channel SDMA event. This bit is the control of End Of Band of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
25 IDMAC_EOBND_SDMA_EN_25	Enable End of Band of Channel SDMA event. This bit is the control of End Of Band of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
24–23 Reserved	This read-only field is reserved and always has the value 0. 0 SDMA event is disabled. 1 SDMA event is enabled.
22 IDMAC_EOBND_SDMA_EN_22	Enable End of Band of Channel SDMA event. This bit is the control of End Of Band of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
21 IDMAC_EOBND_SDMA_EN_21	Enable End of Band of Channel SDMA event. This bit is the control of End Of Band of Channel #n. *n* Indicates the corresponding DMA channel number.

Table continues on the next page...

Field	Description
18 IDMAC_TH_ SDMA_EN_50	Threshold of Channel SDMA event. This bit is the control of Threshold of Channel #n. n Indicates the corresponding DMA channel number. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
17 IDMAC_TH_ SDMA_EN_49	Threshold of Channel SDMA event. This bit is the control of Threshold of Channel #n. n Indicates the corresponding DMA channel number. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
16 IDMAC_TH_ SDMA_EN_48	Threshold of Channel SDMA event. This bit is the control of Threshold of Channel #n. n Indicates the corresponding DMA channel number. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
15 IDMAC_TH_ SDMA_EN_47	Threshold of Channel SDMA event. This bit is the control of Threshold of Channel #n. n Indicates the corresponding DMA channel number. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
14 IDMAC_TH_ SDMA_EN_46	Threshold of Channel SDMA event. This bit is the control of Threshold of Channel #n. n Indicates the corresponding DMA channel number. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
13 IDMAC_TH_ SDMA_EN_45	Threshold of Channel SDMA event. This bit is the control of Threshold of Channel #n. n Indicates the corresponding DMA channel number. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
12 IDMAC_TH_ SDMA_EN_44	Threshold of Channel SDMA event. This bit is the control of Threshold of Channel #n. n Indicates the corresponding DMA channel number. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
11 IDMAC_TH_ SDMA_EN_43	Threshold of Channel SDMA event. This bit is the control of Threshold of Channel #n. n Indicates the corresponding DMA channel number. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.

Table continues on the next page...

IPUx_SDMA_EVENT_14 field descriptions (continued)

Field	Description
10 IDMAC_TH_ SDMA_EN_42	Threshold of Channel SDMA event. This bit is the control of Threshold of Channel #n. n Indicates the corresponding DMA channel number. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
9 IDMAC_TH_ SDMA_EN_41	Threshold of Channel SDMA event. This bit is the control of Threshold of Channel #n. n Indicates the corresponding DMA channel number. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
8 IDMAC_TH_ SDMA_EN_40	Threshold of Channel SDMA event. This bit is the control of Threshold of Channel #n. n Indicates the corresponding DMA channel number. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
7–2 Reserved	This read-only field is reserved and always has the value 0. 0 SDMA event is disabled. 1 SDMA event is enabled.
1 IDMAC_TH_ SDMA_EN_33	Threshold of Channel SDMA event. This bit is the control of Threshold of Channel #n. n Indicates the corresponding DMA channel number. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
0 Reserved	This read-only field is reserved and always has the value 0. 0 SDMA event is disabled. 1 SDMA event is enabled.

37.5.31 Shadow Registers Memory Priority 1 Register (IPUx_SRM_PRI1)

The register controls the priority of SRM updates. The priority level for each block that has a shadow of its registers in the SRM should be unique. The priority level defines the order of SRM updates. A block with priority set to 010 will be updated before a block with priority set to 001.

Address: Base address + A0h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

IPUx_SRM_PRI1 field descriptions

Field	Description
31–13 Reserved	This read-only field is reserved and always has the value 0.
12–11 CSI0_SRM_MODE	CSI0 SRM Mode This field controls the SRM logic that handles the CSI0 registers 00 Automatic swapping is disabled; ARM platform is allowed to access the CSI1's region in the RAM 01 The SRM logic is controlled by the FSU. The update will be done of the next frame. 10 The SRM logic is controlled by the FSU. Registers are swapped continuously frame by frame 11 Update now. The SRM is controlled by the ARM Platform. The Register will be update now
10–8 CSI0_SRM_PRI	CSI0 SRM priority This bits define the priority of the CSI1 block
7–5 Reserved	This read-only field is reserved and always has the value 0.
4–3 CSI1_SRM_MODE	CSI1 SRM Mode This field controls the SRM logic that handles the CSI1 registers 00 Automatic swapping is disabled; ARM platform is allowed to access the CSI0's region in the RAM 01 The SRM logic is controlled by the FSU. The update will be done of the next frame. 10 The SRM logic is controlled by the FSU. Registers are swapped continuously frame by frame 11 Update now. The SRM is controlled by the ARM platform. The Register will be update now
CSI1_SRM_PRI	CSI1 SRM priority This bits define the priority of the CSI0 module

37.5.32 Shadow Registers Memory Priority 2 Register (IPUx_SRM_PRI2)

The register controls the priority of SRM updates. The priority level for each block that has a shadow of its registers in the SRM should be unique. The priority level defines the order of SRM updates. a block with priority set to 010 will be updated before a block with priority set to 001.

IPUx_SRM_PRI2 field descriptions

Field	Description
31–29 Reserved	This read-only field is reserved and always has the value 0.
28–27 DI1_SRM_MODE	DCI1 SRM Mode This field controls the SRM logic that handles the DI1 registers 00 Automatic swapping is disabled; ARM platform is allowed to access the DI1 region in the RAM 01 The SRM logic is controlled by the FSU. The update will be done of the next frame. 10 The SRM logic is controlled by the FSU. Registers are swapped continuously frame by frame 11 Update now. The SRM is controlled by the ARM platform. The Register will be update now
26–24 DI1_SRM_PRI	DI1 SRM priority This bits define the priority of the DI1 module
23–21 Reserved	This read-only field is reserved and always has the value 0.
20–19 DI0_SRM_MCU_USE	DI0 SRM is used by ARM platform This bit indicates that the registers of the DI0 are currently being updated by the ARM platform. The ARM platform should set this bit before accessing the SRM part that is relevant to the DI0. The ARM platform should clear this bit when the update procedure is finished. When this bit is set the SRM mechanism will not update the DI0's registers to avoid data coherency problems. 1 DI0 SRM is currently updated by the ARM platform 0 DI0 SRM s currently not updated by the ARM platform
18–16 DI0_SRM_PRI	DI0 SRM priority This bits define the priority of the DI0 module

Table continues on the next page...

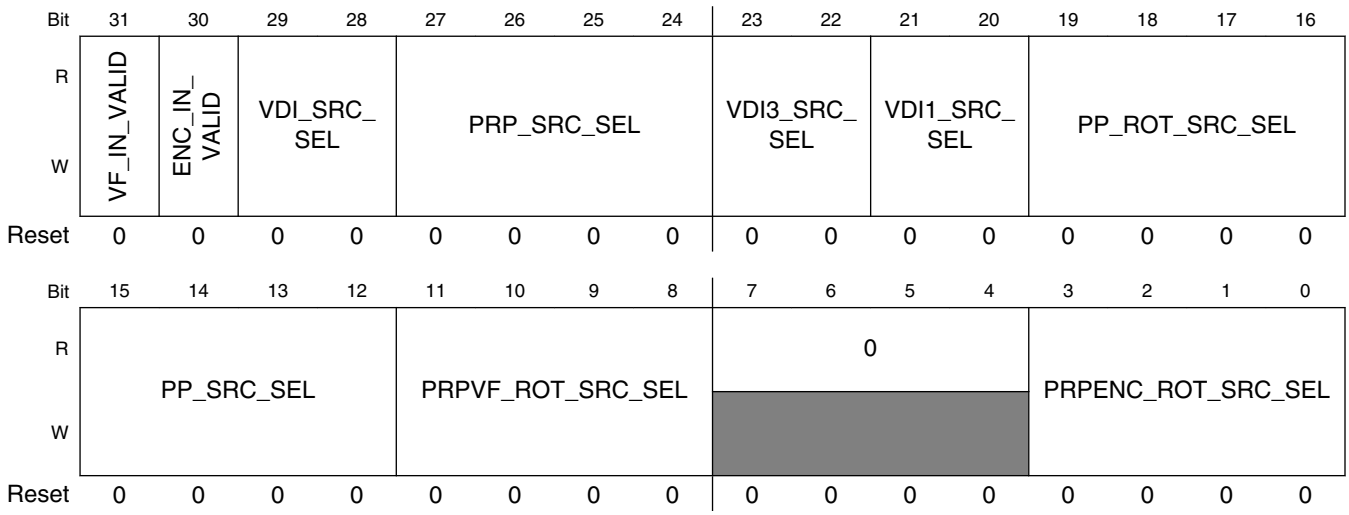
IPUx_SRM_PRI2 field descriptions (continued)

Field	Description
15–14 DC_6_SRM_ MODE	DC Group #6 SRM Mode This field controls the SRM logic that handles the DC Group #6 registers 00 Automatic swapping is disabled; ARM platform is allowed to access the DC Group #6's region in the RAM 01 The SRM logic is controlled by the FSU. The update will be done of the next frame. 10 The SRM logic is controlled by the FSU. Registers are swapped continuously frame by frame 11 Update now. The SRM is controlled by the ARM platform. The Register will be update now
13–12 DC_2_SRM_ MODE	DC Group #2 SRM Mode This field controls the SRM logic that handles the DC Group #2 registers 00 Automatic swapping is disabled; ARM platform is allowed to access the DC Group #2's region in the RAM 01 The SRM logic is controlled by the FSU. The update will be done of the next frame. 10 The SRM logic is controlled by the FSU. Registers are swapped continuously frame by frame 11 Update now. The SRM is controlled by the ARM platform. The Register will be update now
11–9 DC_SRM_PRI	DC SRM priority This bits define the priority of the DC module
8–7 DP_A1_SRM_ MODE	DP Async flow #1 SRM Mode This field controls the SRM logic that handles the DP Async flow #1 registers 00 Automatic swapping is disabled; ARM platform is allowed to access the DP Async flow #1 region in the RAM 01 The SRM logic is controlled by the FSU. The update will be done of the next frame. 10 The SRM logic is controlled by the FSU. Registers are swapped continuously frame by frame 11 Update now. The SRM is controlled by the ARM platform. The Register will be update now
6–5 DP_A0_SRM_ MODE	DP Async flow #0 SRM Mode This field controls the SRM logic that handles the DP Async flow #0 registers 00 Automatic swapping is disabled; ARM platform is allowed to access the DP Async flow #0 region in the RAM 01 The SRM logic is controlled by the FSU. The update will be done of the next frame. 10 The SRM logic is controlled by the FSU. Registers are swapped continuously frame by frame 11 Update now. The SRM is controlled by the ARM platform. The Register will be update now
4–3 DP_S_SRM_ MODE	DP sync flow SRM Mode This field controls the SRM logic that handles the DP sync flow registers 00 Automatic swapping is disabled; ARM platform is allowed to access the DP sync flow region in the RAM 01 The SRM logic is controlled by the FSU. The update will be done on the next frame. 10 Reserved 11 Update now. The SRM is controlled by the ARM platform. The Register will be update now
DP_SRM_PRI	DP SRM priority This bits define the priority of the DP module

37.5.33 FSU Processing Flow 1 Register (IPUx_FS_PROC_FLOW1)

This register contain controls for IPU's tasks.

Address: Base address + A8h offset



IPUx_FS_PROC_FLOW1 field descriptions

Field	Description
31 VF_IN_VALID	View-finder Input valid. Setting this bit indicates that the buffer in memory for viewfinder is validated by the ARM platform (valid only when RWS_EN is '1'). 0 View-finder should skip buffer in memory. 1 View-finder should use buffer in memory.
30 ENC_IN_VALID	Encoding Input valid. Setting this bit indicates that the buffer in memory for encoding is validated by the ARM platform (valid only when RWS_EN is '1'). 0 Encoding should skip buffer in memory. 1 Encoding should use buffer in memory.
29–28 VDI_SRC_SEL	Source select for the VDIC This field is relevant if the VDIC works in de-interlacing mode (when VDI_CMB_EN bit is clear) 00 ARM platform 01 CSI direct (cb7) 10 Reserved 10 VDOA 11 Reserved
27–24 PRP_SRC_SEL	Source select for the Pre Processing Task 0000 ARM platform

37.5.35 FSU Processing Flow 3 Register (IPUx_FS_PROC_FLOW3)

This register contains controls for IPU's tasks.

- Hide VPU_SUB_FRAME_SYNC for all versions
- Show VPU_SUB_FRAME_SYNC for IPUv3H version.
- The table below tagged with other settings (like IPU3M_only) should be hidden in IPUv3H version.
- This requires some sophisticated conditional tag settings

37.5.38 SKIP Register (IPUx_SKIP)

This register controls the different frame skipping supported by the IPU.

Address: Base address + BCh offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	VDI_SKIP												VDI_MAX_ RATIO_SKIP				CSI_SKIP_IC_VF					CSI_ MAX_ RATIO_ SKIP_IC_ VF			CSI_SKIP_IC_ ENC					CSI_ MAX_ RATIO_ SKIP_IC_ ENC		
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

IPUx_SKIP field descriptions

Field	Description
31–20 VDI_SKIP	VDI_SKIP These 12 bits define the skipping pattern of the frames send from the VDIC. The VDIC avoids reading fields from the memory if the output frame is skipped. Skipping is relevant only if the source to the VDIC is coming from the CSI. Skipping is done for a set of frames. The number of frames in a set is defined at VDI_MAX_RATIO_SKIP. when VDI_MAX_RATIO_SKIP = 1 => VDI_SKIP[1:0] is used; other bits are ignored when VDI_MAX_RATIO_SKIP = 2 => VDI_SKIP[2:0] are used; other bits are ignored .. .. when VDI_MAX_RATIO_SKIP = 11 => VDI_SKIP[11:0] are used;
19–16 VDI_MAX_ RATIO_SKIP	Maximum Ratio Skip for VDIC

Table continues on the next page...

IPUx_SKIP field descriptions (continued)

Field	Description
	These bits define the number of frames in a skipping set. The maximum value of this bits is 11. When set to 0 the skipping is disabled.
15–11 CSI_SKIP_IC_VF	CSI SKIP IC_VF These 5 bits define the skipping pattern of the frames send to the IC for view finder task from one of the CSIs as defined on the CSI_SEL and IC_INPUT bits Skipping is done for a set of frames. The number of frames in a set is defined at CSI_MAX_RATIO_SKIP_IC_VF. when CSI_MAX_RATIO_SKIP_IC_VF = 1 => CSI_SKIP_IC_VF[1:0] are used; other bits are ignored when CSI_MAX_RATIO_SKIP_IC_VF = 2 => CSI_SKIP_IC_VF[2:0] are used; other bits are ignored when CSI_MAX_RATIO_SKIP_IC_VF =3 => CSI_SKIP_IC_VF[3:0] are used; other bits are ignored when CSI_MAX_RATIO_SKIP_IC_VF = 4 => CSI_SKIP_IC_VF[4:0] are used; Setting bit #n of CSI_SKIP_IC_VF means that the #n frame in the set is skipped. For example: if CSI_MAX_RATIO_SKIP_IC_VF = 4 and CSI_SKIP_IC_VF = 11010 Frames #0 & Frame #2 will not be skipped as bit0 and bit2 are cleared Frames #1 & Frame #3 will be skipped as bit1 and bit3 are set bit #4 is ignored as CSI_MAX_RATIO_SKIP_IC_VF is set to 4
10–8 CSI_MAX_ RATIO_SKIP_ IC_VF	CSI Maximum Ratio Skip for IC (view finder task) These bits define the number of frames in a skipping set. The maximum value of this bits is 4. When set to 0 the skipping is disabled.
7–3 CSI_SKIP_IC_ ENC	CSI SKIP IC_ENC These 5 bits define the skipping pattern of the frames send to the IC for encoding task from one of the CSIs as defined on the CSI_SEL and IC_INPUT bits Skipping is done for a set of frames. The number of frames in a set is defined at CSI_MAX_RATIO_SKIP_IC_ENC. when CSI_MAX_RATIO_SKIP_IC_ENC = 1 => CSI_SKIP_IC_ENC[1:0] are used; other bits are ignored when CSI_MAX_RATIO_SKIP_IC_ENC = 2 => CSI_SKIP_IC_ENC[2:0] are used; other bits are ignored when CSI_MAX_RATIO_SKIP_IC_ENC = 3 => CSI_SKIP_IC_ENC[3:0] are used; other bits are ignored when CSI_MAX_RATIO_SKIP_IC_ENC = 4 => CSI_SKIP_IC_ENC[4:0] are used; Setting bit #n of CSI_SKIP_IC_ENC means that the #n frame in the set is skipped. For example: if CSI_MAX_RATIO_SKIP_IC_ENC = 4 and CSI_SKIP_IC_ENC = 11010 Frames #0 & Frame #2 will not be skipped as bit0 and bit2 are cleared Frames #1 & Frame #3 will be skipped as bit1 and bit3 are set bit #4 is ignored as CSI_MAX_RATIO_SKIP_IC_ENC is set to 4
CSI_MAX_ RATIO_SKIP_ IC_ENC	CSI Maximum Ratio Skip for IC (encoding task) These bits define the number of frames in a skipping set. The maximum value of this bits is 4. When set to 0 the skipping is disabled.

37.5.39 Display Alternate Configuration Register (IPUx_DISP_ALT_CONF)

This register controls various parameters that are used for alternate flows related to the display modules.

Address: Base address + C0h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

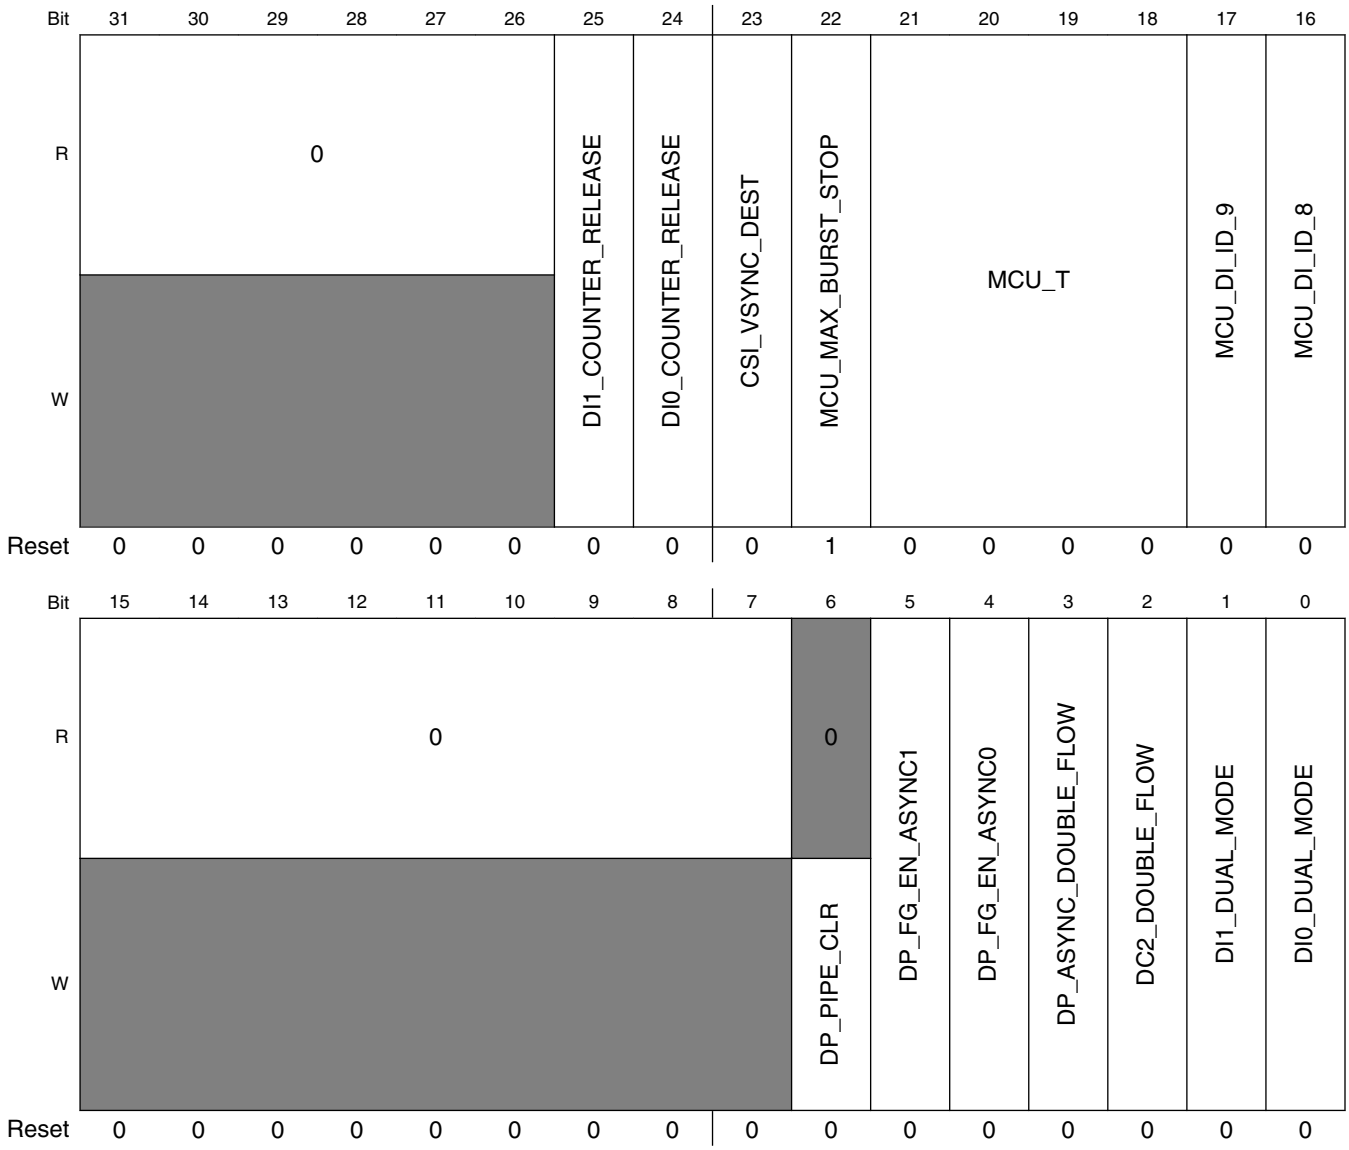
IPUx_DISP_ALT_CONF field descriptions

Field	Description
Reserved	This read-only field is reserved and always has the value 0.

37.5.39 Display General Control Register (IPUx_DISP_GEN)

This register controls various aspects of the display port.

Address: Base address + C4h offset



IPUx_DISP_GEN field descriptions

Field	Description
31–26 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

IPUx_DISP_GEN field descriptions (continued)

Field	Description
25 DI1_COUNTER_RELEASE	DI1 Counter release By default the DI0 counters responsible for waveform generation for sync flow are frozen. For the first attempt to use the DI in sync flow the user should set this bit 1 counter is released and running 0 counter is cleared and stopped
24 DI0_COUNTER_RELEASE	DI1 Counter release By default the DI0 counters responsible for waveform generation for sync flow are frozen. For the first attempt to use the DI in sync flow the user should set this bit 1 counter is released and running 0 counter is cleared and stopped
23 CSI_VSYNC_DEST	CSI_VSYNC destination This bit defines the destination of the VSYNC coming from the CSI's 1 csi1_vsync is connected to DI0; csi0_vsync is connected to DI1 0 csi0_vsync is connected to DI0; csi1_vsync is connected to DI1
22 MCU_MAX_BURST_STOP	ARM platform Maximal burst This bit limit the maximal unspecified length burst. 1 The maximum unspecified burst length is 8-beat 0 The unspecified burst length is unlimited
21–18 MCU_T	The address space for accesses through the AHB-lite slave port is MB and it is split internally (with 32MB resolution) according to bits [28:25] of the address. Using the following notation: Address = (ID[31:29], MSB[28:25], LSB[24:0]) The address is used as follows ("T" is a configurable integer between 0 and 13): MSB<T: access to an external device, with address = (MSB, LSB) T<=MSB<14: access to an external device, with address (MSB-T, LSB)
17 MCU_DI_ID_9	MCU_DI_ID_9 - DI ID via DC channel 9. This bit defines the DI that the ARM platform DC's access via channel #9 1 ARM platform accesses DC's channel #9 via DI1. 0 ARM platform accesses DC's channel #9 via DI0.
16 MCU_DI_ID_8	MCU_DI_ID_8 - DI ID via DC channel 8. This bit defines the DI that the ARM platform DC's access via channel #8 1 ARM platform accesses DC's channel #8 via DI1. 0 ARM platform accesses DC's channel #8 via DI0.
15–7 Reserved	This read-only field is reserved and always has the value 0.
6 DP_PIPE_CLR	DP Pipe Clear This bit clears the internal pipe of the DP. The user may use this bit in case of an error condition This is a self clear bit

Table continues on the next page...

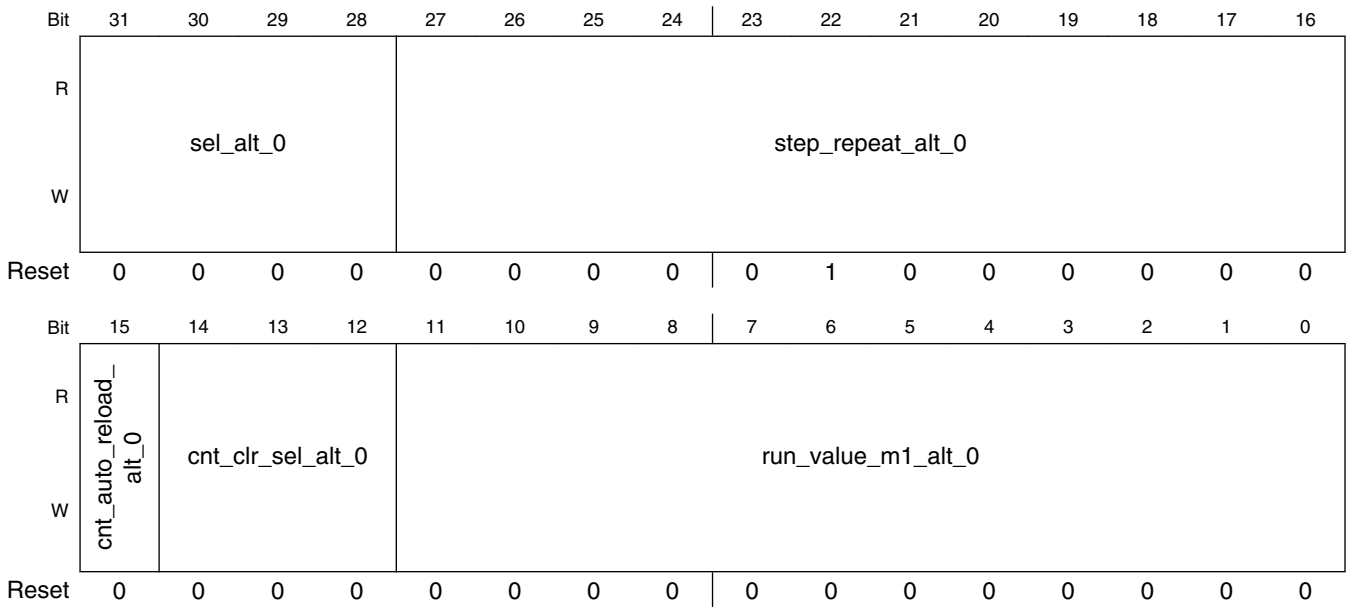
IPUx_DISP_GEN field descriptions (continued)

Field	Description
	1 Clear the internal pipe of the DP 0 Idle - does nothing
5 DP_FG_EN_ASYNC1	FG_EN - partial plane Enable for async flow 1. This bit enables the partial plane channel. 1 partial plane channel is enabled. 0 partial plane channel is disabled.
4 DP_FG_EN_ASYNC0	FG_EN - partial plane Enable for async flow 0. This bit enables the partial plane channel. 1 partial plane channel is enabled. 0 partial plane channel is disabled.
3 DP_ASYNC_DOUBLE_FLOW	DP Async Double Flow. This bit define how many async flows are currently handles via DP channel (ch24+29) 1 2 flows are handled via DP 0 single flow is handled via DP
2 DC2_DOUBLE_FLOW	DC2 Double Flow. This bit define how many flows are currently handles via DC2 channel (ch41) 1 2 flows are handled via DC2 0 single flow is handled via DC2
1 DI1_DUAL_MODE	DI1 dual mode control 1 DI1 operates in dual mode 0 DI1 is not in dual mode
0 DI0_DUAL_MODE	DI0 dual mode control 1 DI0 operates in dual mode 0 DI0 is not in dual mode

37.5.40 Display Alternate Flow Control Register 1 (IPUx_DISP_ALT1)

This register controls various aspects of the display port.

Address: Base address + C8h offset



IPUx_DISP_ALT1 field descriptions

Field	Description
31–28 sel_alt_0	Select alternative parameters instead of DI Sync Wave Gen counter#. The DI is selected according to DP's synchronous channel destination 0000-disable 0001 instead of counter 1 0010 instead of counter 2 1000 instead of counter 8
27–16 step_repeat_alt_0	This fields defines the amount of repetitions that will be performed by the counter
15 cnt_auto_reload_alt_0	Counter auto reload mode 1 The counter will automatically be reloaded forever, ignoring the value of the step_repeat_alt_0 field 0 The counter will not be automatically reloaded, It will be reloaded for the amount of repeat times defined on the step_repeat_alt_0 field
14–12 cnt_clr_sel_alt_0	Counter Clear select This field defines the source of the signals that clears the counter. 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock.

Table continues on the next page...

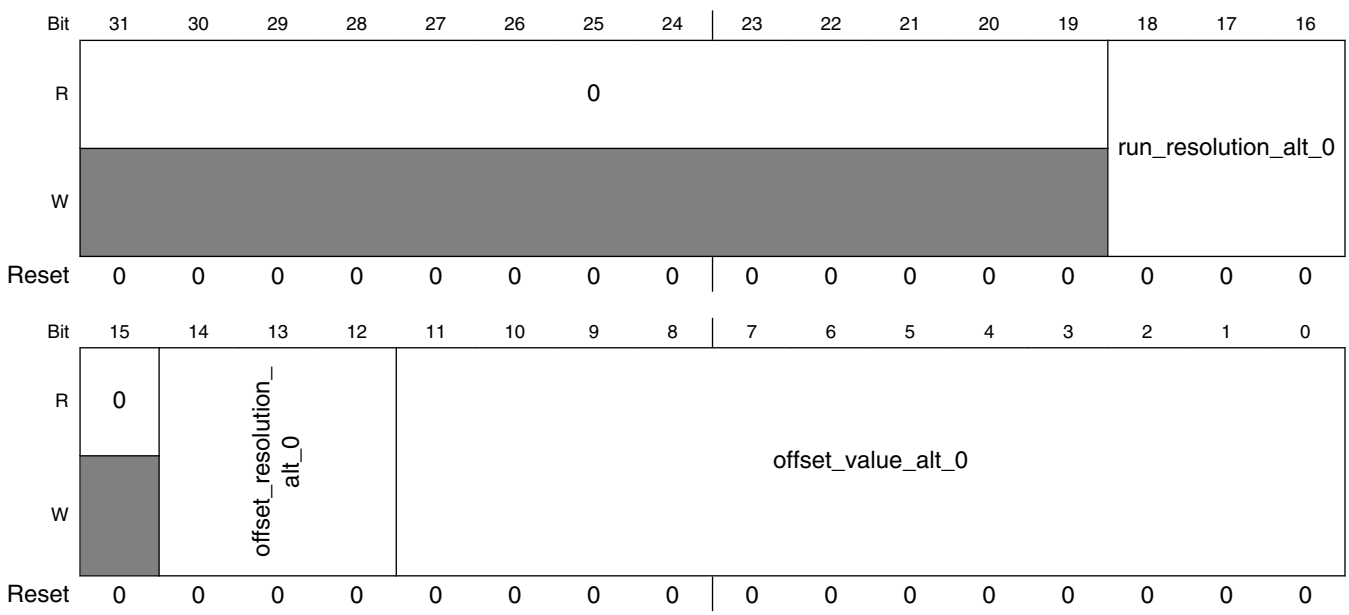
IPUx_DISP_ALT1 field descriptions (continued)

Field	Description
	010 Reserved 011 Reserved 100 Reserved 101 CSI VSYNC. The VSYNC is a trigger coming from one of the CSI's according to the CSI_VSYNC_DEST bit. — 110 External VSYNC 111 Counter is always on.
run_value_m1_alt_0	Counter pre defined value This fields defines the counter pre defines value. real value- 1

37.5.41 Display Alternate Flow Control Register 2 (IPUx_DISP_ALT2)

This register controls various aspects of the display port.

Address: Base address + CCh offset



IPUx_DISP_ALT2 field descriptions

Field	Description
31–19 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

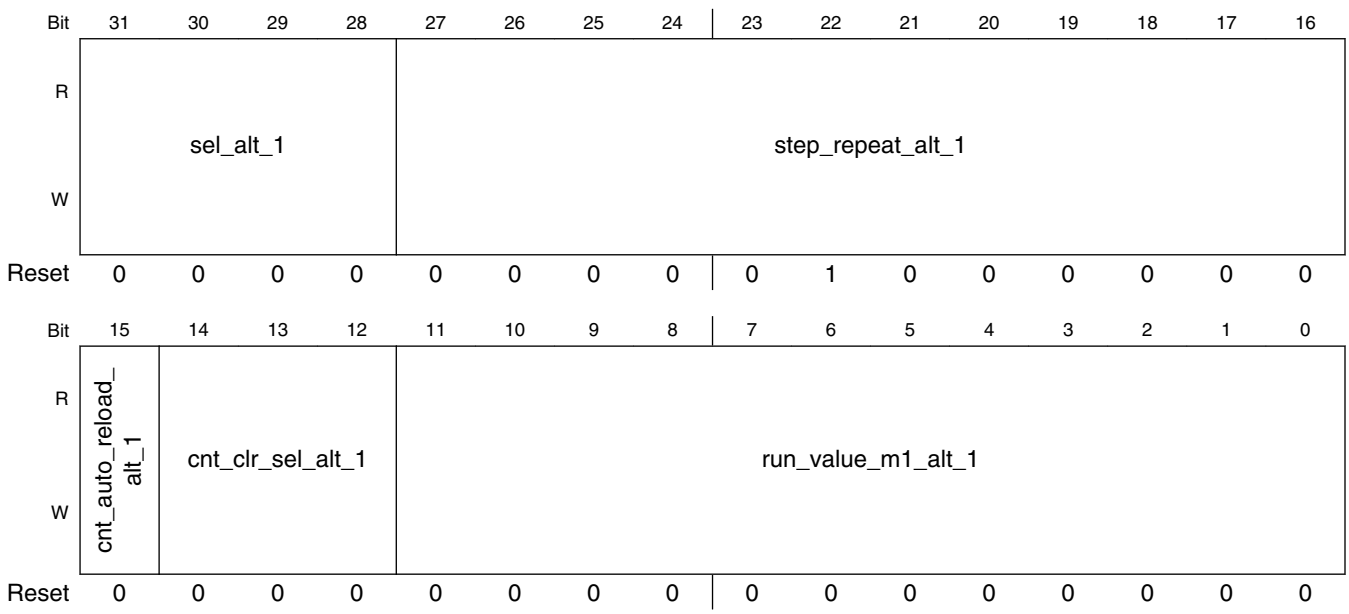
IPUx_DISP_ALT2 field descriptions (continued)

Field	Description
18–16 run_resolution_alt_0	Counter Run Resolution This field defines the trigger causing the counter to increment. The counter run resolution should be defined in the same way as in original DI's counter#
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 offset_resolution_alt_0	Counter offset Resolution This field defines the trigger causing the offset counter to increment The counter offset resolution should be defined in the same way as in original DI's counter#
offset_value_alt_0	Counter offset value The counter can start counting after a pre defined delay This field defines the amount of cycles that the counter will be delayed by

37.5.42 Display Alternate Flow Control Register 3 (IPUx_DISP_ALT3)

This register controls various aspects of the display port.

Address: Base address + D0h offset



IPUx_DISP_ALT3 field descriptions

Field	Description
31–28 sel_alt_1	Select alternative parameters instead of DI Sync Wave Gen counter#. The DI is selected according to DP's synchronous channel destination

Table continues on the next page...

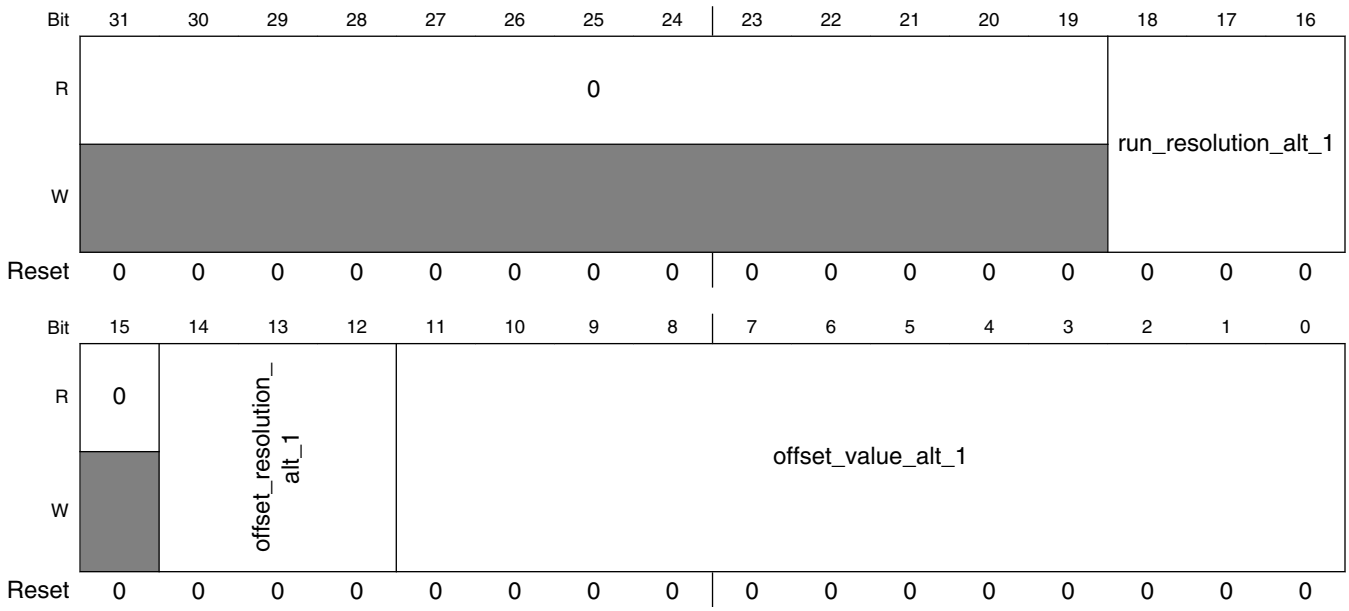
IPUx_DISP_ALT3 field descriptions (continued)

Field	Description
	0000 disable 0001 instead of counter 1 0010 instead of counter 2 1000 instead of counter 8
27–16 step_repeat_alt_1	This fields defines the amount of repetitions that will be performed by the counter
15 cnt_auto_reload_alt_1	Counter auto reload mode 1 The counter will automatically be reloaded forever, ignoring the value of the step_repeat_alt_0 field 0 The counter will not be automatically reloaded, It will be reloaded for the amount of repeat times defined on the step_repeat_alt_0 field
14–12 cnt_clr_sel_alt_1	Counter Clear select This field defines the source of the signals that clears the counter. 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 Reserved 011 Reserved 100 Reserved 101 CSI VSYNC. The VSYNC is a trigger coming from one of the CSI's according to the CSI_VSYNC_DEST bit. — 110 External VSYNC 111 Counter is always on.
run_value_m1_alt_1	Counter pre defined value This fields defines the counter pre defines value. real value- 1

37.5.43 Display Alternate Flow Control Register 4 (IPUx_DISP_ALT4)

This register controls various aspects of the display port.

Address: Base address + D4h offset



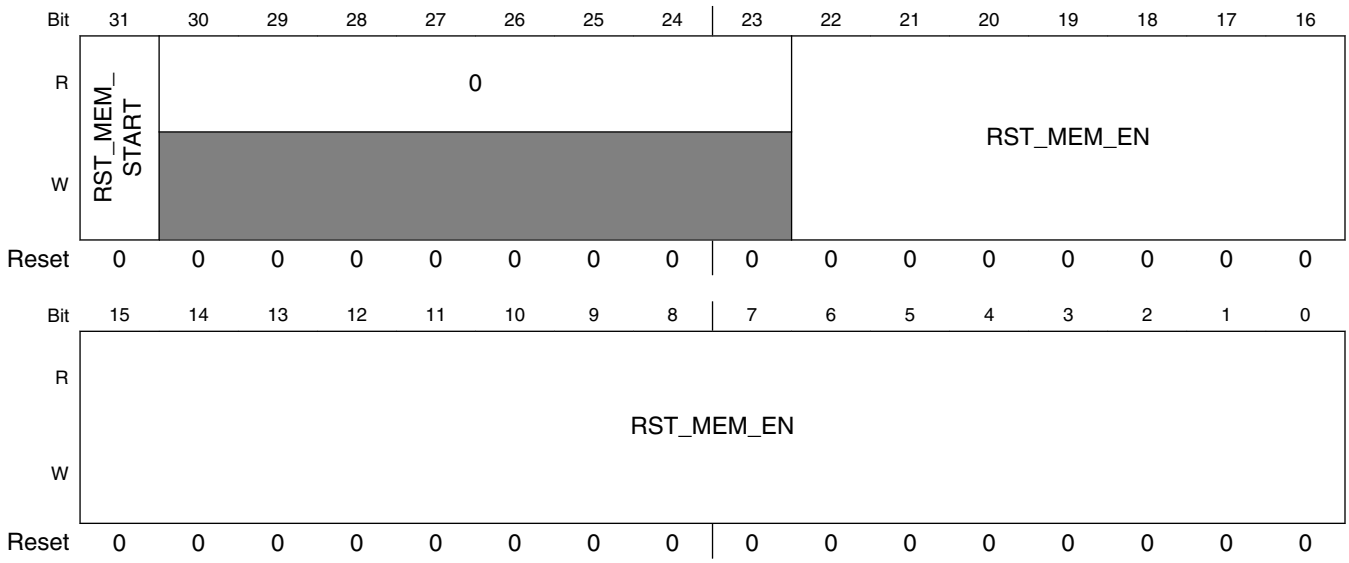
IPUx_DISP_ALT4 field descriptions

Field	Description
31–19 Reserved	This read-only field is reserved and always has the value 0.
18–16 run_resolution_alt_1	Counter Run Resolution This field defines the trigger causing the counter to increment. The counter run resolution should be defined in the same way as in original DI's counter#
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 offset_resolution_alt_1	Counter offset Resolution This field defines the trigger causing the offset counter to increment The counter offset resolution should be defined in the same way as in original DI's counter#
offset_value_alt_1	Counter offset value The counter can start counting after a pre defined delay This field defines the amount of cycles that the counter will be delayed by

37.5.44 Memory Reset Control Register (IPUx_MEM_RST)

This register controls the memory reset mechanism. IPU has a hardware mechanism for clearing the content of the internal memories. This allows the user to clear the content of or more of the internal memories without the need to perform write accesses to the memories.

Address: Base address + DCh offset



IPUx_MEM_RST field descriptions

Field	Description
31 RST_MEM_ START	Memory Reset Start Writing one to this bit activate the memory reset mechanism. The memories that their corresponding RST_MEM_EN bit is set will be cleared. When the memory reset mechanism completes the memory clearing procedure this bit will be automatically cleared. 1 The memory reset mechanism is activated and busy 0 Idle, the memory reset mechanism is not working.
30–23 Reserved	This read-only field is reserved and always has the value 0.
RST_MEM_EN	Reset Memory Enable Each bit on this field enables the memory reset mechanism for a specific memory. The user should set the relevant bits for the memories that need to be cleared. Below is the list of memories and their corresponding bit. srm = rst_mem_en[0] alpha = rst_mem_en[1] cpmem = rst_mem_en[2]

Table continues on the next page...

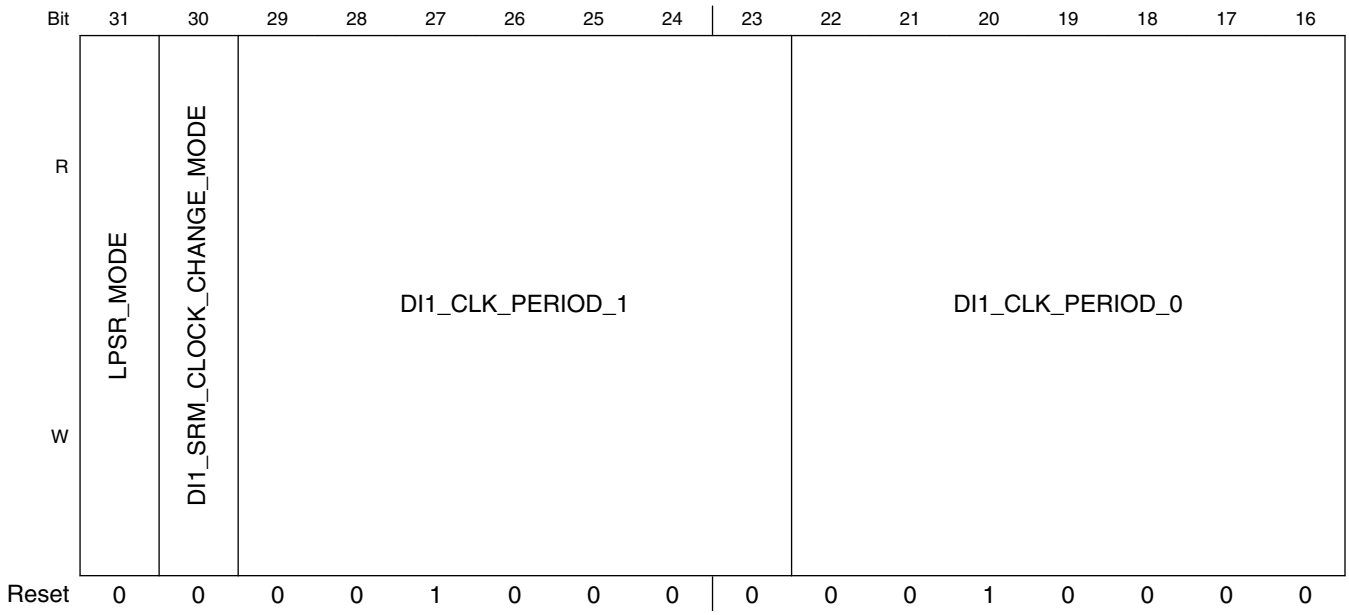
IPUx_MEM_RST field descriptions (continued)

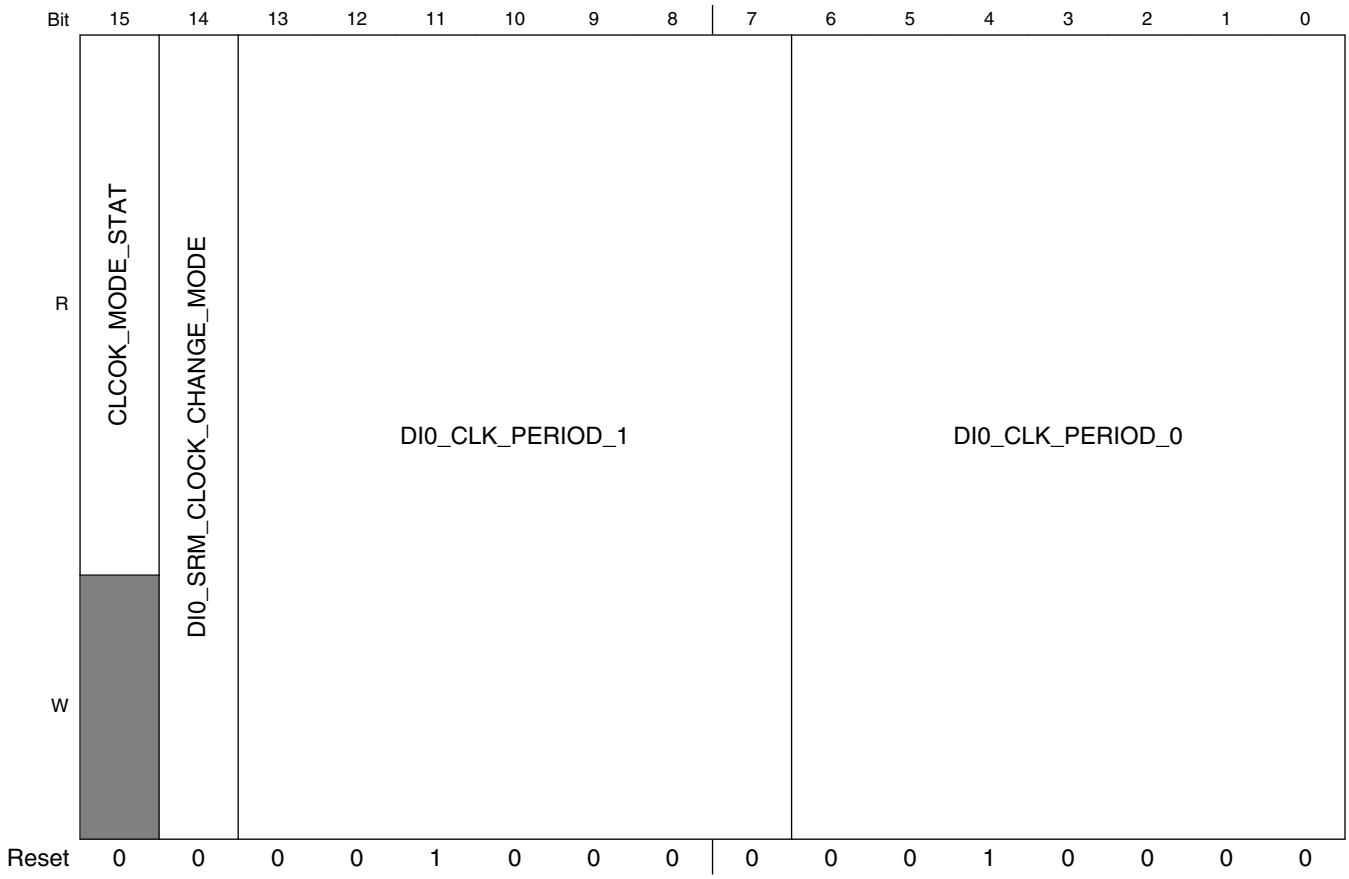
Field	Description
	tpm = rst_mem_en[3] mpm = rst_mem_en[4] bm = rst_mem_en[5] rm = rst_mem_en[6] dstm = rst_mem_en[7] dsom = rst_mem_en[8] lut0 = rst_mem_en[9] lut1 = rst_mem_en[10] ram_smfc = rst_mem_en[11] vdi_fifo2 = rst_mem_en[12] vdi_fifo3 = rst_mem_en[13] icb = rst_mem_en[14] vdi_fifo1 = rst_mem_en[15] dc_template = rst_mem_en[20] dmfc_rd = rst_mem_en[21] dmfc_wr = rst_mem_en[22]

37.5.45 Power Modes Control Register (IPUx_PM)

This register controls the automatic transitions of the IPU between different power modes of the SoC and handles the clock change modes.

Address: Base address + E0h offset





IPUx_PM field descriptions

Field	Description
31 LPSR_MODE	LPSR Mode This bit indicates that the next attempt for entering low power mode is an attempt to move to LPST mode. Setting this bit by the user is essential in order to assure proper response of the IPU to the assertion of the stop request from the CCM. 1 Next low power mode will be LPSR 0 Next low power mode is not LPSR
30 DI1_SRM_ CLOCK_ CHANGE_MODE	SRM clock change mode When the clock is going to be changed to any new ratio other then 1:1, 1:2. 1:4. The user needs to prepare an alternate set of DI setting in the SRM. This bit enable this mode. This bit is self cleared. 1 SRM clock change mode is enabled; the next clock change will be done by updating the DI settings from the SRM 0 SRM clock change mode is disabled.
29–23 DI1_CLK_ PERIOD_1	DI1_CLK period option 1. This parameter defines the period of the clock that the DI1 works with. This parameter contains integer part (bits [6:4]) and fractional part (bits [3:0]). Setting this value to 1.0 (default) means that the DI1 works on the fastest possible clock. Setting a value smaller than 1.0 is not allowed.

Table continues on the next page...

IPUx_PM field descriptions (continued)

Field	Description
	The value to be programmed to the DI1_CLK_PERIOD_1 field is equal to: Fast_freq/Target_freq Where: Target_freq = The frequency that the DI clock works with Fast_freq = fastest possible clock that the DI can work with
22–16 DI1_CLK_ PERIOD_0	DI1_CLK period option 0. This parameter defines the period of the clock that the DI1 works with. This parameter contains integer part (bits [6:4]) and fractional part (bits [3:0]). Setting this value to 1.0 (default) means that the DI1 works on the fastest possible clock. Setting a value smaller than 1.0 is not allowed. The value to be programmed to the DI1_CLK_PERIOD_1 field is equal to: Fast_freq/Target_freq Where: Target_freq = The frequency that the DI clock works with Fast_freq = fastest possible clock that the DI can work with
15 CLCOK_MODE_ STAT	Clock mode status This is a read only bit indicating what is the current clock mode 1 current clock mode is 1 0 current clock mode is 0
14 DI0_SRM_ CLOCK_ CHANGE_MODE	SRM clock change mode When the clock is going to be changed to any new ratio other then 1:1, 1:2. 1:4. The user needs to prepare an alternate set of DI setting in the SRM. This bit enable this mode. This bit is self cleared. 1 SRM clock change mode is enabled; the next clock change will be done by updating the DI settings from the SRM 0 SRM clock change mode is disabled.
13–7 DI0_CLK_ PERIOD_1	DI0_CLK period option 1. This parameter defines the period of the clock that the DI0 works with. This parameter contains integer part (bits [6:4]) and fractional part (bits [3:0]). Setting this value to 1.0 (default) means that the DI0 works on the fastest possible clock. Setting a value smaller than 1.0 is not allowed. The value to be programmed to the DI0_CLK_PERIOD_1 field is equal to: Fast_freq/Target_freq Where: Target_freq = The frequency that the DI clock works with Fast_freq = fastest possible clock that the DI can work with
DI0_CLK_ PERIOD_0	DI0_CLK period option 0. This parameter defines the period of the clock that the DI0 works with. This parameter contains integer part (bits [6:4]) and fractional part (bits [3:0]).

Table continues on the next page...

IPUx_PM field descriptions (continued)

Field	Description
	Setting this value to 1.0 (default) means that the DI0 works on the fastest possible clock. Setting a value smaller than 1.0 is not allowed. The value to be programmed to the DI0_CLK_PERIOD_1 field is equal to: Fast_freq/Target_freq Where: Target_freq = The frequency that the DI clock works with Fast_freq = fastest possible clock that the DI can work with

37.5.46 General Purpose Register (IPUx_GPR)

The register contains general purpose bits.

Address: Base address + E4h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

IPUx_GPR field descriptions

Field	Description
31 IPU_CH_BUF1_RDY1_CLR	This bit defines the IPU_CH_BUF1_RDY1 properties. This register can be a write one to clear OR write one to set.

Table continues on the next page...

IPUx_GPR field descriptions (continued)

Field	Description
	1 writing one to a bit of this register clears this bit; **IPU_CH_BUF1_RDY1** is w1c register 0 writing one to a bit of this register sets this bit **IPU_CH_BUF1_RDY1** is w1s register
30 IPU_CH_BUF1_RDY0_CLR	This bit defines the **IPU_CH_BUF1_RDY0** properties. This register can be a write one to clear OR write one to set. 1 writing one to a bit of this register clears this bit; **IPU_CH_BUF1_RDY0** is w1c register 0 writing one to a bit of this register sets this bit **IPU_CH_BUF1_RDY0** is w1s register
29 IPU_CH_BUF0_RDY1_CLR	This bit defines the **IPU_CH_BUF0_RDY1** properties. This register can be a write one to clear OR write one to set. 1 writing one to a bit of this register clears this bit; **IPU_CH_BUF0_RDY1** is w1c register 0 writing one to a bit of this register sets this bit **IPU_CH_BUF0_RDY1** is w1s register
28 IPU_CH_BUF0_RDY0_CLR	This bit defines the **IPU_CH_BUF0_RDY0** properties. This register can be a write one to clear OR write one to set. 1 writing one to a bit of this register clears this bit; **IPU_CH_BUF0_RDY0** is w1c register 0 writing one to a bit of this register sets this bit **IPU_CH_BUF0_RDY0** is w1s register
27 IPU_ALT_CH_BUF1_RDY1_CLR	This bit defines the **IPU_ALT_CH_BUF1_RDY1** properties. This register can be a write one to clear OR write one to set. 1 writing one to a bit of this register clears this bit; **IPU_ALT_CH_BUF1_RDY1** is w1c register 0 writing one to a bit of this register sets this bit **IPU_ALT_CH_BUF1_RDY1** is w1s register
26 IPU_ALT_CH_BUF1_RDY0_CLR	This bit defines the **IPU_ALT_CH_BUF1_RDY0** properties. This register can be a write one to clear OR write one to set. 1 writing one to a bit of this register clears this bit; **IPU_ALT_CH_BUF1_RDY0** is w1c register 0 writing one to a bit of this register sets this bit **IPU_ALT_CH_BUF1_RDY0** is w1s register
25 IPU_ALT_CH_BUF0_RDY1_CLR	This bit defines the **IPU_ALT_CH_BUF0_RDY1** properties. This register can be a write one to clear OR write one to set. 1 writing one to a bit of this register clears this bit; **IPU_ALT_CH_BUF0_RDY1** is w1c register 0 writing one to a bit of this register sets this bit **IPU_ALT_CH_BUF0_RDY1** is w1s register
24 IPU_ALT_CH_BUF0_RDY0_CLR	This bit defines the **IPU_ALT_CH_BUF0_RDY0** properties. This register can be a write one to clear OR write one to set. 1 writing one to a bit of this register clears this bit; **IPU_ALT_CH_BUF0_RDY0** is w1c register 0 writing one to a bit of this register sets this bit **IPU_ALT_CH_BUF0_RDY0** is w1s register
23 IPU_DI1_CLK_CHANGE_ACK_DIS	Disable DI1's clock change mechanism. 1 clock change mechanism is disabled. DI automatically acknowledges a clock change request 0 clock change mechanism is disabled. DI performs the clock change procedure
22 IPU_DI0_CLK_CHANGE_ACK_DIS	Disable DI0's clock change mechanism. 1 clock change mechanism is disabled. DI automatically acknowledges a clock change request 0 clock change mechanism is disabled. DI performs the clock change procedure
21 IPU_CH_BUF2_RDY1_CLR	This bit defines the **IPU_CH_BUF2_RDY1** properties. This register can be a write one to clear OR write one to set. 1 writing one to a bit of this register clears this bit; **IPU_CH_BUF2_RDY1** is w1c register 0 writing one to a bit of this register sets this bit **IPU_CH_BUF2_RDY1** is w1s register

Field	Description
9 DMA_CH_ALT_ DB_MODE_ SEL_41	Double Buffer Mode Select. This bit indicates if a double buffer is used for this channel. *n* Indicates the corresponding DMA channel number. 0 Double buffer is not used for this channel. 1 Double buffer is used for this channel.
8–2 Reserved	This read-only field is reserved and always has the value 0. 0 Double buffer is not used for this channel. 1 Double buffer is used for this channel.
1 DMA_CH_ALT_ DB_MODE_ SEL_33	Double Buffer Mode Select. This bit indicates if a double buffer is used for this channel. *n* Indicates the corresponding DMA channel number. 0 Double buffer is not used for this channel. 1 Double buffer is used for this channel.
0 Reserved	This read-only field is reserved and always has the value 0. 0 Double buffer is not used for this channel. 1 Double buffer is used for this channel.

37.5.51 Alternate Channel Triple Buffer Mode Select 0 Register (IPUx_ALT_CH_TRB_MODE_SEL0)

The register contains triple buffer mode select control information for 32 IPU's DMA channels.

When the channel is configured for triple buffer mode. The double buffer mode settings configured on the corresponding DB_MODE_SEL bit are overridden.

- Hide VPU_SUB_FRAME_SYNC for all versions
- Show VPU_SUB_FRAME_SYNC for IPUv3H version.
- The table below tagged with other settings (like IPU3M_only) should be hidden in IPUv3H version.
- This requires some sophisticated conditional tag settings

IPUx_INT_STAT_1 field descriptions

Field	Description
31 IDMAC_EOF_31	End of Frame of Channel interrupt. This bit is the status bit of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is cleared. 1 Interrupt is requested.
30 Reserved	This read-only field is reserved and always has the value 0. 0 Interrupt is cleared. 1 Interrupt is requested.
29 IDMAC_EOF_29	End of Frame of Channel interrupt. This bit is the status bit of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is cleared. 1 Interrupt is requested.
28 IDMAC_EOF_28	End of Frame of Channel interrupt. This bit is the status bit of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is cleared. 1 Interrupt is requested.
27 IDMAC_EOF_27	End of Frame of Channel interrupt. This bit is the status bit of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is cleared. 1 Interrupt is requested.
26 IDMAC_EOF_26	End of Frame of Channel interrupt. This bit is the status bit of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is cleared. 1 Interrupt is requested.
25 IDMAC_EOF_25	End of Frame of Channel interrupt. This bit is the status bit of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is cleared. 1 Interrupt is requested.
24 IDMAC_EOF_24	End of Frame of Channel interrupt. This bit is the status bit of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is cleared. 1 Interrupt is requested.
23 IDMAC_EOF_23	End of Frame of Channel interrupt. This bit is the status bit of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is cleared. 1 Interrupt is requested.
22 IDMAC_EOF_22	End of Frame of Channel interrupt. This bit is the status bit of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number.

IPUx_INT_STAT_9 field descriptions

Field	Description
31 CSI1_PUPE	CSI1_PUPE - CSI1 parameters update error interrupt. This bit indicates on an interrupt that is a result of an error generated by the CSI1. The error is generated in case where new frame arrived from the CSI1 before the completion of the CSI1's parameters update by the SRM 0 Interrupt is cleared. 1 Interrupt is requested.
30 CSI0_PUPE	CSI0_PUPE - CSI0 parameters update error interrupt. This bit indicates on an interrupt that is a result of an error generated by the CSI0. The error is generated in case where new frame arrived from the CSI0 before the completion of the CSI0's parameters update by the SRM 0 Interrupt is cleared. 1 Interrupt is requested.
29 Reserved	This read-only field is reserved and always has the value 0.
28 IC_VF_BUF_OVF	This bit indicates on an interrupt that is a result of the IC Buffer overflow for view finder coming from the IC. The user needs to write 1 to this bit in order to clear it. 0 Interrupt is cleared. 1 Interrupt is requested.
27 IC_ENC_BUF_OVF	This bit indicates on an interrupt that is a result of the IC Buffer overflow for encoding coming from the IC. The user needs to write 1 to this bit in order to clear it. 0 Interrupt is cleared. 1 Interrupt is requested.
26 IC_BAYER_BUF_OVF	This bit indicates on an interrupt that is a result of the IC Buffer overflow for Bayer coming from the IC. The user needs to write 1 to this bit in order to clear it. 0 Interrupt is cleared. 1 Interrupt is requested.
25–1 Reserved	This read-only field is reserved and always has the value 0.
0 VDI_FIFO1_OVF	FIFO1 overflow Interrupt1 The VDIC generate FIFO1 overflow interrupt1 when write pointer of FIFO1 overrun read pointer. 0 Interrupt is cleared. 1 Interrupt is requested.

37.5.61 Interrupt Status Register 10 (IPUx_INT_STAT_10)

IPU status registers are not stored in the SRM during power gating mode.This register contains part of IPU interrupts status bits. This register holds error interrupt indications coming from different modules within All the bits in this register are write one to clear.

Address: Base address + 224h offset

IPUx_INT_STAT_10 field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30 AXIR_ERR	This bit indicates on an interrupt that is a result of AXI read access resulted with error response. The user needs to write 1 to this bit in order to clear it. 0 Interrupt is cleared. 1 Interrupt is requested.
29 AXIW_ERR	This bit indicates on an interrupt that is a result of AXI write access resulted with error response. The user needs to write 1 to this bit in order to clear it. 0 Interrupt is cleared. 1 Interrupt is requested.
28 NON_ PRIVILEGED_ ACC_ERR	Non Privileged Access Error interrupt. This bit indicates on an interrupt that is a result of access the CPMEM or the DP memory in user mode 0 Interrupt is cleared. 1 Interrupt is requested.
27 Reserved	This read-only field is reserved and always has the value 0.
26 IC_BAYER_ FRM_LOST_ ERR	This bit indicates on an interrupt that is a result of IC's Bayer frame lost. 0 Interrupt is disabled. 1 Interrupt is enabled.
25 IC_ENC_FRM_ LOST_ERR	This bit indicates on an interrupt that is a result of IC's encoding frame lost.

Table continues on the next page...

IPUx_INT_STAT_10 field descriptions (continued)

Field	Description
	0 Interrupt is disabled. 1 Interrupt is enabled.
24 IC_VF_FRM_LOST_ERR	This bit indicates on an interrupt that is a result of IC's view finder frame lost. 0 Interrupt is disabled. 1 Interrupt is enabled.
23 Reserved	This read-only field is reserved and always has the value 0.
22 DI1_TIME_OUT_ERR	DI1 time out error interrupt This bit indicates on the interrupt that is a result of a time out error during a read access via DI1
21 DI0_TIME_OUT_ERR	DI0 time out error interrupt This bit indicates on the interrupt that is a result of a time out error during a read access via DI0
20 DI1_SYNC_DISP_ERR	DI1 Synchronous display error interrupt This bit indicates on the interrupt that is a result of an error during access to a synchronous display via DI1
19 DI0_SYNC_DISP_ERR	DI0 Synchronous display error interrupt This bit indicates on the interrupt that is a result of an error during access to a synchronous display via DI0
18 DC_TEARING_ERR_6	Tearing Error #6 interrupt This bit indicates on the interrupt that is a result of tearing error while the anti tearing mechanism is activated for DC channel 6
17 DC_TEARING_ERR_2	Tearing Error #2 interrupt This bit indicates on the interrupt that is a result of tearing error while the anti tearing mechanism is activated for DC channel 2
16 DC_TEARING_ERR_1	Tearing Error #1 interrupt This bit indicates on the interrupt that is a result of tearing error while the anti tearing mechanism is activated for DC channel 1
15–4 Reserved	This read-only field is reserved and always has the value 0.
3 SMFC3_FRM_LOST	Frame Lost of SMFC channel 3 interrupt. This bit indicates on an interrupt that is a result of a result of a Frame Lost of SMFC channel 3 0 Interrupt is cleared. 1 Interrupt is requested.
2 SMFC2_FRM_LOST	Frame Lost of SMFC channel 2 interrupt. This bit indicates on an interrupt that is a result of a result of a Frame Lost of SMFC channel 2 0 Interrupt is cleared. 1 Interrupt is requested.
1 SMFC1_FRM_LOST	Frame Lost of SMFC channel 1 interrupt. This bit indicates on an interrupt that is a result of a result of a Frame Lost of SMFC channel 1 0 Interrupt is cleared. 1 Interrupt is requested.

Table continues on the next page...

IPUx_INT_STAT_10 field descriptions (continued)

Field	Description
0 SMFC0_FRM_LOST	Frame Lost of SMFC channel 0 interrupt. This bit indicates on an interrupt that is a result of a result of a Frame Lost of SMFC channel 0 0 Interrupt is cleared. 1 Interrupt is requested.

37.5.62 Interrupt Status Register 11 (IPUx_INT_STAT_11)

IPU status registers are not stored in the SRM during power gating mode.This register contains part of IPU interrupts status bits. The status bits of the end-of-band indication (EOBND) of DMA Channels interrupts [31:0] can be found in this register.

- Hide VDOA_SYNC for all versions
- Show VDOA_SYNC for IPUv3H version.
- The table below tagged with other settings (like IPU3M_only) should be hidden in IPUv3H version.

IPUx_INT_STAT_15 field descriptions (continued)

Field	Description
7 DP_ASF_BRAKE	DP Async Flow Brake indication interrupt. This bit indicates on the interrupt that is a result of the async flow brake at the DP 0 Interrupt is cleared. 1 Interrupt is requested.
6 DP_SF_BRAKE	DP Sync Flow Brake indication interrupt. This bit indicates on the interrupt that is a result of the Sync flow brake at the DP 0 Interrupt is cleared. 1 Interrupt is requested.
5 DP_ASF_END	DP Async Flow End indication interrupt. This bit indicates on the interrupt that is a result of the Async flow end at the DP 0 Interrupt is cleared. 1 Interrupt is requested.
4 DP_ASF_START	DP Async Flow Start indication interrupt. This bit indicates on the interrupt that is a result of the Async flow start at the DP 0 Interrupt is cleared. 1 Interrupt is requested.
3 DP_SF_END	DP Sync Flow End indication interrupt. This bit indicates on the interrupt that is a result of the Sync flow end at the DP 0 Interrupt is cleared. 1 Interrupt is requested.
2 DP_SF_START	DP Sync Flow Start indication interrupt. This bit indicates on the interrupt that is a result of the Sync flow start at the DP 0 Interrupt is cleared. 1 Interrupt is requested.
1 SNOOPING2_INT	IPU snooping 2 event indication interrupt. This bit indicates on the interrupt that is a result of the detection of a snooping 2 signal assertion coming to the IPU 0 Interrupt is cleared. 1 Interrupt is requested.
0 SNOOPING1_INT	IPU snooping 1 event indication interrupt. This bit indicates on the interrupt that is a result of the detection of a snooping 1 signal assertion coming to the 0 Interrupt is cleared. 1 Interrupt is requested.

37.5.67 Current Buffer Register 0 (IPUx_CUR_BUF_0)

This register contains the current buffer status information bit for each DMA channel.

Address: Base address + 23Ch offset

IPUx_CUR_BUF_0 field descriptions

Field	Description
31 DMA_CH_CUR_BUF_31	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
30 Reserved	This read-only field is reserved and always has the value 0. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
29 DMA_CH_CUR_BUF_29	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
28 DMA_CH_CUR_BUF_28	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.

Table continues on the next page...

Field	Description
27 DMA_CH_CUR_BUF_27	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
26 DMA_CH_CUR_BUF_26	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
25 DMA_CH_CUR_BUF_25	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
24 DMA_CH_CUR_BUF_24	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
23 DMA_CH_CUR_BUF_23	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
22 DMA_CH_CUR_BUF_22	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
21 DMA_CH_CUR_BUF_21	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
20 DMA_CH_CUR_BUF_20	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
19 DMA_CH_CUR_BUF_19	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.

Field	Description
18 DMA_CH_CUR_BUF_18	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
17 DMA_CH_CUR_BUF_17	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
16 Reserved	This read-only field is reserved and always has the value 0. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
15 DMA_CH_CUR_BUF_15	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
14 DMA_CH_CUR_BUF_14	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
13 DMA_CH_CUR_BUF_13	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
12 DMA_CH_CUR_BUF_12	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
11 DMA_CH_CUR_BUF_11	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
10 DMA_CH_CUR_BUF_10	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
9 DMA_CH_CUR_BUF_9	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number.

Table continues on the next page...

IPUx_CUR_BUF_0 field descriptions (continued)

Field	Description
	0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
8 DMA_CH_CUR_BUF_8	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
7–6 Reserved	This read-only field is reserved and always has the value 0. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
5 DMA_CH_CUR_BUF_5	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
4 Reserved	This read-only field is reserved and always has the value 0. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
3 DMA_CH_CUR_BUF_3	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
2 DMA_CH_CUR_BUF_2	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
1 DMA_CH_CUR_BUF_1	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
0 DMA_CH_CUR_BUF_0	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.

37.5.68 Current Buffer Register 1 (IPUx_CUR_BUF_1)

This register contains the current buffer status information bit for each DMA channel.

Address: Base address + 240h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

IPUx_ALT_CUR_1 field descriptions

Field	Description
31–21 Reserved	This read-only field is reserved and always has the value 0. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
20 DMA_CH_ALT_CUR_BUF_52	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
19–10 Reserved	This read-only field is reserved and always has the value 0. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
9 DMA_CH_ALT_CUR_BUF1_n	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number.

Table continues on the next page...

IPUx_ALT_CUR_1 field descriptions (continued)

Field	Description
	0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
8–2 Reserved	This read-only field is reserved and always has the value 0. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
1 DMA_CH_ALT_CUR_BUF0_n	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
0 Reserved	This read-only field is reserved and always has the value 0. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.

37.5.71 Shadow Registers Memory Status Register (IPUx_SRM_STAT)

The register contains status bits of SRM updates. There is a bit for each block. The bit is set when the SRM is currently updating the module's registers. When the SRM completes updating the registers of the block the bit is cleared. SW should not update the block's registers while it is being updated by the SRM.

Address: Base address + 24Ch offset

IPUx_DISP_TASKS_STAT field descriptions

Field	Description
31–12 Reserved	This read-only field is reserved and always has the value 0.
11 DC_ASYNC2_CUR_FLOW	Current asynchronous #2 flow via the DC 1 alternate flow 0 main flow
10–8 DC_ASYNCH2_STAT	Status of the Asynchronous flow #2 through the DC 000 IDLE - the task is idle 001 PRIM_ACTIVE - The primary flow of this task is currently active 010 ALT_ACTIVE - The alternate flow of this task is currently active 011 UPDATE_PARAM - The FSU is busy updating parameters from the SRM 100 PAUSE - The task is paused 101 Reserved 110 Reserved 111 Reserved
7–6 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

IPUx_DISP_TASKS_STAT field descriptions (continued)

Field	Description
5–4 DC_ASYNC1_ STAT	Status of the Asynchronous flow #1 through the DC (ch 28) 00 IDLE - The task is idle 01 ACTIVE - This task is currently active 10 WAIT_FOR_ READY - The task is waiting for a buffer to be ready
3 DP_ASYNC_ CUR_FLOW	Current asynchronous flow via the DP 1 alternate flow 0 main flow
DP_ASYNC_ STAT	Status of the Asynchronous flow through the DP 000 IDLE - the task is idle 001 PRIM_ACTIVE - The primary flow of this task is currently active 010 ALT_ACTIVE - The alternate flow of this task is currently active 011 UPDATE_PARAM - The FSU is busy updating parameters from the SRM 100 PAUSE - The task is paused 101 Reserved 110 Reserved 111 Reserved

37.5.74 Triple Current Buffer Register 0 (IPUx_TRIPLE_CUR_BUF_0)

This register contains the current buffer status information for triple buffer mode for each DMA channel.

- Hide VPU_SUB_FRAME_SYNC for all versions
- Show VPU_SUB_FRAME_SYNC for IPUv3H version.
- The table below tagged with other settings (like IPU3M_only) should be hidden in IPUv3H version.
- This requires some sophisticated conditional tag settings

IPUx_TRIPLE_CUR_BUF_0 field descriptions

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27–26 DMA_CH_ TRIPLE_CUR_ BUF_13	Current Buffer for triple buffer mode. This bits indicate which buffer is in use by the DMA when triple buffer mode is selected. Each pair of bits indicate the corresponding DMA channel (bits [1:0] correspond to ch #0; (bits [3:2] correspond to ch #1, etc.) 11 NA 00 Current buffer used by DMA is buffer 0. 01 Current buffer used by DMA is buffer 1. 10 Current buffer used by DMA is buffer 2.
25–22 Reserved	This read-only field is reserved and always has the value 0.
21–20 DMA_CH_ TRIPLE_CUR_ BUF_10	Current Buffer for triple buffer mode. This bits indicate which buffer is in use by the DMA when triple buffer mode is selected. Each pair of bits indicate the corresponding DMA channel (bits [1:0] correspond to ch #0; (bits [3:2] correspond to ch #1, etc.) 11 NA 00 Current buffer used by DMA is buffer 0. 01 Current buffer used by DMA is buffer 1. 10 Current buffer used by DMA is buffer 2.
19–18 DMA_CH_ TRIPLE_CUR_ BUF_9	Current Buffer for triple buffer mode. This bits indicate which buffer is in use by the DMA when triple buffer mode is selected. Each pair of bits indicate the corresponding DMA channel (bits [1:0] correspond to ch #0; (bits [3:2] correspond to ch #1, etc.) 11 NA 00 Current buffer used by DMA is buffer 0. 01 Current buffer used by DMA is buffer 1. 10 Current buffer used by DMA is buffer 2.
17–16 DMA_CH_ TRIPLE_CUR_ BUF_8	Current Buffer for triple buffer mode. This bits indicate which buffer is in use by the DMA when triple buffer mode is selected. Each pair of bits indicate the corresponding DMA channel (bits [1:0] correspond to ch #0; (bits [3:2] correspond to ch #1, etc.) 11 NA 00 Current buffer used by DMA is buffer 0. 01 Current buffer used by DMA is buffer 1. 10 Current buffer used by DMA is buffer 2.
Reserved	This read-only field is reserved and always has the value 0.

37.5.75 Triple Current Buffer Register 1 (IPUx_TRIPLE_CUR_BUF_1)

This register contains the current buffer status information for triple buffer mode for each DMA channel.

Address: Base address + 25Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

IPUx_TRIPLE_CUR_BUF_1 field descriptions (continued)

Field	Description
21–16 Reserved	This read-only field is reserved and always has the value 0.
15–14 DMA_CH_ TRIPLE_CUR_ BUF_23	Current Buffer for triple buffer mode. This bits indicate which buffer is in use by the DMA when triple buffer mode is selected. Each pair of bits indicate the corresponding DMA channel (bits [1:0] correspond to ch #0; (bits [3:2] correspond to ch #1, etc.) 11 NA 00 Current buffer used by DMA is buffer 0. 01 Current buffer used by DMA is buffer 1. 10 Current buffer used by DMA is buffer 2.
13–12 Reserved	This read-only field is reserved and always has the value 0.
11–10 DMA_CH_ TRIPLE_CUR_ BUF_21	Current Buffer for triple buffer mode. This bits indicate which buffer is in use by the DMA when triple buffer mode is selected. Each pair of bits indicate the corresponding DMA channel (bits [1:0] correspond to ch #0; (bits [3:2] correspond to ch #1, etc.) 11 NA 00 Current buffer used by DMA is buffer 0. 01 Current buffer used by DMA is buffer 1. 10 Current buffer used by DMA is buffer 2.
Reserved	This read-only field is reserved and always has the value 0.

37.5.76 Triple Current Buffer Register 2 (IPUx_TRIPLE_CUR_BUF_2)

This register contains the current buffer status information for triple buffer mode for each DMA channel.

Address: Base address + 260h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

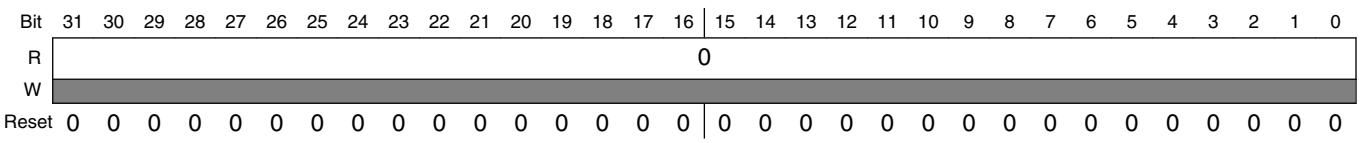
IPUx_TRIPLE_CUR_BUF_2 field descriptions

Field	Description
Reserved	This read-only field is reserved and always has the value 0. 00 Current buffer used by DMA is buffer 0. 01 Current buffer used by DMA is buffer 1. 10 Current buffer used by DMA is buffer 2.

37.5.76 Triple Current Buffer Register 3 (IPUx_TRIPLE_CUR_BUF_3)

This register contains the current buffer status information for triple buffer mode for each DMA channel.

Address: Base address + 264h offset



IPUx_TRIPLE_CUR_BUF_3 field descriptions

Field	Description
Reserved	This read-only field is reserved and always has the value 0. 00 Current buffer used by DMA is buffer 0. 01 Current buffer used by DMA is buffer 1. 10 Current buffer used by DMA is buffer 2.

37.5.76 IPU Channels Buffer 0 Ready 0 Register (IPUx_CH_BUF0_RDY0)

The register contains buffer 0 ready control information for 32 IPU's DMA channels (31-0). This register can be a write one to set or a write one to clear according to the **IPU_CH_BUF0_RDY0_CLR bit**.

The register is shown in IPU Channels Buffer 0 Ready 0 Register (IPU_CH_BUF0_RDY0), and the register fields are described in IPU Channels Buffer 0 Ready 0 Register (IPU_CH_BUF0_RDY0).

Address: Base address + 268h offset

Field	Description
DMA_CH_BUF2_RDY_x	Buffer 2 is ready. This bit indicates that ARM platform finished/writing reading buffer 2 in memory. 0 Buffer 2 is not ready. 1 Buffer 2 is ready.

37.5.86 IDMAC Configuration Register (IPUx_IDMAC_CONF)

Address: Base address + 8000h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	Reserved						USED_BUFS_EN_R	USED_BUFS_MAX_R				USED_BUFS_EN_W	USED_BUFS_MAX_W			P_ENDIAN
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	Reserved										RDI	WIDPT	MAX_REQ_READ			
Reset	0	0	0	0	0	0	0	0	0	0	1	0	1	1	1	1

IPUx_IDMAC_CONF field descriptions

Field	Description
31–26 -	This field is reserved. Reserved, should be cleared.
25 USED_BUFS_EN_R	Enables the limit on the number of pending non real time read requests.
24–21 USED_BUFS_MAX_R	Limit the number of pending non real time read requests. The value can be between 0 to 8. This field has no affect if USED_BUFS_EN_R is cleared
20 USED_BUFS_EN_W	Enables the limit on the number of pending non real time write requests.

Table continues on the next page...

IPUx_IDMAC_CONF field descriptions (continued)

Field	Description
19–17 USED_BUFS_MAX_W	Limit the number of pending non real time write requests. The value can be between 0 to 6. This field has no affect if USED_BUFS_EN_W is cleared
16 P_ENDIAN	Pixel Endianness. The pixel Endianness must not be changed while any of the IDMAC channels is enabled. 0 little endian 1 Big endian
15–6 -	This field is reserved. Reserved, should be cleared.
5 RDI	Read Data Interleaving. This bit must match the slave read data interleaving support. If the AXI slave connected to the IPU supports read data interleaving then this bit must be set. If the AXI slave does not support read data interleaving then the IDMAC can utilize this and issue more address phases on read. In that case it is recommended to have this bit cleared. 0 The AXI slave does not support read data interleaving 1 The AXI slave supports read data interleaving
4–3 WIDPT	Write Interleaving Depth These 2 bits define the Write Interleaving Depth of the AXI port. This bits should be configured by the user according to the AXI slave's Write Interleaving Depth. WIDPT defines the maximal number of active bursts (yet to be responded) with different IDs. IDMAC will block data phase if the next data's ID is new (no such ID active) and the number of active IDs is equal to WIDPT. 00 Write Interleaving Depth of 1 01 Write Interleaving Depth of 2 10 Write Interleaving Depth of 3 11 Write Interleaving Depth of 4
MAX_REQ_READ	Maximum Read Requests. This fields sets the maximum pending requests allowed in the AXI Read requests queue.

37.5.87 IDMAC Channel Enable 1 Register (IPUx_IDMAC_CH_EN_1)

Address: Base address + 8004h offset

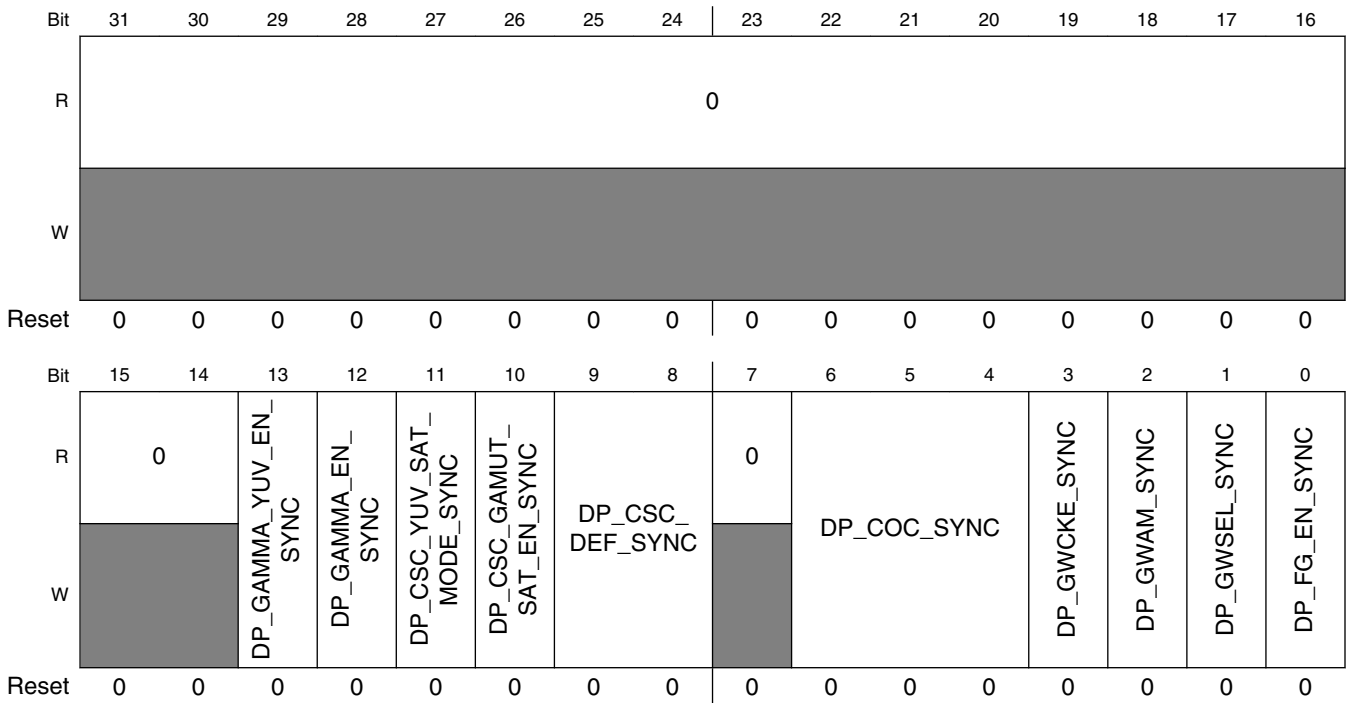
37.5.108 DP Common Configuration Sync Flow Register (IPUx_DP_COM_CONF_SYNC)

This register contains common configuration parameters for the DP.

Address: Base address + 1_8000h offset



IPUx_DP_COM_CONF_SYNC field descriptions

Field	Description
31–14 Reserved	This read-only field is reserved and always has the value 0.
13 DP_GAMMA_YUV_EN_SYNC	GAMMA's YUV mode enable for sync flow 0 YUV mode is OFF. 1 YUV mode is ON.
12 DP_GAMMA_EN_SYNC	GAMMA_EN - Gamma correction block enable bit 0 disable 1 enable
11 DP_CSC_YUV_SAT_MODE_SYNC	CSC_YUV_SAT_MODE YUV saturation mode for color space conversion 0 Y/U/V range 0 -255 1 Y range 16-235, U/V range 16-240

Table continues on the next page...

IPUx_DP_COM_CONF_SYNC field descriptions (continued)

Field	Description
10 DP_CSC_ GAMUT_SAT_ EN_SYNC	CSC_GAMUT_SAT_EN Indicate if GAMUT saturation is enabled 0 disable GAMUT mapping 1 enable GAMUT mapping
9–8 DP_CSC_DEF_ SYNC	CSC_DEF Enable or disable Color Space Conversion. 00 CSC disable 01 CSC enable after combining 10 CSC enable before combining on BG channel 11 CSC enable before combining on FG channel
7 Reserved	This read-only field is reserved and always has the value 0.
6–4 DP_COC_SYNC	COC - Cursor Operation Control Controls the format of the cursor and the type of arithmetic operations 000 Transparent, cursor is disabled. 001 Full cursor. 010 Reversed cursor. 011 AND between full plane and cursor. 100 Reserved 101 OR between full plane and cursor. 110 XOR between full plane and cursor. 111 Reserved.
3 DP_GWCKE_ SYNC	GWCKE - Graphic Window Color Keying Enable Enable or disable graphic window color keying. 1 Enable color keying of graphic window 0 Disable color keying of graphic window
2 DP_GWAM_ SYNC	GWAM - Graphic Window Alpha Mode Select the use of Alpha to be global or local. 1 Global Alpha. 0 Local Alpha.
1 DP_GWSEL_ SYNC	GWSEL - Graphic Window Select Select graphic window to be on partial plane or full plane. 1 Graphic window is partial plane. 0 Graphic window is full plane.
0 DP_FG_EN_ SYNC	FG_EN - partial plane Enable. This bit enables the partial plane channel. 1 partial plane channel is enabled. 0 partial plane channel is disabled.

37.5.109 DP Graphic Window Control Sync Flow Register (IPUx_DP_Graph_Wind_CTRL_SYNC)

This register contains common configuration parameters for the DP.

Address: Base address + 1_8004h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Field	Description
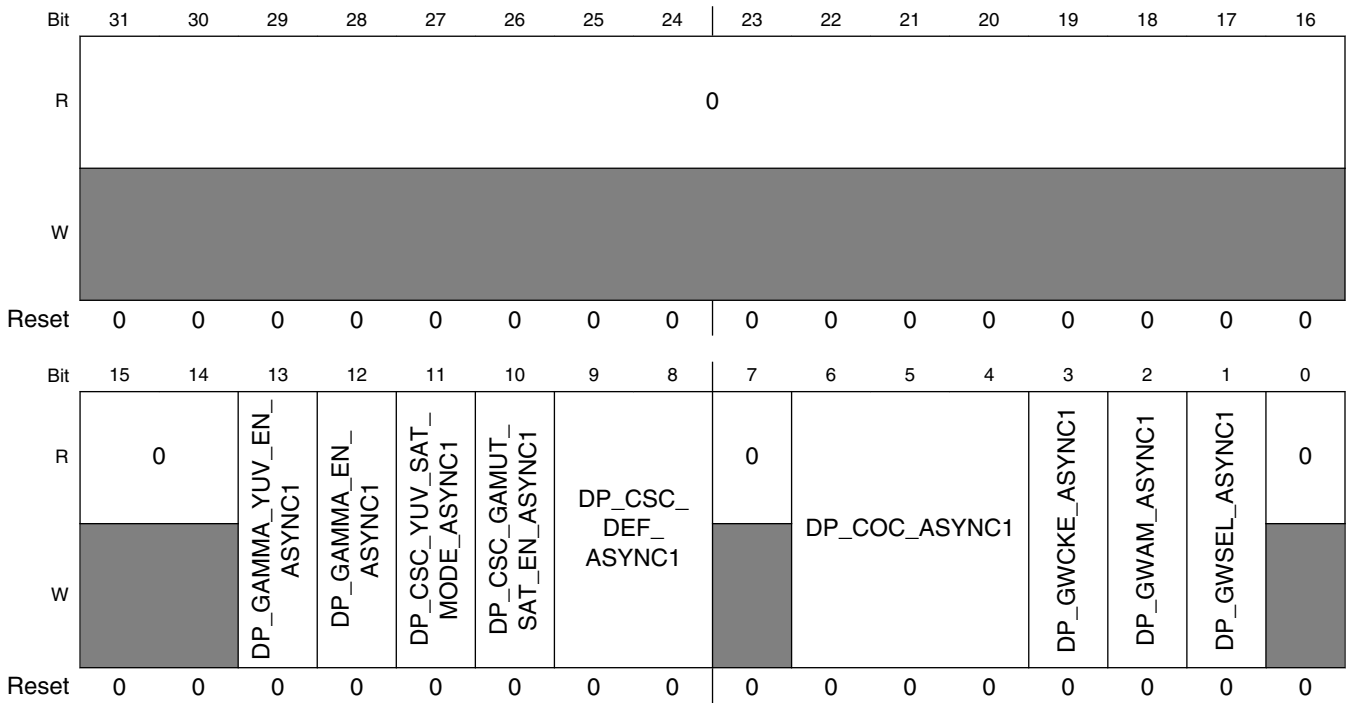
31–30 DP_CSC_S2_ASYNC0	S0 parameter of color conversion. 00 scale factor of 2 01 scale factor of 1 10 scale factor of 0 11 scale factor of -1
29–16 DP_CSC_B2_ASYNC0	B0 parameter of color conversion.
15–14 DP_CSC_S1_ASYNC0	S0 parameter of color conversion. 00 scale factor of 2 01 scale factor of 1 10 scale factor of 0 11 scale factor of -1
DP_CSC_B1_ASYNC0	B0 parameter of color conversion.

37.5.129 DP Common Configuration Async 1 Flow Register (IPUx_DP_COM_CONF_ASYNC1)

This register contains common configuration parameters for the DP.

Address: Base address + 1_80BCh offset



IPUx_DP_COM_CONF_ASYNC1 field descriptions

Field	Description
31–14 Reserved	This read-only field is reserved and always has the value 0.
13 DP_GAMMA_YUV_EN_ASYNC1	GAMMA's YUV mode enable for async flow 1 0 YUV mode is OFF. 1 YUV mode is ON.
12 DP_GAMMA_EN_ASYNC1	GAMMA_EN - Gamma correction block enable bit 0 disable 1 enable
11 DP_CSC_YUV_SAT_MODE_ASYNC1	CSC_YUV_SAT_MODE YUV saturation mode for color space conversion 0 Y/U/V range 0 -255 1 Y range 16-235, U/V range 16-240

Table continues on the next page...

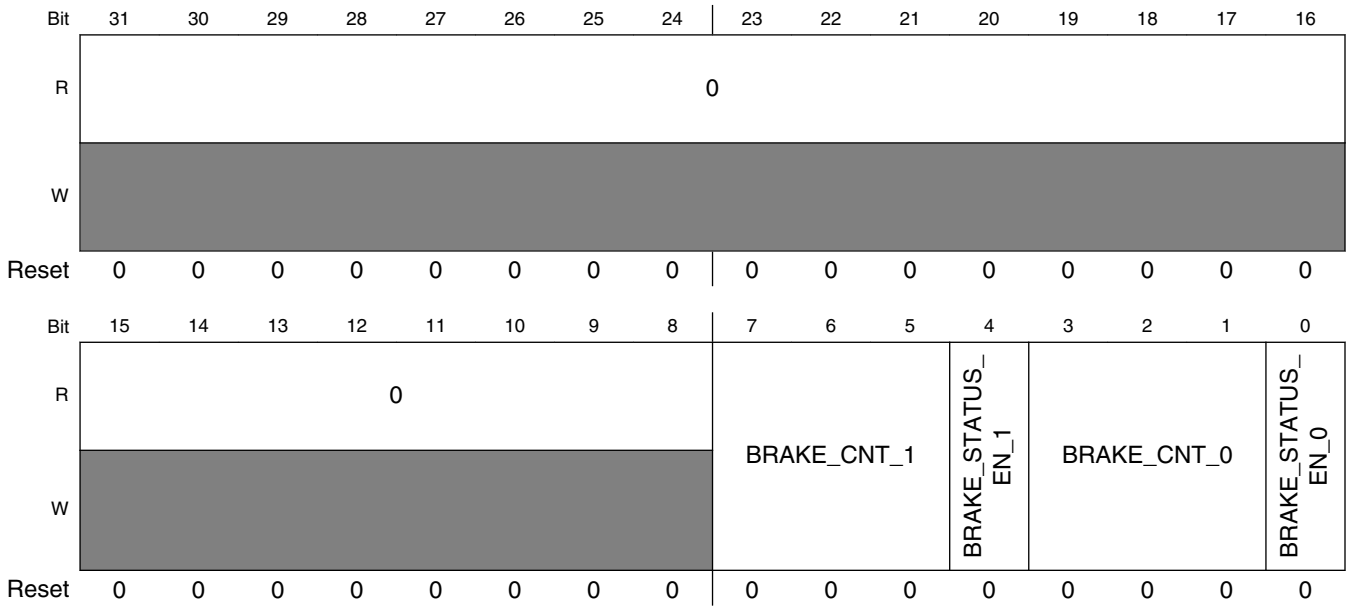
IPUx_DP_COM_CONF_ASYNC1 field descriptions (continued)

Field	Description
10 DP_CSC_ GAMUT_SAT_ EN_ASYNC1	CSC_GAMUT_SAT_EN Indicate if GAMUT saturation is enabled 0 disable GAMUT mapping 1 enable GAMUT mapping
9–8 DP_CSC_DEF_ ASYNC1	CSC_DEF Enable or disable Color Space Conversion. 00 CSC disable 01 CSC enable after combining 10 CSC enable before combining on BG channel 11 CSC enable before combining on FG channel
7 Reserved	This read-only field is reserved and always has the value 0.
6–4 DP_COC_ ASYNC1	COC - Cursor Operation Control Controls the format of the cursor and the type of arithmetic operations 000 Transparent, cursor is disabled. 001 Full cursor. 010 Reversed cursor. 011 AND between full plane and cursor. 100 Reserved 101 OR between full plane and cursor. 110 XOR between full plane and cursor. 111 Reserved
3 DP_GWCKE_ ASYNC1	GWCKE - Graphic Window Color Keying Enable Enable or disable graphic window color keying. 1 Enable color keying of graphic window 0 Disable color keying of graphic window
2 DP_GWAM_ ASYNC1	GWAM - Graphic Window Alpha Mode Select the use of Alpha to be global or local. 1 Global Alpha. 0 Local Alpha.
1 DP_GWSEL_ ASYNC1	GWSEL - Graphic Window Select Select graphic window to be on partial plane or full plane. 1 Graphic window is partial plane. 0 Graphic window is full plane.
0 Reserved	This read-only field is reserved and always has the value 0.

37.5.130 DP Debug Control Register (IPUx_DP_DEBUG_CNT)

This is the debug unit control register. This register is not stored in the SRM.

Address: Base address + 1_80BCh offset



IPUx_DP_DEBUG_CNT field descriptions

Field	Description
31–8 Reserved	This read-only field is reserved and always has the value 0.
7–5 BRAKE_CNT_1	The async flow can be broken multiple times. It possible to control which breaking event will cause the interrupt. This field counts the breaking events for unit #1
4 BRAKE_ STATUS_EN_1	This bit enables the break/status unit #1
3–1 BRAKE_CNT_0	The async flow can be broken multiple times. It possible to control which breaking event will cause the interrupt. This field counts the breaking events for unit #0
0 BRAKE_ STATUS_EN_0	This bit enables the break/status unit #0

37.5.131 DP Graphic Window Control Async 1 Flow Register (IPUx_DP_GRAPH_WIND_CTRL_ASYNC1)

This register contains common configuration parameters for the DP.

Address: Base address + 1_80C0h offset

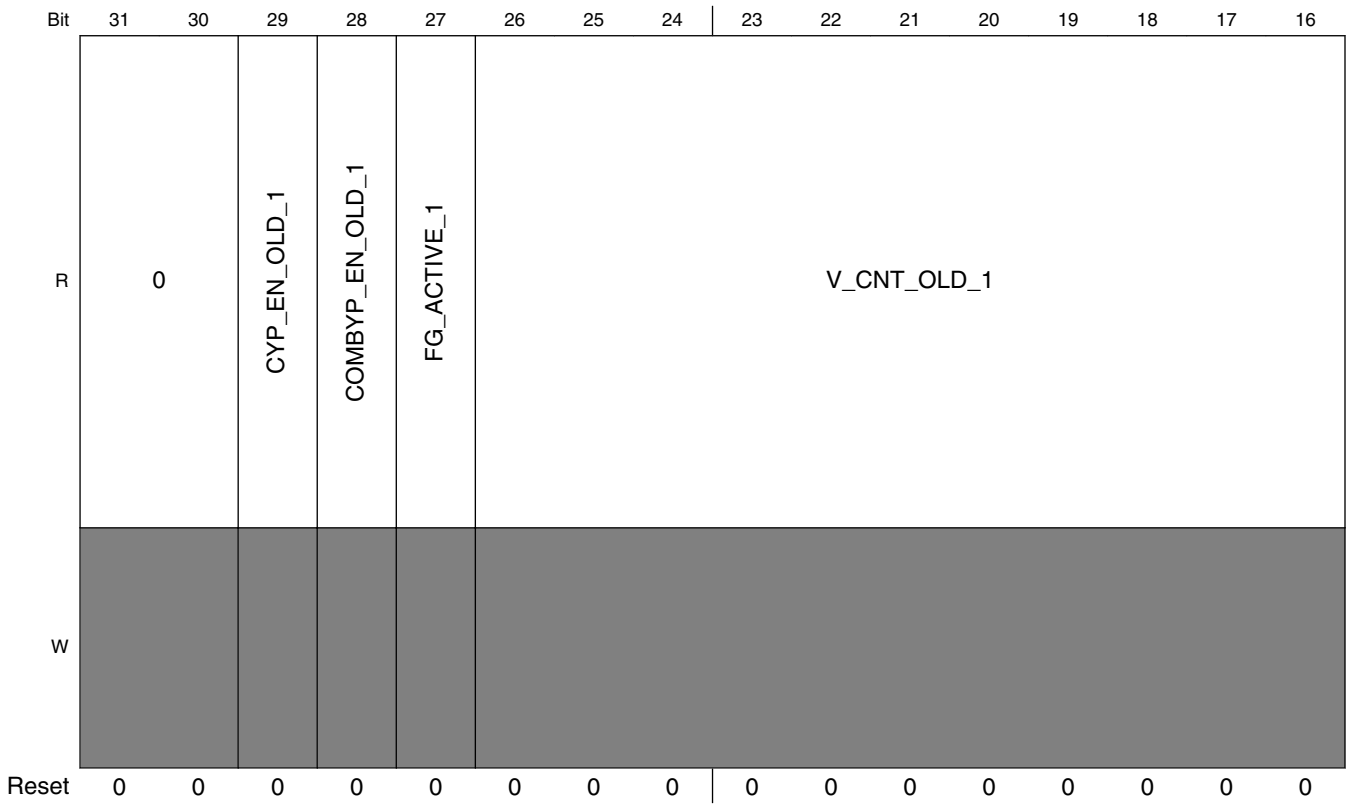
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	DP_GWAV_ASYNC1								DP_GWCKR_ASYNC1								DP_GWCKG_ASYNC1								DP_GWCKB_ASYNC1							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

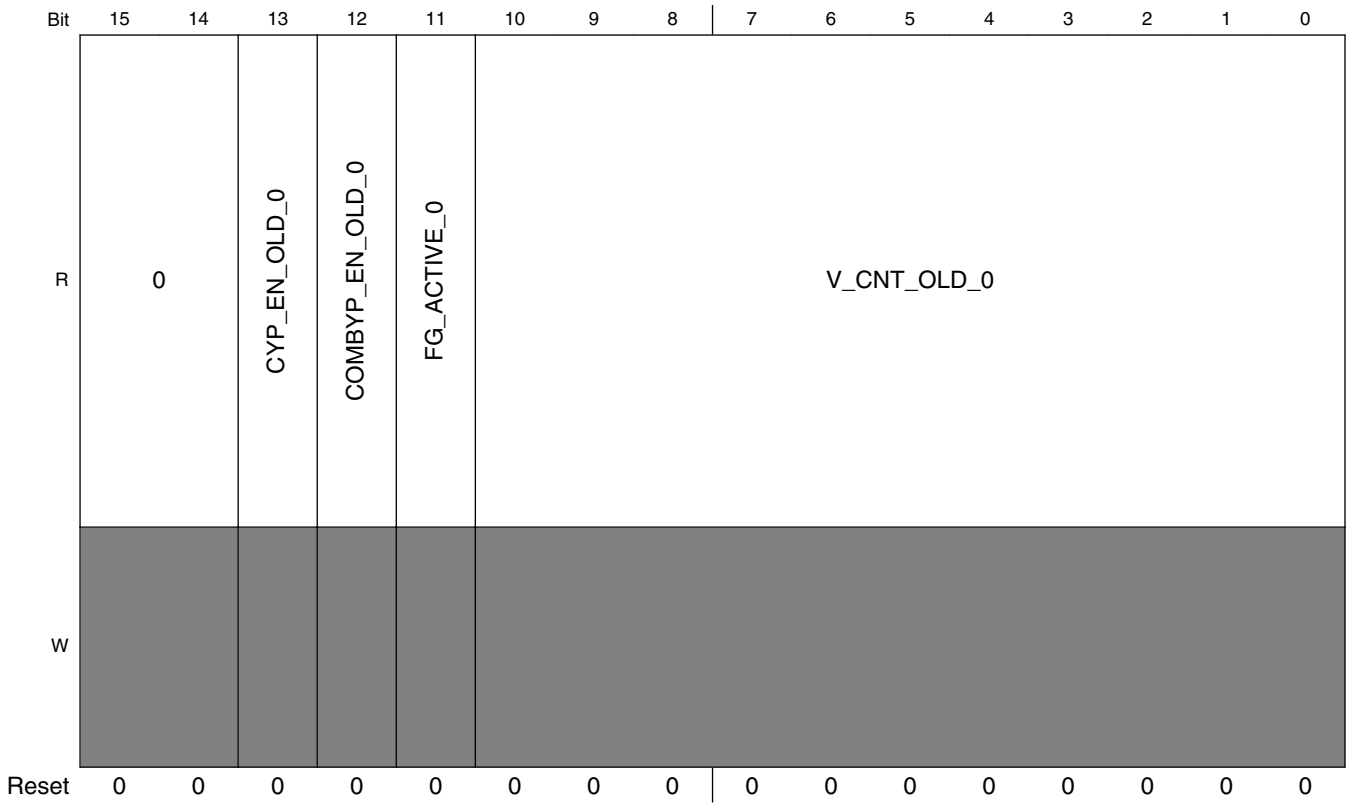
IPUx_DP_GRAPH_WIND_CTRL_ASYNC1 field descriptions

Field	Description
31–24 DP_GWAV_ASYNC1	GWAV - Graphic Window Alpha Value Defines the alpha value of graphic window used for alpha blending between graphic window and full plane. The Value the number that writing to GWAV register. The Actual Value the number, that insert to calculation in Combining Module. If Value = < 0.5- 1/256 (01111111) then Actual Value = Value. If Value >= 0.5 (10000000), then Actual Value = Value + 1/256. 00000000 Actual value is 00000000; Graphic window totally opaque i.e. overlay on LCD screen 01111111 Actual value is 01111111; 10000000 Actual value is 10000001 10000001 Actual value is 10000010 11111110 Actual value is 11111111 11111111 Actual value is 100000000;Graphic window totally transparent i.e. not displayed on LCD screen
23–16 DP_GWCKR_ASYNC1	GWCKR - Graphic Window Color Keying Red Component Defines the red component of graphic window color keying. 00000000 No red 11111111 Full red
15–8 DP_GWCKG_ASYNC1	GWCKG - Graphic Window Color Keying Green Component Defines the green component of graphic window color keying. 00000000 No Green 11111111 Full Green
DP_GWCKB_ASYNC1	GWCKB - Graphic Window Color Keying Blue Component Defines the blue component of graphic window color keying. 00000000 No blue 11111111 Full blue

37.5.132 DP Debug Status Register (IPUx_DP_DEBUG_STAT)

Address: Base address + 1_80C0h offset





IPUx_DP_DEBUG_STAT field descriptions

Field	Description
31–30 Reserved	This read-only field is reserved and always has the value 0.
29 CYP_EN_OLD_1	The async flow has been broken in the middle of a cursor (This filed is relevant for debug unit #1)
28 COMBYP_EN_OLD_1	the async1 flow has been broken in the middle of combining (This filed is relevant for debug unit #1)
27 FG_ACTIVE_1	Displaying the partial frame has been started (This filed is relevant for debug unit #1)
26–16 V_CNT_OLD_1	The exact row where the async flow has been broken (This filed is relevant for debug unit #0)
15–14 Reserved	This read-only field is reserved and always has the value 0.
13 CYP_EN_OLD_0	The async flow has been broken in the middle of a cursor (This filed is relevant for debug unit #0)
12 COMBYP_EN_OLD_0	the async flow has been broken in the middle of combining (This filed is relevant for debug unit #0)
11 FG_ACTIVE_0	Displaying the partial frame has been started for async flow (This filed is relevant for debug unit #0)
V_CNT_OLD_0	The exact row where the async flow has been broken (This filed is relevant for debug unit #0)

37.5.133 DP Partial Plane Window Position Async 1 Flow Register (IPUx_DP_FG_POS_ASYNC1)

The DP partial plane Window Position Register is used to determine the starting position of the partial plane window relative to BG window position.

This Register is used for the synchronous flow only.

Address: Base address + 1_80C4h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0					DP_FGXP_ASYNC1											0					DP_FGYP_ASYNC1										
W

IPUx_DP_FG_POS_ASYNC1 field descriptions

Field	Description
31–27 Reserved	This read-only field is reserved and always has the value 0.
26–16 DP_FGXP_ ASYNC1	FGXP partial plane Window X Position. partial plane Window X Position - Specifies the number of pixels between the start of full plane window X position and the beginning of the first data of new line.
15–11 Reserved	This read-only field is reserved and always has the value 0.
DP_FGYP_ ASYNC1	FGYP partial plane window Y position partial plane Window Y Position - Specifies the number of lines between the start of full plane windows Y position and the beginning of the first data.

37.5.134 DP Cursor Postion and Size Async 1 Flow Register (IPUx_DP_CUR_POS_ASYNC1)

The LCD Cursor Position Register is used to determine the starting position of the cursor relative to BG windows position.

Address: Base address + 1_80C8h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

IPUx_DP_CUR_POS_ASYNC1 field descriptions

Field	Description
31–27 DP_CYP_ ASYNC1	CYP - Cursor Y Position Represents the cursors vertical starting position Y in pixel count (from 0 to CYH).Live View Resolution Mode.
26–16 DP_CYH_ ASYNC1	CYH - Cursor Height Specifies the height of the hardware cursor in pixels.
15–11 DP_CXP_ ASYNC1	CXP - Cursor X Position Represents the cursors horizontal starting position X in pixel count (from 0 to CXW).
DP_CXW_ ASYNC1	CXW - Cursor Width. Specifies the width of the hardware cursor in pixels.

37.5.135 DP Color Cursor Mapping Async 1 Flow Register (IPUx_DP_CUR_MAP_ASYNC1)

The LCD Color Cursor Mapping Register defines the color of the cursor in passive or TFT color modes.

Address: Base address + 1_80CCh offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

IPUx_DP_CUR_MAP_ASYNC1 field descriptions

Field	Description
31–24 Reserved	This read-only field is reserved and always has the value 0.
23–16 DP_CUR_COL_ B_ASYNC1	CUR_COL_B - Cursor Blue Field Defines the Blue component of the cursor color in color mode 00000000 No Blue. 11111111 Full Blue.
15–8 DP_CUR_COL_ G_ASYNC1	CUR_COL_G - Cursor Green Field Defines the Green component of the cursor color in color mode 00000000 No Green. 11111111 Full Green.
DP_CUR_COL_ R_ASYNC1	CUR_COL_R - Cursor Red Field Defines the Red component of the cursor color in color mode

Table continues on the next page...

IPUx_DP_CUR_MAP_ASYNC1 field descriptions (continued)

Field	Description
	00000000 No Red. 11111111 Full Red.

37.5.136 DP Gamma Constants Async 1 Flow Register i (IPUx_DP_GAMMA_C_ASYNC1_i)

This registers contains CONSTANTi parameters used for gamma correction inside the display processor (DP).

Address: Base address + 1_80D0h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Field	Description
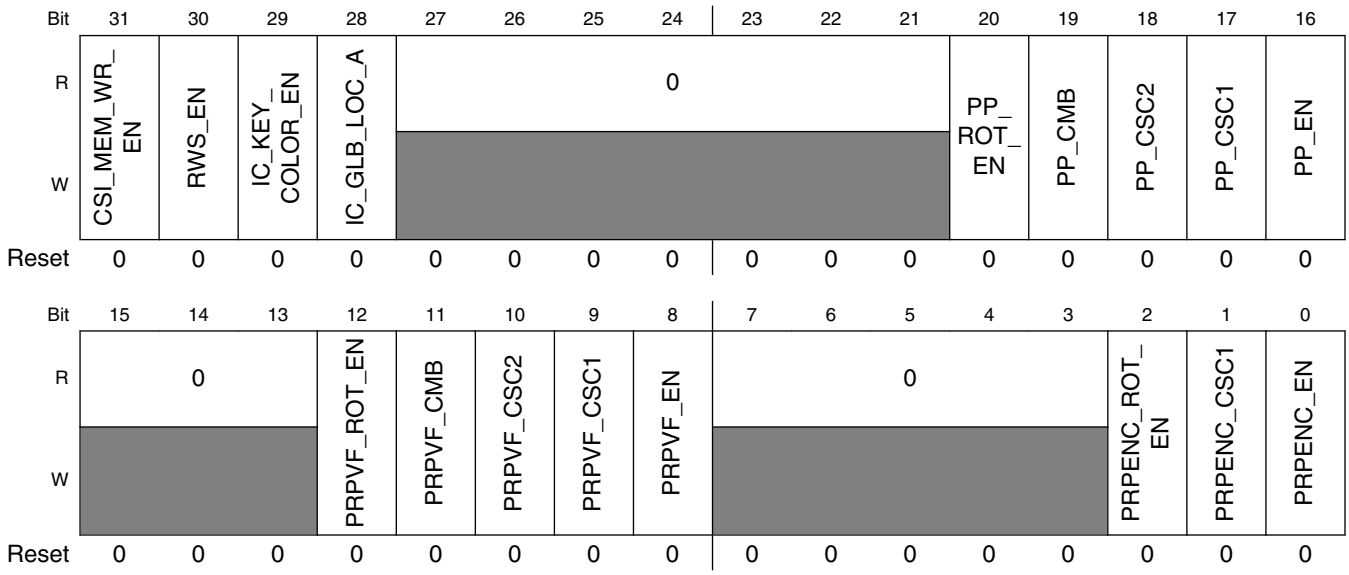
31–30 DP_CSC_S2_ASYNC1	S0 parameter of color conversion. 00 scale factor of 2 01 scale factor of 1 10 scale factor of 0 11 scale factor of -1
29–16 DP_CSC_B2_ASYNC1	B0 parameter of color conversion.
15–14 DP_CSC_S1_ASYNC1	S0 parameter of color conversion. 00 scale factor of 2 01 scale factor of 1 10 scale factor of 0 11 scale factor of -1
DP_CSC_B1_ASYNC1	B0 parameter of color conversion.

37.5.141 IC Configuration Register (IPUx_IC_CONF)

This register contains control parameter for IC 3 tasks (pre-processing for encoding, pre-processing for view-finder and post processing).

Address: Base address + 2_0000h offset



IPUx_IC_CONF field descriptions

Field	Description
31 CSI_MEM_WR_EN	CSI direct memory write enable. This bit enables writing data from sensor directly to memory even when a raw sensor is not attached. 0 CSI direct writing to memory is disabled. 1 CSI direct writing to memory is enabled.
30 RWS_EN	Raw sensor enable. This bit indicate if a Raw sensor is attached (Bayer format). This bit is used together with the CSI_MEM_WR_EN bit as follows: CSI_MEM_WR_EN=0, RWS_EN=0 - data is fed from the CSI to the IC for processing; CSI_MEM_WR_EN=1, RWS_EN=0 - data is fed from the CSI to the IC for processing and also for writing to the system memory; CSI_MEM_WR_EN=0, RWS_EN=1 - data is fed from the CSI to the system memory (via the IC) and from the system memory to the IC for processing; CSI_MEM_WR_EN=1, RWS_EN=1 - non-valid configuration. 0 Raw sensor is not attached. 1 Raw sensor is attached.
29 IC_KEY_COLOR_EN	Key Color enable. This bit enables the key color feature.

Table continues on the next page...

IPUx_IC_CONF field descriptions (continued)

Field	Description
	0 Key color is disabled. 1 Key color is enabled.
28 IC_GLB_LOC_A	Global Alpha. This bit select the source of Alpha parameter. 0 Alpha parameter is local. 1 Alpha parameter is global.
27–21 Reserved	This read-only field is reserved and always has the value 0.
20 PP_ROT_EN	Post-Processing Rotation Task enable. This bit enable Post-Processing Rotation Task. 0 Rotation is disabled. 1 Rotation is enabled.
19 PP_CMB	Post-Processing Task combining enable. This bit enables combining. 0 Combining is disabled. 1 Combining is enabled.
18 PP_CSC2	Post-Processing Task color conversion RGB-->YUV enable. This bit enables YUV-->RGB. Reserved 0 RGB-->YUV is disabled. 1 RGB-->YUV is enabled.
17 PP_CSC1	Post-Processing Task color conversion YUV-->RGB enable. This bit enables YUV-->RGB. 0 YUV-->RGB is disabled. 1 YUV-->RGB is enabled.
16 PP_EN	Post-Processing Task enable. This bit enables the Post-Processing task. 0 Task is disabled. 1 Task is enabled.
15–13 Reserved	This read-only field is reserved and always has the value 0.
12 PRPVF_ROT_EN	Preprocessing Rotation Task for viewfinder enable. This bit enable Preprocessing Rotation Task for viewfinder. 0 Rotation is disabled. 1 Rotation is enabled.
11 PRPVF_CMB	Preprocessing Task for View-Finder combining enable. This bit enables combining. 0 Combining is disabled. 1 Combining is enabled.
10 PRPVF_CSC2	Reserved
9 PRPVF_CSC1	Pre-processing task for view-finder first color conversion enable. This bit enables first color conversion. 0 First color conversion is disabled. 1 First color conversion is enabled.
8 PRPVF_EN	Preprocessing Task for View-Finder enable. This bit enables the View-Finder task.

Table continues on the next page...

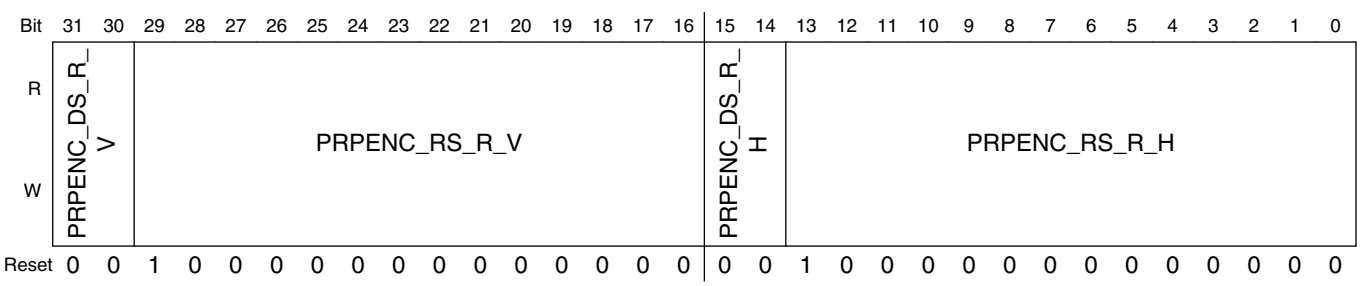
IPUx_IC_CONF field descriptions (continued)

Field	Description
	0 Task is disabled. 1 Task is enabled.
7–3 Reserved	This read-only field is reserved and always has the value 0.
2 PRPENC_ROT_EN	Preprocessing Rotation Task for encoding enable. This bit enable Preprocessing Rotation Task for encoding. 0 Rotation is disabled. 1 Rotation is enabled.
1 PRPENC_CSC1	Preprocessing Task for encoding color conversion enable. This bit enables color conversion. 0 Color conversion is disabled. 1 Color conversion is enabled.
0 PRPENC_EN	Preprocessing Task for encoding enable. This bit enables the encoding task. 0 Task is disabled. 1 Task is enabled.

37.5.142 IC Preprocessing Encoder Resizing Coefficients Register (IPUx_IC_PRP_ENC_RSC)

This register contains the resizing and downsizing parameters for Preprocessing task for encoding.

Address: Base address + 2_0004h offset



IPUx_IC_PRP_ENC_RSC field descriptions

Field	Description
31–30 PRPENC_DS_R_V	Preprocessing task for encoding Downsizing vertical Ratio. This field contains the downsizing vertical coefficient of Preprocessing for Encoding.
29–16 PRPENC_RS_R_V	Preprocessing task for encoding Resizing vertical Ratio. This field contains the resizing vertical coefficient of Preprocessing for Encoding. Resizing Ratio is equal to PRPENC_RS_R_V: M

Table continues on the next page...

IPUx_IC_PRP_ENC_RSC field descriptions (continued)

Field	Description
	Where M = 2^13; SI - input size; SO - output size PRPENC_RS_R_V = floor(M*(SI-1)/(SO-1));
15–14 PRPENC_DS_R_H	Preprocessing task for encoding Downsizing horizontal Ratio. This field contains the downsizing horizontal coefficient of Preprocessing for Encoding. Values: 00 1 01 2 10 4 11 RSV
PRPENC_RS_R_H	Preprocessing task for encoding Resizing horizontal Ratio. This field contains the resizing horizontal coefficient of Preprocessing for Encoding. Resizing Ratio is equal to PRPENC_RS_R_H: M Where M = 2^13; SI - input size; SO - output size PRPENC_RS_R_H = floor(M*(SI-1)/(SO-1));

37.5.143 IC Preprocessing View-Finder Resizing Coefficients Register (IPUx_IC_PRP_VF_RSC)

This register contains the resizing and downsizing parameters for preprocessing task for display.

Address: Base address + 2_0008h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

IPUx_IC_PP_RSC field descriptions

Field	Description
31–30 PP_DS_R_V	Post-Processing task Downsizing vertical Ratio. This field contains the downsizing vertical coefficient of Post-Processing.
29–16 PP_RS_R_V	Post-Processing task Resizing vertical Ratio. This field contains the resizing vertical coefficient of Post-Processing. Resizing Ratio is equal to PP_RS_R_V: M Where M = 2^13; SI - input size; SO - output size PP_RS_R_V = floor(M*(SI-1)/(SO-1));

Table continues on the next page...

IPUx_IC_PP_RSC field descriptions (continued)

Field	Description
15–14 PP_DS_R_H	Post-Processing task Downsizing horizontal Ratio. This field contains the downsizing horizontal coefficient of Post-Processing. 00 1 01 2 10 4 11 RSV
PP_RS_R_H	Post-Processing task Resizing horizontal Ratio. This field contains the resizing horizontal coefficient of Post-Processing. Resizing Ratio is equal to PP_RS_R_H: M Where M = 2^13; SI - input size; SO - output size PP_RS_R_H = floor(M*(SI-1)/(SO-1));

37.5.145 IC Combining Parameters Register 1 (IPUx_IC_CMBP_1)

IPUx_IC_IDMAC_1 field descriptions (continued)

Field	Description
22 T3_FLIP_RS	LEFT/RIGHT flip for Post Processing (PP) task; his bit affect the flipping done on the resizing unit. The value of this field must be identical to the corresponding channel's HF parameter in the IDMAC's CPMEM 1 horizontal flip enabled 0 no flip
21 T2_FLIP_RS	LEFT/RIGHT flip for View Finder (VF) task; this bit affect the flipping done on the resizing unit. The value of this field must be identical to the corresponding channel's HF parameter in the IDMAC's CPMEM 1 horizontal flip enabled 0 no flip
20 T1_FLIP_RS	LEFT/RIGHT flip for Encoding (ENC) task; this bit affect the flipping done on the resizing unit. The value of this field must be identical to the corresponding channel's HF parameter in the IDMAC's CPMEM 1 horizontal flip enabled 0 no flip
19 T3_FLIP_UD	UP/DOWN flip for Post Processing (PP) task The value of this field must be identical to the corresponding channel's VF parameters in the IDMAC's CPMEM 1 Vertical flip enable 0 no flip
18 T3_FLIP_LR	LEFT/RIGHT flip for Post Processing (PP) task; this bit affect the flipping done on the rotation unit The value of this field must be identical to the corresponding channel's HF parameter in the IDMAC's CPMEM 1 horizontal flip enabled 0 no flip
17 T3_ROT	Rotation for Post Processing (PP) task The value of this field must be identical to the corresponding channel's ROT parameters in the IDMAC's CPMEM 1 90 degree rotation clockwise 0 no rotation
16 T2_FLIP_UD	UP/DOWN flip for View Finder (VF) task The value of this field must be identical to the corresponding channel's VF parameters in the IDMAC's CPMEM 1 Vertical flip enable 0 no flip
15 T2_FLIP_LR	LEFT/RIGHT flip for View Finder (VF) task; this bit affect the flipping done on the rotation unit The value of this field must be identical to the corresponding channel's HF parameter in the IDMAC's CPMEM 1 horizontal flip enabled 0 no flip

Table continues on the next page...

IPUx_IC_IDMAC_1 field descriptions (continued)

Field	Description
14 T2_ROT	Rotation for View Finder (VF) task The value of this field must be identical to the corresponding channel's ROT parameters in the IDMAC's CPMEM 1 90 degree rotation clockwise 0 no rotation
13 T1_FLIP_UD	UP/DOWN flip for Encoding (ENC) task The value of this field must be identical to the corresponding channel's VF parameters in the IDMAC's CPMEM 1 Vertical flip enable 0 no flip
12 T1_FLIP_LR	LEFT/RIGHT flip for Encoding (ENC) task; this bit affect the flipping done on the rotation unit The value of this field must be identical to the corresponding channel's HF parameter in the IDMAC's CPMEM 1 horizontal flip enabled 0 no flip
11 T1_ROT	Rotation for Encoding (ENC) task The value of this field must be identical to the corresponding channel's ROT parameters in the IDMAC's CPMEM 1 90 degree rotation clockwise 0 no rotation
10–8 Reserved	This read-only field is reserved and always has the value 0.
7 CB7_BURST_16	This bit defines the number of active cycles within a burst (burst size) coming from the IDMAC for IC's CB7 For pixel data the number of pixels should match the NPB[6:2] value on the IDMAC's CPMEM 0 Burst size is 8 pixels; The Matching NPB[6:2] should be 00111 1 Burst size is 16 pixels; The Matching NPB[6:2] should be 01111
6 CB6_BURST_16	This bit defines the number of active cycles within a burst (burst size) coming from the IDMAC for IC's CB6 For pixel data the number of pixels should match the NPB[6:2] value on the IDMAC's CPMEM 0 Burst size is 8 pixels; The Matching NPB[6:2] should be 00111 1 Burst size is 16 pixels; The Matching NPB[6:2] should be 01111
5 CB5_BURST_16	This bit defines the number of active cycles within a burst (burst size) coming from the IDMAC for IC's CB5 For pixel data the number of pixels should match the NPB[6:2] value on the IDMAC's CPMEM 0 Burst size is 8 pixels; The Matching NPB[6:2] should be 00111 1 Burst size is 16 pixels; The Matching NPB[6:2] should be 01111
4 CB4_BURST_16	This bit defines the number of active cycles within a burst (burst size) coming from the IDMAC for IC's CB4 For pixel data the number of pixels should match the NPB[6:2] value on the IDMAC's CPMEM

Table continues on the next page...

IPUx_IC_IDMAC_1 field descriptions (continued)

Field	Description
	0 Burst size is 8 pixels; The Matching NPB[6:2] should be 00111 1 Burst size is 16 pixels; The Matching NPB[6:2] should be 01111
3 CB3_BURST_16	This bit defines the number of active cycles within a burst (burst size) coming from the IDMAC for IC's CB3 For pixel data the number of pixels should match the NPB[6:2] value on the IDMAC's CPMEM 0 Burst size is 8 pixels; The Matching NPB[6:2] should be 00111 1 Burst size is 16 pixels; The Matching NPB[6:2] should be 01111
2 CB2_BURST_16	This bit defines the number of active cycles within a burst (burst size) coming from the IDMAC for IC's CB2 For pixel data the number of pixels should match the NPB[6:2] value on the IDMAC's CPMEM 0 Burst size is 8 pixels; The Matching NPB[6:2] should be 00111 1 Burst size is 16 pixels; The Matching NPB[6:2] should be 01111
1 CB1_BURST_16	This bit defines the number of active cycles within a burst (burst size) coming from the IDMAC for IC's CB1 For pixel data the number of pixels should match the NPB[6:2] value on the IDMAC's CPMEM 0 Burst size is 8 pixels; The Matching NPB[6:2] should be 00111 1 Burst size is 16 pixels; The Matching NPB[6:2] should be 01111
0 CB0_BURST_16	This bit defines the number of active cycles within a burst (burst size) coming from the IDMAC for IC's CB0 For pixel data the number of pixels should match the NPB[6:2] value on the IDMAC's CPMEM 0 Burst size is 8 pixels; The Matching NPB[6:2] should be 00111 1 Burst size is 16 pixels; The Matching NPB[6:2] should be 01111

37.5.151 CSI0 Sensor Configuration Register (IPUx_CSI0_SENS_CONF)

Address: Base address + 3_0000h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	CSI0_DATA_EN_POL	0	CSI0_FORCE_EOF	CSI0_JPEG_MODE	CSI0_JPEG8_EN	CSI0_DATA_DEST			CSI0_DIV_RATIO							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	CSI0_EXT_VSYNC	CSI0_DATA_WIDTH				CSI0_SENS_DATA_FORMAT			CSI0_PACK_TIGHT	CSI0_SENS_PRTCL			CSI0_SENS_PIX_CLK_POL	CSI0_DATA_POL	CSI0_HSYNC_POL	CSI0_VSYNC_POL
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

IPUx_CSI0_SENS_CONF field descriptions

Field	Description
31 CSI0_DATA_EN_POL	Invert IPP_IND_SENSB_DATA_EN input. This bit selects the polarity of IPP_IND_SENSB_DATA_EN signal. 0 IPP_IND_SENSB_DATA_EN is directly applied to internal circuitry. 1 IPP_IND_SENSB_DATA_EN is inverted before applied to internal circuitry.
30 Reserved	This read-only field is reserved and always has the value 0.
29 CSI0_FORCE_EOF	Force End of frame This is a self clear bit allowing the user to force an End-of-frame event; This bit can be used in cases where the frame sent by the sensor was not completed. 1 force end of frame 0 no action
28 CSI0_JPEG_MODE	JPEG Mode - this bit defines the mode of the control signals when working in JPEG mode 1 The data is valid as long as HSYNC and VSYNC signals are active; HSYNC is valid for single frame 0 The frame starts withe the assertion of VSYNC. The frame ends on the next VSYNC or by setting the **CSI0_FORCE_EOF bit.**
27 CSI0_JPEG8_EN	JPEG8 enable bit 1 JPEG8 detection is enabled 0 JPEG8 is disabled
26–24 CSI0_DATA_DEST	These bits enable the destination of the data coming from the CSI. CSI0_DATA_DEST[0] - Reserved CSI0_DATA_DEST[1] - destination is IC CSI0_DATA_DEST[2] - destination is IDMAC via SMFC
23–16 CSI0_DIV_RATIO	DIV Ratio Clock division ratio minus 1. This field defines the division ratio of HSP_CLK into SENSB_MCLK: SENSB_MCLK rate = HSP_CLK rate /(DIV_RATIO+1)
15 CSI0_EXT_VSYNC	External VSYNC enable. This bits select between external and internal VSYNC. 0 Internal VSYNC mode. 1 External VSYNC mode.
14–11 CSI0_DATA_WIDTH	Data width. This field defines the number of bits per color. Values: 0000 4 bits per color 0001 8 bits per color 0010 9 bits per color 0011 10 bits per color 0100 11 bits per color 0101 12 bits per color 0110 13 bits per color 0111 14 bits per color 1000 15 bits per color 1001 16 bits per color

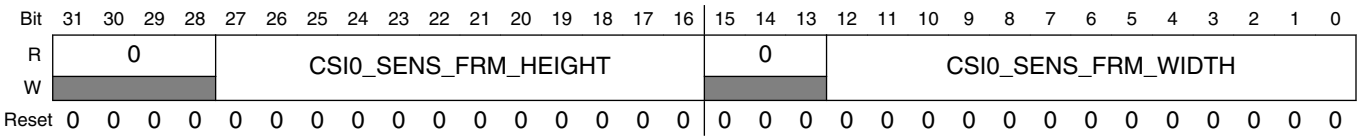
Table continues on the next page...

IPUx_CSI0_SENS_CONF field descriptions (continued)

Field	Description
10–8 CSI0_SENS_ DATA_FORMAT	Data format from the sensor. This field defines the data format for the input of the CSI sensor. Values: 000 full RGB or YUV444 001 YUV422 (YUYV...) 010 YUV422 (UYVY...) 011 Bayer or Generic data 100 RGB565 101 RGB555 110 RGB444 111 JPEG
7 CSI0_PACK_ TIGHT	CSI0 Pack Tight When the data format is YUV or RGB and the component's width is 9-16 bits, it can be sent to the memory in 2 different ways. 1 Three 10 bits components are packed into a 32 bit word. Color extension/reduction is performed 0 Each component is written as a 16 bit word where the MSB is written to bit #15, color extension is done for the remaining least significant bits.
6–4 CSI0_SENS_ PRTCL	Sensor Protocol. This bit defines the Sensor timing/data mode protocol. Values: 000 Gated clock mode 001 Non-gated clock mode 010 CCIR progressive mode (BT.656) 011 CCIR interlaced mode (BT.656) 100 CCIR progressive (BT.1120 DDR mode: data arrives on every edge of the clock) 101 CCIR progressive (BT.1120 SDR mode: data arrives only on the positive edge of the clock) 110 CCIR interlaced mode (BT.1120 DDR mode: data arrives on every edge of the clock) 111 CCIR interlaced mode (BT.1120 SDR mode: data arrives only on the positive edge of the clock)
3 CSI0_SENS_ PIX_CLK_POL	Invert Pixel clock input. This bit selects the polarity of pixel clock. 0 pixel clock is directly applied to internal circuitry. 1 pixel clock is inverted before applied to internal circuitry.
2 CSI0_DATA_ POL	Invert data input. This bit selects the polarity of data input. 0 data lines are directly applied to internal circuitry. 1 data lines are inverted before applied to internal circuitry.
1 CSI0_HSYNC_ POL	Invert IPP_IND_SENSB_HSYNC input. This bit selects the polarity of IPP_IND_SENSB_HSYNC signal. 0 IPP_IND_SENSB_HSYNC is directly applied to internal circuitry. 1 IPP_IND_SENSB_HSYNC is inverted before applied to internal circuitry.
0 CSI0_VSYNC_ POL	Invert IPP_IND_SENSB_VSYNC input. This bit selects the polarity of IPP_IND_SENSB_VSYNC signal. 0 IPP_IND_SENSB_VSYNC is not inverted before applied to internal circuitry. 1 IPP_IND_SENSB_VSYNC is inverted before applied to internal circuitry.

37.5.152 CSI0 Sense Frame Size Register (IPUx_CSI0_SENS_FRM_SIZE)

Address: Base address + 3_0004h offset

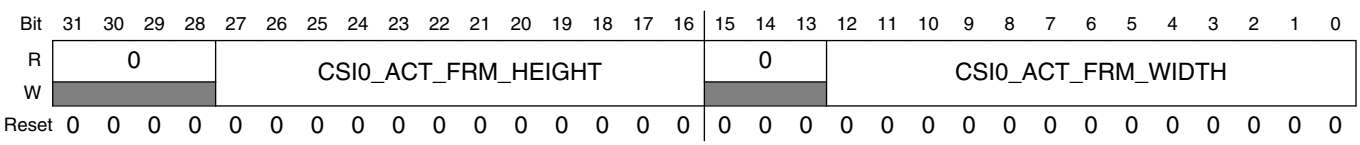


IPUx_CSI0_SENS_FRM_SIZE field descriptions

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27–16 CSI0_SENS_ FRM_HEIGHT	Sensor frame height minus 1. This field defines the sensor frame rows number minus 1.
15–13 Reserved	This read-only field is reserved and always has the value 0.
CSI0_SENS_ FRM_WIDTH	Sensor frame width minus 1. This field defines the sensor frame column number minus 1.

37.5.153 CSI0 Actual Frame Size Register (IPUx_CSI0_ACT_FRM_SIZE)

Address: Base address + 3_0008h offset

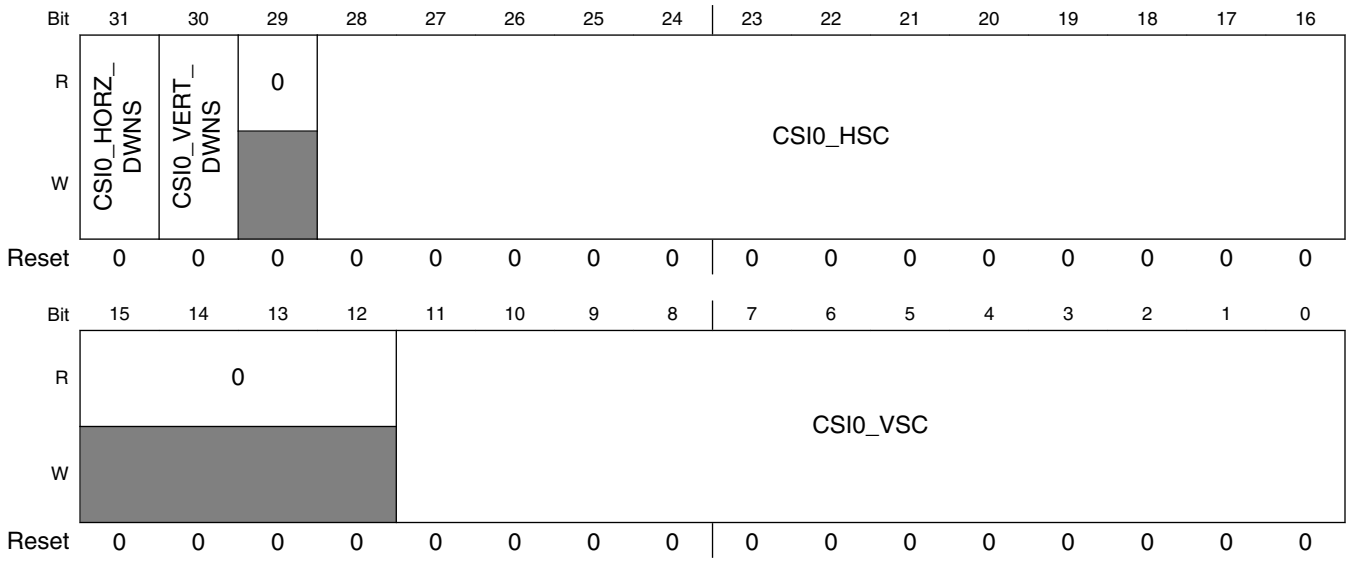


IPUx_CSI0_ACT_FRM_SIZE field descriptions

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27–16 CSI0_ACT_ FRM_HEIGHT	Actual frame height minus 1. This field defines the CSI output frame rows number minus 1.
15–13 Reserved	This read-only field is reserved and always has the value 0.
CSI0_ACT_ FRM_WIDTH	Actual frame width minus 1. This field defines the CSI output frame columns number minus 1.

37.5.154 CSI0 Output Control Register (IPUx_CSI0_OUT_FRM_CTRL)

Address: Base address + 3_000Ch offset

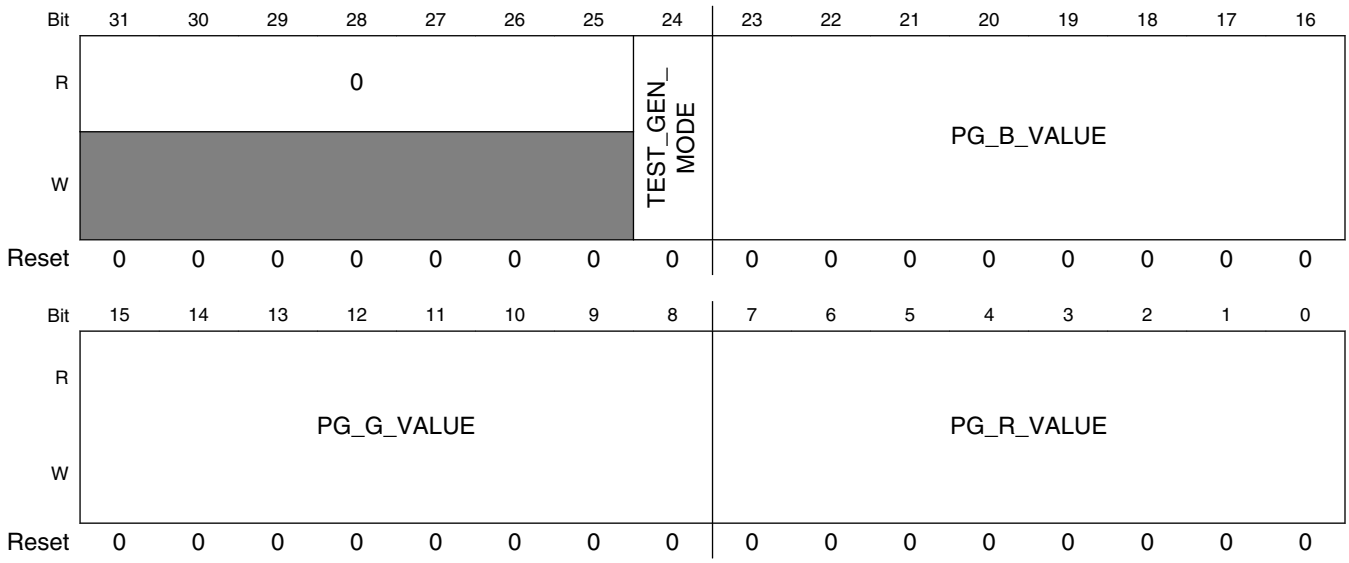


IPUx_CSI0_OUT_FRM_CTRL field descriptions

Field	Description
31 CSI0_HORZ_DWNS	Enable horizontal downsizing (decimation) by 2. 0 Downsizing disabled 1 Downsizing enabled
30 CSI0_VERT_DWNS	Enable vertical downsizing (decimation) by 2. 0 Downsizing disabled 1 Downsizing enabled
29 Reserved	This read-only field is reserved and always has the value 0.
28–16 CSI0_HSC	Horizontal skip. This field defines the number of columns to skip. In Interlaced mode this number refers to the number of lines per field.
15–12 Reserved	This read-only field is reserved and always has the value 0.
CSI0_VSC	Vertical skip. This field defines the number of rows to skip.

37.5.155 CSI0 Test Control Register (IPUx_CSI0_TST_CTRL)

Address: Base address + 3_0010h offset

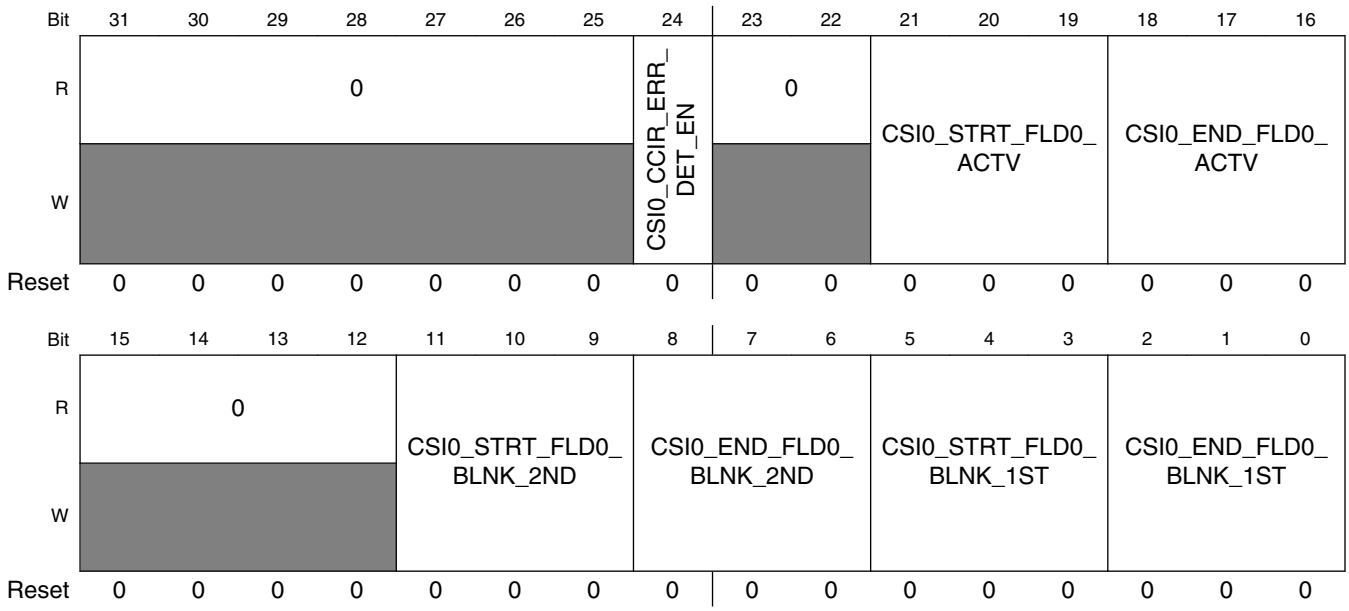


IPUx_CSI0_TST_CTRL field descriptions

Field	Description
31–25 Reserved	This read-only field is reserved and always has the value 0.
24 TEST_GEN_ MODE	Test generator mode. This bit activates the signal generation. 0 Test signal generator is inactive. 1 Test signal generator is active.
23–16 PG_B_VALUE	Pattern generator B value. This field selects the B value for the generated pattern of even pixel.
15–8 PG_G_VALUE	Pattern generator G value. This field selects the G value for the generated pattern of even pixel.
PG_R_VALUE	Pattern generator R value. This field selects the R value for the generated pattern of even pixel.

37.5.156 CSI0 CCIR Code Register 1 (IPUx_CSI0_CCIR_CODE_1)

Address: Base address + 3_0014h offset



IPUx_CSI0_CCIR_CODE_1 field descriptions

Field	Description
31–25 Reserved	This read-only field is reserved and always has the value 0.
24 CSI0_CCIR_ERR_DET_EN	Enable error detection and correction for CCIR interlaced mode with protection bit. 0 Error detection and correction is disabled. 1 Error detection and correction is enabled.
23–22 Reserved	This read-only field is reserved and always has the value 0.
21–19 CSI0_STRT_FLD0_ACTV	Start of field 0 active line command (interlaces mode). (In progressive mode, start of active line command mode).
18–16 CSI0_END_FLD0_ACTV	End of field 0 active line command (interlaces mode). (In progressive mode, end of active line command mode).
15–12 Reserved	This read-only field is reserved and always has the value 0.
11–9 CSI0_STRT_FLD0_BLNK_2ND	Start of field 0 second blanking line command (interlaces mode). (In progressive mode this field is ignored).
8–6 CSI0_END_FLD0_BLNK_2ND	End of field 0 second blanking line command (interlaces mode). (In progressive mode this field is ignored).

Table continues on the next page...

IPUx_CSI0_CCIR_CODE_1 field descriptions (continued)

Field	Description
5–3 CSI0_STRT_ FLD0_BLNK_ 1ST	Start of field 0 first blanking line command (interlaces mode). (In progressive mode this field indicates start of blanking line command).
CSI0_END_ FLD0_BLNK_ 1ST	End of field 0 first blanking line command (interlaces mode). (In progressive mode this field is ignored).

37.5.157 CSI0 CCIR Code Register 2 (IPUx_CSI0_CCIR_CODE_2)

IPUx_CSI0_CCIR_CODE_2 field descriptions

Field	Description
31–22 Reserved	This read-only field is reserved and always has the value 0.
21–19 CSI0_STRT_ FLD1_ACTV	Start of field 1 active line command (interlaces mode). (In progressive mode this field is ignored).
18–16 CSI0_END_ FLD1_ACTV	End of field 1 active line command (interlaces mode). (In progressive mode this field is ignored).
15–12 Reserved	This read-only field is reserved and always has the value 0.
11–9 CSI0_STRT_ FLD1_BLNK_ 2ND	Start of field 1 second blanking line command (interlaces mode). (In progressive mode this field is ignored).
8–6 CSI0_END_ FLD1_BLNK_ 2ND	End of field 1 second blanking line command (interlaces mode). (In progressive mode this field is ignored).
5–3 CSI0_STRT_ FLD1_BLNK_ 1ST	Start of field 1 first blanking line command (interlaces mode). (In progressive mode this field is ignored).
CSI0_END_ FLD1_BLNK_ 1ST	End of field 1 first blanking line command (interlaces mode). (In progressive mode this field is ignored).

37.5.158 CSI0 CCIR Code Register 3 (IPUx_CSI0_CCIR_CODE_3)

Address: Base address + 3_001Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0								CSI0_CCIR_PRECOM																							
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

IPUx_CSI0_CCIR_CODE_3 field descriptions

Field	Description
31–30 Reserved	This read-only field is reserved and always has the value 0.
CSI0_CCIR_ PRECOM	CCIR pre command. This field defines the sequence which comes before the CCIR command. For BT.656 the code should be written to bits [23:0] while bits [29:24] are ignored (3X8bit) For BT.1120 the code should be written to bits [29:0] (3X10bit)

37.5.159 CSI0 Data Identifier Register (IPUx_CSI0_DI)

Address: Base address + 3_0020h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	CSI0_MIPI_DI3								CSI0_MIPI_DI2								CSI0_MIPI_DI1								CSI0_MIPI_DI0							
W																																
Reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

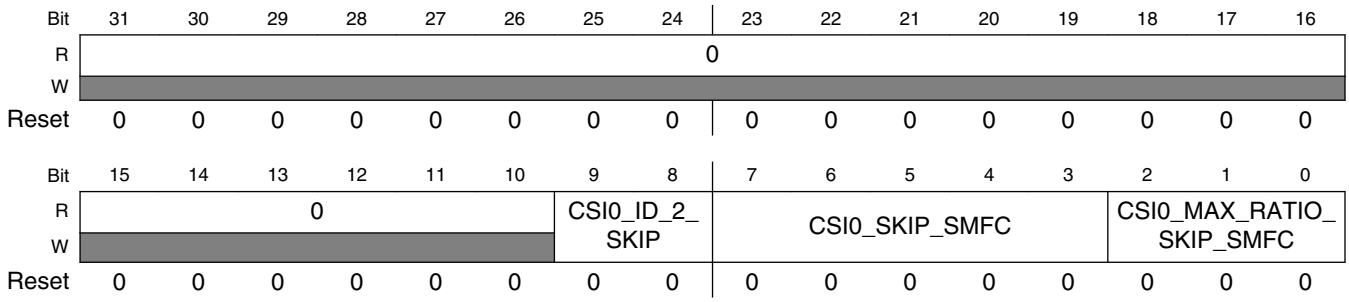
IPUx_CSI0_DI field descriptions

Field	Description
31–24 CSI0_MIPI_DI3	CSI0_MIPI_DI3 This field holds the Data Identifier #3 handled by the CSI. The upper two bits should always be written as 00.
23–16 CSI0_MIPI_DI2	CSI0_MIPI_DI2 This field holds the Data Identifier #2 handled by the CSI. The upper two bits should always be written as 00.
15–8 CSI0_MIPI_DI1	CSI0_MIPI_DI1 This field holds the Data Identifier #1 handled by the CSI. The upper two bits should always be written as 00.
CSI0_MIPI_DI0	CSI0_MIPI_DI0 This field holds the Data Identifier #0 handled by the CSI. The upper two bits should always be written as 00. This is the main stream.

37.5.160 CSI0 SKIP Register (IPUx_CSI0_SKIP)

This register controls the frame skipping supported between CSI0 and the SMFC.

Address: Base address + 3_0024h offset



IPUx_CSI0_SKIP field descriptions

Field	Description
31–10 Reserved	This read-only field is reserved and always has the value 0.
9–8 CSI0_ID_2_SKIP	CSI0 to SMFC Skipping ID. Data from the CSI0 to the SMFC has an ID associated with it. The ID is received from the MIPI interface. The skipping mechanism between the CSI0 and the SMFC can be used for only one ID. There is no skipping for data coming with ID different from the ID programed in this bits 00 - Skipping mechanism is activated on frames with ID equal to 00 01 - Skipping mechanism is activated on frames with ID equal to 01 10 - Skipping mechanism is activated on frames with ID equal to 10 11 - Skipping mechanism is activated on frames with ID equal to 11
7–3 CSI0_SKIP_SMFC	CSI0 SKIP SMFC These 5 bits define the skipping pattern of the frames send to the SMFC. Skipping is done for a set of frames. The number of frames in a set is defined at CSI0_MAX_RATIO_SKIP_SMFC. when CSI0_MAX_RATIO_SKIP_SMFC = 1 => CSI0_SKIP_SMFC[0] is used; other bits are ignored when CSI0_MAX_RATIO_SKIP_SMFC = 2 => CSI0_SKIP_SMFC[1:0] are used; other bits are ignored when CSI0_MAX_RATIO_SKIP_SMFC = 3 => CSI0_SKIP_SMFC[2:0] are used; other bits are ignored when CSI0_MAX_RATIO_SKIP_SMFC = 4 => CSI0_SKIP_SMFC[3:0] are used; other bits are ignored when CSI0_MAX_RATIO_SKIP_SMFC = 5 => CSI0_SKIP_SMFC[4:0] are used; Setting bit #n of CSI0_SKIP_SMFC means that the #n frame in the set is skipped. For example: if CSI0_MAX_RATIO_SKIP_SMFC = 4 and CSI0_SKIP_SMFC = 11010 Frames #0 & Frame #2 will not be skipped as bit0 and bit2 are cleared Frames #1 & Frame #3 will be skipped as bit1 and bit3 are set bit #4 is ignored as CSI0_MAX_RATIO_SKIP_SMFC is set to 4

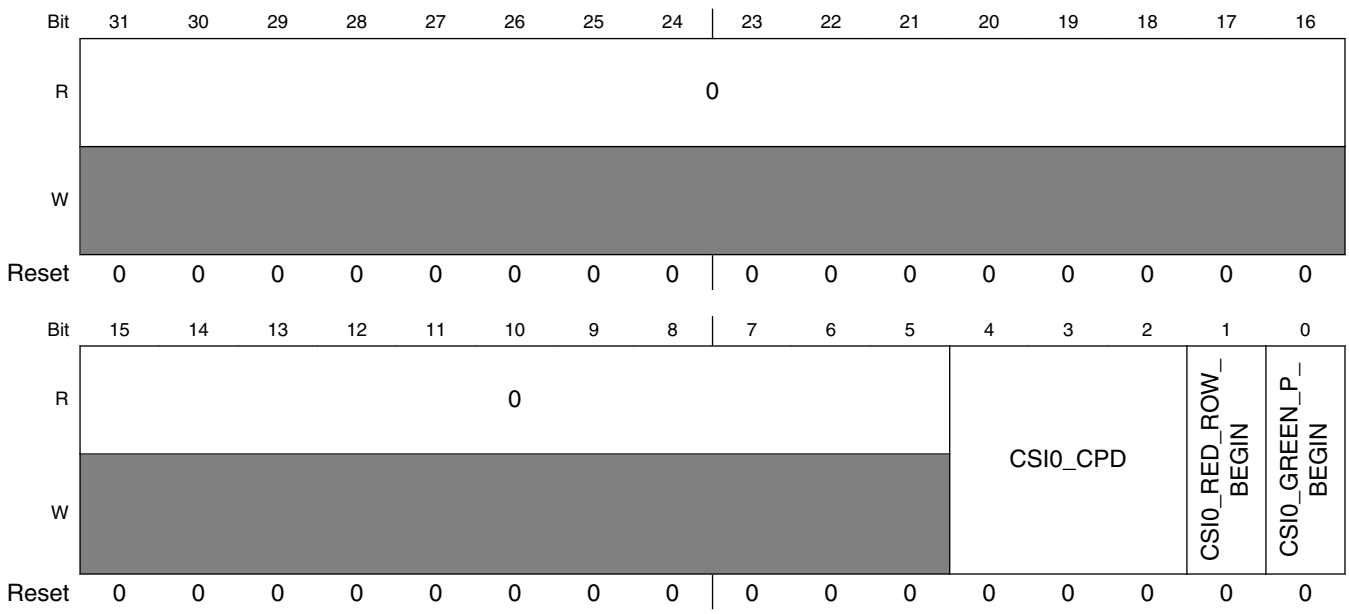
Table continues on the next page...

IPUx_CSI0_SKIP field descriptions (continued)

Field	Description
CSI0_MAX_ RATIO_SKIP_ SMFC	CSI0 Maximum Ratio Skip for SMFC These bits define the number of frames in a skipping set. The skipping number is equal to CSI0_MAX_RATIO_SKIP_SMFC+1; The maximum value of this bits is 5. When set to 0 the skipping is disabled.

37.5.161 CSI0 Compander Control Register (IPUx_CSI0_CPD_CTRL)

Address: Base address + 3_0028h offset



IPUx_CSI0_CPD_CTRL field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4–2 CSI0_CPD	CSI0_CPD These bits enable the compander in the path to different destination. CSI0_CPD[0] - CSI0_CPD[1] - Enable for the compander for data sent to the IC CSI0_CPD[2] - Enable for the compander for data sent to the IDMAC via SMFC If all the 3 bits are zero the compander is disabled Reserved
1 CSI0_RED_ ROW_BEGIN	Color of first row in the frame. Reserved

Table continues on the next page...

IPUx_CSI0_CPD_CTRL field descriptions (continued)

Field	Description
	0 First row in the frame is GBGB. 1 First row in the frame is GRGR.
0 CSI0_GREEN_P_BEGIN	Color of first component in the frame. Reserved 0 First component in the frame is blue or red, depending from RED_ROW bit. 1 First component in the frame is green

37.5.162 CSI0 Red Component Compander Constants Register <i> (IPUx_CSI0_CPD_RC_i)

These registers contain CONSTANT <i> parameters used for companding of red component.

Address: Base address + 3_002Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

IPUx_CSI1_SENS_CONF field descriptions

Field	Description
31 CSI0_DATA_EN_POL	Invert IPP_IND_SENSB_DATA_EN input. This bit selects the polarity of IPP_IND_SENSB_DATA_EN signal. 0 IPP_IND_SENSB_DATA_EN is directly applied to internal circuitry. 1 IPP_IND_SENSB_DATA_EN is inverted before applied to internal circuitry.
30 Reserved	This read-only field is reserved and always has the value 0.
29 CSI1_FORCE_EOF	Force End of frame This is a self clear bit allowing the user to force an End-of-frame event; This bit can be used in cases where the frame sent by the sensor was not completed. 1 force end of frame 0 no action
28 CSI1_JPEG_MODE	JPEG Mode - this bit defines the mode of the control signals when working in JPEG mode 1 The data is valid as long as HSYNC and VSYNC signals are active; HSYNC is valid for single frame 0 The frame starts withe the assertion of VSYNC. The frame ends on the next VSYNC or by setting the **CSI0_FORCE_EOF bit**
27 CSI1_JPEG8_EN	JPEG8 enable bit 1 JPEG8 detection is enabled 0 JPEG8 is disabled

Table continues on the next page...

IPUx_CSI1_SENS_CONF field descriptions (continued)

Field	Description
26–24 CSI1_DATA_DEST	These bits enable the destination of the data coming from the CSI. CSI1_DATA_DEST[0] - Reserved CSI1_DATA_DEST[1] - destination is IC CSI1_DATA_DEST[2] - destination is IDMAC via SMFC
23–16 CSI1_DIV_RATIO	DIV Ratio Clock division ratio minus 1. This field defines the division ratio of HSP_CLK into SENSB_MCLK: SENSB_MCLK rate = HSP_CLK rate /(DIV_RATIO+1)
15 CSI1_EXT_VSYNC	External VSYNC enable. This bits select between external and internal VSYNC. 0 Internal VSYNC mode. 1 External VSYNC mode.
14–11 CSI1_DATA_WIDTH	Data width. This fields defines the number of bits per color. Values: 0000 4 bits per color 0000 Reserved 0001 8 bits per color 0010 9 bits per color 0010 Reserved 0011 10 bits per color 0100 11 bits per color 0100 Reserved 0101 12 bits per color 0101 Reserved 0110 13 bits per color 0110 Reserved 0111 14 bits per color 0111 Reserved 1000 15 bits per color 1000 Reserved 1001 16 bits per color
10–8 CSI1_SENS_DATA_FORMAT	Data format from the sensor. This field defines the data format for the input of the CSI sensor. Values: 000 full RGB or YUV444 001 YUV422 (YUYV...) 010 YUV422 (UYVY...) 011 Bayer or Generic data 100 RGB565 101 RGB555 110 RGB444 111 JPEG
7 CSI1_PACK_TIGHT	**CSI1 Pack Tight** When the data format is YUV or RGB and the component's width is 9-16 bits, it can be sent to the memory in 2 different ways

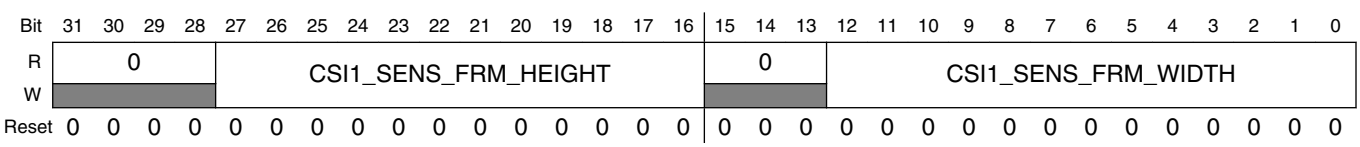
Table continues on the next page...

IPUx_CSI1_SENS_CONF field descriptions (continued)

Field	Description
	1 Three 10 bits components are packed into a 32 bit word. Color extension/reduction is performed 0 Each component is written as a 16 bit word where the MSB is written to bit #15, color extension is done for the remaining least significant bits.
6–4 CSI1_SENS_PRTCL	Sensor Protocol. This bit defines the Sensor timing/data mode protocol. Values: 000 Gated clock mode 001 Non-gated clock mode 010 CCIR progressive mode (BT.656) 011 CCIR interlaced mode (BT.656) 100 CCIR progressive (BT.1120 DDR mode: data arrives on every edge of the clock) 101 CCIR progressive (BT.1120 SDR mode: data arrives only on the positive edge of the clock) 110 CCIR interlaced mode (BT.1120 DDR mode: data arrives on every edge of the clock) 111 CCIR interlaced mode (BT.1120 SDR mode: data arrives only on the positive edge of the clock)
3 CSI1_SENS_PIX_CLK_POL	Invert Pixel clock input. This bit selects the polarity of pixel clock. 0 pixel clock is directly applied to internal circuitry. 1 pixel clock is inverted before applied to internal circuitry.
2 CSI1_DATA_POL	Invert data input. This bit selects the polarity of data input. 0 data lines are directly applied to internal circuitry. 1 data lines are inverted before applied to internal circuitry.
1 CSI1_HSYNC_POL	Invert IPP_IND_SENSB_HSYNC input. This bit selects the polarity of IPP_IND_SENSB_HSYNC signal. 0 IPP_IND_SENSB_HSYNC is directly applied to internal circuitry. 1 IPP_IND_SENSB_HSYNC is inverted before applied to internal circuitry.
0 CSI1_VSYNC_POL	Invert IPP_IND_SENSB_VSYNC input. This bit selects the polarity of IPP_IND_SENSB_VSYNC signal. 0 IPP_IND_SENSB_VSYNC is not inverted before applied to internal circuitry. 1 IPP_IND_SENSB_VSYNC is inverted before applied to internal circuitry.

37.5.173 CSI1 Sense Frame Size Register (IPUx_CSI1_SENS_FRM_SIZE)

Address: Base address + 3_8004h offset



IPUx_CSI1_SENS_FRM_SIZE field descriptions

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

IPUx_CSI1_SENS_FRM_SIZE field descriptions (continued)

Field	Description
27–16 CSI1_SENS_ FRM_HEIGHT	Sensor frame height minus 1. This field defines the sensor frame rows number minus 1.
15–13 Reserved	This read-only field is reserved and always has the value 0.
CSI1_SENS_ FRM_WIDTH	Sensor frame width minus 1. This field defines the sensor frame column number minus 1.

37.5.174 CSI1 Actual Frame Size Register (IPUx_CSI1_ACT_FRM_SIZE)

Address: Base address + 3_8008h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

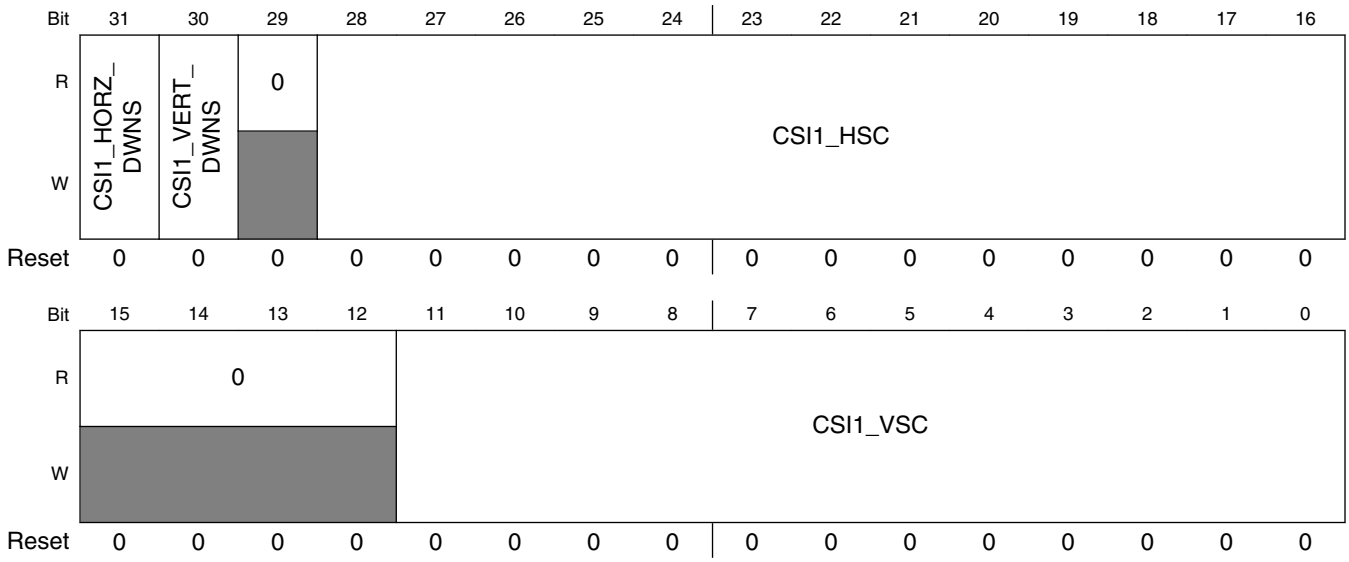
IPUx_CSI1_ACT_FRM_SIZE field descriptions

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27–16 CSI1_ACT_ FRM_HEIGHT	Actual frame height minus 1. This field defines the CSI output frame rows number minus 1.
15–13 Reserved	This read-only field is reserved and always has the value 0.
CSI1_ACT_ FRM_WIDTH	Actual frame width minus 1. This field defines the CSI output frame columns number minus 1.

37.5.175 CSI1 Output Control Register (IPUx_CSI1_OUT_FRM_CTRL)

Address: Base address + 3_800Ch offset

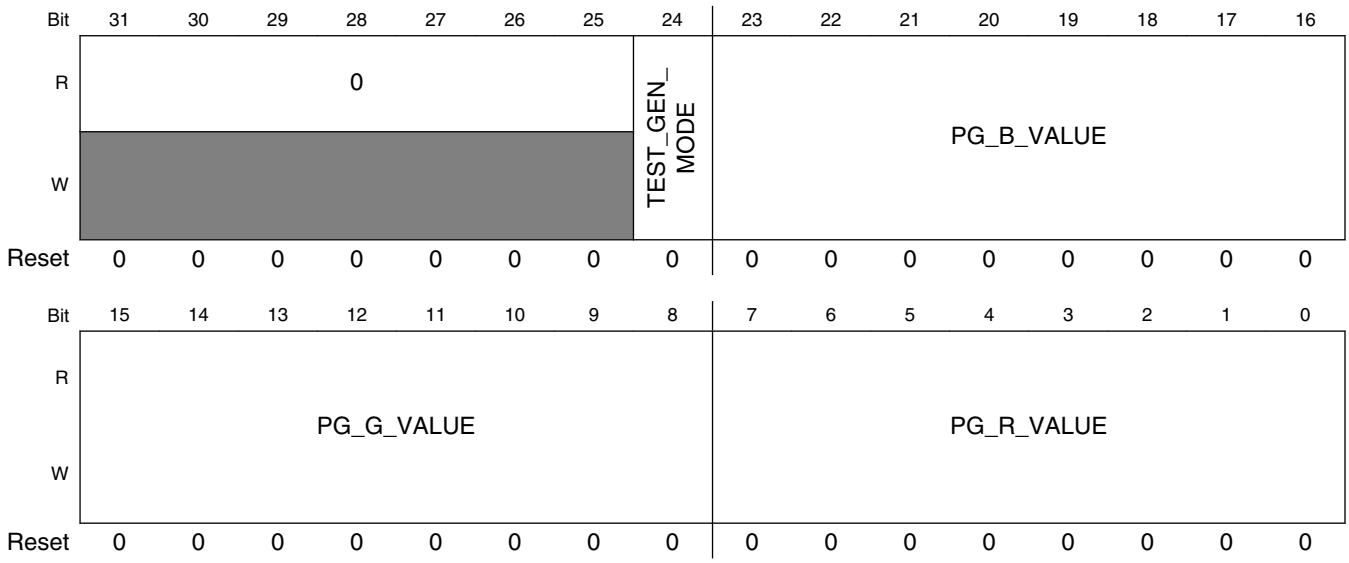


IPUx_CSI1_OUT_FRM_CTRL field descriptions

Field	Description
31 CSI1_HORZ_DWNS	Enable horizontal downsizing (decimation) by 2. 0 Downsizing disabled 1 Downsizing enabled
30 CSI1_VERT_DWNS	Enable vertical downsizing (decimation) by 2. 0 Downsizing disabled 1 Downsizing enabled
29 Reserved	This read-only field is reserved and always has the value 0.
28–16 CSI1_HSC	Horizontal skip. This field defines the number of columns to skip. In Interlaced mode this number refers to the number of lines per field
15–12 Reserved	This read-only field is reserved and always has the value 0.
CSI1_VSC	Vertical skip. This field defines the number of rows to skip.

37.5.176 CSI1 Test Control Register (IPUx_CSI1_TST_CTRL)

Address: Base address + 3_8010h offset

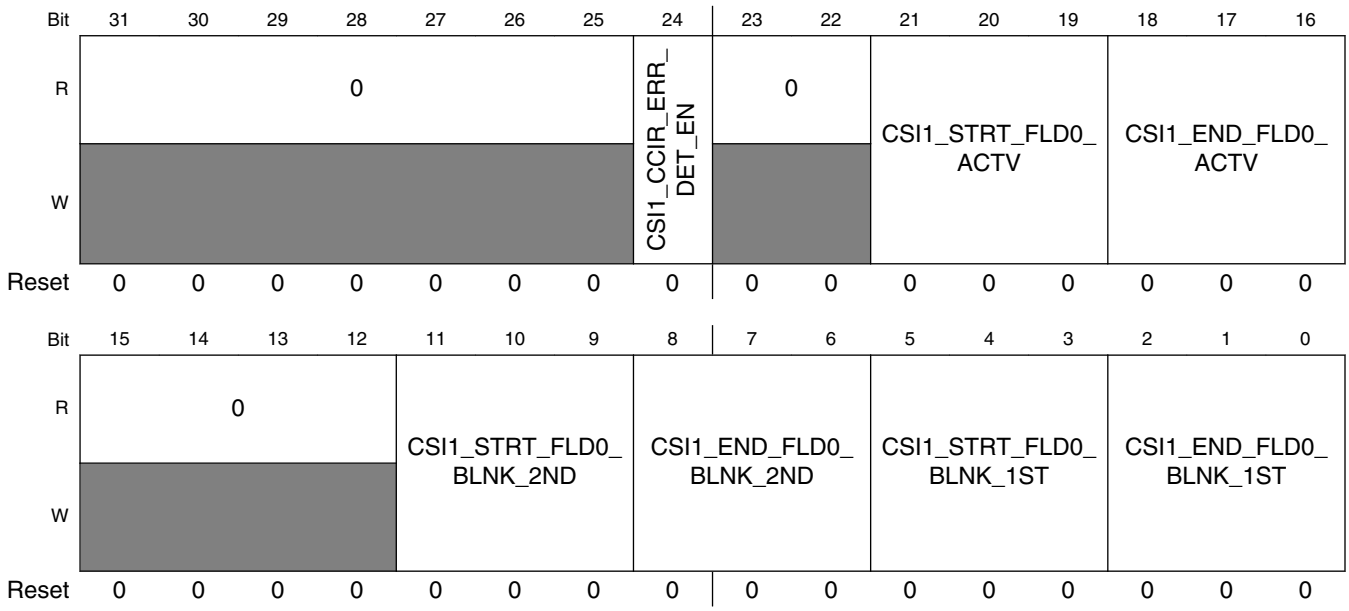


IPUx_CSI1_TST_CTRL field descriptions

Field	Description
31–25 Reserved	This read-only field is reserved and always has the value 0.
24 TEST_GEN_ MODE	Test generator mode. This bit activates the signal generation. 0 Test signal generator is inactive. 1 Test signal generator is active.
23–16 PG_B_VALUE	Pattern generator B value. This field selects the B value for the generated pattern of even pixel.
15–8 PG_G_VALUE	Pattern generator G value. This field selects the G value for the generated pattern of even pixel.
PG_R_VALUE	Pattern generator R value. This field selects the R value for the generated pattern of even pixel.

37.5.177 CSI1 CCIR Code Register 1 (IPUx_CSI1_CCIR_CODE_1)

Address: Base address + 3_8014h offset



IPUx_CSI1_CCIR_CODE_1 field descriptions

Field	Description
31–25 Reserved	This read-only field is reserved and always has the value 0.
24 CSI1_CCIR_ERR_DET_EN	Enable error detection and correction for CCIR interlaced mode with protection bit. 0 Error detection and correction is disabled. 1 Error detection and correction is enabled.
23–22 Reserved	This read-only field is reserved and always has the value 0.
21–19 CSI1_STRT_FLD0_ACTV	Start of field 0 active line command (interlaces mode). (In progressive mode, start of active line command mode).
18–16 CSI1_END_FLD0_ACTV	End of field 0 active line command (interlaces mode). (In progressive mode, end of active line command mode).
15–12 Reserved	This read-only field is reserved and always has the value 0.
11–9 CSI1_STRT_FLD0_BLNK_2ND	Start of field 0 second blanking line command (interlaces mode). (In progressive mode this field is ignored).
8–6 CSI1_END_FLD0_BLNK_2ND	End of field 0 second blanking line command (interlaces mode). (In progressive mode this field is ignored).

Table continues on the next page...

IPUx_CSI1_CCIR_CODE_1 field descriptions (continued)

Field	Description
5–3 CSI1_STRT_ FLD0_BLNK_ 1ST	Start of field 0 first blanking line command (interlaces mode). (In progressive mode this field indicates start of blanking line command).
CSI1_END_ FLD0_BLNK_ 1ST	End of field 0 first blanking line command (interlaces mode). (In progressive mode this field is ignored).

37.5.178 CSI1 CCIR Code Register 2 (IPUx_CSI1_CCIR_CODE_2)

Address: Base address + 3_8018h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

IPUx_CSI1_CCIR_CODE_3 field descriptions

Field	Description
31–30 Reserved	This read-only field is reserved and always has the value 0.
CSI1_CCIR_ PRECOM	CCIR pre command. This field defines the sequence which comes before the CCIR command. For BT.656 the code should be written to bits [23:0] while bits [29:24] are ignored (3X8bit) For BT.1120 the code should be written to bits [29:0] (3X10bit)

37.5.180 CSI1 Data Identifier Register (IPUx_CSI1_DI)

Address: Base address + 3_8020h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	CSI1_MIPI_DI3								CSI1_MIPI_DI2								CSI0_MIPI_DI1								CSI1_MIPI_DI0							
W																																
Reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

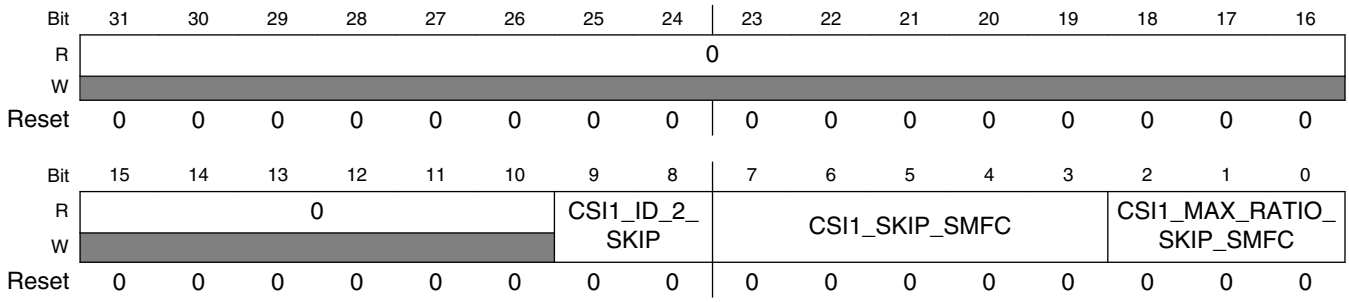
IPUx_CSI1_DI field descriptions

Field	Description
31–24 CSI1_MIPI_DI3	CSI1_MIPI_DI3 This field holds the Data Identifier #3 handled by the CSI. The upper two bits should always be written as 00.
23–16 CSI1_MIPI_DI2	CSI1_MIPI_DI2 This field holds the Data Identifier #2 handled by the CSI. The upper two bits should always be written as 00.
15–8 CSI0_MIPI_DI1	CSI1_MIPI_DI1 This field holds the Data Identifier #1 handled by the CSI. The upper two bits should always be written as 00.
CSI1_MIPI_DI0	CSI1_MIPI_DI0 This field holds the Data Identifier #0 handled by the CSI. The upper two bits should always be written as 00. This is the main stream.

37.5.181 CSI1 SKIP Register (IPUx_CSI1_SKIP)

This register control the frame skipping supported between CSI1 and the SMFC.

Address: Base address + 3_8024h offset



IPUx_CSI1_SKIP field descriptions

Field	Description
31–10 Reserved	This read-only field is reserved and always has the value 0.
9–8 CSI1_ID_2_SKIP	CSI1 to SMFC Skipping ID. Data from the CSI1 to the SMFC has an ID associated with it. The ID is received from the MIPI interface. The skipping mechanism between the CSI1 and the SMFC can be used for only one ID. There is no skipping for data coming with ID different from the ID programed in this bits 00 - Skipping mechanism is activated on frames with ID equal to 00 01 - Skipping mechanism is activated on frames with ID equal to 01 10 - Skipping mechanism is activated on frames with ID equal to 10 11 - Skipping mechanism is activated on frames with ID equal to 11
7–3 CSI1_SKIP_SMFC	CSI1 SKIP SMFC These 5 bits define the skipping pattern of the frames send to the SMFC. Skipping is done for a set of frames. The number of frames in a set is defined at CSI1_MAX_RATIO_SKIP_SMFC. when CSI1_MAX_RATIO_SKIP_SMFC = 1 => CSI1_SKIP_SMFC[0] is used; other bits are ignored when CSI1_MAX_RATIO_SKIP_SMFC = 2 => CSI1_SKIP_SMFC[1:0] are used; other bits are ignored when CSI1_MAX_RATIO_SKIP_SMFC = 3 => CSI1_SKIP_SMFC[2:0] are used; other bits are ignored when CSI1_MAX_RATIO_SKIP_SMFC = 4 => CSI1_SKIP_SMFC[3:0] are used; other bits are ignored when CSI1_MAX_RATIO_SKIP_SMFC = 5 => CSI1_SKIP_SMFC[4:0] are used; Setting bit #n of CSI1_SKIP_SMFC means that the #n frame in the set is skipped. For example: if CSI1_MAX_RATIO_SKIP_SMFC = 4 and CSI1_SKIP_SMFC = 11010 Frames #0 & Frame #2 will not be skipped as bit0 and bit2 are cleared Frames #1 & Frame #3 will be skipped as bit1 and bit3 are set bit #4 is ignored as CSI1_MAX_RATIO_SKIP_SMFC is set to 4

Table continues on the next page...

IPUx_CSI1_SKIP field descriptions (continued)

Field	Description
CSI1_MAX_ RATIO_SKIP_ SMFC	CSI1 Maximum Ratio Skip for SMFC These bits define the number of frames in a skipping set. These bits define the number of frames in a skipping set. The skipping number is equal to CSI1_MAX_RATIO_SKIP_SMFC+1; The maximum value of this bits is 5. When set to 0 the skipping is disabled.

37.5.182 CSI1 Compander Control Register (IPUx_CSI1_CPD_CTRL)

Address: Base address + 3_8028h offset

Field	Description
31 di0_pin8_pin15_sel	This bit routes PIN8 over PIN15 1 PIN8 is routed to PIN15, PIN8 is also routed to PIN8 0 PIN15 is routed to PIN15, PIN8 is routed to PIN8
30–28 di0_disp_y_sel	DI0 Display Vertical coordinate (Y) select. This field defines which one of the 8 counters will be used as a display's line counter. 000 counter #1 is selected 111 counter #8 is selected
27–24 DI0_CLOCK_STOP_MODE	DI clock stop mode When performing a clock change. The DI stops the clock to the display. These field defines when the clock will be stopped. Stopping at EOL/EOF is supported for the case where the data is coming from the IDMAC (DMA access). In case that only direct accesses is performed, the user should set this field to 0000 0001-1001 stop at the next event of one of the counters (counter #1 to counter #9) 0000 stop at the next edge of the display clock 1100 stop at EOL (end of a line), but if stop request is during blanking interval, stop now 1101 stop at EOF (end of a frame), but if stop request is during blanking interval, stop now 1110 stop at EOL (end of a line), but if stop request is during blanking interval, stop at the end of the next line 1111 stop at EOF (end of a frame), but if stop request is during blanking interval, stop at the end of the next frame

Table continues on the next page...

IPUx_DI0_GENERAL field descriptions (continued)

Field	Description
23 DI0_DISP_CLOCK_INIT	Display clock's initial mode For synchronization error conditions the display clock can be stopped on the next VSYNC 1 The display's clock is running after the next VSYNC (indicating new frame) 0 The display's clock is stopped after the next VSYNC (indicating new frame)
22 di0_mask_sel	DI0 Mask select. IPP_PIN_2 output of the DI that functions as MASK signal can come from 2 sources: counter #2 or extracted from the MASK data coming from the memory. 1 IPP_PIN_2 is coming from extracted MASK data coming from the memory 0 IPP_PIN_2 is coming from counter #2
21 di0_vsync_ext	DI0 External VSYNC. This bit selects the source of the VSYNC signal 1 External to the IPU 0 Internally generated by the IPU
20 di0_clk_ext	DI0 External Clock. This bit selects the source of the DI0's clock 1 The source of the clock is external to the IPU 0 The clock is internally generated by the IPU
19–18 DI0_WATCHDOG_MODE	DI0 watchdog mode In case of a display error where the DI clock is stopped (defined at di0_err_treatment). An internal watchdog counts DI clocks. If this timer reached its pre defined value the DI will skip the current frame and restart on the frame. This 2 bits define the number of DI clock cycles that the timer counts. 00 The timer counts 4 DI cycles 01 The timer counts 16 DI cycles 10 The timer counts 64 DI cycles 11 The timer counts 128 DI cycles
17 di0_polarity_disp_clk	DI0 Output Clock's polarity This bits define the polarity of the DI0's clock. 1 The output clock is active high 0 The output clock is active low
16 Reserved	This read-only field is reserved and always has the value 0.
15–12 di0_sync_count_sel	For synchronous flow error: selects synchronous flow synchronization counter in DI:
11 di0_err_treatment	In case of synchronous flow error there are 2 ways to handle the display 1 to wait (stop clock) 0 Drive the last component
10 di0_erm_vsync_sel	DI0 error recovery block's VSYNC source select The error recovery block detect a case where the DI's VSYNC is asserted before the EOF. This bit selects the source of the VSYNC signal monitored by this mechanism.

Table continues on the next page...

IPUx_DI0_GENERAL field descriptions (continued)

Field	Description
	1 vsync_post - an internal VSYNC signal asserted 2 lines after the DI's VSYNC 0 vsync_pre - an internal VSYNC signal asserted 2 lines before the DI's VSYNC
9 di0_polarity_cs1	DI0 Chip Select's 1 polarity This bits define the polarity of the DI's CS1. 1 The CS1 is active high 0 The CS1 is active low
8 di0_polarity_cs0	DI0 Chip Select's 0 polarity This bits define the polarity of the DI's CS0. 1 The CS0 is active high 0 The CS0 is active low
di0_polarity_i_1	DI0 output pin's polarity This bits define the polarity of each of the DI's outputs. 1 The output pin is active high 0 The output pin is active low

37.5.194 DI0 Base Sync Clock Gen 0 Register (IPUx_DI0_BS_CLKGEN0)

Address: Base address + 4_0004h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

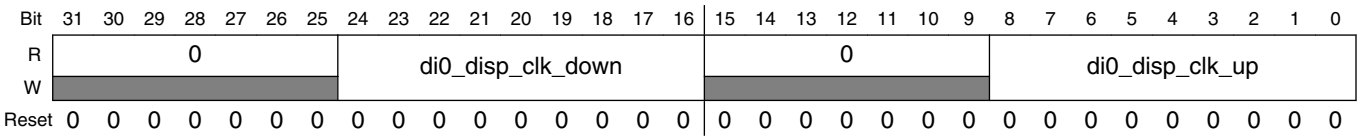
IPUx_DI0_BS_CLKGEN0 field descriptions

Field	Description
31–25 Reserved	This read-only field is reserved and always has the value 0.
24–16 di0_disp_clk_offset	DI0 Display Clock Offset The DI has the ability to delay the display's clock This field defines the amount of IPU's clock cycles added as delay on this clock.
15–12 Reserved	This read-only field is reserved and always has the value 0.
di0_disp_clk_period	DI0 Display Clock Period This field defines the Display interface clock period for display write access. This parameter contains an integer part (bits 11:4) and a fractional part (bits 3:0). It defines a fractional division ratio of the HSP_CLK clock for generation of the display's interface clock.

37.5.195 DI0 Base Sync Clock Gen 1 Register (IPUx_DI0_BS_CLKGEN1)

Address: Base address + 4_0008h offset



IPUx_DI0_BS_CLKGEN1 field descriptions

Field	Description
31–25 Reserved	This read-only field is reserved and always has the value 0.
24–16 di0_disp_clk_down	DI0 display clock falling edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is a time interval between display's access start point and display's interface clock falling edge.
15–9 Reserved	This read-only field is reserved and always has the value 0.
di0_disp_clk_up	DI0 display clock rising edge position This parameter contains an integer part (bits 8:1) and a fractional part (bit 0). The position value is a time interval between display's access start point and display's interface clock rising edge.

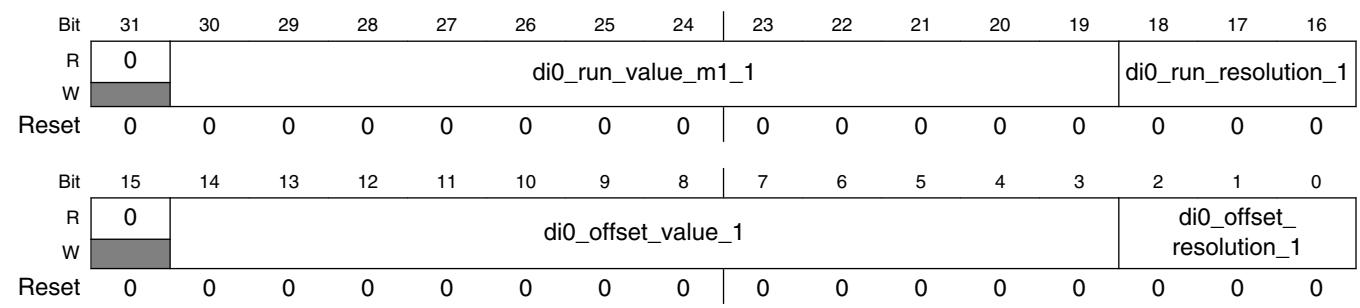
Address: Base address + 4_000Ch offset



IPUx_DI0_SW_GEN0_1 field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.

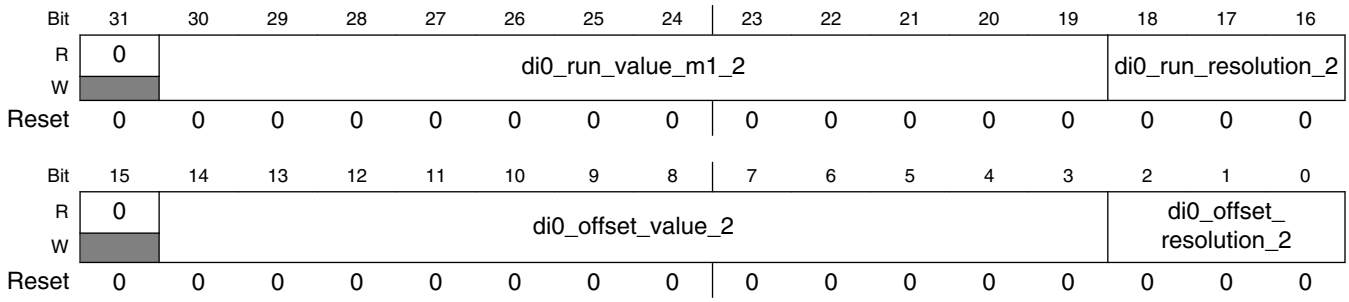
Table continues on the next page...

IPUx_DI0_SW_GEN0_1 field descriptions (continued)

Field	Description
30–19 di0_run_value_m1_1	DI0 counter #1 pre defined value This fields defines the counter #1 pre defines value. When the counter is auto reload mode (di0_cnt_auto_reload_1 bit is set), the counter automatically restarts. otherwise the counter restarts for the amount of time defined on the corresponding di0_step_repeat field.
18–16 di0_run_resolution_1	DI0 counter #1 Run Resolution This field defines the trigger causing the counter to increment. 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 NA 011 NA 100 NA 101 CSI VSYNC. The VSYNC is a trigger coming from one of the CSIs according to the CSI_VSYNC_DEST bit. — 110 External VSYNC 111 Counter is always on.
15 Reserved	This read-only field is reserved and always has the value 0.
14–3 di0_offset_value_1	DI0 counter #1 offset value The counter can start counting after a pre defined delay This field defines the amount of cycles that the counter will be delayed by
di0_offset_resolution_1	DI0 counter #1 offset Resolution This field defines the trigger causing the offset counter to increment 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock 010 NA 011 NA 100 NA 101 CSI VSYNC. The VSYNC is a trigger coming from one of the CSIs according to the CSI_VSYNC_DEST bit. — 110 External VSYNC 111 Counter is always on.

37.5.197 DI0 Sync Wave Gen 2 Register 0 (IPUx_DI0_SW_GEN0_2)

Address: Base address + 4_0010h offset



IPUx_DI0_SW_GEN0_2 field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–19 di0_run_value_m1_2	DI0 counter #2 pre defined value This fields defines the counter #2 pre defines value. When the counter is auto reload mode (di0_cnt_auto_reload_2 bit is set), the counter automatically restarts. otherwise the counter restarts for the amount of time defined on the corresponding di0_step_repeat field.
18–16 di0_run_resolution_2	DI0 counter #2 Run Resolution This field defines the trigger causing the counter to increment. 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock 010 The Counter is triggered by counter #1 011 NA 100 NA 101 CSI VSYNC. The VSYNC is a trigger coming from one of the CSI's according to the CSI_VSYNC_DEST bit. — 110 External VSYNC 111 Counter is always on.
15 Reserved	This read-only field is reserved and always has the value 0.
14–3 di0_offset_value_2	DI0 counter #2 offset value The counter can start counting after a pre defined delay This field defines the amount of cycles that the counter will be delayed by
di0_offset_resolution_2	DI0 counter #2 offset Resolution This field defines the trigger causing the offset counter to increment 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1

Table continues on the next page...

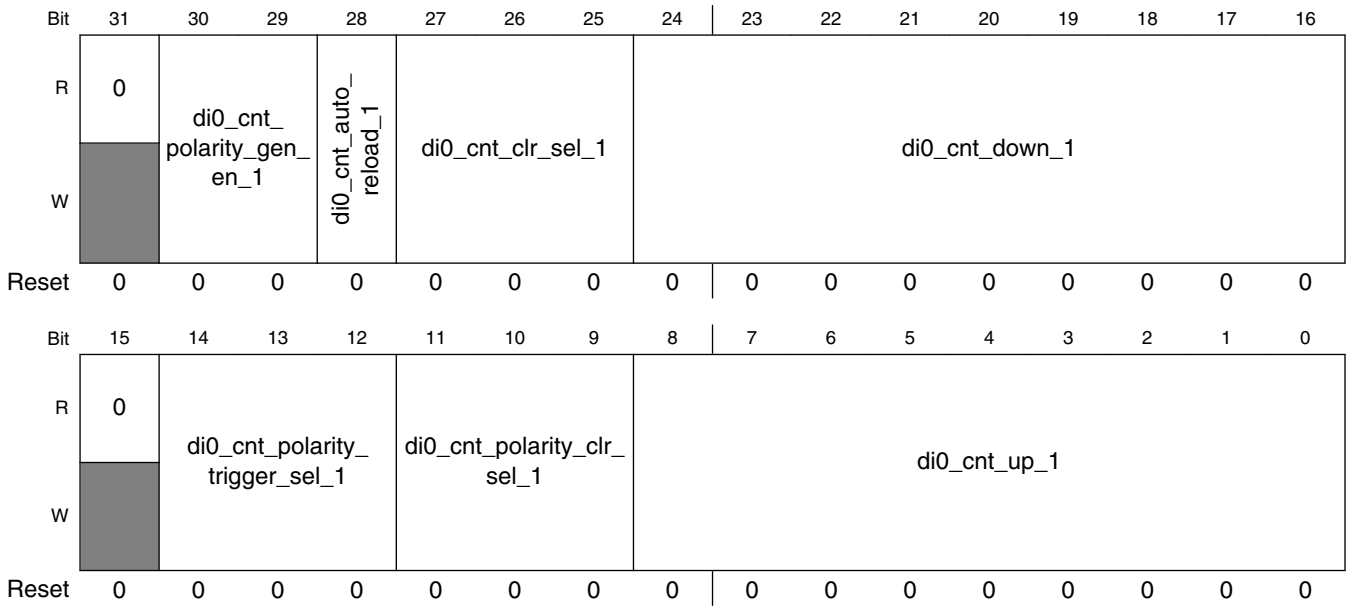
37.5.205 DI0 Sync Wave Gen 1 Register 1 (IPUx_DI0_SW_GEN1_1)

Address: Base address + 4_0030h offset



IPUx_DI0_SW_GEN1_1 field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–29 di0_cnt_polarity_gen_en_1	DI0 Counter polarity generator enable The counter's output polarity can be changed on the fly. 00 Dynamic polarity change is disabled 01 The counters UP and DOWN value are calculated according to the trigger selected by cnt_polarity_trigger_sel field. When selecting this mode the UP and DOWN values has to be a multiple of 2. 10 Dynamic polarity change is enabled 11 Outputs polarity is dynamically changed every time the counter reaches its pre defined value
28 di0_cnt_auto_reload_1	Counter auto reload mode 1 The counter will automatically be reloaded forever, ignoring the value of the di0_step_repeat_<i> field 0 The counter will not be automatically reloaded, It will be reloaded for the amount of repeat times defined on the di0_step_repeat_1 field
27–25 di0_cnt_clr_sel_1	Counter Clear select This field defines the source of the signals that clears the counter. 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 Reserved

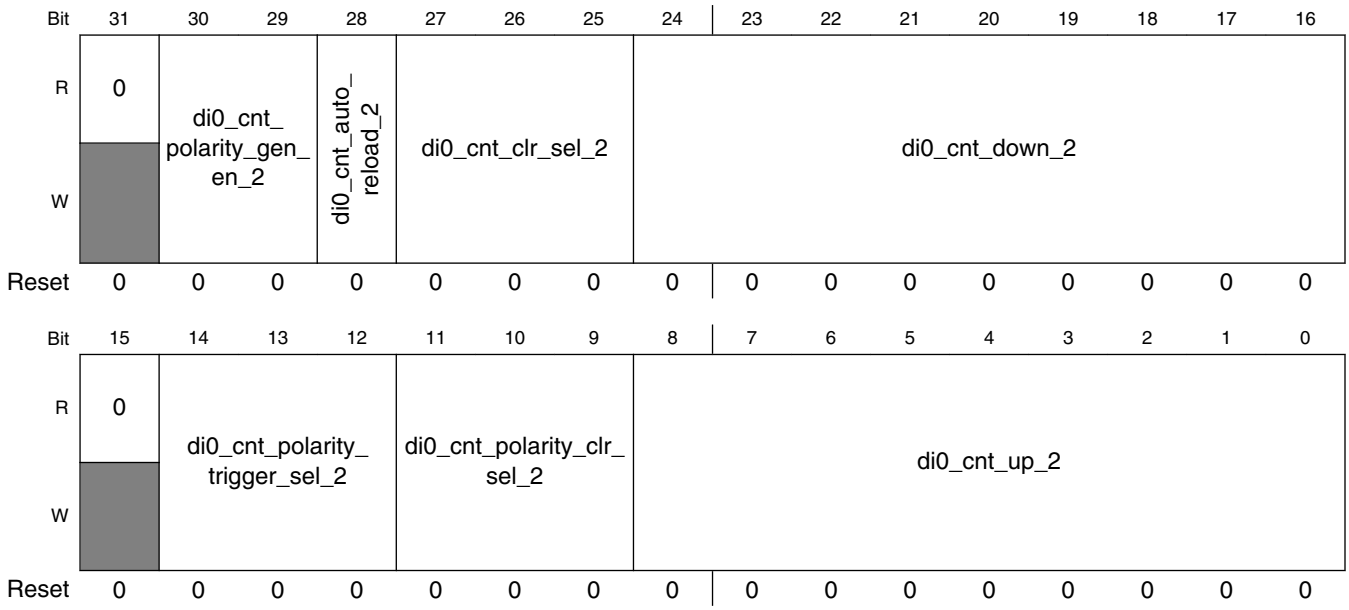
Table continues on the next page...

IPUx_DI0_SW_GEN1_1 field descriptions (continued)

Field	Description
	011 Reserved 100 Reserved 101 CSI VSYNC. The VSYNC is a trigger coming from one of the CSI's according to the CSI_VSYNC_DEST bit. — 110 External VSYNC 111 Counter is always on.
24–16 di0_cnt_down_1	Counter falling edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's falling edge.
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 di0_cnt_polarity_trigger_sel_1	DI0 Counter's toggling trigger select This field selects the counter's trigger causing the output to toggle 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 Reserved 011 Reserved 100 Reserved 101 CSI VSYNC. The VSYNC is a trigger coming from one of the CSI's according to the CSI_VSYNC_DEST bit. — 110 External VSYNC 111 Counter is always on.
11–9 di0_cnt_polarity_clr_sel_1	DI0 counter's polarity Clear select This field selects the input to the counter telling the counter wether to invert the output 000 Output is always inverted 001 Output is kept the same (no inversion) 010 Reserved 011 Reserved 100 Reserved 101 Reserved 110 Reserved 111 Reserved
di0_cnt_up_1	Counter rising edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's rising edge.

37.5.206 DI0 Sync Wave Gen 2 Register 1 (IPUx_DI0_SW_GEN1_2)

Address: Base address + 4_0034h offset



IPUx_DI0_SW_GEN1_2 field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–29 di0_cnt_polarity_gen_en_2	DI0 Counter polarity generator enable The counter's output polarity can be changed on the fly. 00 Dynamic polarity change is disabled 01 The counters UP and DOWN value are calculated according to the trigger selected by cnt_polarity_trigger_sel field. When selecting this mode the UP and DOWN values has to be a multiple of 2. 10 Dynamic polarity change is enabled 11 Outputs polarity is dynamically changed every time the counter reaches its pre defined value
28 di0_cnt_auto_reload_2	Counter auto reload mode 1 The counter will automatically be reloaded forever, ignoring the value of the di0_step_repeat_<i> field 0 The counter will not be automatically reloaded, It will be reloaded for the amount of repeat times defined on the di0_step_repeat_<i> field
27–25 di0_cnt_clr_sel_2	Counter Clear select This field defines the source of the signals that clears the counter. 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1

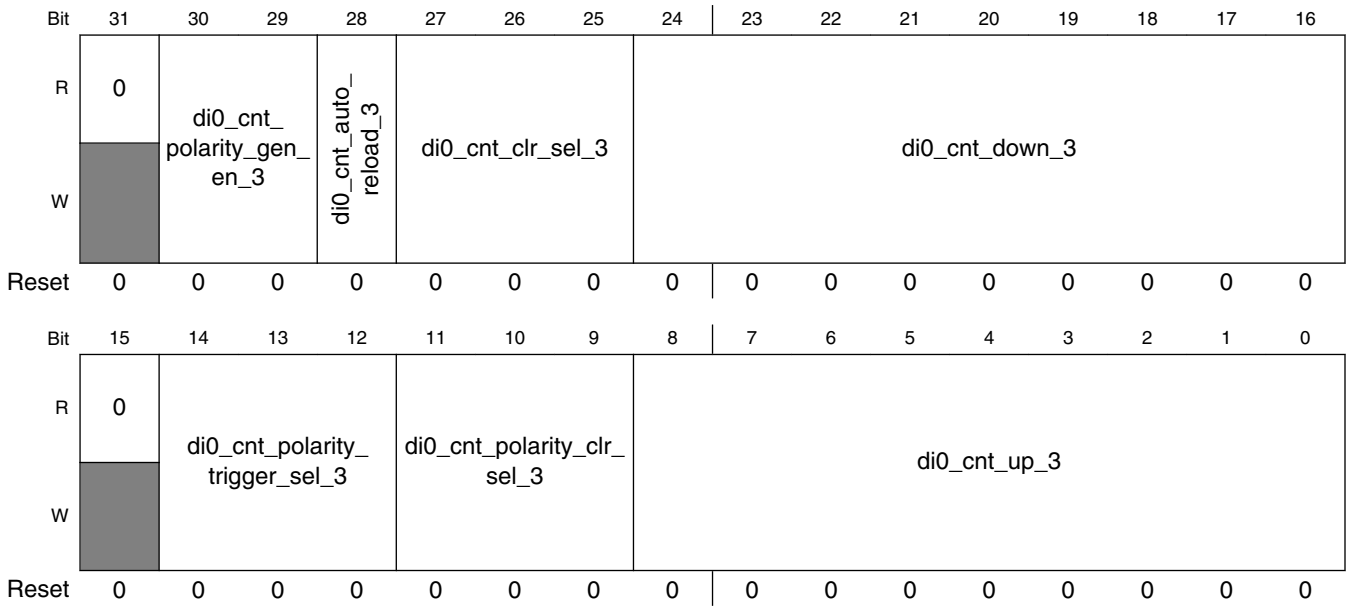
Table continues on the next page...

IPUx_DI0_SW_GEN1_2 field descriptions (continued)

Field	Description
	011 Reserved 100 Reserved 101 CSI VSYNC. The VSYNC is a trigger coming from one of the CSI's according to the CSI_VSYNC_DEST bit. — 110 External VSYNC 111 Counter is always on.
24–16 di0_cnt_down_2	Counter falling edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's falling edge.
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 di0_cnt_polarity_trigger_sel_2	DI0 Counter's toggling trigger select This field selects the counter's trigger causing the output to toggle 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1 011 Reserved 100 Reserved 101 CSI VSYNC. The VSYNC is a trigger coming from one of the CSI's according to the CSI_VSYNC_DEST bit. — 110 External VSYNC 111 Counter is always on.
11–9 di0_cnt_polarity_clr_sel_2	DI0 counter's polarity Clear select This field selects the input to the counter telling the counter wether to invert the output 000 Output is always inverted 001 Output is kept the same (no inversion) 010 Reserved 011 Reserved 100 Reserved 101 Reserved 110 Reserved 111 Reserved
di0_cnt_up_2	Counter rising edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's rising edge.

37.5.207 DI0 Sync Wave Gen 3 Register 1 (IPUx_DI0_SW_GEN1_3)

Address: Base address + 4_0038h offset



IPUx_DI0_SW_GEN1_3 field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–29 di0_cnt_polarity_gen_en_3	DI0 Counter polarity generator enable The counter's output polarity can be changed on the fly. 00 Dynamic polarity change is disabled 01 The counters UP and DOWN value are calculated according to the trigger selected by cnt_polarity_trigger_sel field. When selecting this mode the UP and DOWN values has to be a multiple of 2. 10 Dynamic polarity change is enabled 11 Outputs polarity is dynamically changed every time the counter reaches its pre defined value
28 di0_cnt_auto_reload_3	Counter auto reload mode 1 The counter will automatically be reloaded forever, ignoring the value of the di0_step_repeat_<i> field 0 The counter will not be automatically reloaded, It will be reloaded for the amount of repeat times defined on the di0_step_repeat_<i> field
27–25 di0_cnt_clr_sel_3	Counter Clear select This field defines the source of the signals that clears the counter. 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1

Table continues on the next page...

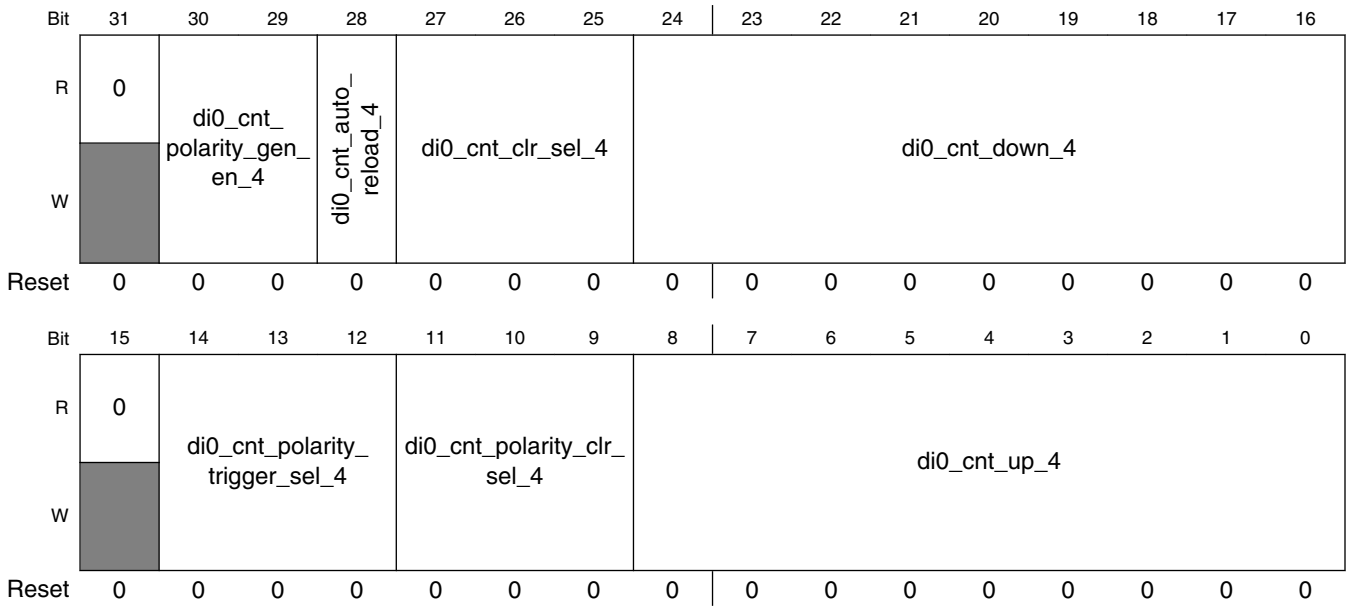
Field	Description
	011 The Counter is triggered by counter #2 100 Reserved 101 CSI VSYNC. The VSYNC is a trigger coming from one of the CSI's according to the CSI_VSYNC_DEST bit. — 110 External VSYNC 111 Counter is always on.
24–16 di0_cnt_down_3	Counter falling edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's falling edge.
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 di0_cnt_polarity_trigger_sel_3	DI0 Counter's toggling trigger select This field selects the counter's trigger causing the output to toggle 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1 011 The Counter is triggered by counter #2 100 Reserved 101 CSI VSYNC. The VSYNC is a trigger coming from one of the CSI's according to the CSI_VSYNC_DEST bit. — 110 External VSYNC 111 Counter is always on.
11–9 di0_cnt_polarity_clr_sel_3	DI0 counter's polarity Clear select This field selects the input to the counter telling the counter wether to invert the output 000 Output is always inverted 001 Output is kept the same (no inversion) 010 Output is inverted if the output of counter #1 is set 011 Output is inverted if the output of counter #2 is set 100 Reserved 101 Reserved 110 Reserved 111 Reserved
di0_cnt_up_3	Counter rising edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's rising edge.

37.5.208 DI0 Sync Wave Gen 4 Register 1 (IPUx_DI0_SW_GEN1_4)

Address: Base address + 4_003Ch offset



IPUx_DI0_SW_GEN1_4 field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–29 di0_cnt_polarity_gen_en_4	DI0 Counter polarity generator enable The counter's output polarity can be changed on the fly. 00 Dynamic polarity change is disabled 01 The counters UP and DOWN value are calculated according to the trigger selected by cnt_polarity_trigger_sel field. When selecting this mode the UP and DOWN values has to be a multiple of 2. 10 Dynamic polarity change is enabled 11 Outputs polarity is dynamically changed every time the counter reaches its pre defined value
28 di0_cnt_auto_reload_4	Counter auto reload mode 1 The counter will automatically be reloaded forever, ignoring the value of the di0_step_repeat_<i> field 0 The counter will not be automatically reloaded, It will be reloaded for the amount of repeat times defined on the di0_step_repeat_<i> field
27–25 di0_cnt_clr_sel_4	Counter Clear select This field defines the source of the signals that clears the counter. 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1

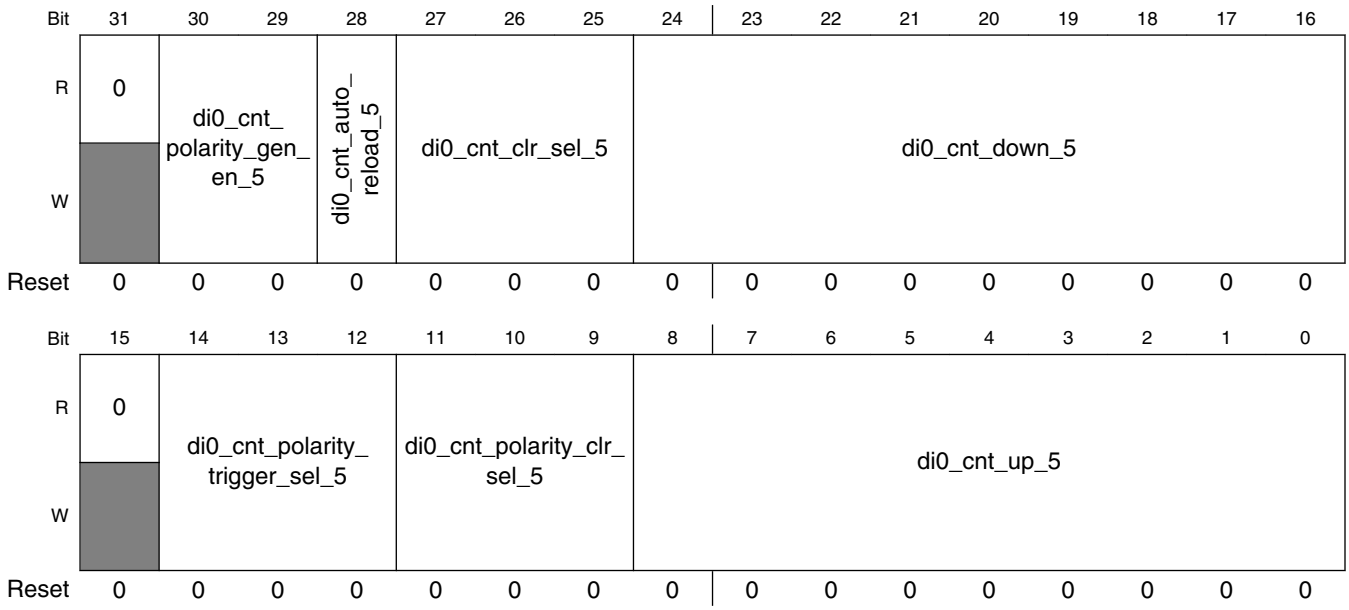
Table continues on the next page...

IPUx_DI0_SW_GEN1_4 field descriptions (continued)

Field	Description
	011 The Counter is triggered by counter #2 100 The Counter is triggered by counter #3 101 CSI VSYNC. The VSYNC is a trigger coming from one of the CSI's according to the CSI_VSYNC_DEST bit. — 110 External VSYNC 111 Counter is always on.
24–16 di0_cnt_down_4	Counter falling edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's falling edge.
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 di0_cnt_polarity_trigger_sel_4	DI0 Counter's toggling trigger select This field selects the counter's trigger causing the output to toggle 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1 011 The Counter is triggered by counter #2 100 The Counter is triggered by counter #3 101 CSI VSYNC. The VSYNC is a trigger coming from one of the CSI's according to the CSI_VSYNC_DEST bit. — 110 External VSYNC 111 Counter is always on.
11–9 di0_cnt_polarity_clr_sel_4	DI0 counter's polarity Clear select This field selects the input to the counter telling the counter wether to invert the output 000 Output is always inverted 001 Output is kept the same (no inversion) 010 Output is inverted if the output of counter #1 is set 011 Output is inverted if the output of counter #2 is set 100 Output is inverted if the output of counter #3 is set 101 Reserved 110 Reserved 111 Reserved
di0_cnt_up_4	Counter rising edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's rising edge.

37.5.209 DI0 Sync Wave Gen 5 Register 1 (IPUx_DI0_SW_GEN1_5)

Address: Base address + 4_0040h offset



IPUx_DI0_SW_GEN1_5 field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–29 di0_cnt_polarity_gen_en_5	DI0 Counter polarity generator enable The counter's output polarity can be changed on the fly. 00 Dynamic polarity change is disabled 01 The counters UP and DOWN value are calculated according to the trigger selected by cnt_polarity_trigger_sel field. When selecting this mode the UP and DOWN values has to be a multiple of 2. 10 Dynamic polarity change is enabled 11 Outputs polarity is dynamically changed every time the counter reaches its pre defined value
28 di0_cnt_auto_reload_5	Counter auto reload mode 1 The counter will automatically be reloaded forever, ignoring the value of the di0_step_repeat_<i> field 0 The counter will not be automatically reloaded, It will be reloaded for the amount of repeat times defined on the di0_step_repeat_<i> field
27–25 di0_cnt_clr_sel_5	Counter Clear select This field defines the source of the signals that clears the counter. 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1

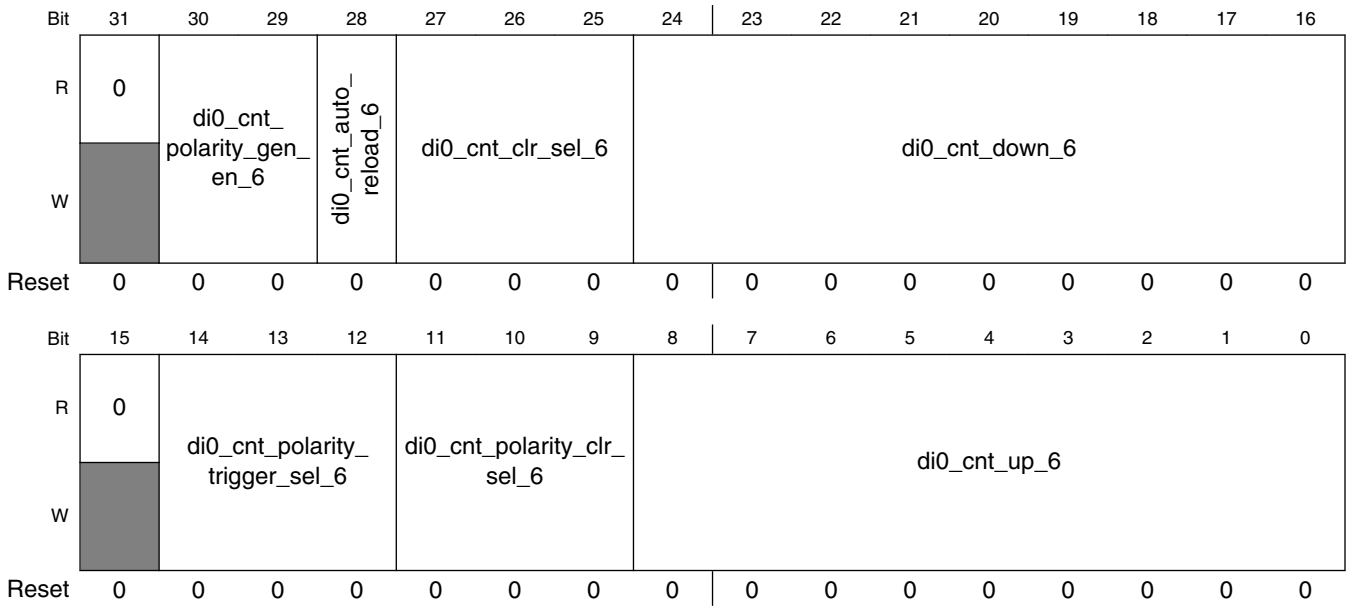
Table continues on the next page...

IPUx_DI0_SW_GEN1_5 field descriptions (continued)

Field	Description
	011 The Counter is triggered by counter #2 100 The Counter is triggered by counter #3 101 The Counter is triggered by counter #4 110 External VSYNC 111 Counter is always on.
24–16 di0_cnt_down_5	Counter falling edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's falling edge.
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 di0_cnt_polarity_trigger_sel_5	DI0 Counter's toggling trigger select This field selects the counter's trigger causing the output to toggle 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1 011 The Counter is triggered by counter #2 100 The Counter is triggered by counter #3 101 The Counter is triggered by counter #4 110 External VSYNC 111 Counter is always on.
11–9 di0_cnt_polarity_clr_sel_5	DI0 counter's polarity Clear select This field selects the input to the counter telling the counter wether to invert the output 000 Output is always inverted 001 Output is kept the same (no inversion) 010 Output is inverted if the output of counter #1 is set 011 Output is inverted if the output of counter #2 is set 100 Output is inverted if the output of counter #3 is set 101 Output is inverted if the output of counter #4 is set 110 Reserved 111 Reserved
di0_cnt_up_5	Counter rising edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's rising edge.

37.5.210 DI0 Sync Wave Gen 6 Register 1 (IPUx_DI0_SW_GEN1_6)

Address: Base address + 4_0044h offset



IPUx_DI0_SW_GEN1_6 field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–29 di0_cnt_polarity_gen_en_6	DI0 Counter polarity generator enable The counter's output polarity can be changed on the fly. 00 Dynamic polarity change is disabled 01 The counters UP and DOWN value are calculated according to the trigger selected by cnt_polarity_trigger_sel field. When selecting this mode the UP and DOWN values has to be a multiple of 2. 10 Dynamic polarity change is enabled 11 Outputs polarity is dynamically changed every time the counter reaches its pre defined value
28 di0_cnt_auto_reload_6	Counter auto reload mode 1 The counter will automatically be reloaded forever, ignoring the value of the di0_step_repeat_<i> field 0 The counter will not be automatically reloaded, It will be reloaded for the amount of repeat times defined on the di0_step_repeat_<i> field
27–25 di0_cnt_clr_sel_6	Counter Clear select This field defines the source of the signals that clears the counter. 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1

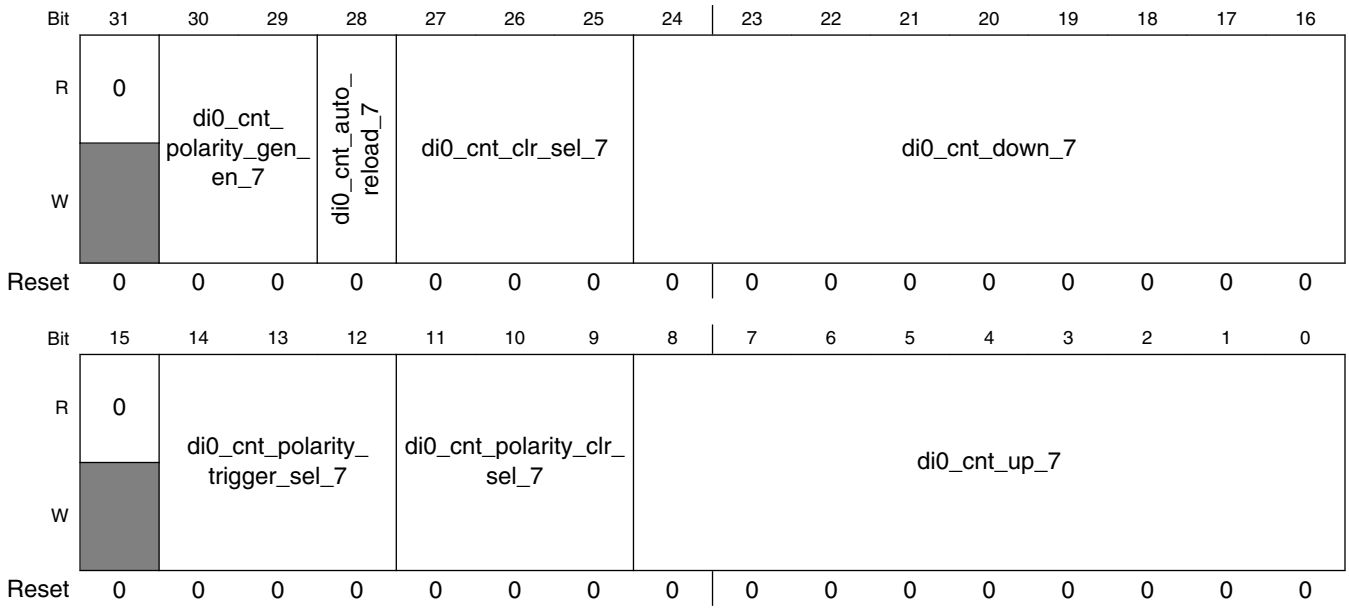
Table continues on the next page...

IPUx_DI0_SW_GEN1_6 field descriptions (continued)

Field	Description
	011 The Counter is triggered by counter #2 100 The Counter is triggered by counter #3 101 The Counter is triggered by counter #4 110 The Counter is triggered by counter #5 111 Counter is always on.
24–16 di0_cnt_down_6	Counter falling edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's falling edge.
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 di0_cnt_polarity_trigger_sel_6	DI0 Counter's toggling trigger select This field selects the counter's trigger causing the output to toggle 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1 011 The Counter is triggered by counter #2 100 The Counter is triggered by counter #3 101 The Counter is triggered by counter #4 110 The Counter is triggered by counter #5 111 Counter is always on.
11–9 di0_cnt_polarity_clr_sel_6	DI0 counter's polarity Clear select This field selects the input to the counter telling the counter wether to invert the output 000 Output is always inverted 001 Output is kept the same (no inversion) 010 Output is inverted if the output of counter #1 is set 011 Output is inverted if the output of counter #2 is set 100 Output is inverted if the output of counter #3 is set 101 Output is inverted if the output of counter #4 is set 110 Output is inverted if the output of counter #5 is set 111 Reserved
di0_cnt_up_6	Counter rising edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's rising edge.

37.5.211 DI0 Sync Wave Gen 7 Register 1 (IPUx_DI0_SW_GEN1_7)

Address: Base address + 4_0048h offset



IPUx_DI0_SW_GEN1_7 field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–29 di0_cnt_polarity_gen_en_7	DI0 Counter polarity generator enable The counter's output polarity can be changed on the fly. 00 Dynamic polarity change is disabled 01 The counters UP and DOWN value are calculated according to the trigger selected by cnt_polarity_trigger_sel field. When selecting this mode the UP and DOWN values has to be a multiple of 2. 10 Dynamic polarity change is enabled 11 Outputs polarity is dynamically changed every time the counter reaches its pre defined value
28 di0_cnt_auto_reload_7	Counter auto reload mode 1 The counter will automatically be reloaded forever, ignoring the value of the di0_step_repeat_<i> field 0 The counter will not be automatically reloaded, It will be reloaded for the amount of repeat times defined on the di0_step_repeat_<i> field
27–25 di0_cnt_clr_sel_7	Counter Clear select This field defines the source of the signals that clears the counter. 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1

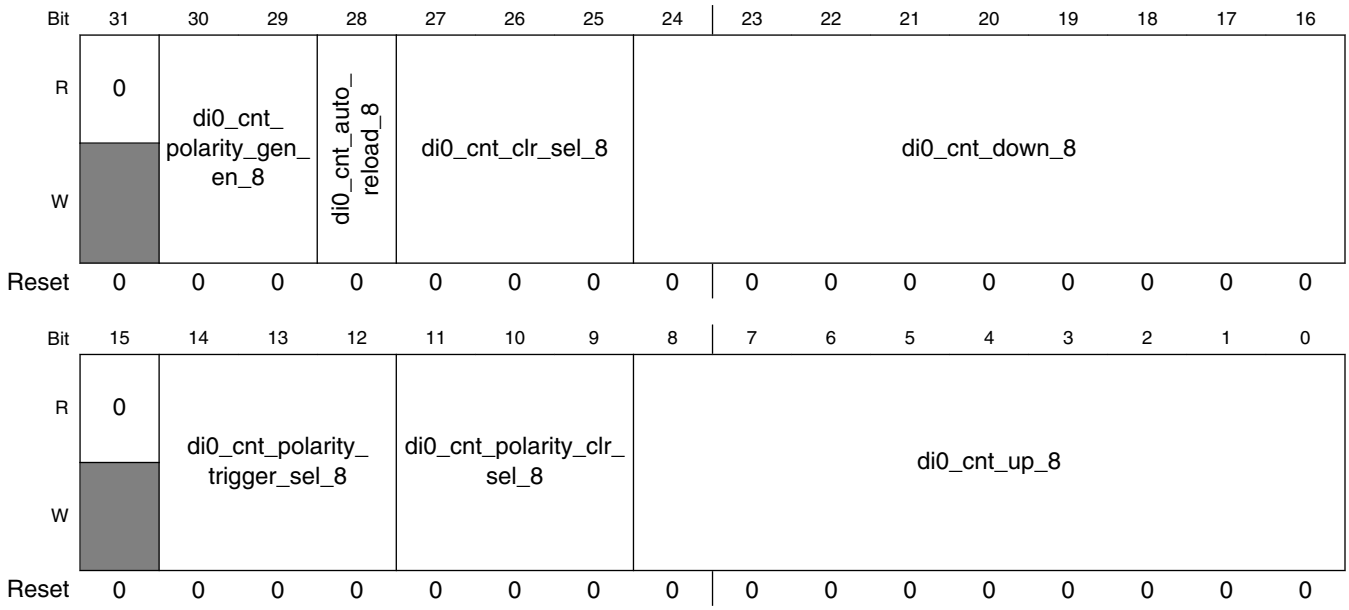
Table continues on the next page...

IPUx_DI0_SW_GEN1_7 field descriptions (continued)

Field	Description
	011 The Counter is triggered by counter #2 100 The Counter is triggered by counter #3 101 The Counter is triggered by counter #4 110 The Counter is triggered by counter #5 111 Counter is always on.
24–16 di0_cnt_down_7	Counter falling edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's falling edge.
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 di0_cnt_polarity_trigger_sel_7	DI0 Counter's toggling trigger select This field selects the counter's trigger causing the output to toggle 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1 011 The Counter is triggered by counter #2 100 The Counter is triggered by counter #3 101 The Counter is triggered by counter #4 110 The Counter is triggered by counter #5 111 Counter is always on.
11–9 di0_cnt_polarity_clr_sel_7	DI0 counter's polarity Clear select This field selects the input to the counter telling the counter wether to invert the output 000 Output is always inverted 001 Output is kept the same (no inversion) 010 Output is inverted if the output of counter #1 is set 011 Output is inverted if the output of counter #2 is set 100 Output is inverted if the output of counter #3 is set 101 Output is inverted if the output of counter #4 is set 110 Output is inverted if the output of counter #5 is set 111 Output is inverted if the output of counter #6 is set
di0_cnt_up_7	Counter rising edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's rising edge.

37.5.212 DI0 Sync Wave Gen 8 Register 1 (IPUx_DI0_SW_GEN1_8)

Address: Base address + 4_004Ch offset



IPUx_DI0_SW_GEN1_8 field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–29 di0_cnt_polarity_gen_en_8	DI0 Counter polarity generator enable The counter's output polarity can be changed on the fly. 00 Dynamic polarity change is disabled 01 The counters UP and DOWN value are calculated according to the trigger selected by cnt_polarity_trigger_sel field. When selecting this mode the UP and DOWN values has to be a multiple of 2. 10 Dynamic polarity change is enabled 11 Outputs polarity is dynamically changed every time the counter reaches its pre defined value
28 di0_cnt_auto_reload_8	Counter auto reload mode 1 The counter will automatically be reloaded forever, ignoring the value of the di0_step_repeat_<i> field 0 The counter will not be automatically reloaded, It will be reloaded for the amount of repeat times defined on the di0_step_repeat_<i> field
27–25 di0_cnt_clr_sel_8	Counter Clear select This field defines the source of the signals that clears the counter. 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1

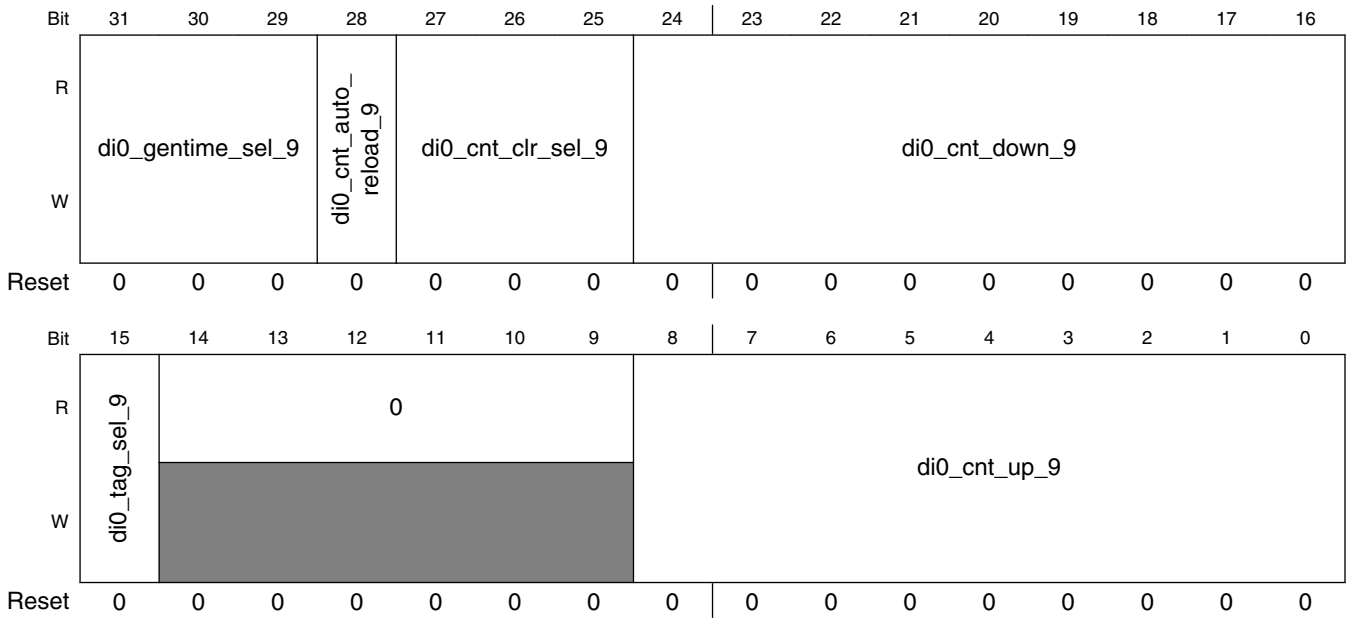
Table continues on the next page...

IPUx_DI0_SW_GEN1_8 field descriptions (continued)

Field	Description
	011 The Counter is triggered by counter #2 100 The Counter is triggered by counter #3 101 The Counter is triggered by counter #4 110 The Counter is triggered by counter #5 111 Counter is always on.
24–16 di0_cnt_down_8	Counter falling edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's falling edge.
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 di0_cnt_polarity_trigger_sel_8	DI0 Counter's toggling trigger select This field selects the counter's trigger causing the output to toggle 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1 011 The Counter is triggered by counter #2 100 The Counter is triggered by counter #3 101 The Counter is triggered by counter #4 110 The Counter is triggered by counter #5 111 Counter is always on.
11–9 di0_cnt_polarity_clr_sel_8	DI0 counter's polarity Clear select This field selects the input to the counter telling the counter wether to invert the output 000 Output is always inverted 001 Output is kept the same (no inversion) 010 Output is inverted if the output of counter #1 is set 011 Output is inverted if the output of counter #2 is set 100 Output is inverted if the output of counter #3 is set 101 Output is inverted if the output of counter #4 is set 110 Output is inverted if the output of counter #5 is set 111 Output is inverted if the output of counter #6 is set
di0_cnt_up_8	Counter rising edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's rising edge.

37.5.213 DI0 Sync Wave Gen 9 Register 1 (IPUx_DI0_SW_GEN1_9)

Address: Base address + 4_0050h offset



IPUx_DI0_SW_GEN1_9 field descriptions

Field	Description
31–29 di0_gentime_sel_9	Counter #9 main waveform select This field defines the counter that counter #9's auxiliary waveform will be attached too. 000 Counter #9's waveform is attached to counter #1's waveform 001 Counter #9's waveform is attached to counter #2's waveform 010 Counter #9's waveform is attached to counter #3's waveform 011 Counter #9's waveform is attached to counter #4's waveform 100 Counter #9's waveform is attached to counter #5's waveform 101 Counter #9's waveform is attached to counter #6's waveform 110 Counter #9's waveform is attached to counter #7's waveform 111 Counter #9's waveform is attached to counter #8's waveform
28 di0_cnt_auto_reload_9	Counter auto reload mode 1 The counter will automatically be reloaded forever, ignoring the value of the di0_step_repeat_<i> field 0 The counter will not be automatically reloaded, It will be reloaded for the amount of repeat times defined on the di0_step_repeat_<i> field
27–25 di0_cnt_clr_sel_9	Counter Clear select This field defines the source of the signals that clears the counter. 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1

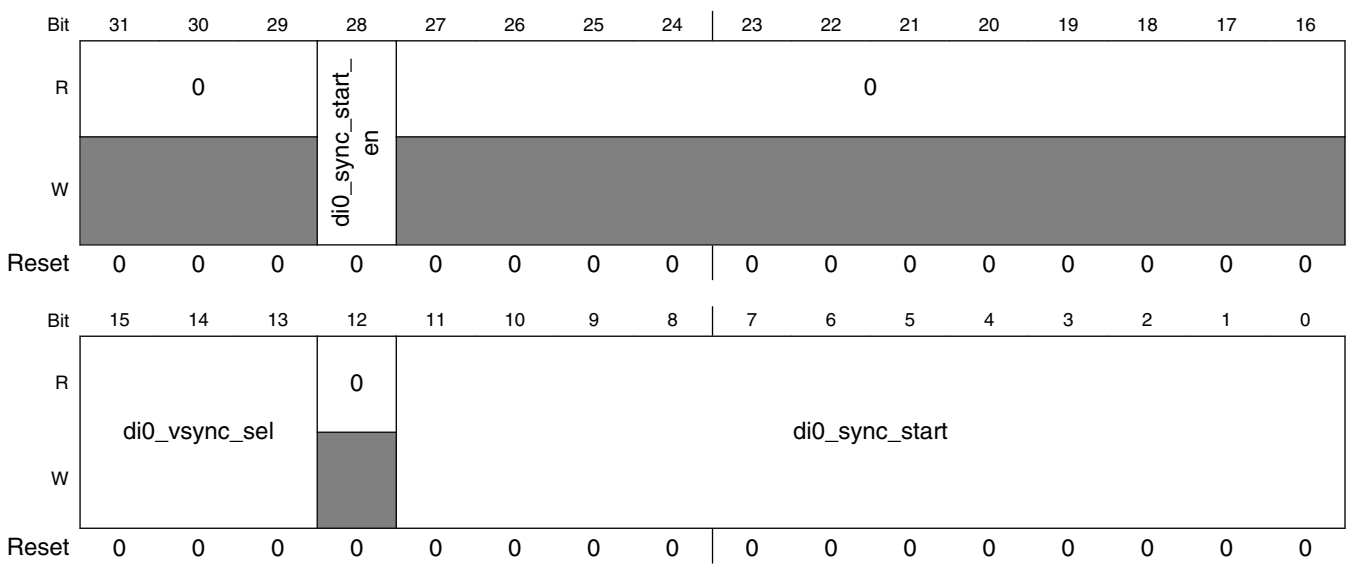
Table continues on the next page...

IPUx_DI0_SW_GEN1_9 field descriptions (continued)

Field	Description
	011 The Counter is triggered by counter #2 100 The Counter is triggered by counter #3 101 The Counter is triggered by counter #4 110 The Counter is triggered by counter #5 111 Counter is always on.
24–16 di0_cnt_down_9	Counter falling edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's falling edge.
15 di0_tag_sel_9	Counter #9 can send a synchronous tag when counter #9 reach its predefined value or when it's triggering counter reaches its pre defined value. 1 tag source is counter #9 0 Tag's source is the triggering counter.
14–9 Reserved	This read-only field is reserved and always has the value 0.
di0_cnt_up_9	Counter rising edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's rising edge.

37.5.214 DI0 Sync Assistance Gen Register (IPUx_DI0_SYNC_AS_GEN)

Address: Base address + 4_0054h offset



IPUx_DI0_SYNC_AS_GEN field descriptions

Field	Description
31–29 Reserved	This read-only field is reserved and always has the value 0.
28 di0_sync_start_en	di0_sync_start_en
27–16 Reserved	This read-only field is reserved and always has the value 0.
15–13 di0_vsync_sel	VSYNC select This field defines which of the counters functions as VSYNC signal 000 VSYNC is coming from counter #1 001 VSYNC is coming from counter #2 111 VSYNC is coming from counter #8
12 Reserved	This read-only field is reserved and always has the value 0.
di0_sync_start	DI0 Sync start This field defines the number of low (including blanking rows) on the which the DI0 starts preparing the data for the next frame.

37.5.215 DI0 Data Wave Gen <i> Register (IPUx_DI0_DW_GEN_i)

Address: Base address + 4_0058h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

IPUx_DI0_DW_GEN_i field descriptions

Field	Description
31–24 di0_access_size_i	DI0 Access Size <i> This field defines the amount of IPU cycles between any 2 accesses (an access may be a pixel or generic data that may have more one component)
23–16 di0_componnent_size_i	DI0 component Size This field defines the amount of IPU cycles between any 2 components
15–14 di0_cst_i	DI0 Chip Select pointer for waveform <i> This field points to a register that defines the waveform of the CS pin. The CS is automatically mapped to a specific display 00 The waveform is defined according to the settings on DI0_DW_SET0_<i> 01 The waveform is defined according to the settings on DI0_DW_SET1_<i>

Table continues on the next page...

IPUx_DI0_DW_GEN_i field descriptions (continued)

Field	Description
	10 The waveform is defined according to the settings on DI0_DW_SET2_<i> 11 The waveform is defined according to the settings on DI0_DW_SET3_<i>
13–12 di0_pt_6_i	DI0 PIN_17 pointer for waveform <i> This field points to a register that defines the waveform of the PIN_17 pin. 00 The waveform is defined according to the settings on DI0_DW_SET0_<i> 01 The waveform is defined according to the settings on DI0_DW_SET1_<i> 10 The waveform is defined according to the settings on DI0_DW_SET2_<i> 11 The waveform is defined according to the settings on DI0_DW_SET3_<i>
11–10 di0_pt_5_i	DI0 PIN_16 pointer for waveform <i> This field points to a register that defines the waveform of the PIN_16 pin. 00 The waveform is defined according to the settings on DI0_DW_SET0_<i> 01 The waveform is defined according to the settings on DI0_DW_SET1_<i> 10 The waveform is defined according to the settings on DI0_DW_SET2_<i> 11 The waveform is defined according to the settings on DI0_DW_SET3_<i>
9–8 di0_pt_4_i	DI0 PIN_15 pointer for waveform <i> This field points to a register that defines the waveform of the PIN_15 pin. 00 The waveform is defined according to the settings on DI0_DW_SET0_<i> 01 The waveform is defined according to the settings on DI0_DW_SET1_<i> 10 The waveform is defined according to the settings on DI0_DW_SET2_<i> 11 The waveform is defined according to the settings on DI0_DW_SET3_<i>
7–6 di0_pt_3_i	DI0 PIN_14 pointer for waveform <i> This field points to a register that defines the waveform of the PIN_14 pin. 00 The waveform is defined according to the settings on DI0_DW_SET0_<i> 01 The waveform is defined according to the settings on DI0_DW_SET1_<i> 10 The waveform is defined according to the settings on DI0_DW_SET2_<i> 11 The waveform is defined according to the settings on DI0_DW_SET3_<i>
5–4 di0_pt_2_i	DI0 PIN_13 pointer for waveform <i> This field points to a register that defines the waveform of the PIN_13 pin. 00 The waveform is defined according to the settings on DI0_DW_SET0_<i> 01 The waveform is defined according to the settings on DI0_DW_SET1_<i> 10 The waveform is defined according to the settings on DI0_DW_SET2_<i> 11 The waveform is defined according to the settings on DI0_DW_SET3_<i>
3–2 di0_pt_1_i	DI0 PIN_12 pointer for waveform <i> This field points to a register that defines the waveform of the PIN_12 pin. 00 The waveform is defined according to the settings on DI0_DW_SET0_<i> 01 The waveform is defined according to the settings on DI0_DW_SET1_<i> 10 The waveform is defined according to the settings on DI0_DW_SET2_<i> 11 The waveform is defined according to the settings on DI0_DW_SET3_<i>
di0_pt_0_i	DI0 PIN_11 pointer for waveform <i> This field points to a register that defines the waveform of the PIN_11 pin.

Table continues on the next page...

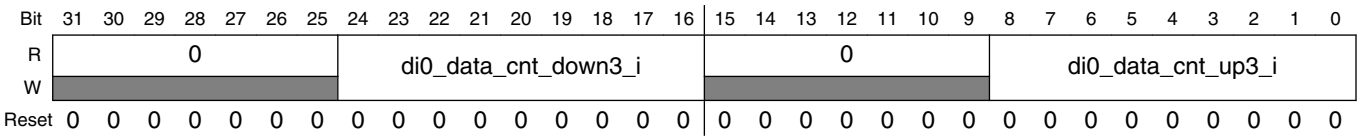
IPUx_DI0_DW_SET2_i field descriptions

Field	Description
31–25 Reserved	This read-only field is reserved and always has the value 0.
24–16 di0_data_cnt_down2_i	Waveform's falling edge position. This field defines the Waveform's falling edge position. The Waveform is mapped to a pint according to the corresponding di0_pt_*_<i>
15–9 Reserved	This read-only field is reserved and always has the value 0.
di0_data_cnt_up2_i	Waveform's rising edge position. This field defines the Waveform's rising edge position. The Waveform is mapped to a pint according to the corresponding di0_pt_*_<i>

37.5.219 DI0 Data Wave Set 3 <i> Register (IPUx_DI0_DW_SET3_i)

Address: Base address + 4_0118h offset

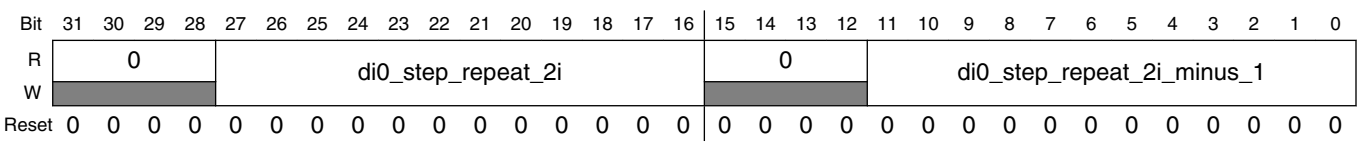


IPUx_DI0_DW_SET3_i field descriptions

Field	Description
31–25 Reserved	This read-only field is reserved and always has the value 0.
24–16 di0_data_cnt_down3_i	Waveform's falling edge position. This field defines the Waveform's falling edge position. The Waveform is mapped to a pint according to the corresponding di0_pt_*_<i>
15–9 Reserved	This read-only field is reserved and always has the value 0.
di0_data_cnt_up3_i	Waveform's rising edge position. This field defines the Waveform's rising edge position. The Waveform is mapped to a pint according to the corresponding di0_pt_*_<i>

37.5.220 DI0 Step Repeat <i> Registers (IPUx_DI0_STP_REP_i)

Address: Base address + 4_0148h offset

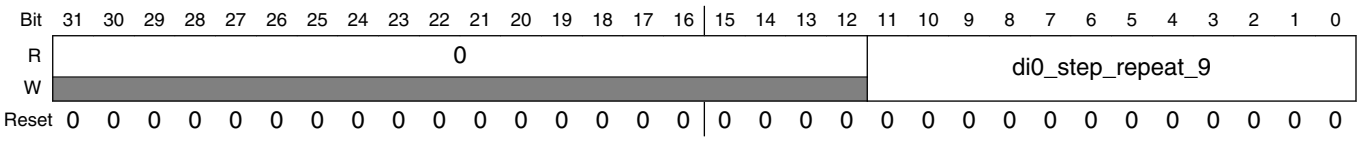


IPUx_DI0_STP_REP_i field descriptions

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27–16 di0_step_repeat_2i	Step Repeat <i> This fields defines the amount of repetitions that will be performed by the counter <i>
15–12 Reserved	This read-only field is reserved and always has the value 0.
di0_step_repeat_2i_minus_1	Step Repeat <i> This fields defines the amount of repetitions that will be performed by the counter <i>

37.5.221 DI0 Step Repeat 9 Registers (IPUx_DI0_STP_REP_9)

Address: Base address + 4_0158h offset

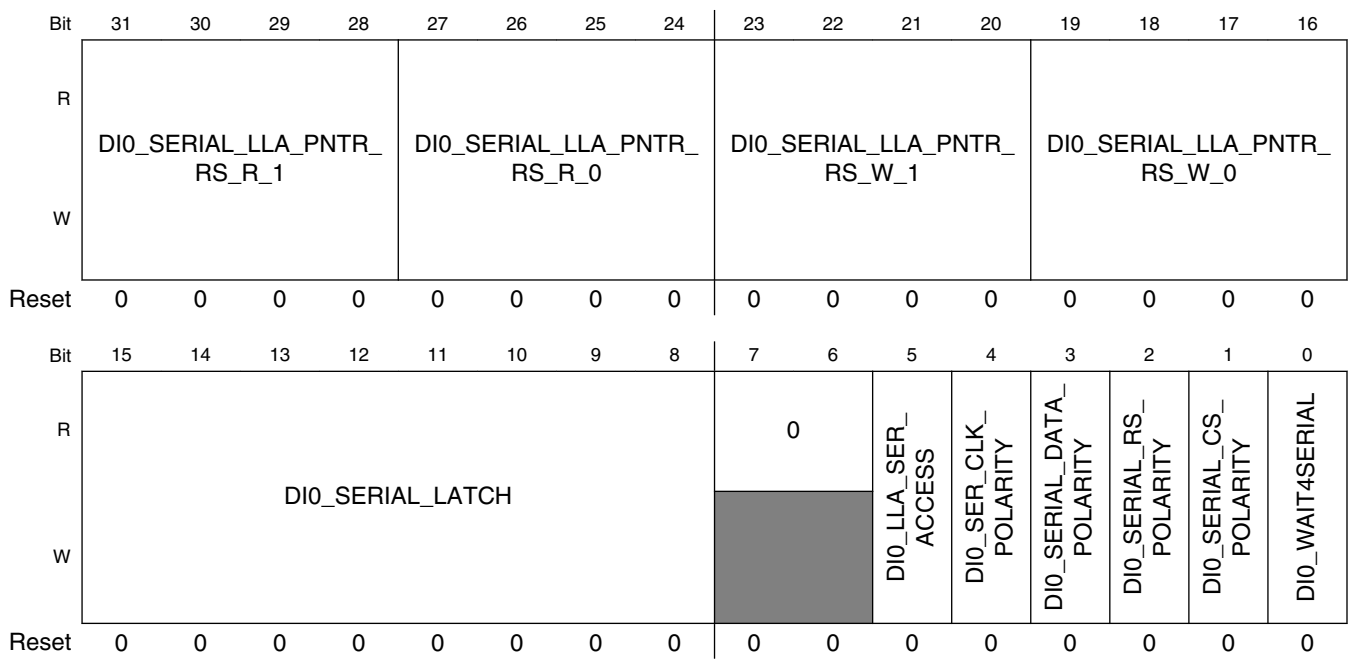


IPUx_DI0_STP_REP_9 field descriptions

Field	Description
31–12 Reserved	This read-only field is reserved and always has the value 0.
di0_step_repeat_9	Step Repeat 9 This fields defines the amount of repetitions that will be performed by the counter 9

37.5.222 DI0 Serial Display Control Register (IPUx_DI0_SER_CONF)

Address: Base address + 4_015Ch offset



IPUx_DI0_SER_CONF field descriptions

Field	Description
31–28 DI0_SERIAL_LLA_PNTR_RS_R_1	RS 3 waveform pointer for read low level access This pointer defines which waveform set will be chosen when the read low level access is targeted to RS group 1. 0000 Waveform set #1 0001 Waveform set #2 1011 Waveform set #12 1100 Reserved 1101 Reserved 1100 Reserved
27–24 DI0_SERIAL_LLA_PNTR_RS_R_0	RS 2 waveform pointer for read low level access This pointer defines which waveform set will be chosen when the read low level access is targeted to RS group 0. 0000 Waveform set #1 0001 Waveform set #2 1011 Waveform set #12 1100 Reserved 1101 Reserved 1100 Reserved
23–20 DI0_SERIAL_LLA_PNTR_RS_W_1	RS 1 waveform pointer for write low level access This pointer defines which waveform set will be chosen when the low level write access is targeted to RS group 1. 0000 Waveform set #1 0001 Waveform set #2 1011 Waveform set #12 1100 Reserved 1101 Reserved 1100 Reserved
19–16 DI0_SERIAL_LLA_PNTR_RS_W_0	RS 0 waveform pointer for write low level access This pointer defines which waveform set will be chosen when the low level write access is targeted to RS group 0. 0000 Waveform set #1 0001 Waveform set #2 1011 Waveform set #12 1100 Reserved 1101 Reserved 1100 Reserved
15–8 DI0_SERIAL_LATCH	DI0 Serial Latch This field defines how many cycles to insert between serial read accesses start to data sampling in the
7–6 Reserved	This read-only field is reserved and always has the value 0.

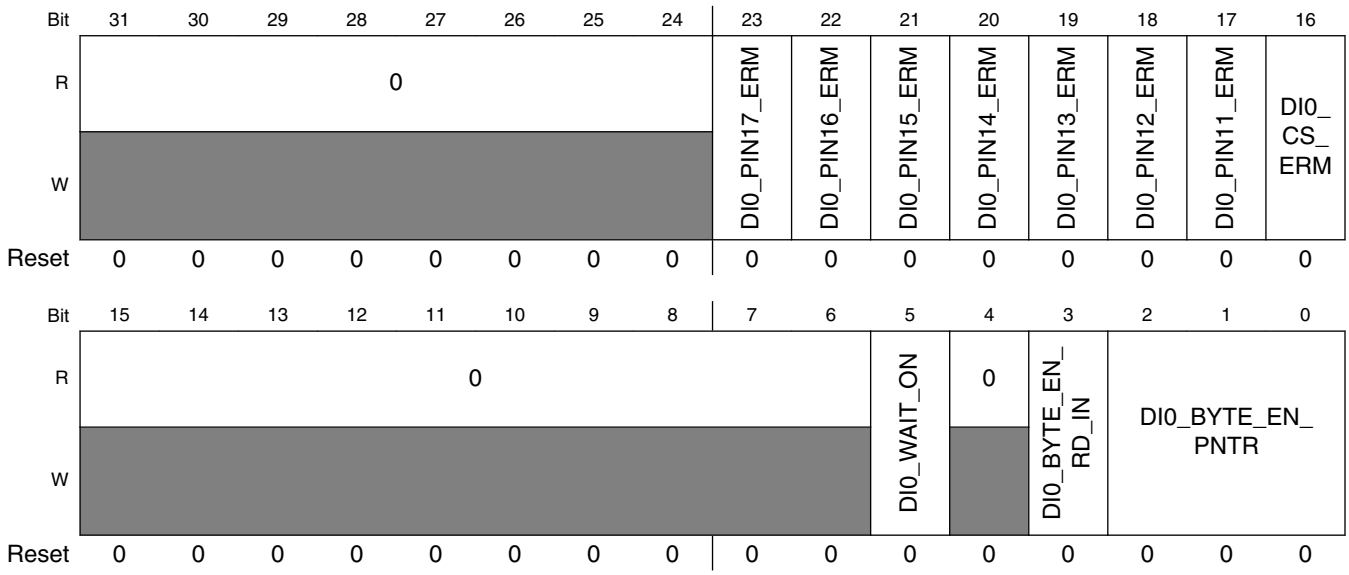
Table continues on the next page...

IPUx_DI0_SER_CONF field descriptions (continued)

Field	Description
5 DI0_LLA_SER_ACCESS	Direct Low Level Access to Serial display 1 ARM platform access is performed via a direct path to the serial display in LLA mode, in this mode only the ARM platform in LLA mode can access the serial port 0 ARM platform access to the serial display port is not done directly, hence other source are allowed to access the serial port. The arbitration is done automatically
4 DI0_SER_CLK_POLARITY	Serial Clock Polarity The output polarity of the SER_CLK pin 1 The clock is inverted 0 The clock is not inverted
3 DI0_SERIAL_DATA_POLARITY	Serial Data Polarity The output polarity of the SER_DATA pin 1 The data is inverted 0 The data is not inverted
2 DI0_SERIAL_RS_POLARITY	Serial RS Polarity The output polarity of the SER_RS pin 1 The RS is inverted 0 The RS is not inverted
1 DI0_SERIAL_CS_POLARITY	Serial Chip Select Polarity The output polarity of the SER_CS pin 1 The CS is inverted 0 The CS is not inverted
0 DI0_WAIT4SERIAL	Wait for Serial When the parallel display share pins with the serial port. Accessing the parallel port is not allowed till the serial port completes its access. 1 The parallel port should wait to the serial port as the pins are shared 0 The parallel port should not wait to the serial port as the pins are not shared

37.5.223 DI0 Special Signals Control Register (IPUx_DI0_SSC)

Address: Base address + 4_0160h offset



IPUx_DI0_SSC field descriptions

Field	Description
31–24 Reserved	This read-only field is reserved and always has the value 0.
23 DI0_PIN17_ERM	DI0 PIN17 error recovery mode. This bit defines the error recovery mode of the PIN17 pin. 1 The PIN17 pin is cleared in case of a synchronous display error. The clear will be done on the next VSYNC 0 Nothing is done to the PIN17 pin following a display error detection
22 DI0_PIN16_ERM	DI0 PIN16 error recovery mode. This bit defines the error recovery mode of the PIN16 pin. 1 The PIN16 pin is cleared in case of a synchronous display error. The clear will be done on the next VSYNC 0 Nothing is done to the PIN16 pin following a display error detection
21 DI0_PIN15_ERM	DI0 PIN15 error recovery mode. This bit defines the error recovery mode of the PIN15 pin. 1 The PIN15 pin is cleared in case of a synchronous display error. The clear will be done on the next VSYNC 0 Nothing is done to the PIN15 pin following a display error detection
20 DI0_PIN14_ERM	DI0 PIN14 error recovery mode. This bit defines the error recovery mode of the PIN14 pin.

Table continues on the next page...

IPUx_DI0_SSC field descriptions (continued)

Field	Description
	1 The PIN14 pin is cleared in case of a synchronous display error. The clear will be done on the next VSYNC 0 Nothing is done to the PIN14 pin following a display error detection
19 DI0_PIN13_ERM	DI0 PIN13 error recovery mode. This bit defines the error recovery mode of the PIN13 pin. 1 The PIN13 pin is cleared in case of a synchronous display error. The clear will be done on the next VSYNC 0 Nothing is done to the PIN13 pin following a display error detection
18 DI0_PIN12_ERM	DI0 PIN12 error recovery mode. This bit defines the error recovery mode of the PIN12 pin. 1 The PIN12 pin is cleared in case of a synchronous display error. The clear will be done on the next VSYNC 0 Nothing is done to the PIN12 pin following a display error detection
17 DI0_PIN11_ERM	DI0 PIN11 error recovery mode. This bit defines the error recovery mode of the PIN11 pin. 1 The PIN11 pin is cleared in case of a synchronous display error. The clear will be done on the next VSYNC 0 Nothing is done to the PIN11 pin following a display error detection
16 DI0_CS_ERM	DI0 GLUELOGIC error recovery mode. This bit defines the error recovery mode of the GLUELOGIC. 1 The GLUELOGIC is release in case of a synchronous display error. The release will be done on the next VSYNC 0 Nothing is done to the GLUELOGIC following a display error detection
15–6 Reserved	This read-only field is reserved and always has the value 0.
5 DI0_WAIT_ON	Wait On This field defines the DC's response to WAIT signal 1 The DC holds the flow as long as WAIT is asserted 0 The DC continues the flow regardless the WAIT signal
4 Reserved	This read-only field is reserved and always has the value 0.
3 DI0_BYTE_EN_RD_IN	Byte Enable Read In This bit selects the source of the byte enable pins 1 The write byte enable signals are routed via bits [17:16] of the display's data, The read byte enable signals are routed via bits [19:18 of the display's data 0 The byte enable signals are routed via bits [17:16] of the display's data for both read and write
DI0_BYTE_EN_PNTR	Byte Enable Pointer This pointer selects the pin asserted along with the byte enables signals 000 wave form of byte enable as pin_11

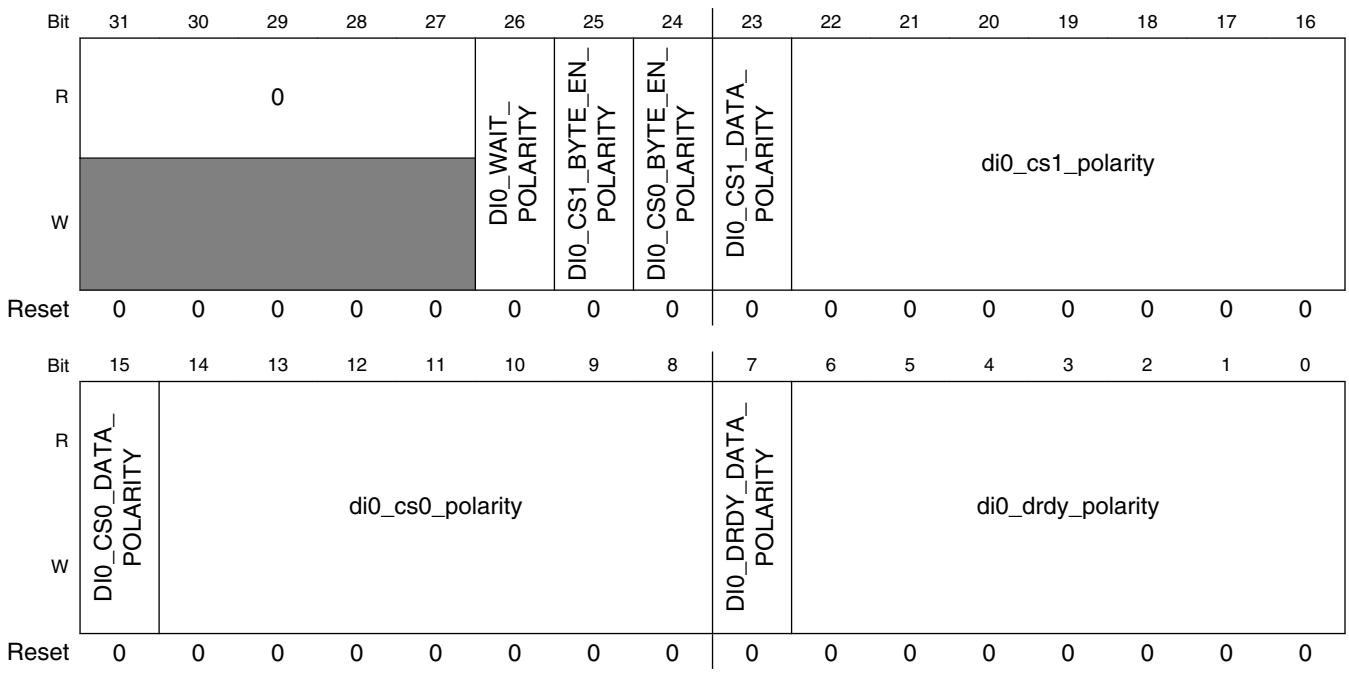
Table continues on the next page...

IPUx_DI0_SSC field descriptions (continued)

Field	Description
	001 wave form of byte enable as pin_12 111 wave form of byte enable as suitable CS pin

37.5.224 DI0 Polarity Register (IPUx_DI0_POL)

Address: Base address + 4_0164h offset



IPUx_DI0_POL field descriptions

Field	Description
31–27 Reserved	This read-only field is reserved and always has the value 0.
26 DI0_WAIT_POLARITY	WAIT polarity This bit defines the polarity of the wait signal input coming from the displa1 1 active high 0 active low
25 DI0_CS1_BYTE_EN_POLARITY	Byte Enable associated with CS1 polarity This bit defines the polarity of the byte enable signals to the display 1 active high 0 active low
24 DI0_CS0_BYTE_EN_POLARITY	Byte Enable associated with CS0 polarity This bit defines the polarity of the byte enable signals to the display

Table continues on the next page...

IPUx_DI0_POL field descriptions (continued)

Field	Description
	1 active high 0 active low
23 DI0_CS1_DATA_POLARITY	Data Polarity associated with CS1
22–16 di0_cs1_polarity	DI0 output pin's polarity for CS1 This bits define the polarity of each of the DI's outputs when CS1 is asserted 1 The output pin is active high 0 The output pin is active low
15 DI0_CS0_DATA_POLARITY	Data Polarity associated with CS0
14–8 di0_cs0_polarity	DI0 output pin's polarity for CS1 This bits define the polarity of each of the DI's outputs when CS1 is asserted 1 The output pin is active high 0 The output pin is active low
7 DI0_DRDY_DATA_POLARITY	Data Polarity associated with DRDY
di0_drdy_polarity	DI0 output dynamic pin's polarity for synchronous access This bits define the polarity of each of the DI's outputs when synchronous display access is asserted The pins' default polarity is the same as defined in the di0_drdy_polarity bits 1 The output pin is active high 0 The output pin is active low

37.5.225 DI0 Active Window 0 Register (IPUx_DI0_AW0)

Address: Base address + 4_0168h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

IPUx_DI0_AW0 field descriptions

Field	Description
31–28 DI0_AW_TRIG_SEL	This field selects the trigger for sending data during the display's active window 000 disabled 001 The trigger is the same trigger that triggers the displays clock. 010 The trigger is counter #1

Table continues on the next page...

IPUx_DI0_AW0 field descriptions (continued)

Field	Description
	011 The trigger is counter #2 100 The trigger is counter #3 101 The trigger is counter #4 110 The trigger is counter #5 111 The trigger is always on.
27–16 DI0_AW_HEND	This field defines the horizontal end of the active window
15–12 DI0_AW_ HCOUNT_SEL	GM: This field selects the counter that counts the horizontal position of the display's active window 0000 disabled 0001 reserved 0010 The counter is counter #1 0011 The counter is counter #2 0100 The counter is counter #3 0101 The counter is counter #4 0110 The counter is counter #5 1001 The counter is counter #8
DI0_AW_ HSTART	This field defines the horizontal start of the active window DI0_AW_HSTART < DI0_AW_HEND

37.5.226 DI0 Active Window 1 Register (IPUx_DI0_AW1)

Address: Base address + 4_016Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

IPUx_DI0_AW1 field descriptions

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27–16 DI0_AW_VEND	This field defines the vertical end of the active window
15–12 DI0_AW_ VCOUNT_SEL	This field selects the counter that counts the vertical position of the display's active window 0000 disabled 0001 reserved 0010 The counter is counter #1 0011 The counter is counter #2 0100 The counter is counter #3 0101 The counter is counter #4

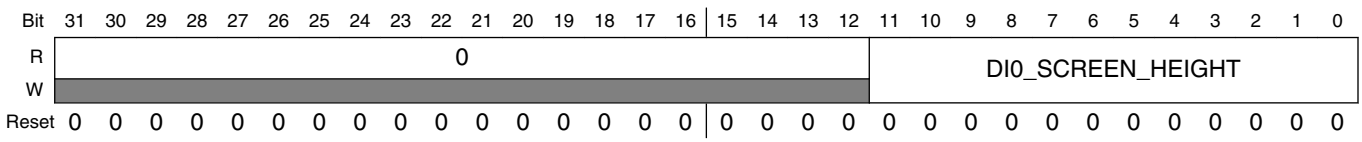
Table continues on the next page...

IPUx_DI0_AW1 field descriptions (continued)

Field	Description
	0110 The counter is counter #5 1001 The counter is counter #8
DI0_AW_ VSTART	This field defines the vertical start of the active window DI0_AW_VSTART < DI0_AW_VEND

37.5.227 DI0 Screen Configuration Register (IPUx_DI0_SCR_CONF)

Address: Base address + 4_0170h offset

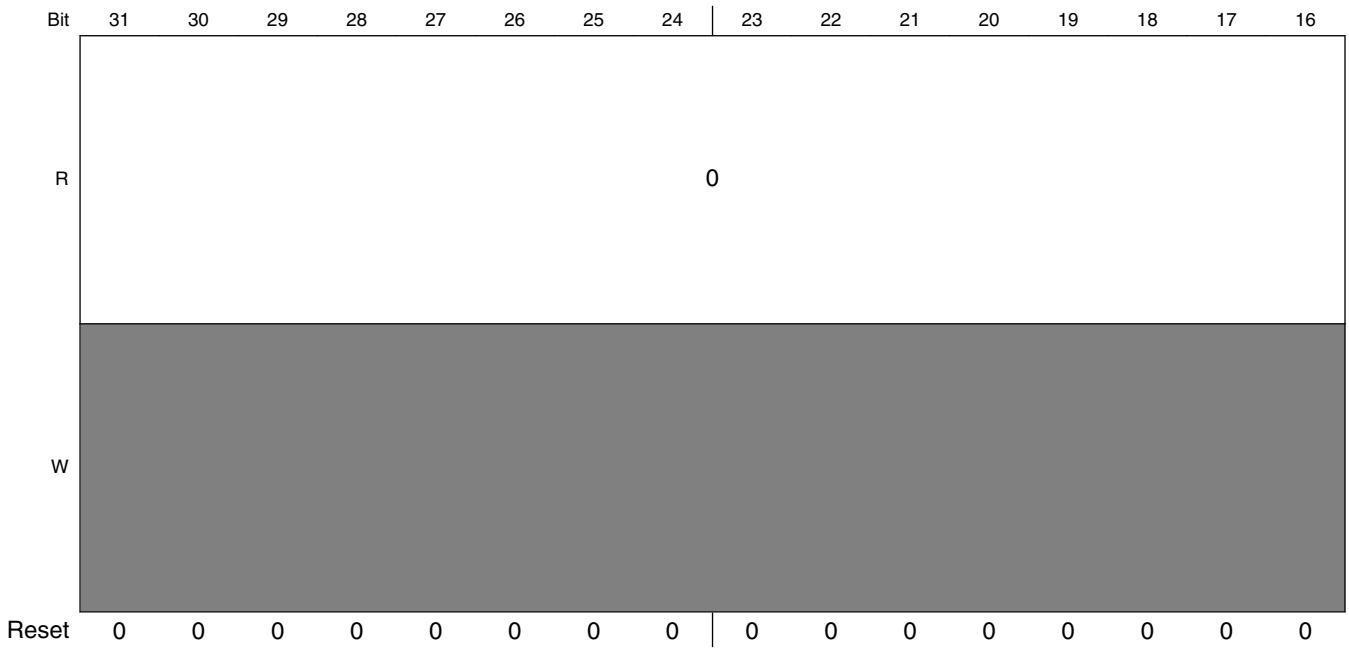


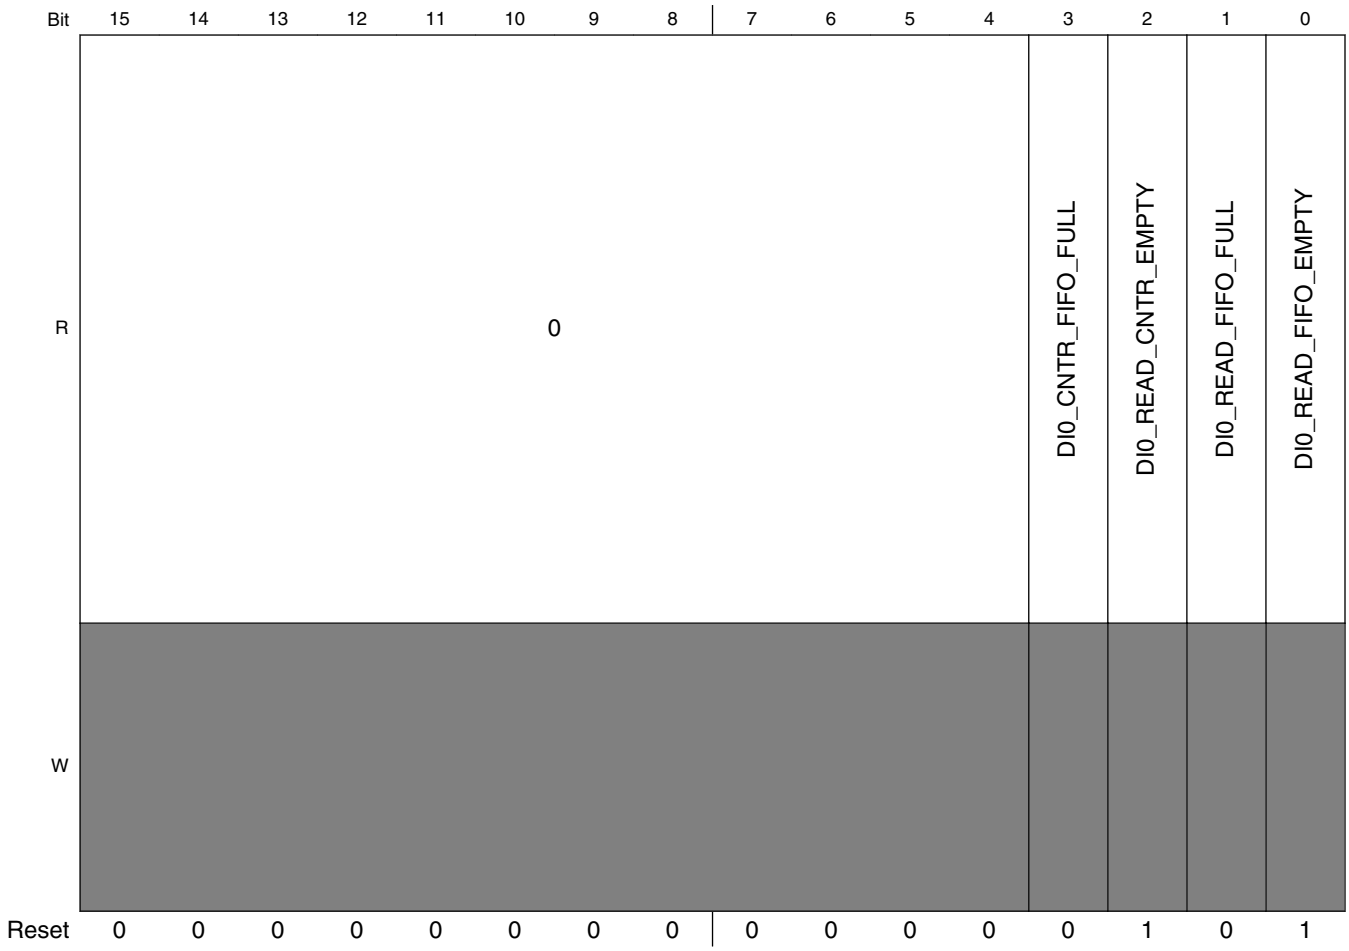
IPUx_DI0_SCR_CONF field descriptions

Field	Description
31–12 Reserved	This read-only field is reserved and always has the value 0.
DI0_SCREEN_ HEIGHT	This field defines the number of display rows (Number_of_ROWS = DI0_SCREEN_HEIGHT+1) This field is used for VSYNC calculation and for anti-tearing

37.5.228 DI0 Status Register (IPUx_DI0_STAT)

Address: Base address + 4_0174h offset



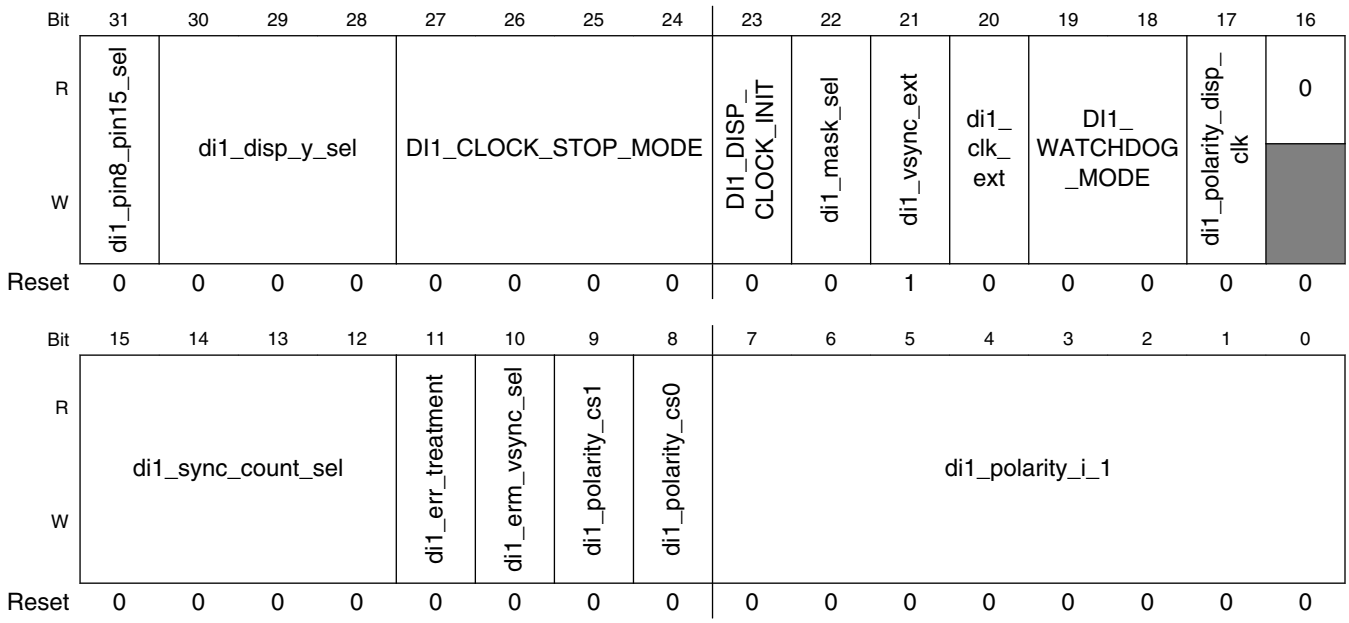


IPUx_DI0_STAT field descriptions

Field	Description
31–4 Reserved	This read-only field is reserved and always has the value 0.
3 DI0_CNTR_ FIFO_FULL	This bit indicates a full state of the DI0 FIFO. This FIFO is part of the DI0 synchronizer.
2 DI0_READ_ CNTR_EMPTY	This bit indicates an empty state of the DI0 FIFO. This FIFO is part of the DI0 synchronizer.
1 DI0_READ_ FIFO_FULL	This bit indicates a full state of the DI0 FIFO when performing a read. This FIFO is part of the DI0 synchronizer.
0 DI0_READ_ FIFO_EMPTY	This bit indicates an empty state of the DI0 FIFO when performing a read. This FIFO is part of the DI0 synchronizer.

37.5.229 DI1General Register (IPUx_DI1_GENERAL)

Address: Base address + 4_8000h offset



IPUx_DI1_GENERAL field descriptions

Field	Description
31 di1_pin8_pin15_sel	This bit routes PIN8 over PIN15 1 PIN8 is routed to PIN15, PIN8 is also routed to PIN8 0 PIN15 is routed to PIN15, PIN8 is routed to PIN8
30–28 di1_disp_y_sel	DI1 Display Vertical coordinate (Y) select. This field defines which one of the 8 counters will be used as a display's line counter. 000 counter #1 is selected 111 counter #8 is selected
27–24 DI1_CLOCK_STOP_MODE	DI clock stop mode When performing a clock change. The DI stops the clock to the display. These field defines when the clock will be stopped Stopping at EOL/EOF is supported for the case where the data is coming from the IDMAC (DMA access). In case that only direct accesses is performed, the user should set this field to 0000 0001-1001 stop at the next event of one of the counters (counter #1 to counter #9) 0000 stop at the next edge of the display clock 1100 stop at EOL (end of a line), but if stop request is during blanking interval, stop now 1101 stop at EOF (end of a frame), but if stop request is during blanking interval, stop now 1110 stop at EOL (end of a line), but if stop request is during blanking interval, stop at the end of the next line 1111 stop at EOF (end of a frame), but if stop request is during blanking interval, stop at the end of the next frame

Table continues on the next page...

IPUx_DI1_GENERAL field descriptions (continued)

Field	Description
23 DI1_DISP_CLOCK_INIT	Display clock's initial mode For synchronization error conditions the display clock can be stopped on the next VSYNC 1 The display's clock is running after the next VSYNC (indicating new frame) 0 The display's clock is stopped after the next VSYNC (indicating new frame)
22 di1_mask_sel	DI1 Mask select. IPP_PIN_2 output of the DI that functions as MASK signal can come from 2 sources: counter #2 or extracted from the MASK data coming from the memory. 1 IPP_PIN_2 is coming from extracted MASK data coming from the memory 0 IPP_PIN_2 is coming from counter #2
21 di1_vsync_ext	DI1 External VSYNC. This bit selects the source of the VSYNC signal 1 External to the IPU 0 Internally generated by the IPU
20 di1_clk_ext	DI1 External Clock. This bit selects the source of the DI's clock 1 The source of the clock is external to the IPU 0 The clock is internally generated by the IPU
19–18 DI1_WATCHDOG_MODE	DI1 watchdog mode In case of a display error where the DI clock is stopped (defined at di0_err_treatment). An internal watchdog counts DI clocks. If this timer reached its pre defined value the DI will skip the current frame and restart on the frame. This 2 bits define the number of DI clock cycles that the timer counts. 00 The timer counts 4 DI cycles 01 The timer counts 16 DI cycles 10 The timer counts 64 DI cycles 11 The timer counts 128 DI cycles
17 di1_polarity_disp_clk	DI1 Output Clock's polarity This bits define the polarity of the DI's clock. 1 The output clock is active high 0 The output clock is active low
16 Reserved	This read-only field is reserved and always has the value 0.
15–12 di1_sync_count_sel	For synchronous flow error: selects synchronous flow synchronization counter in DI:
11 di1_err_treatment	In case of synchronous flow error there are 2 ways to handle the display 1 to wait (i.e. stop clock) 0 Drive the last component
10 di1_erm_vsync_sel	DI1 error recovery module's VSYNC source select The error recovery block detect a case where the DI's VSYNC is asserted before the EOF. This bit selects the source of the VSYNC signal monitored by this mechanism.

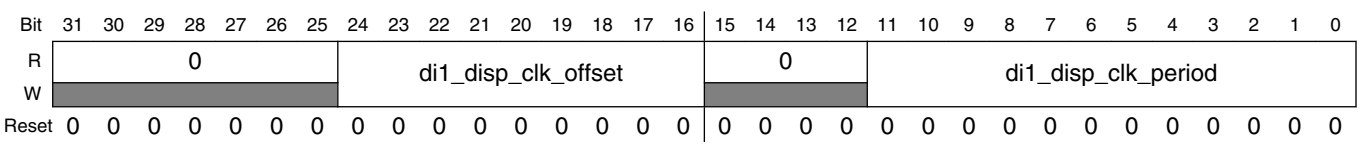
Table continues on the next page...

IPUx_DI1_GENERAL field descriptions (continued)

Field	Description
	1 vsync_post - an internal VSYNC signal asserted 2 lines after the DI's VSYNC 0 vsync_pre - an internal VSYNC signal asserted 2 lines before the DI's VSYNC
9 di1_polarity_cs1	DI1 Chip Select's 1 polarity This bits define the polarity of the DI's CS1. 1 The CS1 is active high 0 The CS1 is active low
8 di1_polarity_cs0	DI1 Chip Select's 0 polarity This bits define the polarity of the DI's CS0. 1 The CS0 is active high 0 The CS0 is active low
di1_polarity_i_1	DI1 output pin's polarity This bits define the polarity of each of the DI's outputs. 1 The output pin is active high 0 The output pin is active low

37.5.230 DI1 Base Sync Clock Gen 0 Register (IPUx_DI1_BS_CLKGEN0)

Address: Base address + 4_8004h offset

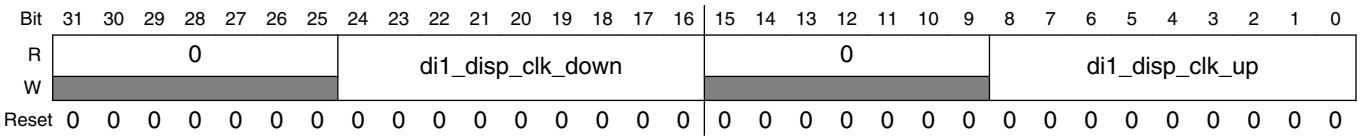


IPUx_DI1_BS_CLKGEN0 field descriptions

Field	Description
31–25 Reserved	This read-only field is reserved and always has the value 0.
24–16 di1_disp_clk_offset	DI1 Display Clock Offset The DI has the ability to delay the display's clock This field defines the amount of IPU's clock cycles added as delay on this clock.
15–12 Reserved	This read-only field is reserved and always has the value 0.
di1_disp_clk_period	DI1 Display Clock Period This field defines the Display interface clock period for display write access. This parameter contains an integer part (bits 11:4) and a fractional part (bits 3:0). It defines a fractional division ratio of the HSP_CLK clock for generation of the display's interface clock.

37.5.231 DI1 Base Sync Clock Gen 1 Register (IPUx_DI1_BS_CLKGEN1)

Address: Base address + 4_8008h offset

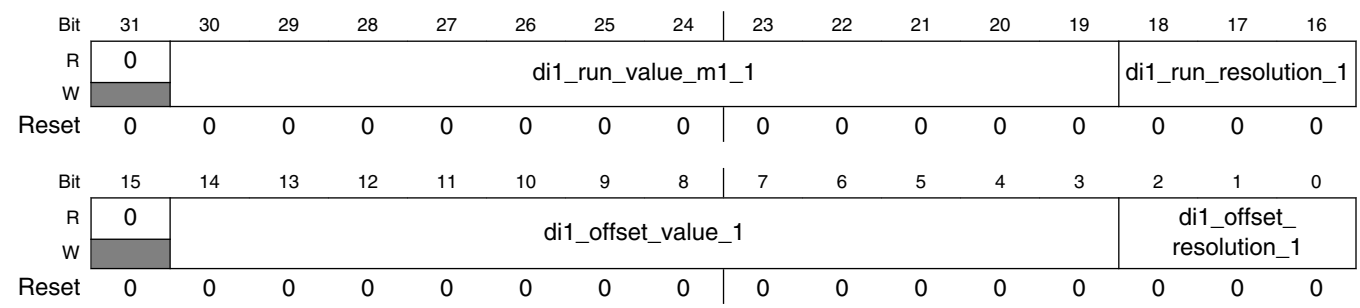


IPUx_DI1_BS_CLKGEN1 field descriptions

Field	Description
31–25 Reserved	This read-only field is reserved and always has the value 0.
24–16 di1_disp_clk_down	DI1 display clock falling edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is a time interval between display's access start point and display 's interface clock falling edge.
15–9 Reserved	This read-only field is reserved and always has the value 0.
di1_disp_clk_up	DI1 display clock rising edge position This parameter contains an integer part (bits 8:1) and a fractional part (bit 0). The position value is a time interval between display's access start point and display 's interface clock rising edge.

37.5.232 DI1 Sync Wave Gen 1 Register 0 (IPUx_DI1_SW_GEN0_1)

Address: Base address + 4_800Ch offset



IPUx_DI1_SW_GEN0_1 field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

IPUx_DI1_SW_GEN0_1 field descriptions (continued)

Field	Description
30–19 di1_run_value_m1_1	DI1 counter #1 pre defined value This fields defines the counter #1 pre defines value. When the counter is auto reload mode (di1_cnt_auto_reload_1 bit is set), the counter automatically restarts. otherwise the counter restarts for the amount of time defined on the corresponding di1_step_repeat field.
18–16 di1_run_resolution_1	DI1 counter #1 Run Resolution This field defines the trigger causing the counter to increment. 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 NA 011 NA 100 NA 101 CSI VSYNC. The VSYNC is a trigger coming from one of the CSI's according to the CSI_VSYNC_DEST bit. — 110 External VSYNC 111 Counter is always on.
15 Reserved	This read-only field is reserved and always has the value 0.
14–3 di1_offset_value_1	DI1 counter #1 offset value The counter can start counting after a pre defined delay This field defines the amount of cycles that the counter will be delayed by
di1_offset_resolution_1	DI1 counter #1 offset Resolution This field defines the trigger causing the offset counter to increment 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 NA 011 NA 100 NA 101 CSI VSYNC. The VSYNC is a trigger coming from one of the CSI's according to the CSI_VSYNC_DEST bit. — 110 External VSYNC 111 Counter is always on.

37.5.233 DI1 Sync Wave Gen 2 Register 0 (IPUx_DI1_SW_GEN0_2)

Address: Base address + 4_8010h offset

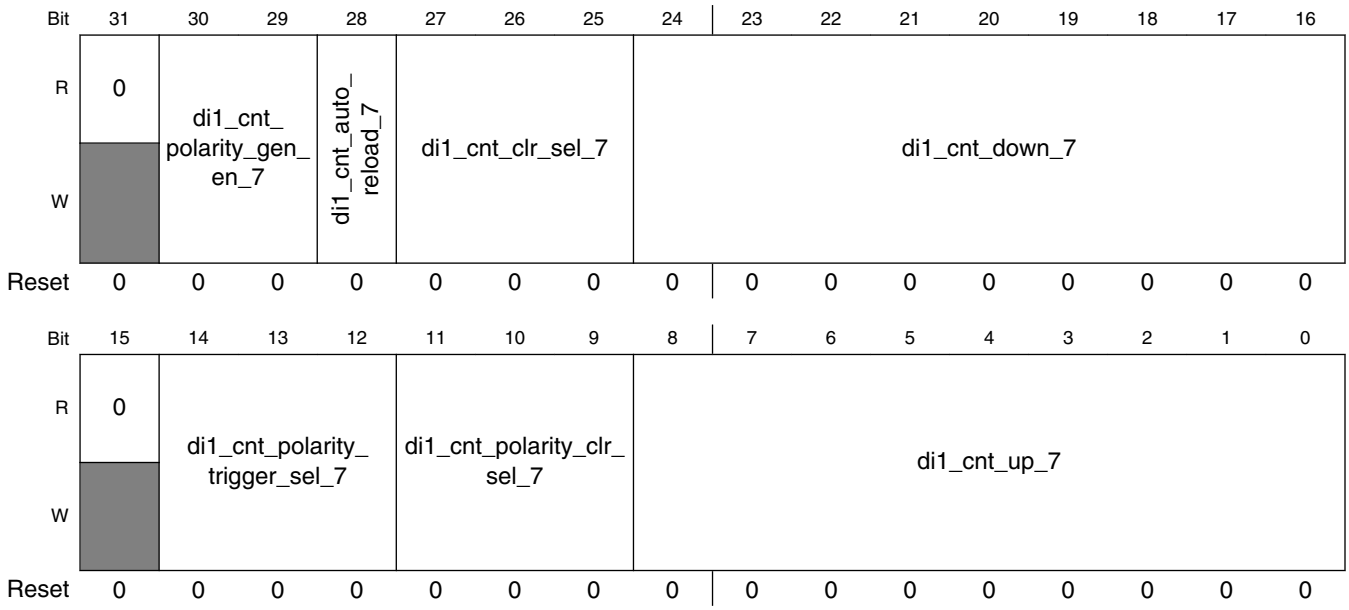
11–9 di1_cnt_polarity_clr_sel_6	DI1 counter's polarity Clear select This field selects the input to the counter telling the counter wether to invert the output 000 Output is always inverted 001 Output is kept the same (no inversion) 010 Output is inverted if the output of counter #1 is set 011 Output is inverted if the output of counter #2 is set 100 Output is inverted if the output of counter #3 is set 101 Output is inverted if the output of counter #4 is set 110 Output is inverted if the output of counter #5 is set 111 Reserved
di1_cnt_up_6	Counter rising edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's rising edge.

37.5.247 DI1Sync Wave Gen 7 Register 1 (IPUx_DI1_SW_GEN1_7)

Address: Base address + 4_8048h offset



IPUx_DI1_SW_GEN1_7 field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–29 di1_cnt_polarity_gen_en_7	DI1 Counter polarity generator enable The counter's output polarity can be changed on the fly. 00 Dynamic polarity change is disabled 01 The counters UP and DOWN value are calculated according to the trigger selected by cnt_polarity_trigger_sel field. When selecting this mode the UP and DOWN values has to be a multiple of 2. 10 Dynamic polarity change is enabled 11 Outputs polarity is dynamically changed every time the counter reaches its pre defined value
28 di1_cnt_auto_reload_7	Counter auto reload mode 1 The counter will automatically be reloaded forever, ignoring the value of the di1_step_repeat_<i> field 0 The counter will not be automatically reloaded, It will be reloaded for the amount of repeat times defined on the di1_step_repeat_<i> field
27–25 di1_cnt_clr_sel_7	Counter Clear select This field defines the source of the signals that clears the counter. 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1

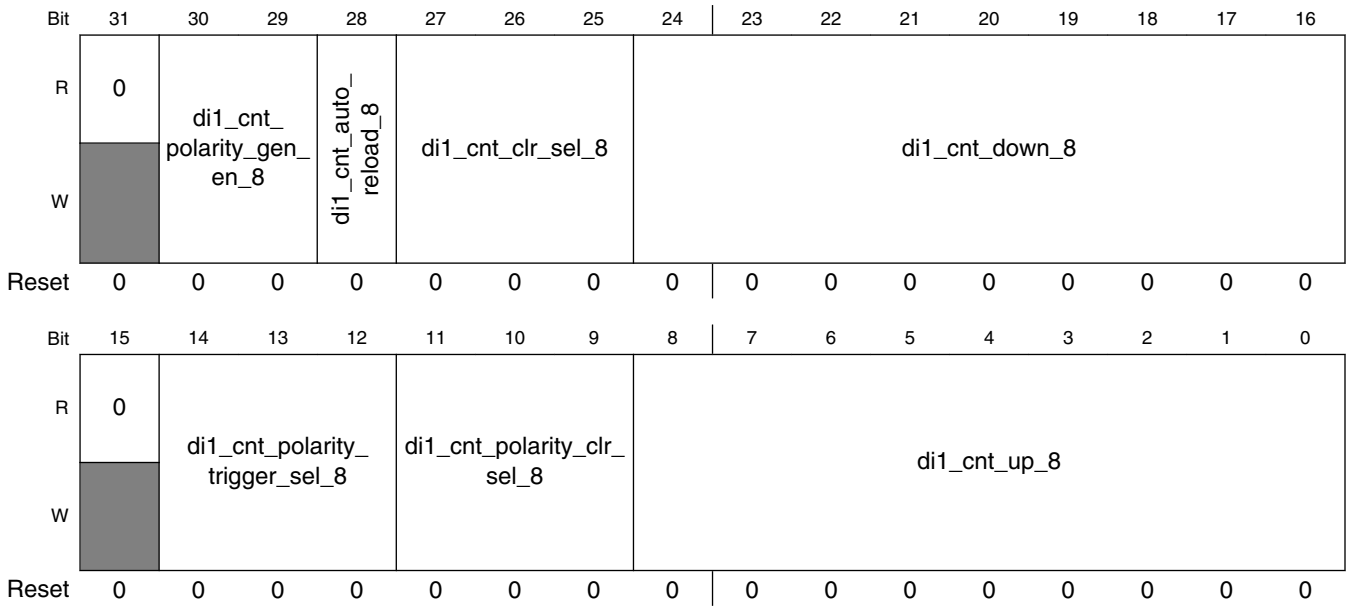
Table continues on the next page...

IPUx_DI1_SW_GEN1_7 field descriptions (continued)

Field	Description
	011 The Counter is triggered by counter #2 100 The Counter is triggered by counter #3 101 The Counter is triggered by counter #4 110 The Counter is triggered by counter #5 111 Counter is always on.
24–16 di1_cnt_down_7	Counter falling edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's falling edge.
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 di1_cnt_polarity_trigger_sel_7	DI1 Counter's toggling trigger select This field selects the counter's trigger causing the output to toggle 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1 011 The Counter is triggered by counter #2 100 The Counter is triggered by counter #3 101 The Counter is triggered by counter #4 110 The Counter is triggered by counter #5 111 Counter is always on.
11–9 di1_cnt_polarity_clr_sel_7	DI1 counter's polarity Clear select This field selects the input to the counter telling the counter wether to invert the output 000 Output is always inverted 001 Output is kept the same (no inversion) 010 Output is inverted if the output of counter #1 is set 011 Output is inverted if the output of counter #2 is set 100 Output is inverted if the output of counter #3 is set 101 Output is inverted if the output of counter #4 is set 110 Output is inverted if the output of counter #5 is set 111 Output is inverted if the output of counter #6 is set
di1_cnt_up_7	Counter rising edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's rising edge.

37.5.248 DI1 Sync Wave Gen 8 Register 1 (IPUx_DI1_SW_GEN1_8)

Address: Base address + 4_804Ch offset



IPUx_DI1_SW_GEN1_8 field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–29 di1_cnt_polarity_gen_en_8	DI1 Counter polarity generator enable The counter's output polarity can be changed on the fly. 00 Dynamic polarity change is disabled 01 The counters UP and DOWN value are calculated according to the trigger selected by cnt_polarity_trigger_sel field. When selecting this mode the UP and DOWN values has to be a multiple of 2. 10 Dynamic polarity change is enabled 11 Outputs polarity is dynamically changed every time the counter reaches its pre defined value
28 di1_cnt_auto_reload_8	Counter auto reload mode 1 The counter will automatically be reloaded forever, ignoring the value of the di1_step_repeat_<i> field 0 The counter will not be automatically reloaded, It will be reloaded for the amount of repeat times defined on the di1_step_repeat_<i> field
27–25 di1_cnt_clr_sel_8	Counter Clear select This field defines the source of the signals that clears the counter. 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1

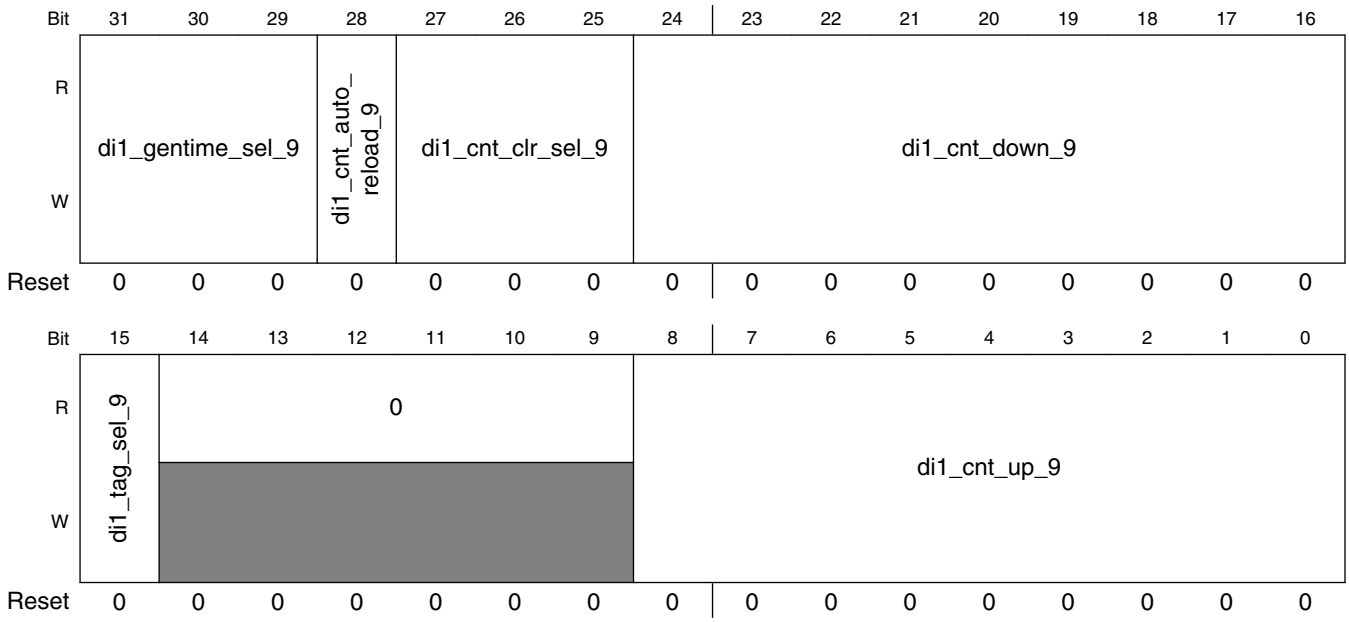
Table continues on the next page...

IPUx_DI1_SW_GEN1_8 field descriptions (continued)

Field	Description
	011 The Counter is triggered by counter #2 100 The Counter is triggered by counter #3 101 The Counter is triggered by counter #4 110 The Counter is triggered by counter #5 111 Counter is always on.
24–16 di1_cnt_down_8	Counter falling edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's falling edge.
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 di1_cnt_polarity_trigger_sel_8	DI1 Counter's toggling trigger select This field selects the counter's trigger causing the output to toggle 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1 011 The Counter is triggered by counter #2 100 The Counter is triggered by counter #3 101 The Counter is triggered by counter #4 110 The Counter is triggered by counter #5 111 Counter is always on.
11–9 di1_cnt_polarity_clr_sel_8	DI1 counter's polarity Clear select This field selects the input to the counter telling the counter wether to invert the output 000 Output is always inverted 001 Output is kept the same (no inversion) 010 Output is inverted if the output of counter #1 is set 011 Output is inverted if the output of counter #2 is set 100 Output is inverted if the output of counter #3 is set 101 Output is inverted if the output of counter #4 is set 110 Output is inverted if the output of counter #5 is set 111 Output is inverted if the output of counter #6 is set
di1_cnt_up_8	Counter rising edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's rising edge.

37.5.249 DI1 Sync Wave Gen 9 Register 1 (IPUx_DI1_SW_GEN1_9)

Address: Base address + 4_8050h offset



IPUx_DI1_SW_GEN1_9 field descriptions

Field	Description
31–29 di1_gentime_sel_9	Counter #9 main waveform select This field defines the counter that counter #9's auxiliary waveform will be attached too. 000 Counter #9's waveform is attached to counter #1's waveform 001 Counter #9's waveform is attached to counter #2's waveform 010 Counter #9's waveform is attached to counter #3's waveform 011 Counter #9's waveform is attached to counter #4's waveform 100 Counter #9's waveform is attached to counter #5's waveform 101 Counter #9's waveform is attached to counter #6's waveform 110 Counter #9's waveform is attached to counter #7's waveform 111 Counter #9's waveform is attached to counter #8's waveform
28 di1_cnt_auto_reload_9	Counter auto reload mode 1 The counter will automatically be reloaded forever, ignoring the value of the di1_step_repeat_<i> field 0 The counter will not be automatically reloaded, It will be reloaded for the amount of repeat times defined on the di1_step_repeat_<i> field
27–25 di1_cnt_clr_sel_9	Counter Clear select This field defines the source of the signals that clears the counter. 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1

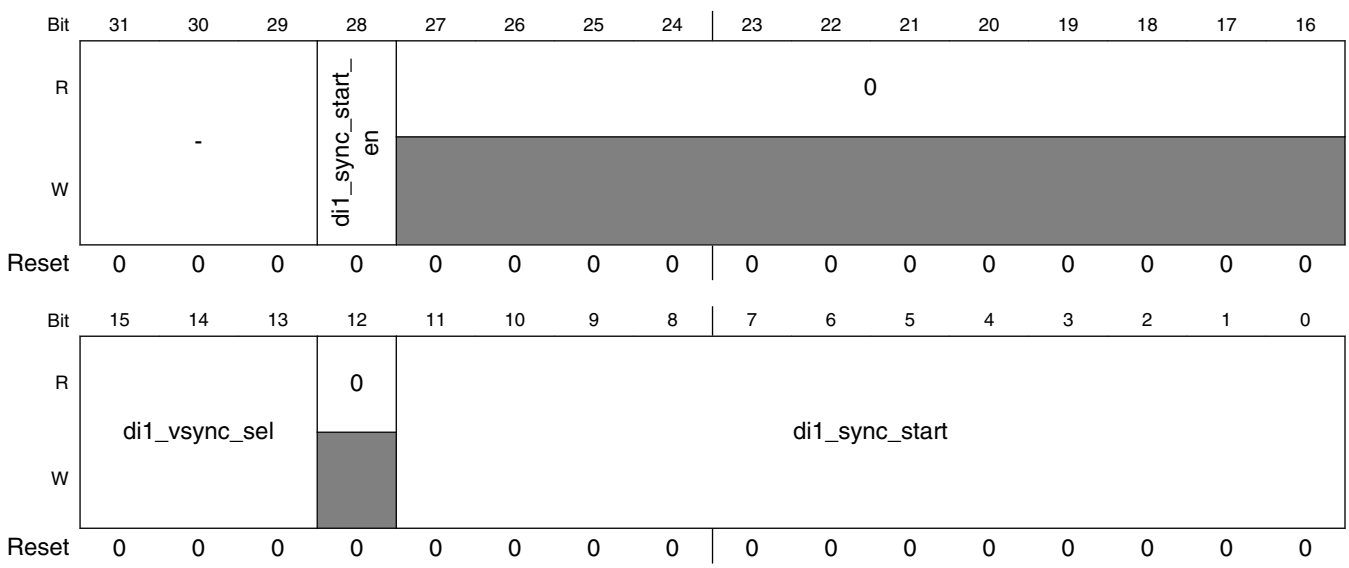
Table continues on the next page...

IPUx_DI1_SW_GEN1_9 field descriptions (continued)

Field	Description
	011 The Counter is triggered by counter #2 100 The Counter is triggered by counter #3 101 The Counter is triggered by counter #4 110 The Counter is triggered by counter #5 111 Counter is always on.
24–16 di1_cnt_down_9	Counter falling edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's falling edge.
15 di1_tag_sel_9	Counter #9 can send a synchronous tag when counter #9 reach its predefined value or when it's triggering counter reaches its pre defined value. 1 tag source is counter #9 0 Tag's source is the triggering counter.
14–9 Reserved	This read-only field is reserved and always has the value 0.
di1_cnt_up_9	Counter rising edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's rising edge.

37.5.250 DI1 Sync Assistance Gen Register (IPUx_DI1_SYNC_AS_GEN)

Address: Base address + 4_8054h offset



IPUx_DI1_SYNC_AS_GEN field descriptions

Field	Description
31–29 -	Reserve
28 di1_sync_start_en	di1_sync_start_en
27–16 Reserved	This read-only field is reserved and always has the value 0.
15–13 di1_vsync_sel	VSYNC select This field defines which of the counters functions as VSYNC signal 000 VSYNC is coming from counter #1 001 VSYNC is coming from counter #2 111 VSYNC is coming from counter #8
12 Reserved	This read-only field is reserved and always has the value 0.
di1_sync_start	DI1 Sync start This field defines the number of low (including blanking rows) on the which the DI1 starts preparing the data for the next frame.

37.5.251 DI1 Data Wave Gen <i> Register (IPUx_DI1_DW_GEN_i)

The DI1_DW_GEN_<i> register holds pointers for the waveform generators.

These registers have different bit arrangements for parallel and serial display. When using a parallel display VDI Plane Size Register 4 is applicable. When using a serial interface VDI Plane Size Register 4 is applicable.

Address: Base address + 4_8058h offset

15–8 DI1_SERIAL_LATCH	DI1 Serial Latch This field defines how many cycles to insert between serial read accesses start to data sampling in the
7–6 Reserved	This read-only field is reserved and always has the value 0.

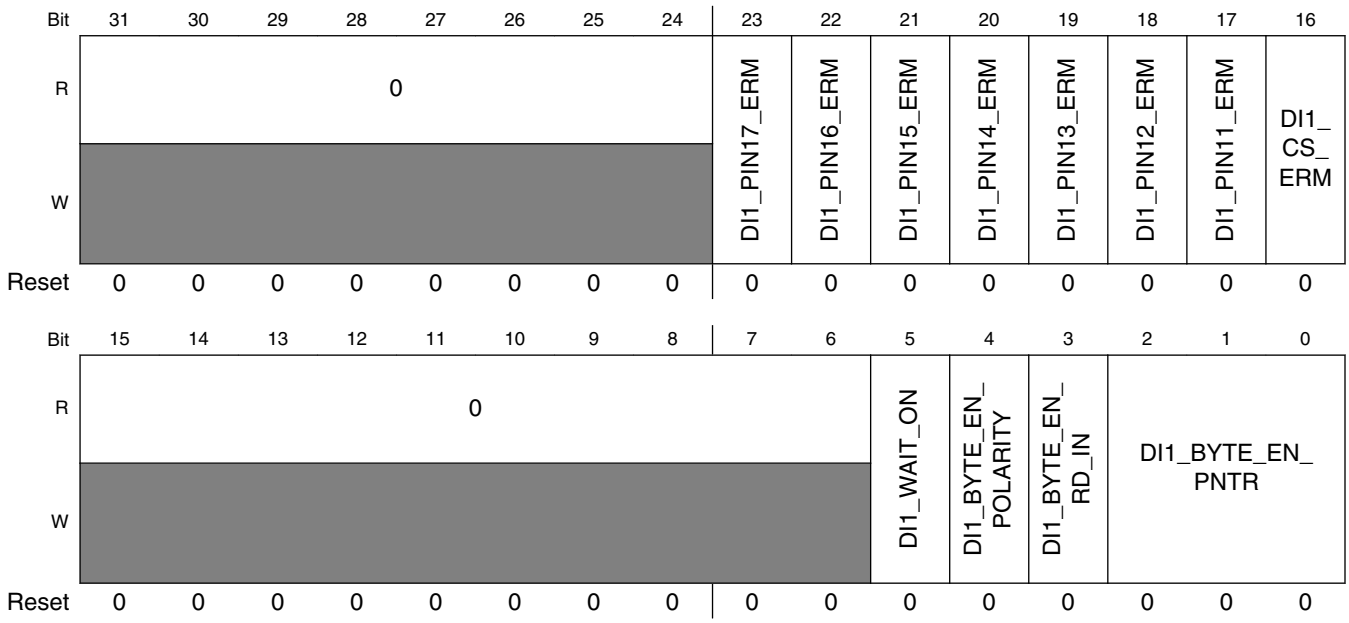
Table continues on the next page...

IPUx_DI1_SER_CONF field descriptions (continued)

Field	Description
5 DI1_LLA_SER_ACCESS	Direct Low Level Access to Serial display 1 ARM platform access is performed via a direct path to the serial display in LLA mode, in this mode only the ARM platform in LLA mode can access the serial port 0 ARM platform access to the serial display port is not done directly, hence other source are allowed to access the serial port. The arbitration is done automatically
4 DI1_SER_CLK_POLARITY	Serial Clock Polarity The output polarity of the SER_CLK pin 1 The clock is inverted 0 The clock is not inverted
3 DI1_SERIAL_DATA_POLARITY	Serial Data Polarity The output polarity of the SER_DATA pin 1 The data is inverted 0 The data is not inverted
2 DI1_SERIAL_RS_POLARITY	Serial RS Polarity The output polarity of the SER_RS pin 1 The RS is inverted 0 The RS is not inverted
1 DI1_SERIAL_CS_POLARITY	Serial Chip Select Polarity The output polarity of the SER_CS pin 1 The CS is inverted 0 The CS is not inverted
0 DI1_WAIT4SERIAL	Wait for Serial When the parallel display share pins with the serial port. Accessing the parallel port is not allowed till the serial port completes its access. 1 The parallel port should wait to the serial port as the pins are shared 0 The parallel port should not wait to the serial port as the pins are not shared

37.5.259 DI1 Special Signals Control Register (IPUx_DI1_SSC)

Address: Base address + 4_8160h offset



IPUx_DI1_SSC field descriptions

Field	Description
31–24 Reserved	This read-only field is reserved and always has the value 0.
23 DI1_PIN17_ERM	DI1 PIN17 error recovery mode. This bit defines the error recovery mode of the PIN17 pin. 1 The PIN17 pin is cleared in case of a synchronous display error. The clear will be done on the next VSYNC. 0 Nothing is done to the PIN17 pin following a display error detection.
22 DI1_PIN16_ERM	DI1 PIN16 error recovery mode. This bit defines the error recovery mode of the PIN16 pin. 1 The PIN16 pin is cleared in case of a synchronous display error. The clear will be done on the next VSYNC. 0 Nothing is done to the PIN16 pin following a display error detection.
21 DI1_PIN15_ERM	DI1 PIN15 error recovery mode. This bit defines the error recovery mode of the PIN15 pin. 1 The PIN15 pin is cleared in case of a synchronous display error. The clear will be done on the next VSYNC. 0 Nothing is done to the PIN15 pin following a display error detection.
20 DI1_PIN14_ERM	DI1 PIN14 error recovery mode. This bit defines the error recovery mode of the PIN14 pin.

Table continues on the next page...

IPUx_DI1_SSC field descriptions (continued)

Field	Description
	1 The PIN14 pin is cleared in case of a synchronous display error. The clear will be done on the next VSYNC. 0 Nothing is done to the PIN14 pin following a display error detection.
19 DI1_PIN13_ERM	DI1 PIN13 error recovery mode. This bit defines the error recovery mode of the PIN13 pin. 1 The PIN13 pin is cleared in case of a synchronous display error. The clear will be done on the next VSYNC. 0 Nothing is done to the PIN13 pin following a display error detection.
18 DI1_PIN12_ERM	DI1 PIN12 error recovery mode. This bit defines the error recovery mode of the PIN12 pin. 1 The PIN12 pin is cleared in case of a synchronous display error. The clear will be done on the next VSYNC. 0 Nothing is done to the PIN12 pin following a display error detection.
17 DI1_PIN11_ERM	DI1 PIN11 error recovery mode. This bit defines the error recovery mode of the PIN11 pin. 1 The PIN11 pin is cleared in case of a synchronous display error. The clear will be done on the next VSYNC. 0 Nothing is done to the PIN11 pin following a display error detection.
16 DI1_CS_ERM	DI1 GLUELOGIC error recovery mode. This bit defines the error recovery mode of the GLUELOGIC. 1 The GLUELOGIC is release in case of a synchronous display error. The release will be done on the next VSYNC. 0 Nothing is done to the GLUELOGIC following a display error detection.
15–6 Reserved	This read-only field is reserved and always has the value 0.
5 DI1_WAIT_ON	Wait On This field defines the DC's response to WAIT signal 1 The DC holds the flow as long as WAIT is asserted. 0 The DC continues the flow regardless the WAIT signal.
4 DI1_BYTE_EN_POLARITY	Byte Enable polarity This bit defines the polarity of the byte enable signals to the display. 1 active high. 0 active low.
3 DI1_BYTE_EN_RD_IN	Byte Enable Read In This bit selects the source of the byte enable pins 1 The write byte enable signals are routed via bits [17:16] of the display's data, The read byte enable signals are routed via bits [19:18 of the display's data 0 The byte enable signals are routed via bits [17:16] of the display's data for both read and write
DI1_BYTE_EN_PNTR	Byte Enable Pointer This pointer selects the pin asserted along with the byte enables signals

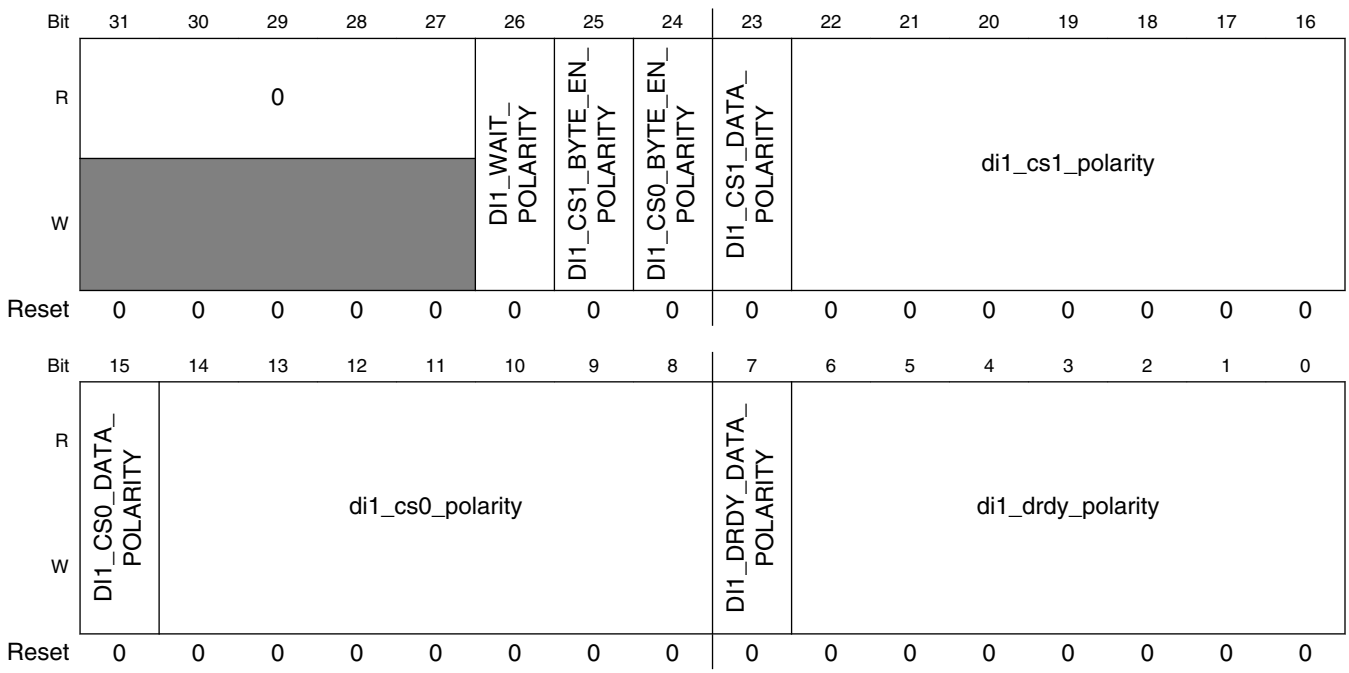
Table continues on the next page...

IPUx_DI1_SSC field descriptions (continued)

Field	Description
	000 wave form of byte enable as pin_11 001 wave form of byte enable as pin_12 111 wave form of byte enable as suitable CS pin

37.5.260 DI1 Polarity Register (IPUx_DI1_POL)

Address: Base address + 4_8164h offset



IPUx_DI1_POL field descriptions

Field	Description
31–27 Reserved	This read-only field is reserved and always has the value 0.
26 DI1_WAIT_POLARITY	WAIT polarity This bit defines the polarity of the wait signal input coming from the displa1 1 active high 0 active low
25 DI1_CS1_BYTE_EN_POLARITY	Byte Enable associated with CS1 polarity This bit defines the polarity of the byte enable signals to the display 1 active high 0 active low

Table continues on the next page...

IPUx_DI1_POL field descriptions (continued)

Field	Description
24 DI1_CS0_BYTE_EN_POLARITY	Byte Enable associated with CS0 polarity This bit defines the polarity of the byte enable signals to the display 1 active high 0 active low
23 DI1_CS1_DATA_POLARITY	Data Polarity associated with CS1
22–16 di1_cs1_polarity	DI1 output pin's polarity for CS1 This bits define the polarity of each of the DI's outputs when CS1 is asserted 1 The output pin is active high 0 The output pin is active low
15 DI1_CS0_DATA_POLARITY	Data Polarity associated with CS0
14–8 di1_cs0_polarity	DI1 output pin's polarity for CS1 This bits define the polarity of each of the DI's outputs when CS1 is asserted 1 The output pin is active high 0 The output pin is active low
7 DI1_DRDY_DATA_POLARITY	Data Polarity associated with DRDY
di1_drdy_polarity	DI1 output dynamic pin's polarity for synchronous access This bits define the polarity of each of the DI's outputs when synchronous display access is asserted The pins' default polarity is the same as defined in the di0_drdy_polarity bits 1 The output pin is active high 0 The output pin is active low

37.5.261 DI1Active Window 0 Register (IPUx_DI1_AW0)

Address: Base address + 4_8168h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

IPUx_SMFC_MAP field descriptions

Field	Description
31–12 Reserved	This read-only field is reserved and always has the value 0.
11–9 MAP_CH3	DMASMFC channel 3mapping bits. 000 CSI0, ID=0 mapped to DMASMFC channel 3. 001 CSI0, ID=1 mapped to DMASMFC channel 3. 010 CSI0, ID=2 mapped to DMASMFC channel 3. 011 CSI0, ID=3 mapped to DMASMFC channel 3. 100 CSI1, ID=0 mapped to DMASMFC channel 3. 101 CSI1, ID=1 mapped to DMASMFC channel 3. 110 CSI1, ID=2 mapped to DMASMFC channel 3. 111 CSI1, ID=3 mapped to DMASMFC channel 3.
8–6 MAP_CH2	DMASMFC channel 2 mapping bits. 000 CSI0, ID=0 mapped to DMASMFC channel 2.

Table continues on the next page...

IPUx_SMFC_MAP field descriptions (continued)

Field	Description
	001 CSI0, ID=1 mapped to DMASMFC channel 2. 010 CSI0, ID=2 mapped to DMASMFC channel 2. 011 CSI0, ID=3 mapped to DMASMFC channel 2. 100 CSI1, ID=0 mapped to DMASMFC channel 2. 101 CSI1, ID=1 mapped to DMASMFC channel 2. 110 CSI1, ID=2 mapped to DMASMFC channel 2. 111 CSI1, ID=3 mapped to DMASMFC channel 2.
5–3 MAP_CH1	DMASMFC channel 1 mapping bits. 000 CSI0, ID=0 mapped to DMASMFC channel 1. 001 CSI0, ID=1 mapped to DMASMFC channel 1. 010 CSI0, ID=2 mapped to DMASMFC channel 1. 011 CSI0, ID=3 mapped to DMASMFC channel 1. 100 CSI1, ID=0 mapped to DMASMFC channel 1. 101 CSI1, ID=1 mapped to DMASMFC channel 1. 110 CSI1, ID=2 mapped to DMASMFC channel 1. 111 CSI1, ID=3 mapped to DMASMFC channel 1.
MAP_CH0	DMASMFC channel 0 mapping bits. 000 CSI0, ID=0 mapped to DMASMFC channel 0. 001 CSI0, ID=1 mapped to DMASMFC channel 0. 010 CSI0, ID=2 mapped to DMASMFC channel 0. 011 CSI0, ID=3 mapped to DMASMFC channel 0. 100 CSI1, ID=0 mapped to DMASMFC channel 0. 101 CSI1, ID=1 mapped to DMASMFC channel 0. 110 CSI1, ID=2 mapped to DMASMFC channel 0. 111 CSI1, ID=3 mapped to DMASMFC channel 0.

37.5.266 SMFC Watermark Control Register (IPUx_SMFC_WMC)

The purpose of this register is to control watermarks levels of DMA channels. The bit setting given relative to FIFO size and not in number of words since FIFO size depend from number of enabled DMA channels.

Address: Base address + 5_0004h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

IPUx_SMFC_WMC field descriptions

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27–25 WM3_CLR	Watermark "clear" level of DMASMFC channel 3. 000 clear watermark level when FIFO is full on 1/8 of their size. 001 clear watermark level when FIFO is full on 2/8 of their size. 110 clear watermark level when FIFO is full on 7/8 of their size. 111 clear watermark level when FIFO is full.
24–22 WM3_SET	Watermark "set" level of DMASMFC channel 3 000 set watermark level when FIFO is full on 1/8 of their size. 001 set watermark level when FIFO is full on 2/8 of their size. 110 set watermark level when FIFO is full on 7/8 of their size. 111 set watermark level when FIFO is full.
21–19 WM2_CLR	Watermark "clear" level of DMASMFC channel 2. 000 clear watermark level when FIFO is full on 1/8 of their size. 001 clear watermark level when FIFO is full on 2/8 of their size. 110 clear watermark level when FIFO is full on 7/8 of their size. 111 clear watermark level when FIFO is full.
18–16 WM2_SET	Watermark "set" level of DMASMFC channel 2. 000 set watermark level when FIFO is full on 1/8 of their size. 001 set watermark level when FIFO is full on 2/8 of their size. 110 set watermark level when FIFO is full on 7/8 of their size. 111 set watermark level when FIFO is full.
15–12 Reserved	This read-only field is reserved and always has the value 0.
11–9 WM1_CLR	Watermark "clear" level of DMASMFC channel 1. 000 clear watermark level when FIFO is full on 1/8 of their size. 001 clear watermark level when FIFO is full on 2/8 of their size. 110 clear watermark level when FIFO is full on 7/8 of their size. 111 clear watermark level when FIFO is full.
8–6 WM1_SET	Watermark "set" level of DMASMFC channel 1. 000 set watermark level when FIFO is full on 1/8 of their size. 001 set watermark level when FIFO is full on 2/8 of their size. 110 set watermark level when FIFO is full on 7/8 of their size. 111 set watermark level when FIFO is full.
5–3 WM0_CLR	Watermark "clear" level of DMASMFC channel 0. 000 clear watermark level when FIFO is full on 1/8 of their size. 001 clear watermark level when FIFO is full on 2/8 of their size. 110 clear watermark level when FIFO is full on 7/8 of their size. 111 clear watermark level when FIFO is full.
WM0_SET	Watermark "set" level of DMASMFC channel 0.

Table continues on the next page...

IPUx_SMFC_WMC field descriptions (continued)

Field	Description
	000 set watermark level when FIFO is full on 1/8 of their size. 001 set watermark level when FIFO is full on 2/8 of their size. 110 set watermark level when FIFO is full on 7/8 of their size. 111 set watermark level when FIFO is full.

37.5.267 SMFC Burst Size Register (IPUx_SMFC_BS)

This register holds the burst size value for each DMASMFC channel. The burst size is the number of IDMAC's active accesses that will done for each IDMAC's burst. This number is a function of PFS, BPP & NPB parameters in the IDMAC's CPMEM. These are the parameters corresponding to the IDMAC's channel used. The table below describes what should be the burst size according to PFS, BPP & NPB settings

Table 37-40. SMFC Burst Size

BPP	PFS	BURST_SIZE
8	6	NPB[6:4]
16	6	NPB[6:3]
All other	All other	NPB[6:2]

Address: Base address + 5_0008h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																BURST3_SIZE				BURST2_SIZE				BURST1_SIZE				BURST0_SIZE			
W

IPUx_SMFC_BS field descriptions

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15–12 BURST3_SIZE	Burst Size of SMFCDMA channel 3. The value programed here should be BURST_SIZE-1 (for example: for a burst size of 1, write 0 to these bits)
11–8 BURST2_SIZE	Burst Size of SMFCDMA channel 2. The value programed here should be BURST_SIZE-1 (for example: for a burst size of 1, write 0 to these bits)
7–4 BURST1_SIZE	Burst Size of SMFCDMA channel 1. The value programed here should be BURST_SIZE-1 (for example: for a burst size of 1, write 0 to these bits)
BURST0_SIZE	Burst Size of SMFCDMA channel 0.

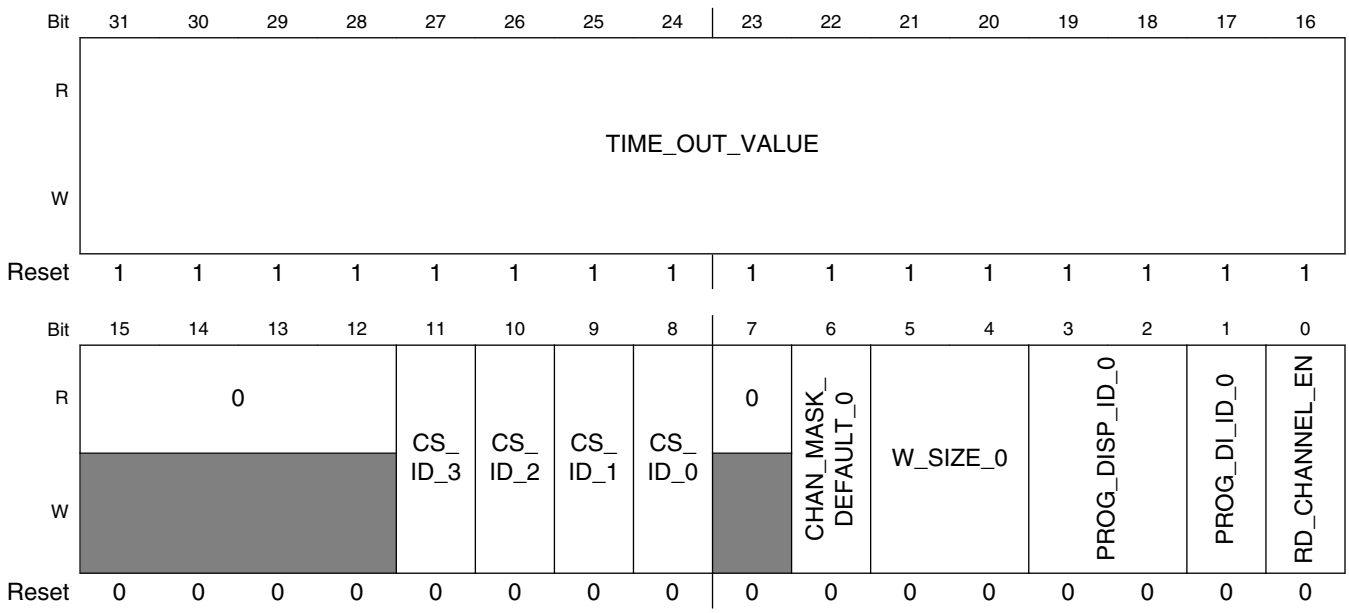
Table continues on the next page...

IPUx_SMFC_BS field descriptions (continued)

Field	Description
	The value programed here should be BURST_SIZE-1 (for example: for a burst size of 1, write 0 to these bits)

37.5.268 DC Read Channel Configuration Register (IPUx_DC_READ_CH_CONF)

Address: Base address + 5_8000h offset



IPUx_DC_READ_CH_CONF field descriptions

Field	Description
31–16 TIME_OUT_ VALUE	Time out value. In case of a error during read accesses to the display, where no response from the display was received. A time-out counter will terminate the current access and perform the next commend defined in the microcode. This field defines the amount of the hsp_clk cycles counted before the time-out event is issued. This event is tied to the interrupt controller and can generate an error interrupt.
15–12 Reserved	This read-only field is reserved and always has the value 0.
11 CS_ID_3	This bit maps an asynchronous display to a chip select 1 display #3 is connected to CS1 0 display #3 is connected to CS0
10 CS_ID_2	This bit maps an asynchronous display to a chip select 1 display #2 is connected to CS1 0 display #2 is connected to CS0

Table continues on the next page...

IPUx_DC_READ_CH_CONF field descriptions (continued)

Field	Description
9 CS_ID_1	This bit maps an asynchronous display to a chip select 1 display #1 is connected to CS1 0 display #1 is connected to CS0
8 CS_ID_0	This bit maps an asynchronous display to a chip select 1 display #0 is connected to CS1 0 display #0 is connected to CS0
7 Reserved	This read-only field is reserved and always has the value 0.
6 CHAN_MASK_DEFAULT_0	Event mask bit for the read channel When more then one event is used during a flow (EOF, EOL, NL, NF, EOFIELD, etc.) masks all the event besides the event that is defined as the highest priority event 1 All the events are used - no mask 0 Only the highest priority event is used, the rest are masked
5–4 W_SIZE_0	Word Size The data coming from the IDMAC is 32bit wide. This field defines the size of the word used by the DC 00 8 bits are used - a 32 bit words includes 4X8bit valid words. 01 16 LSB bits - a 32 bit words includes 2 X16bit valid words. 10 24 MSB bits are used (RGB) - 8 LSB bits are ignored by the DC 11 32 bits are used
3–2 PROG_DISP_ID_0	The field defines which one of the 4 displays can be read. 00 display #0 01 display #1 10 display #2 11 display #3
1 PROG_DI_ID_0	This bit select the DI which a read transaction can be performed through 1 DI #1 0 DI #0
0 RD_CHANNEL_EN	This bit enables the read channel. 1 The Read channel is enabled 0 The Read channel is disabled

37.5.269 DC Read Channel Start Address Register (IPUx_DC_READ_SH_ADDR)

Address: Base address + 5_8004h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

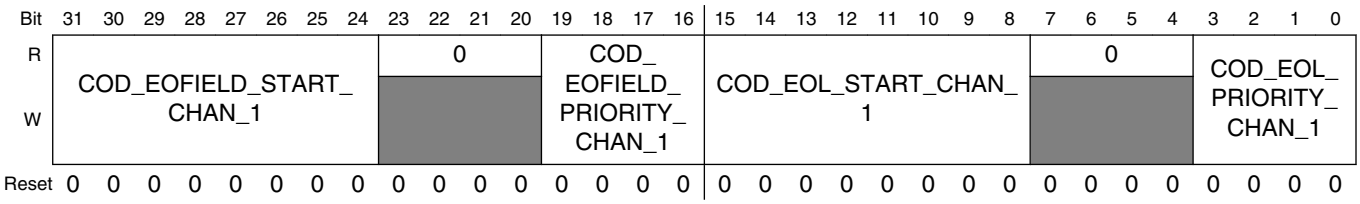
37.5.279 DC Routine Link Register 2 Channel 1 (IPUx_DC_RL2_CH_1)

Address: Base address + 5_8030h offset

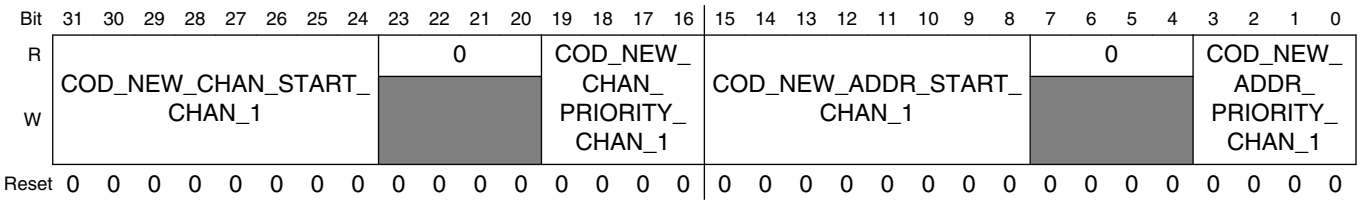


IPUx_DC_RL2_CH_1 field descriptions

Field	Description
31–24 COD_EOFIELD_START_CHAN_1	This field is a pointer to the address within the microcode memory where the routine that handles the end of field event resides (associated with channel #1)
23–20 Reserved	This read-only field is reserved and always has the value 0.
19–16 COD_EOFIELD_PRIORITY_CHAN_1	This field defines the priority of the end of field event (associated with channel #1) The priority between the events should be set to a unique value. i.e. two events must not have the same priority (except 0000 - disable) 0000 disable 0001 Priority #1 (lowest) 0010 Priority #2 1101 Priority #13 (highest) 1110 Reserved 1111 Reserved
15–8 COD_EOL_START_CHAN_1	This field is a pointer to the address within the microcode memory where the routine that handles the end of line event resides (associated with channel #1)
7–4 Reserved	This read-only field is reserved and always has the value 0.
COD_EOL_PRIORITY_CHAN_1	This field defines the priority of the end of line event (associated with channel #1) The priority between the events should be set to a unique value. i.e. two events must not have the same priority (except 0000 - disable) 0000 disable 0001 Priority #1 (lowest) 0010 Priority #2 1101 Priority #13 (highest) 1110 Reserved 1111 Reserved

37.5.280 DC Routine Link Register 3 Channel 1 (IPUx_DC_RL3_CH_1)

Address: Base address + 5_8032h offset

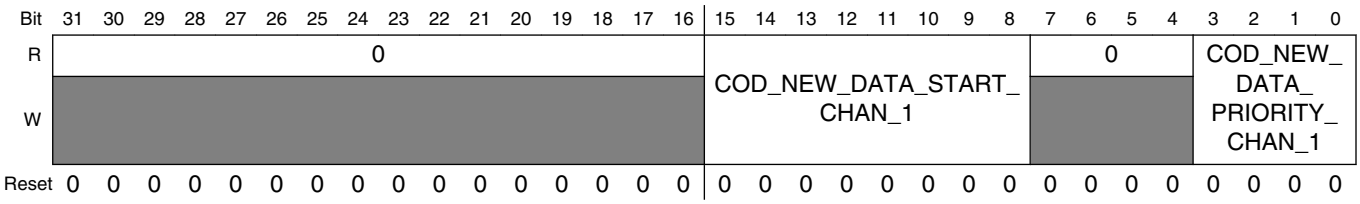


IPUx_DC_RL3_CH_1 field descriptions

Field	Description
31–24 COD_NEW_CHAN_START_CHAN_1	This field is a pointer to the address within the microcode memory where the routine that handles the new channel event resides (associated with channel #1)
23–20 Reserved	This read-only field is reserved and always has the value 0.
19–16 COD_NEW_CHAN_PRIORITY_CHAN_1	This field defines the priority of the new channel event (associated with channel #1) The priority between the events should be set to a unique value. i.e. two events must not have the same priority (except 0000 - disable) 0000 disable 0001 Priority #1 (lowest) 0010 Priority #2 1101 Priority #13 (highest) 1110 Reserved 1111 Reserved
15–8 COD_NEW_ADDR_START_CHAN_1	This field is a pointer to the address within the microcode memory where the routine that handles the new address event resides (associated with channel #1)
7–4 Reserved	This read-only field is reserved and always has the value 0.
COD_NEW_ADDR_PRIORITY_CHAN_1	This field defines the priority of the new address event (associated with channel #1) The priority between the events should be set to a unique value. i.e. two events must not have the same priority (except 0000 - disable) 0000 disable 0001 Priority #1 (lowest) 0010 Priority #2 1101 Priority #13 (highest) 1110 Reserved 1111 Reserved

37.5.281 DC Routine Link Register 4 Channel 1 (IPUx_DC_RL4_CH_1)

Address: Base address + 5_8034h offset

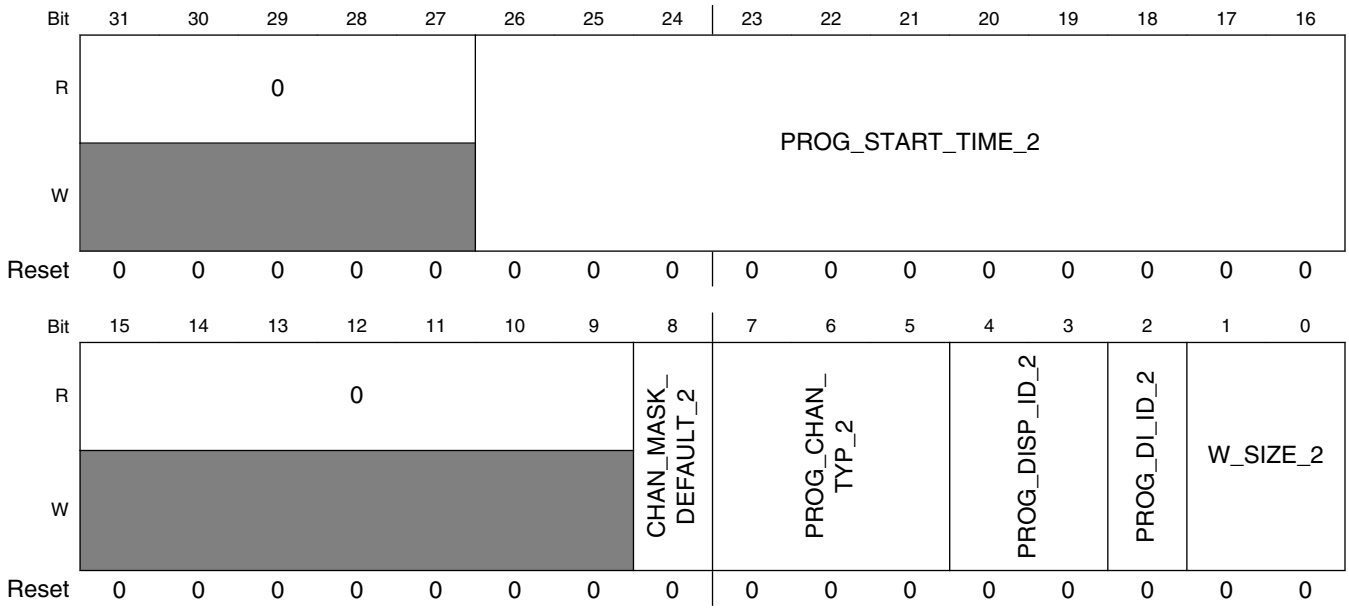


IPUx_DC_RL4_CH_1 field descriptions

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15–8 COD_NEW_DATA_START_CHAN_1	This field is a pointer to the address within the microcode memory where the routine that handles the new data event resides (associated with channel #1)
7–4 Reserved	This read-only field is reserved and always has the value 0.
COD_NEW_DATA_PRIORITY_CHAN_1	This field defines the priority of the new data event (associated with channel #1) The priority between the events should be set to a unique value. i.e. two events must not have the same priority (except 0000 - disable) 0000 disable 0001 Priority #1 (lowest) 0010 Priority #2 1101 Priority #13 (highest) 1110 Reserved 1111 Reserved

37.5.282 DC Write Channel 2 Configuration Register (IPUx_DC_WR_CH_CONF_2)

Address: Base address + 5_8038h offset



IPUx_DC_WR_CH_CONF_2 field descriptions

Field	Description
31–27 Reserved	This read-only field is reserved and always has the value 0.
26–16 PROG_START_TIME_2	This field defines the delay between display 's vertical synchronization pulse and the start time point of DC's channel 2 window. The delay is defined in pairs of rows. It is used for tearing elimination
15–9 Reserved	This read-only field is reserved and always has the value 0.
8 CHAN_MASK_DEFAULT_2	Event mask bit for channel #2 When more then one event is used during a flow (EOF, EOL, NL, NF, EOFIELD, etc.) masks all the event besides the event that is defined as the highest priority event 1 All the events are used - no mask 0 Only the highest priority event is used, the rest are masked
7–5 PROG_CHAN_TYP_2	This field define the mode of operation of channel #2 000 Disable 001 Reserved 010 Reserved 100 Normal mode without anti-tearing. For sync display this is the only mode allowed 101 Normal mode with anti-tearing 110 Reserved 111 Additional command channel is added to the flow handled by DC channel #2

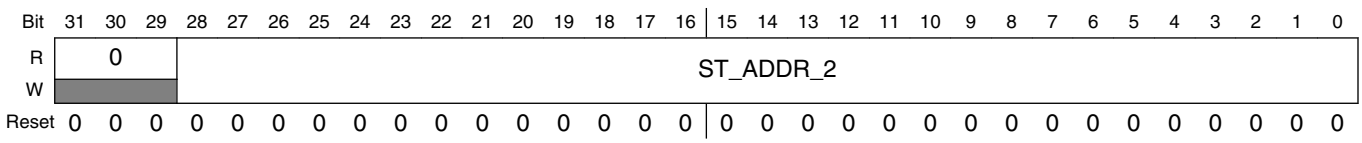
Table continues on the next page...

IPUx_DC_WR_CH_CONF_2 field descriptions (continued)

Field	Description
4–3 PROG_DISP_ID_2	The field defines which one of the 4 displays is associated with channel #2. 00 display #0 01 display #1 10 display #2 11 display #3
2 PROG_DI_ID_2	This bit select the DI which a transaction associated with channel #2 can be performed to 1 DI #1 0 DI #0
W_SIZE_2	Word Size The data coming from the IDMAC is 32bit wide. This field defines the size of the word used by the DC 00 8 bits are used - a 32 bit words includes 4X8bit valid words. 01 16 LSB bits - a 32 bit words includes 2 X16bit valid words. 10 24 MSB bits are used (RGB) - 8 LSB bits are ignored by the DC 11 32 bits are used

37.5.283 DC Write Channel 2 Address Configuration Register (IPUx_DC_WR_CH_ADDR_2)

Address: Base address + 5_803Ch offset



IPUx_DC_WR_CH_ADDR_2 field descriptions

Field	Description
31–29 Reserved	This read-only field is reserved and always has the value 0.
ST_ADDR_2	This field defines the start address within the display's memory space where the write transactions will be done to for channel #2.

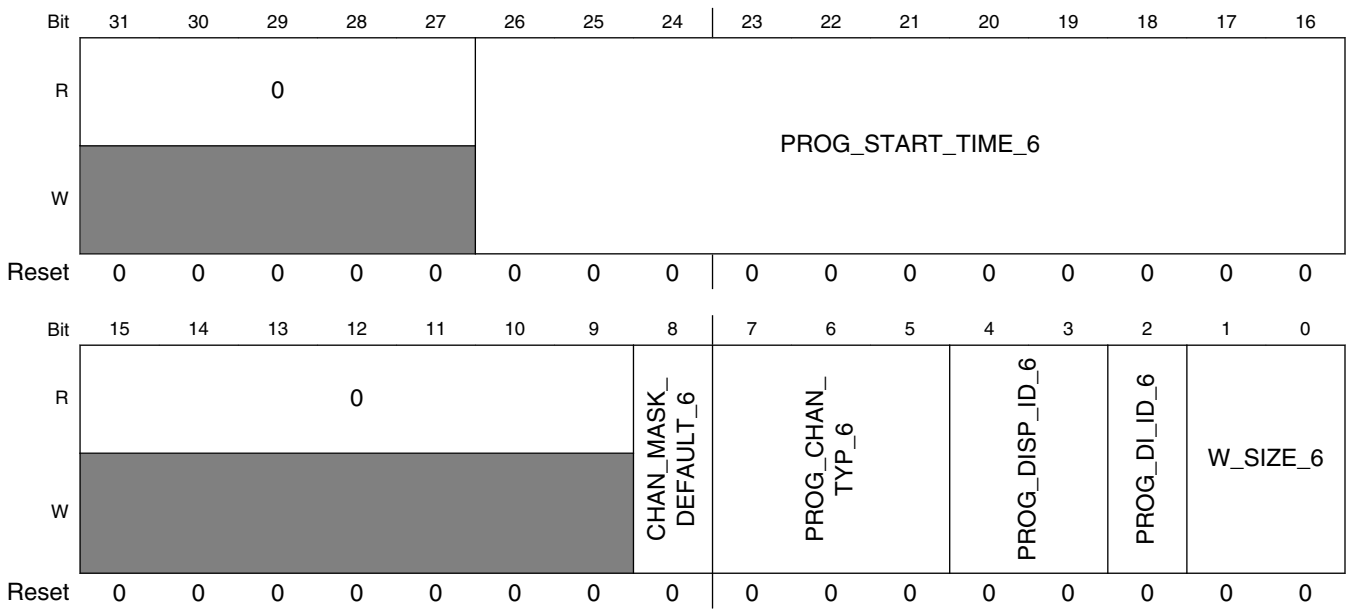
37.5.298 DC Write Channel 6 Configuration Register (IPUx_DC_WR_CH_CONF_6)

Address: Base address + 5_8078h offset



IPUx_DC_WR_CH_CONF_6 field descriptions

Field	Description
31–27 Reserved	This read-only field is reserved and always has the value 0.
26–16 PROG_START_TIME_6	This field defines the delay between display 's vertical synchronization pulse and the start time point of DC's channel 6 window. The delay is defined in pairs of rows. It is used for tearing elimination
15–9 Reserved	This read-only field is reserved and always has the value 0.
8 CHAN_MASK_DEFAULT_6	Event mask bit for channel #6 When more then one event is used during a flow (EOF, EOL, NL, NF, EOFIELD, etc.) masks all the event besides the event that is defined as the highest priority event

Table continues on the next page...

IPUx_DC_WR_CH_CONF_6 field descriptions (continued)

Field	Description
	1 All the events are used - no mask 0 Only the highest priority event is used, the rest are masked
7–5 PROG_CHAN_TYP_6	This field define the mode of operation of channel #6 000 Disable 001 Reserved 010 Reserved 100 Normal mode without anti-tearing. For sync display this is the only mode allowed 101 Normal mode with anti-tearing 110 Reserved 111 Additional command channel is added to the flow handled by DC channel #6
4–3 PROG_DISP_ID_6	The field defines which one of the 4 displays is associated with channel #6. 00 display #0 01 display #1 10 display #2 11 display #3
2 PROG_DI_ID_6	This bit select the DI which a transaction associated with channel #6 can be performed to 1 DI #1 0 DI #0
W_SIZE_6	Word Size associated with channel #6 The data coming from the IDMAC is 32bit wide. This field defines the size of the word used by the DC 00 8 bits are used - a 32 bit words includes 4X8bit valid words. 01 16 LSB bits - a 32 bit words includes 2 X16bit valid words. 10 24 MSB bits are used (RGB) - 8 LSB bits are ignored by the DC 11 32 bits are used

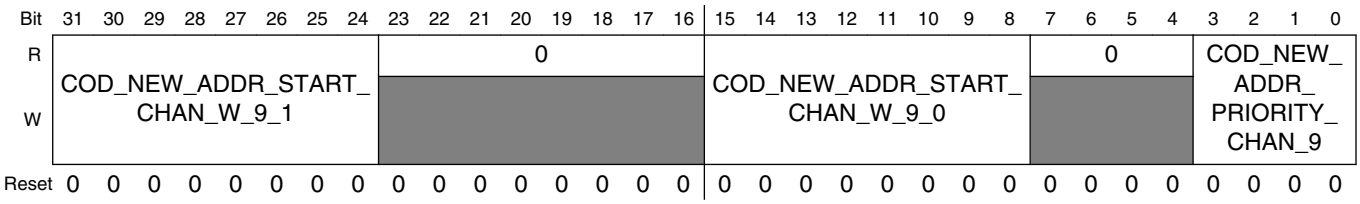
NEW_ADDR_SPACE_SA_9	Channel #8 is used for ARM platform direct access to the display. This field defines the base address of the second region accessible on the display

37.5.315 DC Routine Link Register 1 Channel 9 (IPUx_DC_RL1_CH_9)

Address: Base address + 5_80BCh offset

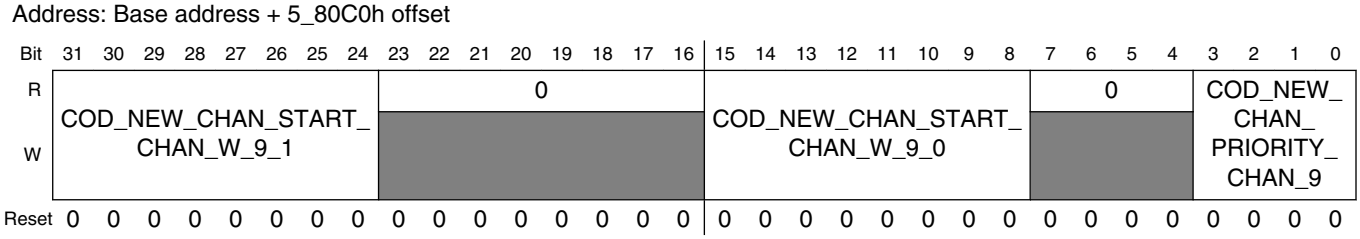


IPUx_DC_RL1_CH_9 field descriptions

Field	Description
31–24 COD_NEW_ADDR_START_CHAN_W_9_1	This field is a pointer to the address within the microcode memory where the routine that handles the new address event resides (associated with channel #9, second region)
23–16 Reserved	This read-only field is reserved and always has the value 0.
15–8 COD_NEW_ADDR_START_CHAN_W_9_0	This field is a pointer to the address within the microcode memory where the routine that handles the new address event resides (associated with channel #9, first region)
7–4 Reserved	This read-only field is reserved and always has the value 0.
COD_NEW_ADDR_PRIORITY_CHAN_9	This field defines the priority of the new address event (associated with channel #9, both regions) The priority between the events should be set to a unique value. i.e. two events must not have the same priority (except 0000 - disable) 0000 disable 0001 Priority #1 (lowest) 0010 Priority #2 1101 Priority #13 (highest) 1110 Reserved 1111 Reserved

37.5.316 DC Routine Link Register 2 Channel 9 (IPUx_DC_RL2_CH_9)

Address: Base address + 5_80C0h offset



IPUx_DC_RL2_CH_9 field descriptions

Field	Description
31–24 COD_NEW_ CHAN_START_ CHAN_W_9_1	This field is a pointer to the address within the microcode memory where the routine that handles the new channel event resides (associated with channel #9, second region)
23–16 Reserved	This read-only field is reserved and always has the value 0.
15–8 COD_NEW_ CHAN_START_ CHAN_W_9_0	This field is a pointer to the address within the microcode memory where the routine that handles the new channel event resides (associated with channel #9, first region)
7–4 Reserved	This read-only field is reserved and always has the value 0.
COD_NEW_ CHAN_ PRIORITY_ CHAN_9	This field defines the priority of the new address event (associated with channel #9, both regions) The priority between the events should be set to a unique value. i.e. two events must not have the same priority (except 0000 - disable) 0000 disable 0001 Priority #1 (lowest) 0010 Priority #2 1101 Priority #13 (highest) 1110 Reserved 1111 Reserved

IPUx_DC_RL6_CH_9 field descriptions

Field	Description
31–24 COD_NEW_DATA_START_CHAN_R_9_1	This field is a pointer to the address within the microcode memory where the routine that handles the new data event resides (associated with channel #9, second region)
23–16 Reserved	This read-only field is reserved and always has the value 0.

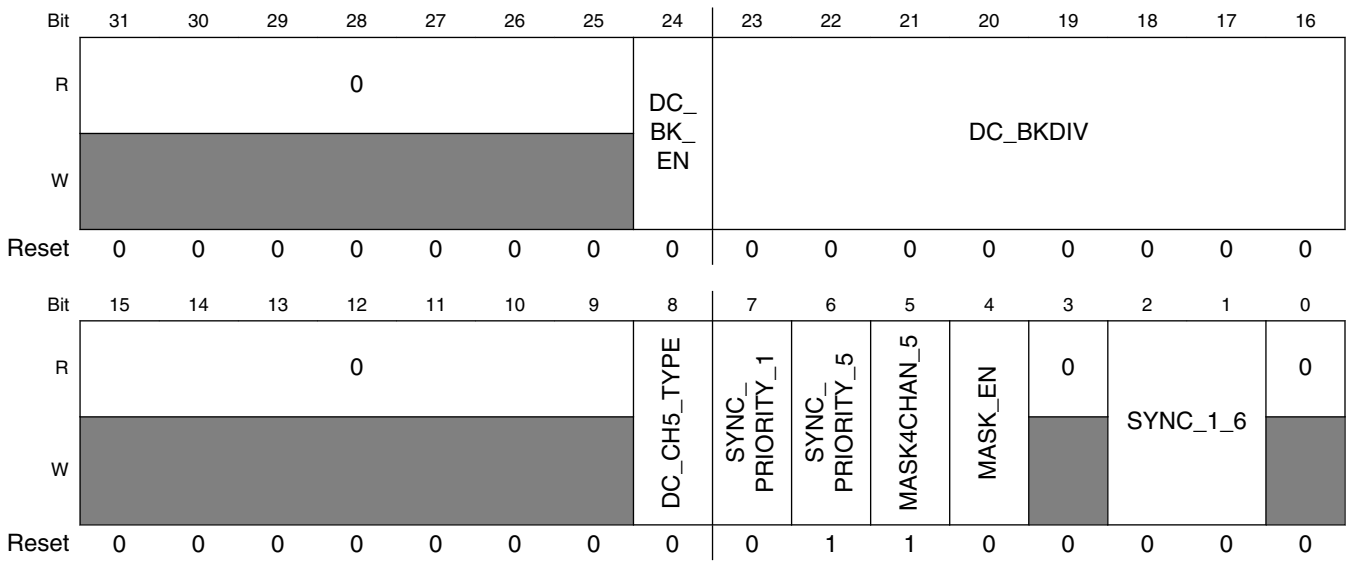
Table continues on the next page...

IPUx_DC_RL6_CH_9 field descriptions (continued)

Field	Description
15–8 COD_NEW_DATA_START_CHAN_R_9_0	This field is a pointer to the address within the microcode memory where the routine that handles the new data event resides (associated with channel #9, first region)
Reserved	This read-only field is reserved and always has the value 0.

37.5.321 DC General Register (IPUx_DC_GEN)

Address: Base address + 5_80D4h offset



IPUx_DC_GEN field descriptions

Field	Description
31–25 Reserved	This read-only field is reserved and always has the value 0.
24 DC_BK_EN	Cursor blinking enable 1 blinking is enabled 0 blinking is disabled
23–16 DC_BKDIV	Blinking Rate This field defines the blinking rate. The blinking occurs every N-th frame While N is defined by DC_BKDIV
15–9 Reserved	This read-only field is reserved and always has the value 0.
8 DC_CH5_TYPE	Channel 5 is used for synchronous flow. When this channel is used for accessing asynchronous display that is activated in a synchronous way

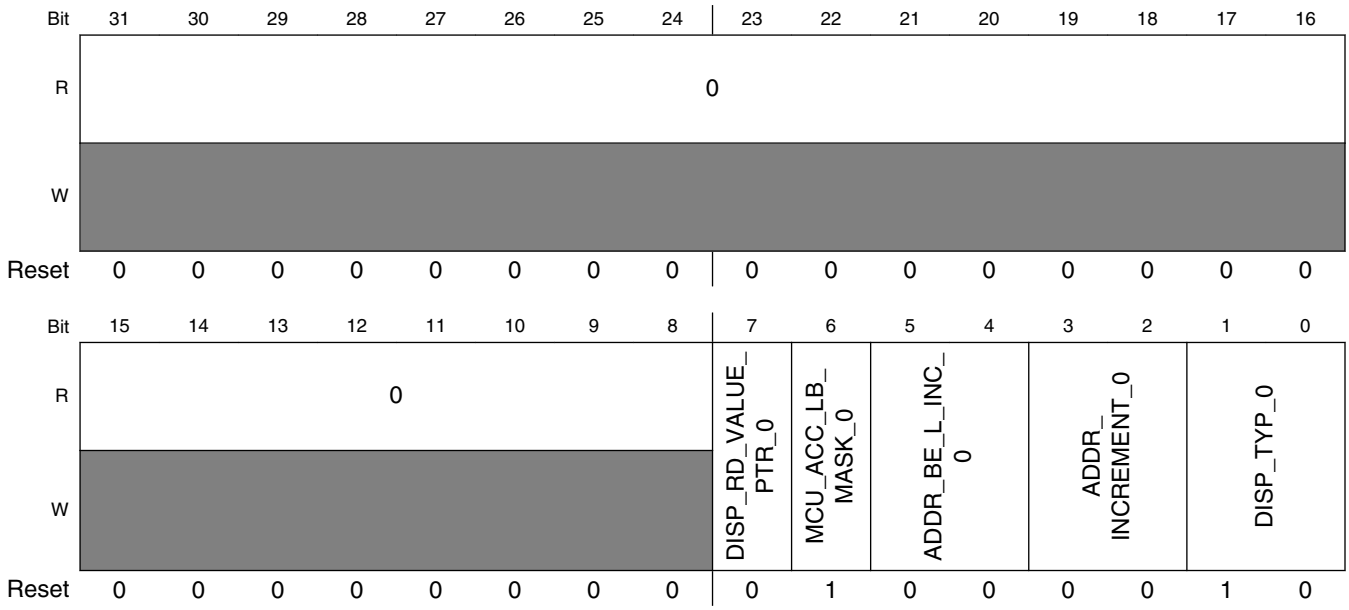
Table continues on the next page...

IPUx_DC_GEN field descriptions (continued)

Field	Description
	1 Enable the asynchronous interface via channel 5 0 normal mode, synchronous flow via channel 5
7 SYNC_ PRIORITY_1	When 2 sync flows are running, this bit sets the priority of channel #1. both SYNC_PRIORITY_5 and SYNC_PRIORITY_1 should not have the value of 0 This bit should be 1 high Priority 0 low Priority
6 SYNC_ PRIORITY_5	When 2 sync flows are running, this bit sets the priority of channel #5. both SYNC_PRIORITY_5 and SYNC_PRIORITY_1 should not have the value of 0 This bit should be 1 high priority 0 low Priority
5 MASK4CHAN_5	Sync flow can be associated with a mask channel. Only one sync flow can have a mask. This bit is ignored if MASK_EN is clear 1 mask channel is associated to the sync flow via DP 0 mask channel is associated to the sync flow via DC (without DP)
4 MASK_EN	Enable of the mask channel 1 mask channel is enabled 0 mask channel is disabled
3 Reserved	This read-only field is reserved and always has the value 0.
2–1 SYNC_1_6	This field 00 Channel 1 of the DC handles async flow 01 Illegal 10 Channel 1 of the DC handles sync flow 11 illegal
0 Reserved	This read-only field is reserved and always has the value 0.

37.5.322 DC Display Configuration 1 Register 0 (IPUx_DC_DISP_CONF1_0)

Address: Base address + 5_80D8h offset



IPUx_DC_DISP_CONF1_0 field descriptions

Field	Description
31–8 Reserved	This read-only field is reserved and always has the value 0.
7 DISP_RD_VALUE_PTR_0	When the display works in wait for status mode. The IPU polls the display and compare the value to the value stored on the status DI_READ_DATA_ACK_VALUE and mask it with DI_READ_DATA_MASK. The DC holds 2 sets of mask and value. This field holds a pointer to the corresponding set of mask and value. 1 DI_READ_DATA_ACK_VALUE_1 & DI_READ_DATA_MASK_1 are used for display 0 0 DI_READ_DATA_ACK_VALUE_0 & DI_READ_DATA_MASK_0 are used for display 0
6 MCU_ACC_LB_MASK_0	The DC compares between the current access to the a calculated address. The calculated address is the next consecutive address following the last address. This bit defines the comparing mode 1 The 2 addresses are fully compared 0 The 2 addresses are compared, but the ADDR[0] bit of the new address is ignored
5–4 ADDR_BE_L_INC_0	This bits define the increment mode when the latest access was done with some of the byte enable signals are low, in that case different increment should be done instead of the normal auto increment of the address IF MCU_ACC_LB_MASK_0 is 0 then only 00 and 10 values are allowed. 00 No increment 01 Increment by 1 10 Increment by 2 11 Increment by 3

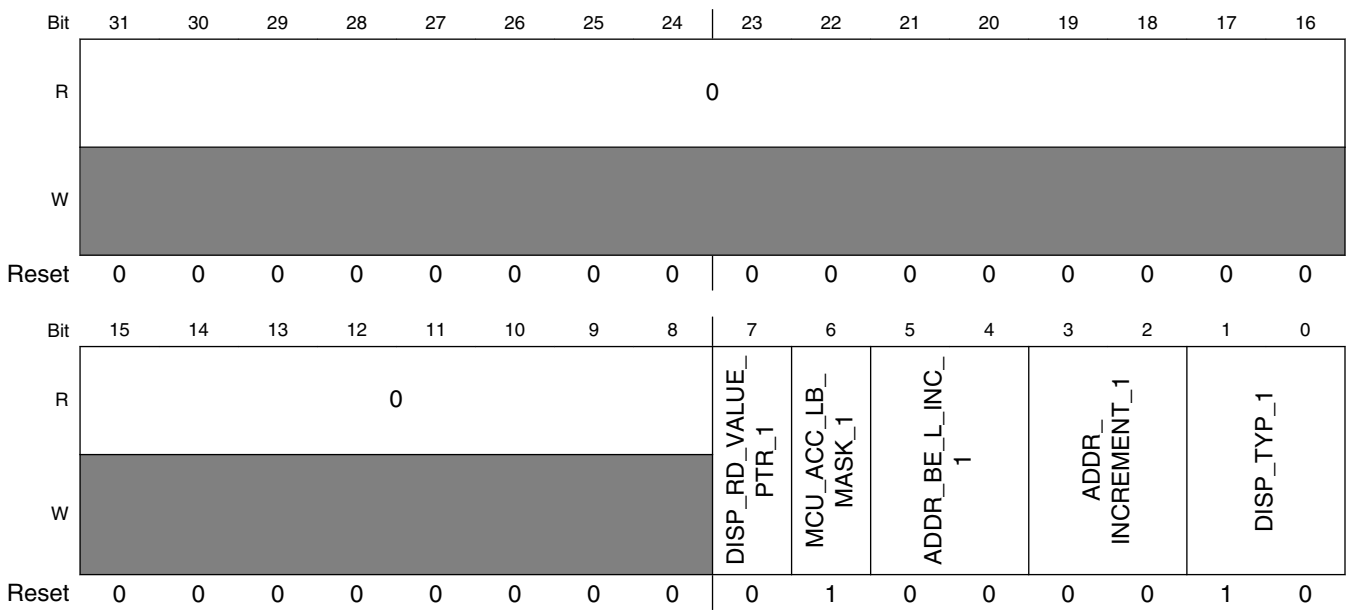
Table continues on the next page...

IPUx_DC_DISP_CONF1_0 field descriptions (continued)

Field	Description
3–2 ADDR_ INCREMENT_0	This field is the increment step for auto increment mode 00 Increment the address by 1 01 Increment the address by 2 10 Increment the address by 3 11 Increment the address by 4
DISP_TYP_0	This field defines the type of the display 00 Serial accesses display 01 Reserved 10 parallel display, without byte_enable support 11 parallel display, with byte_enable support

37.5.323 DC Display Configuration 1 Register 1 (IPUx_DC_DISP_CONF1_1)

Address: Base address + 5_80DCh offset



IPUx_DC_DISP_CONF1_1 field descriptions

Field	Description
31–8 Reserved	This read-only field is reserved and always has the value 0.
7 DISP_RD_ VALUE_PTR_1	When the display works in wait for status mode. The IPU polls the display and compare the value to the value stored on the status DI_READ_DATA_ACK_VALUE and mask it with DI_READ_DATA_MASK. The DC holds 2 sets of mask and value. This field holds a pointer to the corresponding set of mask and value.

Table continues on the next page...

IPUx_DC_DISP_CONF1_1 field descriptions (continued)

Field	Description
	1 DI_READ_DATA_ACK_VALUE_1 & DI_READ_DATA_MASK_1 are used for display 1 0 DI_READ_DATA_ACK_VALUE_0 & DI_READ_DATA_MASK_0 are used for display 1
6 MCU_ACC_LB_MASK_1	The DC compares between the current access to the a calculated address. The calculated address is the next consecutive address following the last address. This bit defines the comparing mode 1 The 2 addresses are fully compared 0 The 2 addresses are compared, but the ADDR[0] bit of the new address is ignored
5–4 ADDR_BE_L_INC_1	This bits define the increment mode when the latest access was done with some of the byte enable signals are low, in that case different increment should be done instead of the normal auto increment of the address IF MCU_ACC_LB_MASK_1 is 0 then only 00 and 10 values are allowed. 00 No increment 01 Increment by 1 10 Increment by 2 11 Increment by 3
3–2 ADDR_INCREMENT_1	This field is the increment step for auto increment mode 00 Increment the address by 1 01 Increment the address by 2 10 Increment the address by 3 11 Increment the address by 4

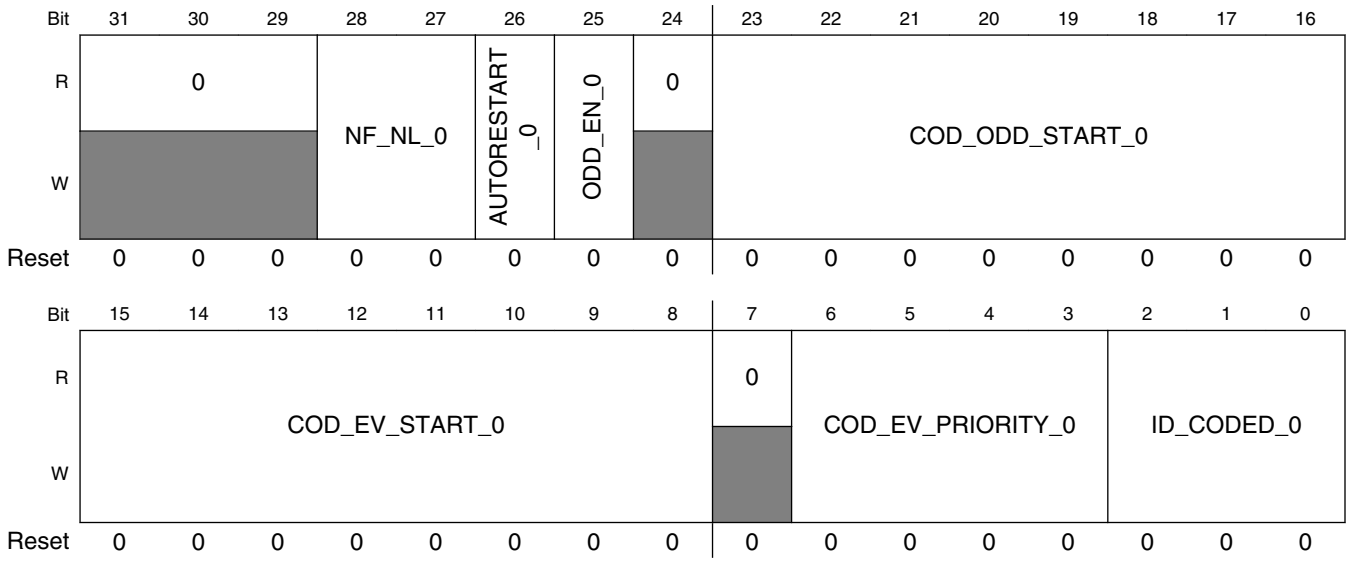
23–16 MD_MASK_23	Mapping unit's mask value #23 This field defines the mask value #23 within the 8bit word coming from the DC.
15–13 Reserved	This read-only field is reserved and always has the value 0.
12–8 MD_OFFSET_22	Mapping unit's offset parameter #22 This field defines the offset parameter #22 within the 24bit word coming from the DC.
MD_MASK_22	Mapping unit's mask value #22 This field defines the mask value #22 within the 8bit word coming from the DC.

37.5.361 DC User General Data Event 0 Register 0 (IPUx_DC_UGDE0_0)

Address: Base address + 5_8174h offset



IPUx_DC_UGDE0_0 field descriptions

Field	Description
31–29 Reserved	This read-only field is reserved and always has the value 0.
28–27 NF_NL_0	the user may attach his general event #0 to New-line New-Frame and New-field events. One of these event triggers the user's general event #0's counter. The actual internal trigger is the pixel following the occurrence of the selected event. 00 New Line 01 New Frame 10 New Field 11 Reserved
26 AUTORESTART_0	User's general event #0 auto restart mode 0 disable 1 User's general event #0's counter is automatically restarted.
25 ODD_EN_0	The user's general event #0 may be split into 2 internal signals. One one mode all the events are sent on one signal, on the second mode odd events are sent over one signal while even events are sent over the other signal (ODD_MODE) 1 ODD_MODE is enabled 0 ODD_MODE is disabled
24 Reserved	This read-only field is reserved and always has the value 0.
23–16 COD_ODD_START_0	This field holds a pointer in the microcode holding the routine to be performed following the user general event #0. When ODD_MODE is enabled, only the odd events will use this pointer

Table continues on the next page...

IPUx_DC_UGDE0_0 field descriptions (continued)

Field	Description
	When ODD_MODE is disabled this field is ignored
15–8 COD_EV_ START_0	This field holds a pointer in the microcode holding the routine to be performed following the user general event #0. When ODD_MODE is enabled, only the even events will use this pointer When ODD_MODE is disabled, all the events will use this pointer
7 Reserved	This read-only field is reserved and always has the value 0.
6–3 COD_EV_ PRIORITY_0	This field defines the priority of the user general event #0 The priority between the events should be set to a unique value. i.e. two events must not have the same priority (except 0000 - disable) 0000 disable 0001 Priority #1 (lowest) 0010 Priority #2 1101 Priority #13 (highest) 1110 Reserved 1111 Reserved
ID_CODED_0	This field defines the number of DC channel number that user's general event #0 will be associated to. 000 DC channel_0 001 DC channel_1 010 DC channel_2 011 DC channel_5 (DP_SYNC) 100 DC channel_6 (DP ASYNC) 101 Reserved 110 Reserved. 111 Reserved.

IPUx_DMFC_RD_CHAN field descriptions

Field	Description
31–26 Reserved	This read-only field is reserved and always has the value 0.
25–24 dmfc_ppw_c	Pixel Per Word coded. This field defines the size of the read data from the display. 00 8 bit per pixel 01 16 bit per pixel 10 24 (rgb) bit per pixel or 32 bit per pixel 11 Reserved
23–21 dmfc_wm_clr_0	Watermark Clear This field defines the watermark's level of the DMFC read FIFO. Crossing this level will clear the watermark signal to the IDMAC. The WM level is the amount of free bursts at the FIFO (dmfc_wm_clr_0 > dmfc_wm_set_0)
20–18 dmfc_wm_set_0	Watermark Set This field defines the watermark's level of the DMFC read FIFO. Crossing this level will send the watermark signal to the IDMAC. The WM level is the amount of free bursts at the FIFO (dmfc_wm_clr_0 > dmfc_wm_set_0)
17 dmfc_wm_en_0	Watermark enable. This bit enables the watermark feature of the FIFO 1 WM feature is enabled 0 WM feature is disabled
16–8 Reserved	This read-only field is reserved and always has the value 0.
7–6 dmfc_burst_size_0	Read burst Size This field defines the burst size of the DMFC's read accesses. This settings must match the settings in the corresponding IDMAC channel's settings. 00 32 words of 128 bit (4 pixels of 32 bit each, going to the IDMAC) 01 16 words of 128 bit 10 8 words of 128 bit 11 4 words of 128 bit
Reserved	This read-only field is reserved and always has the value 0.

37.5.384 DMFC Write Channel Register (IPUx_DMFC_WR_CHAN)

16 WAIT4EOT_1	In normal operation the DMFC sends requests to the IDMAC whenever there is room in the FIFO. When this bit is set the DMFC sends the request only after the current transfer is terminated, (wait4eot mode) When the FIFO is larger then the size of the line, the user should work in wait4eot mode. 1 FIFO #1 is in wait4eot mode 0 FIFO #1 is in normal mode
15–13 dmfc_wm_clr_9	Watermark Clear This field defines the watermark's level of the DMFC's write FIFO. Crossing this level will clear the watermark signal to the IDMAC. The WM level is the amount of occupied bursts at the FIFO (dmfc_wm_clr > dmfc_wm_set)

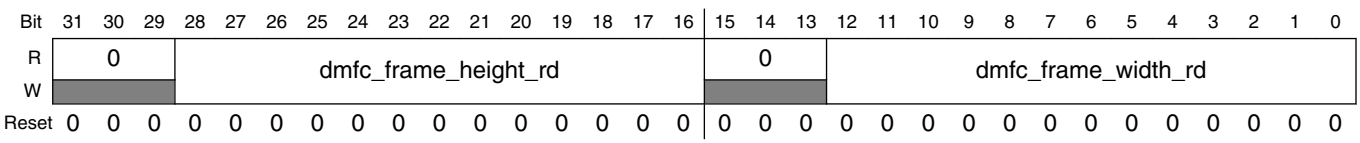
Table continues on the next page...

IPUx_DMFC_GENERAL_1 field descriptions (continued)

Field	Description
12–10 dmfc_wm_set_9	Watermark Set This field defines the watermark's level of the DMFC write FIFO. Crossing this level will send the watermark signal to the IDMAC. The WM level is the amount of occupied bursts at the FIFO (dmfc_wm_clr > dmfc_wm_set
9 dmfc_wm_en_9	Watermark enable. This bit enables the watermark feature of the FIFO 1 WM feature is enabled 0 WM feature is disabled
8 Reserved	This read-only field is reserved and always has the value 0.
7 Reserved	This read-only field is reserved and always has the value 0.
6–5 dmfc_burst_size_9	Burst size of IDMAC's channel 44 This field defines the burst size of the IDMAC's channel 44 write accesses. This settings must match the settings in the corresponding IDMAC channel's settings. This channel is targeted for MASK - the FIFO size is always 32X128; The base address is always the upper half of the 8th segment 00 32 words of 128 bit (4 pixels of 32 bit each, coming from the IDMAC) 01 16 words of 128 bit 10 8 words of 128 bit 11 4 words of 128 bit
4–2 Reserved	This read-only field is reserved and always has the value 0.
dmfc_dcdp_sync_pr	DMFC's memory access priority settings for simultaneous synchronous flows from DC & DP 00 Forbidden - should not be used. 01 DC has higher priority over DP 10 DP has higher priority over DC 11 Round Robin

37.5.389 DMFC General 2 Register (IPUx_DMFC_GENERAL_2)

Address: Base address + 6_0018h offset



IPUx_DMFC_GENERAL_2 field descriptions

Field	Description
31–29 Reserved	This read-only field is reserved and always has the value 0.
28–16 dmfc_frame_ height_rd	Frame height for read channel from the display to the IDMAC; Units are pixels
15–13 Reserved	This read-only field is reserved and always has the value 0.
dmfc_frame_ width_rd	Frame width for read channel from the display to the IDMAC; Units are pixels

37.5.390 DMFC IC Interface Control Register (IPUx_DMFC_IC_CTRL)

Address: Base address + 6_001Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

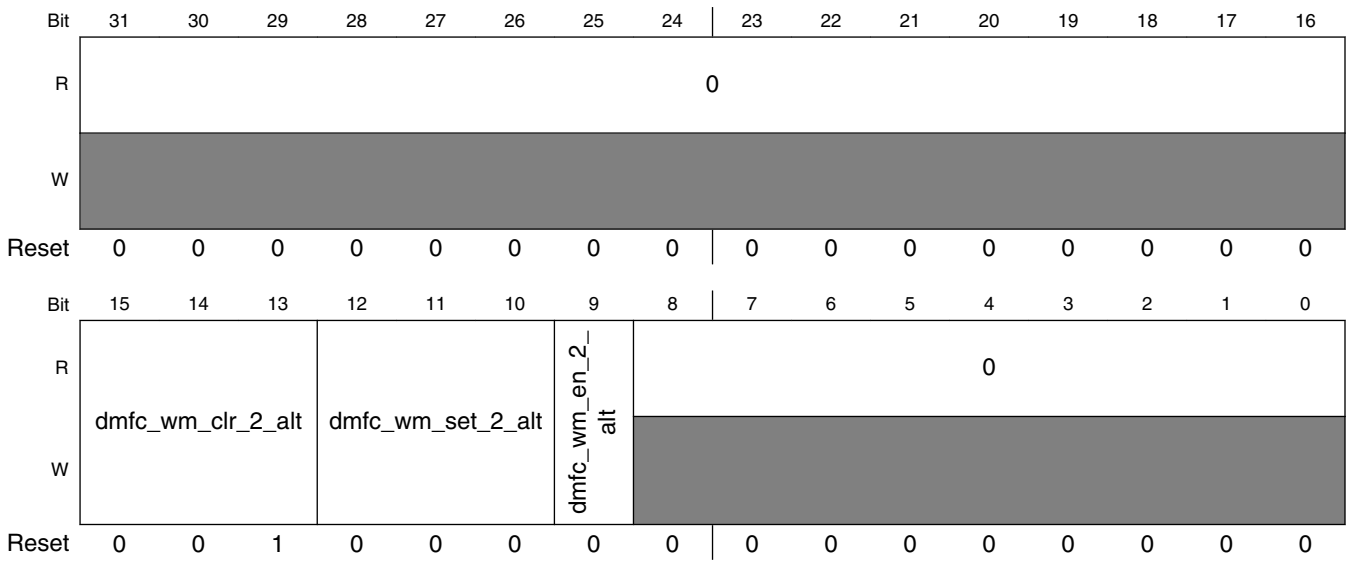
10–8 dmfc_st_addr_2_alt	DMFC Start Address for IDMAC's channel 41 (for alternate flow) This field defines the base address at the DMFC's FIFO of the partition allocated to the channel connected to IDMAC's channel 41. The FIFO is partitioned to 8 equal segments. Each segment is 64X128 words The value of this field is the number of the segment 000 Segment 0 001 Segment 1 111 Segment 7
Reserved	This read-only field is reserved and always has the value 0.

37.5.392 DMFC Write Channel Definition Alternate Register (IPUx_DMFC_WR_CHAN_DEF_ALT)

Address: Base address + 6_0024h offset



IPUx_DMFC_WR_CHAN_DEF_ALT field descriptions

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.

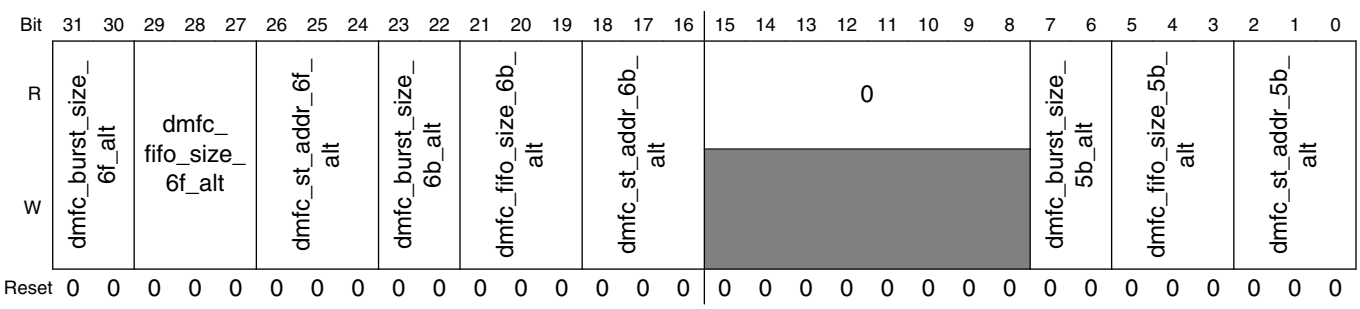
Table continues on the next page...

IPUx_DMFC_WR_CHAN_DEF_ALT field descriptions (continued)

Field	Description
15–13 dmfc_wm_clr_2_alt	Watermark Clear (for alternate flow) This field defines the watermark's level of the DMFC's write FIFO. Crossing this level will clear the watermark signal to the IDMAC. The WM level is the amount of occupied bursts at the FIFO (dmfc_wm_clr > dmfc_wm_set)
12–10 dmfc_wm_set_2_alt	Watermark Set (for alternate flow) This field defines the watermark's level of the DMFC write FIFO. Crossing this level will send the watermark signal to the IDMAC. The WM level is the amount of occupied bursts at the FIFO (dmfc_wm_clr > dmfc_wm_set
9 dmfc_wm_en_2_alt	Watermark enable. (for alternate flow) This bit enables the watermark feature of the FIFO 1 WM feature is enabled 0 WM feature is disabled
Reserved	This read-only field is reserved and always has the value 0.

37.5.393 DMFC MFC Display Processor Channel Alternate Register (IPUx_DMFC_DP_CHAN_ALT)

Address: Base address + 6_0028h offset



IPUx_DMFC_DP_CHAN_ALT field descriptions

Field	Description
31–30 dmfc_burst_size_6f_alt	Burst size of IDMAC's channel 29 (for alternate flow) This field defines the burst size of the IDMAC's channel 29 write accesses. This settings must match the settings in the corresponding IDMAC channel's settings. 00 32 words of 128 bit (4 pixels of 32 bit each, coming from the IDMAC) 01 16 words of 128 bit 10 8 words of 128 bit 11 4 words of 128 bit
29–27 dmfc_fifo_size_6f_alt	DMFC FIFO size for IDMAC's channel 29 (for alternate flow) This field defines the FIFO partition for the DMFC channel connected to IDMAC's channel 29 000 All (512X128 words) the DMFC's FIFO is allocated to this channel

Table continues on the next page...

IPUx_DMFC_DP_CHAN_ALT field descriptions (continued)

Field	Description
	001 256X128 words are allocated to this channel 010 128X128 words are allocated to this channel 011 64X128 words are allocated to this channel 100 32X128 words are allocated to this channel 101 16X128 words are allocated to this channel 110 8X128 words are allocated to this channel 111 4X128 words are allocated to this channel
26–24 dmfc_st_addr_6f_alt	DMFC Start Address for IDMAC's channel 29 (for alternate flow) This field defines the base address at the DMFC's FIFO of the partition allocated to the channel connected to IDMAC's channel 29. The FIFO is partitioned to 8 equal segments. Each segment is 64X128 words The value of this field is the number of the segment 000 Segment 0 001 Segment 1 111 Segment 7
23–22 dmfc_burst_size_6b_alt	Burst size of IDMAC's channel 24 (for alternate flow) This field defines the burst size of the IDMAC's channel 24 write accesses. This settings must match the settings in the corresponding IDMAC channel's settings. 00 32 words of 128 bit (4 pixels of 32 bit each, coming from the IDMAC) 01 16 words of 128 bit 10 8 words of 128 bit 11 4 words of 128 bit
21–19 dmfc_fifo_size_6b_alt	DMFC FIFO size for IDMAC's channel 24 (for alternate flow) This field defines the FIFO partition for the DMFC channel connected to IDMAC's channel 24 000 All (512X128 words) the DMFC's FIFO is allocated to this channel 001 256X128 words are allocated to this channel 010 128X128 words are allocated to this channel 011 64X128 words are allocated to this channel 100 32X128 words are allocated to this channel 101 16X128 words are allocated to this channel 110 8X128 words are allocated to this channel 111 4X128 words are allocated to this channel
18–16 dmfc_st_addr_6b_alt	DMFC Start Address for IDMAC's channel 24 (for alternate flow) This field defines the base address at the DMFC's FIFO of the partition allocated to the channel connected to IDMAC's channel 24. The FIFO is partitioned to 8 equal segments. Each segment is 64X128 words The value of this field is the number of the segment 000 Segment 0 001 Segment 1 111 Segment 7
15–8 Reserved	This read-only field is reserved and always has the value 0.

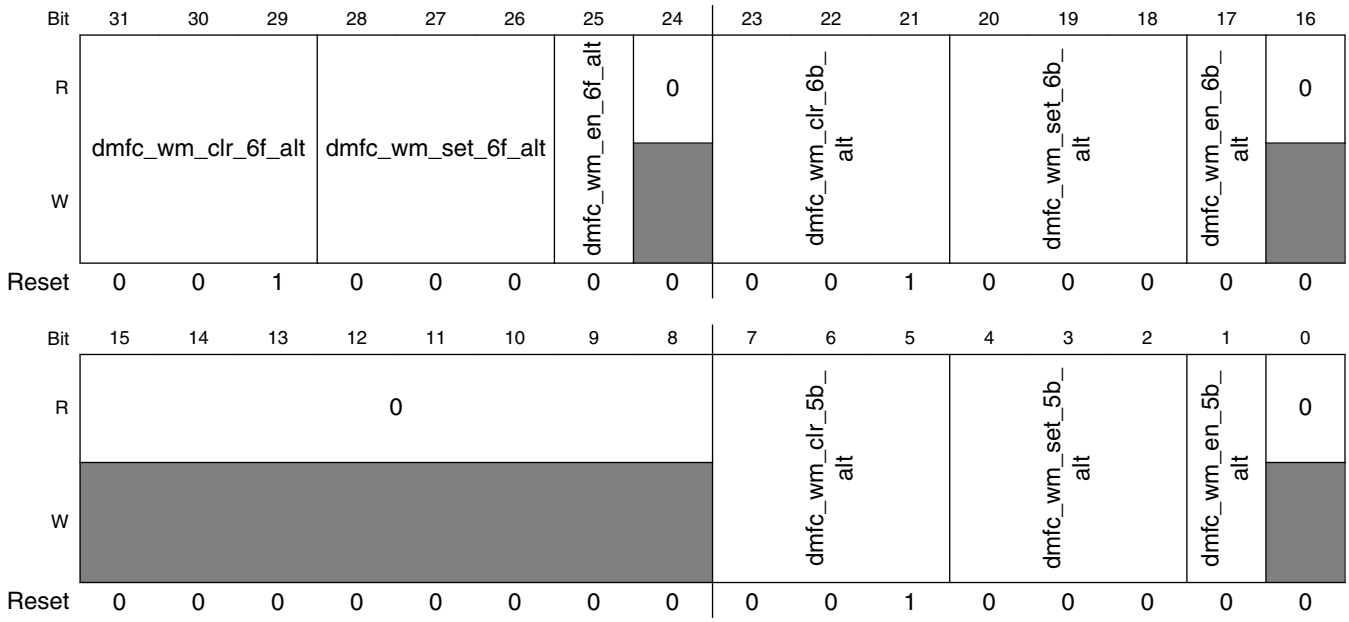
Table continues on the next page...

IPUx_DMFC_DP_CHAN_ALT field descriptions (continued)

Field	Description
7–6 dmfc_burst_size_5b_alt	Burst size of IDMAC's channel 23 (for alternate flow) This field defines the burst size of the IDMAC's channel 23 write accesses. This settings must match the settings in the corresponding IDMAC channel's settings. 00 32 words of 128 bit (4 pixels of 32 bit each, coming from the IDMAC) 01 16 words of 128 bit 10 8 words of 128 bit 11 4 words of 128 bit
5–3 dmfc_fifo_size_5b_alt	DMFC FIFO size for IDMAC's channel 23 (for alternate flow) This field defines the FIFO partition for the DMFC channel connected to IDMAC's channel 23 000 All (512X128 words) the DMFC's FIFO is allocated to this channel 001 256X128 words are allocated to this channel 010 128X128 words are allocated to this channel 011 64X128 words are allocated to this channel 100 32X128 words are allocated to this channel 101 16X128 words are allocated to this channel 110 8X128 words are allocated to this channel 111 4X128 words are allocated to this channel
dmfc_st_addr_5b_alt	DMFC Start Address for IDMAC's channel 23 (for alternate flow) This field defines the base address at the DMFC's FIFO of the partition allocated to the channel connected to IDMAC's channel 23. The FIFO is partitioned to 8 equal segments. Each segment is 64X128 words The value of this field is the number of the segment 000 Segment 0 001 Segment 1 111 Segment 7

37.5.394 DMFC Display Channel Definition Alternate Register (IPUx_DMFC_DP_CHAN_DEF_ALT)

Address: Base address + 6_002Ch offset



IPUx_DMFC_DP_CHAN_DEF_ALT field descriptions

Field	Description
31–29 dmfc_wm_clr_6f_alt	Watermark Clear (for alternate flow) This field defines the watermark's level of the DMFC's write FIFO. Crossing this level will clear the watermark signal to the IDMAC. The WM level is the amount of occupied bursts at the FIFO (dmfc_wm_clr > dmfc_wm_set)
28–26 dmfc_wm_set_6f_alt	Watermark Set (for alternate flow) This field defines the watermark's level of the DMFC write FIFO. Crossing this level will send the watermark signal to the IDMAC. The WM level is the amount of occupied bursts at the FIFO (dmfc_wm_clr > dmfc_wm_set
25 dmfc_wm_en_6f_alt	Watermark enable. (for alternate flow) This bit enables the watermark feature of the FIFO 1 WM feature is enabled 0 WM feature is disabled
24 Reserved	This read-only field is reserved and always has the value 0.
23–21 dmfc_wm_clr_6b_alt	Watermark Clear (for alternate flow) This field defines the watermark's level of the DMFC's write FIFO. Crossing this level will clear the watermark signal to the IDMAC. The WM level is the amount of occupied bursts at the FIFO (dmfc_wm_clr > dmfc_wm_set)

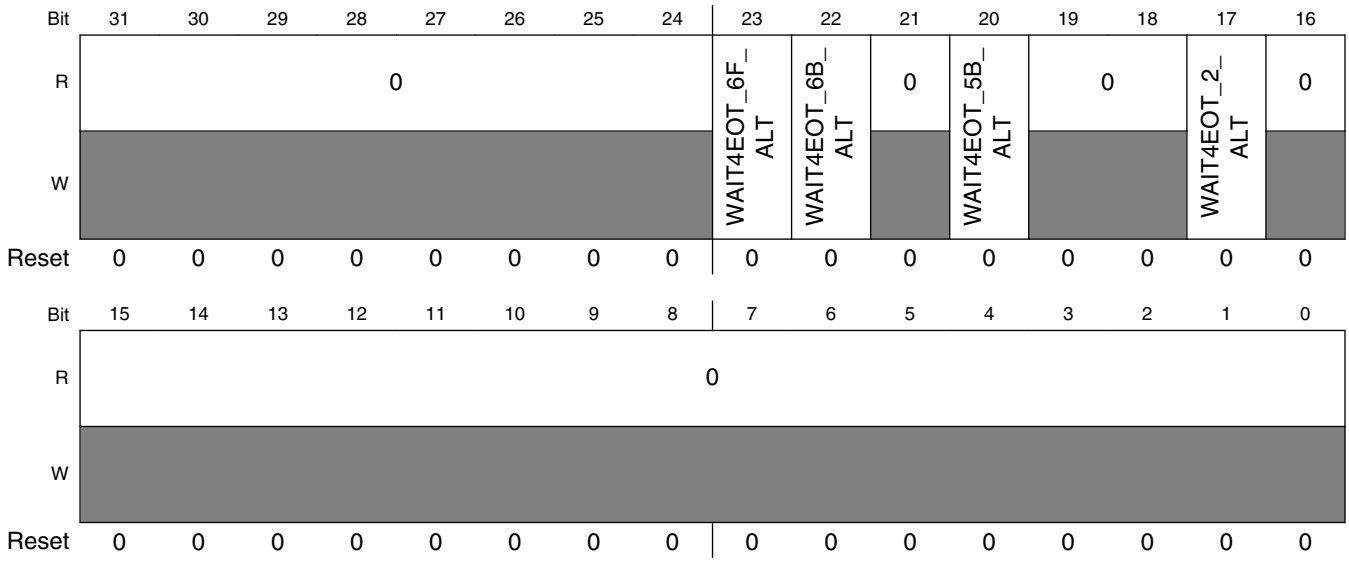
Table continues on the next page...

IPUx_DMFC_DP_CHAN_DEF_ALT field descriptions (continued)

Field	Description
20–18 dmfc_wm_set_ 6b_alt	Watermark Set (for alternate flow) This field defines the watermark's level of the DMFC write FIFO. Crossing this level will send the watermark signal to the IDMAC. The WM level is the amount of occupied bursts at the FIFO (dmfc_wm_clr > dmfc_wm_set
17 dmfc_wm_en_ 6b_alt	Watermark enable. (for alternate flow) This bit enables the watermark feature of the FIFO 1 WM feature is enabled 0 WM feature is disabled
16–8 Reserved	This read-only field is reserved and always has the value 0.
7–5 dmfc_wm_clr_ 5b_alt	Watermark Clear (for alternate flow) This field defines the watermark's level of the DMFC's write FIFO. Crossing this level will clear the watermark signal to the IDMAC. The WM level is the amount of occupied bursts at the FIFO (dmfc_wm_clr > dmfc_wm_set)
4–2 dmfc_wm_set_ 5b_alt	Watermark Set (for alternate flow) This field defines the watermark's level of the DMFC write FIFO. Crossing this level will send the watermark signal to the IDMAC. The WM level is the amount of occupied bursts at the FIFO (dmfc_wm_clr > dmfc_wm_set
1 dmfc_wm_en_ 5b_alt	Watermark enable. (for alternate flow) This bit enables the watermark feature of the FIFO 1 WM feature is enabled 0 WM feature is disabled
0 Reserved	This read-only field is reserved and always has the value 0.

37.5.395 DMFC General 1 Alternate Register (IPUx_DMFC_GENERAL1_ALT)

Address: Base address + 6_0030h offset



IPUx_DMFC_GENERAL1_ALT field descriptions

Field	Description
31–24 Reserved	This read-only field is reserved and always has the value 0.
23 WAIT4EOT_6F_ALT	In normal operation the DMFC sends requests to the IDMAC whenever there is room in the FIFO. When this bit is set the DMFC sends the request only after the current transfer is terminated, (wait4eot mode) When the FIFO is larger then the size of the line, the user should work in wait4eot mode. 1 FIFO #6F is in wait4eot mode (for alternate flow) 0 FIFO #6F is in normal mode (for alternate flow)
22 WAIT4EOT_6B_ALT	In normal operation the DMFC sends requests to the IDMAC whenever there is room in the FIFO. When this bit is set the DMFC sends the request only after the current transfer is terminated, (wait4eot mode) When the FIFO is larger then the size of the line, the user should work in wait4eot mode. 1 FIFO #6B is in wait4eot mode (for alternate flow) 0 FIFO #6B is in normal mode (for alternate flow)
21 Reserved	This read-only field is reserved and always has the value 0.
20 WAIT4EOT_5B_ALT	In normal operation the DMFC sends requests to the IDMAC whenever there is room in the FIFO. When this bit is set the DMFC sends the request only after the current transfer is terminated, (wait4eot mode) When the FIFO is larger then the size of the line, the user should work in wait4eot mode.

Table continues on the next page...

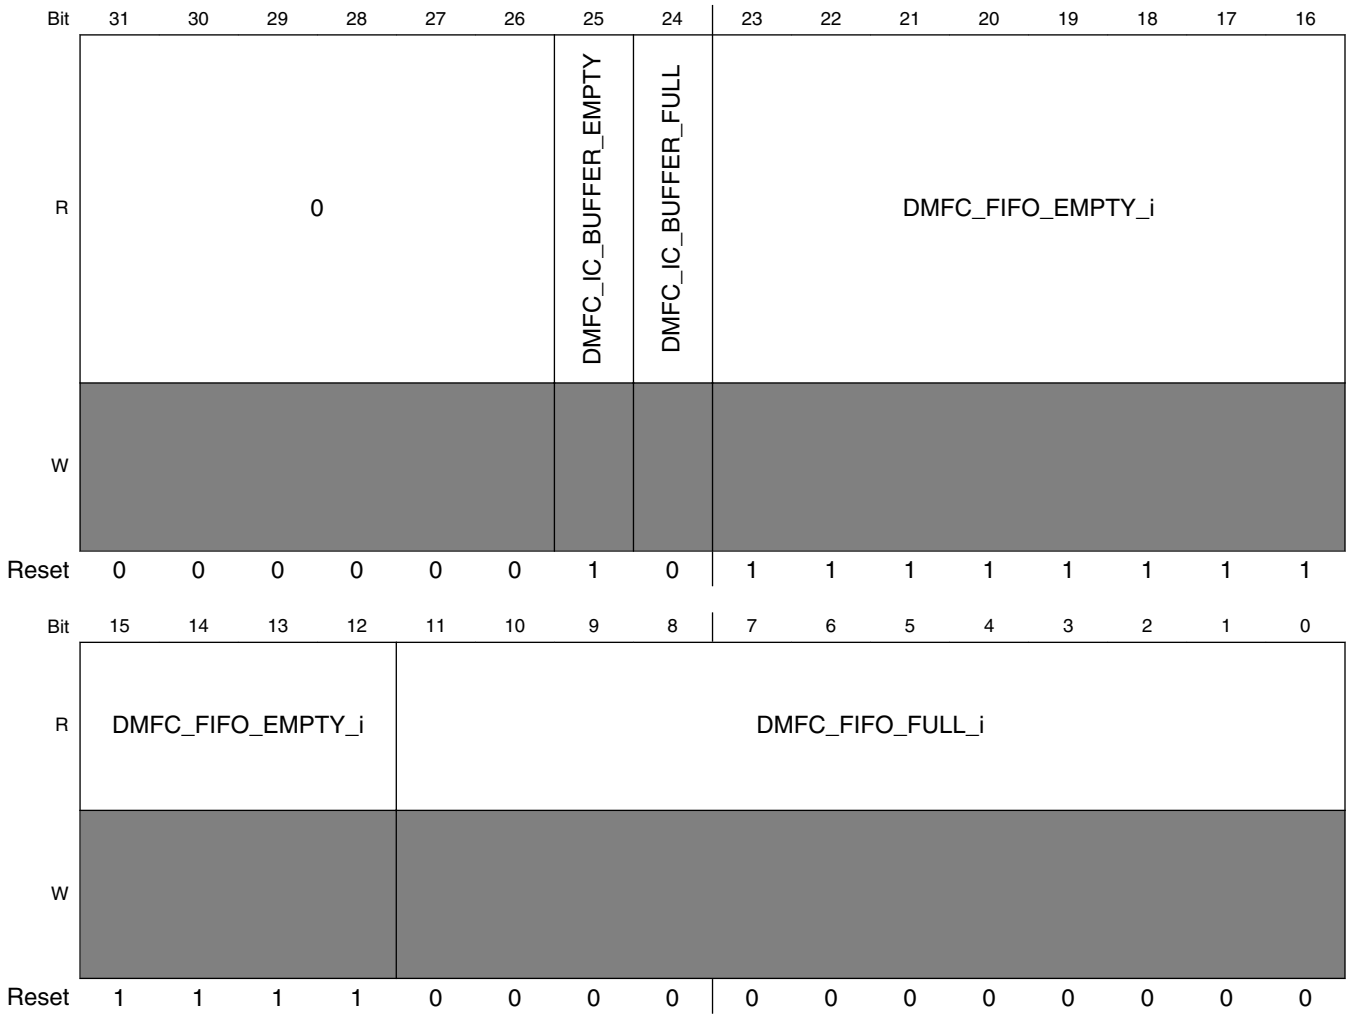
IPUx_DMFC_GENERAL1_ALT field descriptions (continued)

Field	Description
	1 FIFO #5B is in wait4eot mode (for alternate flow) 0 FIFO #5B is in normal mode (for alternate flow)
19–18 Reserved	This read-only field is reserved and always has the value 0.
17 WAIT4EOT_2_ALT	In normal operation the DMFC sends requests to the IDMAC whenever there is room in the FIFO. When this bit is set the DMFC sends the request only after the current transfer is terminated, (wait4eot mode) When the FIFO is larger then the size of the line, the user should work in wait4eot mode. 1 FIFO #2 is in wait4eot mode (for alternate flow) 0 FIFO #2 is in normal mode (for alternate flow)
Reserved	This read-only field is reserved and always has the value 0.

37.5.396 DMFC Status Register (IPUx_DMFC_STAT)

This register contains DMFC's status bits. All the bits in this register are read-only.

Address: Base address + 6_0034h offset



IPUx_DMFC_STAT field descriptions

Field	Description
31–26 Reserved	This read-only field is reserved and always has the value 0.
25 DMFC_IC_ BUFFER_ EMPTY	This bit indicates on a IC FIFO, inside the DMFC, empty condition. 0 IC FIFO not empty 1 IC FIFO is empty

Table continues on the next page...

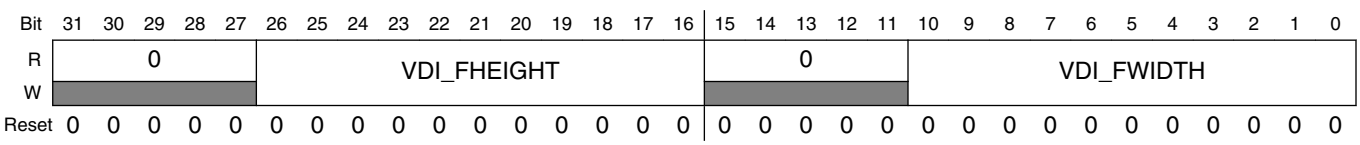
IPUx_DMFC_STAT field descriptions (continued)

Field	Description
24 DMFC_IC_ BUFFER_FULL	This bit indicates on a IC FIFO, inside the DMFC, full condition. 0 IC FIFO not full 1 IC FIFO is full
23–12 DMFC_FIFO_ EMPTY_i	This bit indicates on a DMFC FIFO#<i> empty condition. Mapping of these bit to an actual FIFO number is as follows: bit 0 => 0 bit 1=> 1 bit 2 => 2 bit 3 =>1c bit 4 => 2c bit 5 => 5b bit 6 => 5f bit 7 => 6b bit 8 => 6f bit 9 => 9 bit 10 => 10 (ARM platform access) bit 11 => 11 (ARM platform access) 0 FIFO #<i> is not empty 1 FIFO #<i> is empty
DMFC_FIFO_ FULL_i	This bit indicates on a DMFC FIFO#<i> full condition. Mapping of these bit to an actual FIFO number is as follows: bit 0 => 0 bit 1=> 1 bit 2 => 2 bit 3 =>1c bit 4 => 2c bit 5 => 5b bit 6 => 5f bit 7 => 6b bit 8 => 6f bit 9 => 9 bit 10 => 10 (ARM platform access) bit 11 => 11 (ARM platform access) 0 FIFO #<i> is not full 1 FIFO #<i> is full

37.5.397 VDI Field Size Register (IPUx_VDI_FSIZE)

The register used to control size of VDIC input fields.

Address: Base address + 6_8000h offset



IPUx_VDI_FSIZE field descriptions

Field	Description
31–27 Reserved	This read-only field is reserved and always has the value 0.
26–16 VDI_FHEIGHT	Frame height The value to be written to this register is the frame's height minus 1. The frame height should not be smaller than 16. When VDI_CMB_EN bit is clear: • The frame height should not be greater than 1080. • The frame's height must be even (which means that both fields have the same height) • The frame's height in 4:2:0 format, must be multiple of 4 (which means that both chroma fields have the same height)

Table continues on the next page...

IPUx_VDI_FSIZE field descriptions (continued)

Field	Description
	When VDI_CMB_EN bit is set: • The frame height should not be greater than 1200.
15–11 Reserved	This read-only field is reserved and always has the value 0.
VDI_FWIDTH	Frame width. The value to be written to this register is the frame's width minus 1. The Frame width should not be smaller than 16. The width must be even. When VDI_CMB_EN bit is clear • The Frame width should not be greater than 720968. When VDI_CMB_EN bit is set: • The Frame width should not be greater than 1920.

37.5.398 VDI Control Register (IPUx_VDI_C)

The register used to control modes of operations of VDIC module.

Address: Base address + 6_8004h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

IPUx_VDI_C field descriptions

Field	Description
31 -	VDIC top filed (automatic) This defines what would be the top field to be processed when the data is coming from the CSI 0 top field is field 0 1 top field is field 1
30 -	VDIC top filed (manual) This defines what would be the next top field to be processed when the data is coming from the memory

Table continues on the next page...

IPUx_VDI_C field descriptions (continued)

Field	Description
	0 top field is field 0 1 top field is field 1
29–28 Reserved	This read-only field is reserved and always has the value 0.
27–25 VDI_VWM3_CLR	VDIC WaterMark "clear" level for channel 3. 0 clear watermark level when FIFO3 is full on 1/8 of their size. 1 clear watermark level when FIFO3 is full on 2/8 of their size. 7 clear watermark level when FIFO3 is full.
24–22 VDI_VWM3_SET	VDIC WaterMark "set" level for channel 3. 0 set watermark level when FIFO3 is full on 1/8 of their size. 1 set watermark level when FIFO3 is full on 2/8 of their size. 7 set watermark level when FIFO3 is full.
21–19 VDI_VWM1_CLR	VDIC WaterMark "clear" level for channel 1 or channel 4 (channels 1 and 4 are not working simultaneously). 0 clear watermark level when FIFO1 is full on 1/8 of their size. 1 clear watermark level when FIFO1 is full on 2/8 of their size. 7 clear watermark level when FIFO1 is full.
18–16 VDI_VWM1_SET	VDIC WaterMark "set" level for channel 1 or channel 2 (channels 1 and 4 are not working simultaneously). 0 set watermark level when FIFO1 is full on 1/8 of their size. 1 set watermark level when FIFO1 is full on 2/8 of their size. 7 set watermark level when FIFO1 is full.
15–12 VDI_BURST_ SIZE3	Burst Size for channel 3. The VDIC's burst size is restrict by the IDMAC's restriction - This value must match the IDMAC settings and follow the IDMAC's restrictions 0 Burst size is 1 access. 1 Burst size is 2 accesses. 15 Burst size is 16 accesses.
11–8 VDI_BURST_ SIZE2	Burst Size for channel 2. The VDIC's burst size is restrict by the IDMAC's restriction - This value must match the IDMAC settings and follow the IDMAC's restrictions 0 Burst size is 1 access. 1 Burst size is 2 accesses. 15 Burst size is 16 accesses.
7–4 VDI_BURST_ SIZE1	Burst Size for channels 1 or 4 (channels 1 and 4 are not working simultaneously). The VDIC's burst size is restrict by the IDMAC's restriction - This value must match the IDMAC settings and follow the IDMAC's restrictions 0 Burst size is 1 access. 1 Burst size is 2 accesses. 15 Burst size is 16 accesses.
3–2 VDI_MOT_SEL	Motion select.

Table continues on the next page...

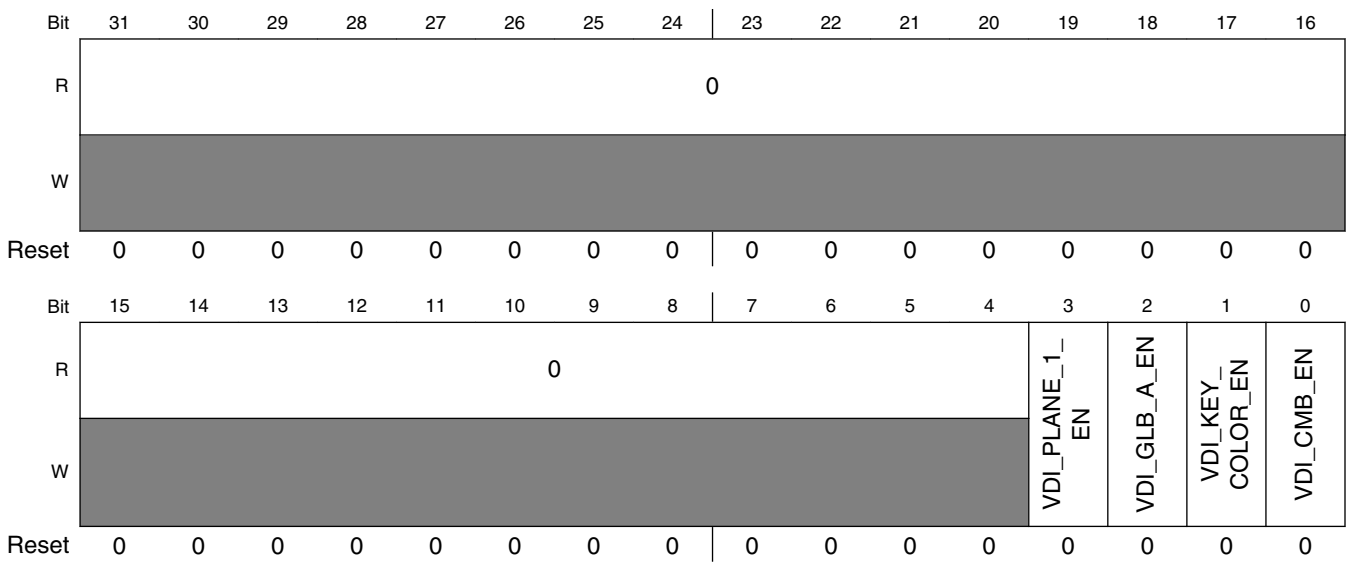
IPUx_VDI_C field descriptions (continued)

Field	Description
	0 Motion determined by ROM "1" (shared toward medium/high motion). 1 Motion determined by ROM "2" (This option will not work well for high motion). 2 Full motion, only vertical filter is used 3 Forbidden.
1 VDI_CH_422	Chroma format at input and output of VDIC. 0 Chroma format is 420. 1 Chroma format is 422.
0 Reserved	This read-only field is reserved and always has the value 0.

37.5.399 VDI Control Register 2 (IPUx_VDI_C2_)

The register used to control modes of operations of VDIC module.

Address: Base address + 6_8008h offset



IPUx_VDI_C2_ field descriptions

Field	Description
31–4 Reserved	This read-only field is reserved and always has the value 0.
3 VDI_PLANE_1_EN	Plane 1 enable 0 plane #1 is disabled 1 plane #1 is enabled

Table continues on the next page...

IPUx_VDI_C2_ field descriptions (continued)

Field	Description
2 VDI_GLB_A_EN	Global alpha enable 0 Alpha is local 1 Alpha is global
1 VDI_KEY_ COLOR_EN	Key Color Enable 0 Key Color disabled. 1 Key color enabled
0 VDI_CMB_EN	Combining enable 0 Combining disabled. The VDIC works in de-interlacing mode 1 Combining enabled. The de-interlacing mode is not functional

37.5.400 VDI Combining Parameters Register 1 (IPUx_VDI_CMDP_1)

The register holds combining paramemters.

Address: Base address + 6_800Ch offset

Chapter 38
Keypad Port (KPP)

38.1 Overview

The Keypad Port (KPP) is a 16-bit peripheral that can be used as a keypad matrix interface or as general purpose input/output (I/O).

The figure below shows the KPP block diagram. The KPP provides interface for the keypad matrix with 2-point contact or 3-point contact keys. The KPP is designed to simplify the software task of scanning a keypad matrix. With appropriate software support, the KPP is capable of detecting, debouncing, and decoding one or multiple keys pressed simultaneously on the keypad.

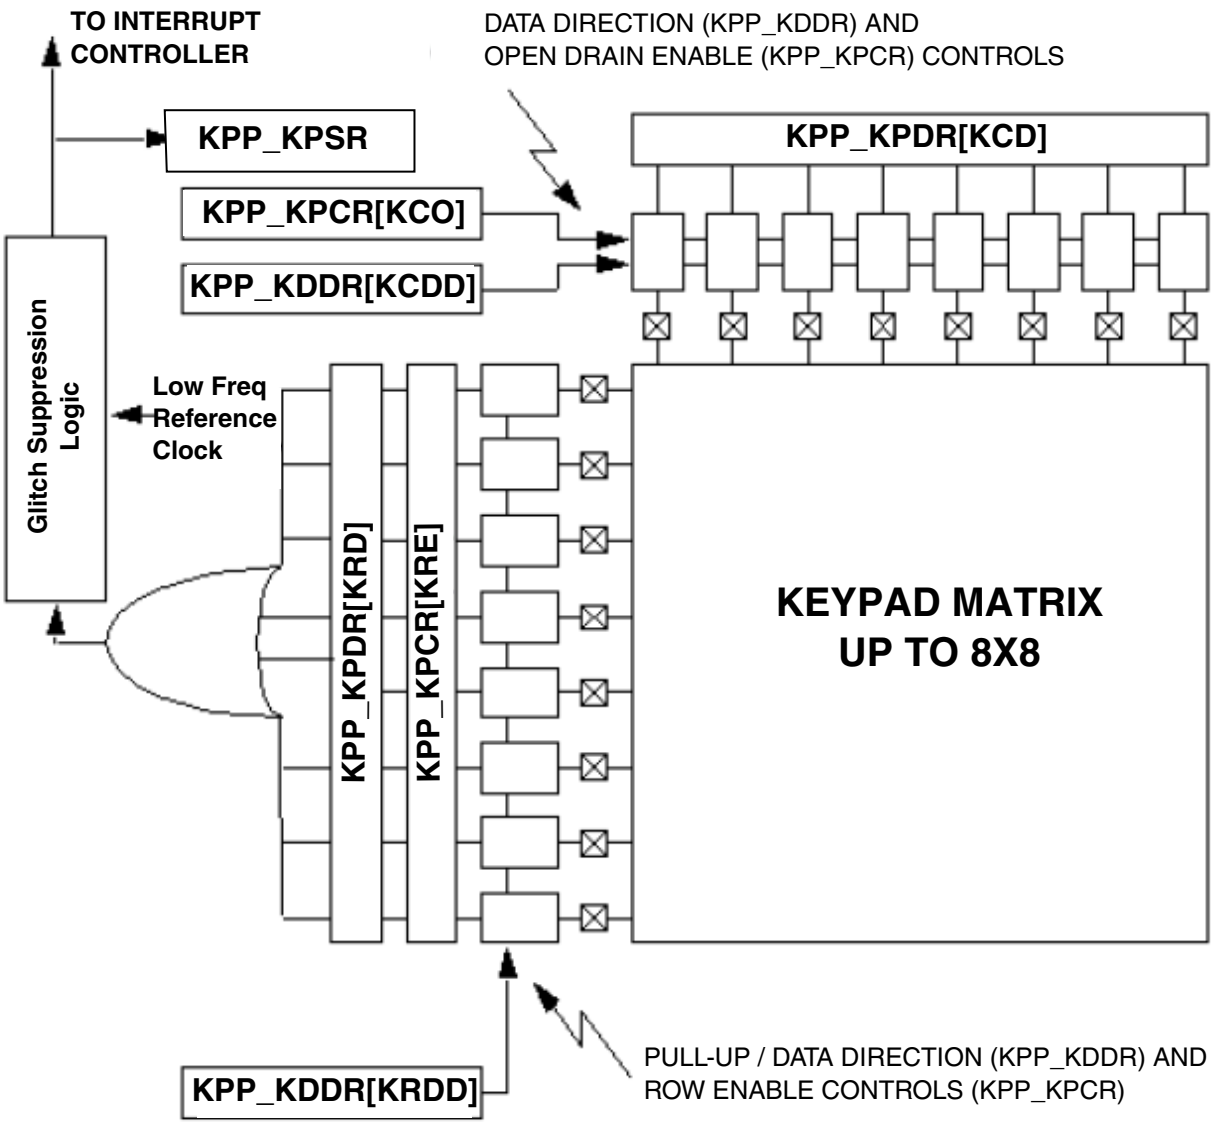

Figure 38-1. KPP Peripheral Block Diagram

38.1.1 Features

The KPP includes these distinctive features:

- Supports up to an 8 x 8 external key pad matrix
- Port pins can be used as general purpose I/O
- Open drain design
- Glitch suppression circuit design
- Multiple-key detection
- Long key-press detection
- Standby key-press detection
- Synchronizer chain clear
- Supports a 2-point and 3-point contact key matrix

38.1.2 Modes and Operations

This block supports the following modes:

- Run Mode-This is the normal functional mode in which the KPP can detect any key press event.
- Low Power Mode-The keypad can detect any key press even in low power modes (when there is no MCU clock).

38.2 Clocks

The table found here describes the clock sources for KPP.

Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 38-1. KPP Clocks

Clock name	Clock Root	Description
ipg_clk_32k	ckil_sync_clk_root	Low-frequency reference clock (32 kHz)
ipg_clk_s	ipg_clk_root	Peripheral access clock

38.3 External Signals

There are several pins dedicated to the KPP. Keypads of any configuration up to eight rows and eight columns are supported through the software configuration of the peripheral pins. Any pins not used for the keypad are available as general purpose I/O. The registers are configured such that the pins can be treated as an I/O port up to 16 bits wide.

See the table below for the list of external signals.

Table 38-2. KPP External Signals

Signal	Description	Pad	Mode	Direction
KEY_COL0	Column input or output pin, from chip	KEY_COL0	ALT3	I/O

Table continues on the next page...

Table 38-2. KPP External Signals (continued)

Signal	Description	Pad	Mode	Direction
		GPIO_5	ALT2	
		SD2_DAT0	ALT4	

38.3.1 Input Pins

Any of the 16 pins associated with the KPP can be configured as inputs by writing a "0" to the appropriate bits in the KPP_KDDR. Additionally, the least significant 8 bits (ROW inputs) corresponding to KPP_KDDR[KRDD] have internal pull-ups, which are enabled when the pin is used as an input.

38.3.2 Output Pins

Any of the 16 pins associated with the KPP can be configured as outputs by writing the appropriate bits in the KPP_KDDR to a "1". Additionally, the 8 most significant bits (15-8) can be designated as open drain outputs by writing a "1" to the appropriate bits in the KPP_KPCR. The lower 8 bits (7-0) are always in "totem pole" style, driven when configured as outputs.

See the table below.

Table 38-3. Keypad Port Column Modes

KPP_KDDR (15:8)	KPP_KPCR (15:8)	Pin Function
0	x	Input
1	0	Totem-Pole Output
1	1	Open-Drain Output

NOTE

Totem pole capability should be provided for column pins. Totem pole configuration helps for a faster discharge of keypad capacitance when all columns need to be quickly brought to a "1" during the scan routine. With this configuration, delay between the scanning of two subsequent columns is reduced.

38.3.3 Generation of Transfer Error Signal on Peripheral Bus

If there is an access to an address which is not implemented, then the KPP asserts a transfer error signal on Peripheral Bus.

38.4 Functional Description

The Keypad Port (KPP) is designed to simplify the software task of scanning a keypad matrix. With appropriate software support and matrix organization, the KPP is capable of detecting, debouncing, and decoding one or more keys pressed simultaneously on the keypad.

Logic in the KPP is capable of detecting a key press even while the processor is in one of the low power standby modes provided that a low frequency reference clock (ipg_clk_32k) is on. The KPP may generate an ARM platform interrupt any time a key press or key release is detected. This interrupt is capable of forcing the processor out of a low power mode.

38.4.1 Keypad Matrix Construction

The KPP is designed to interface to a keypad matrix, which shorts the intersecting row and column lines together whenever a key is depressed. The interface is not optimized for any other switch configuration.

38.4.2 Keypad Port Configuration

The software must initialize the KPP for the size of the keypad matrix. Pins connected to the keypad columns should be configured as open-drain outputs. Pins connected to the keypad rows should be configured as inputs. On-chip, pull-up resistors should be implemented for active keypad rows.

In addition to enabled row inputs in the Keypad Control register, corresponding interrupt (depress or/and release) must also be enabled to generate an interrupt.

Discrete switches that are not part of the matrix may be connected to any unused row inputs. The second terminal of the discrete switch is connected to ground. The hardware detects closures of these switches without the need for software polling.

38.4.3 Keypad Matrix Scanning

Keypad scanning is performed by a software loop that walks a zero across each of the keypad columns, reading the value on the rows at each step. The process is repeated several times in succession, with the results of each pass optionally compared to those from the previous pass. When several (3 or 4) consecutive scans yield the same key closures, a valid key press has been detected. Software then can decode exactly which switch was depressed and pass the value up to the next higher software layer.

The basic debouncing period, which must be defined in the software routine, may be controlled with an internal timer. The basic period is the period between the scan of two consecutive columns, so the debouncing time between two consecutive scans of the whole matrix shall be the number of columns multiplied by the basic period.

38.4.4 Keypad Standby

There is no need for the ARM platform to continually scan the keypad. Between key presses, the keypad can be left in a state that requires no software intervention until the next key press is detected. To place the keypad in a standby state, software should write all column outputs low. Row inputs are left enabled. At this point, the ARM platform can attend to other tasks or revert to a low power standby mode. The KPP will interrupt the ARM platform if any key is pressed.

Upon receiving a keypad interrupt, the ARM platform should set all the column strobes high, and begin a normal keypad scanning routine to determine which key was pressed. It is important that open-drain drivers be used when scanning to prevent a possible DC path between power and ground through two or more switches.

38.4.5 Glitch Suppression on Keypad Inputs

A glitch suppression circuit qualifies the keypad inputs to prevent noise from inadvertently interrupting the ARM platform. The circuit is a 4-state synchronizer clocked from a low frequency reference clock (ipg_clk_32k) source. This clock must continue to run in any low power mode where the keypad is a wake-up source, as the ARM platform interrupt is generated from the synchronized input. An interrupt is not generated until all four synchronizer stages have latched a valid key assertion. This guarantees the filtering out of any noise less than three clock periods in duration of a low frequency reference clock. Noise filtering of the duration between three to four clock periods cannot be guaranteed. The interrupt output is latched in an S-R latch and remains asserted until cleared by the software. The Set input of the latch is rising-edge clocked. See the figure below.

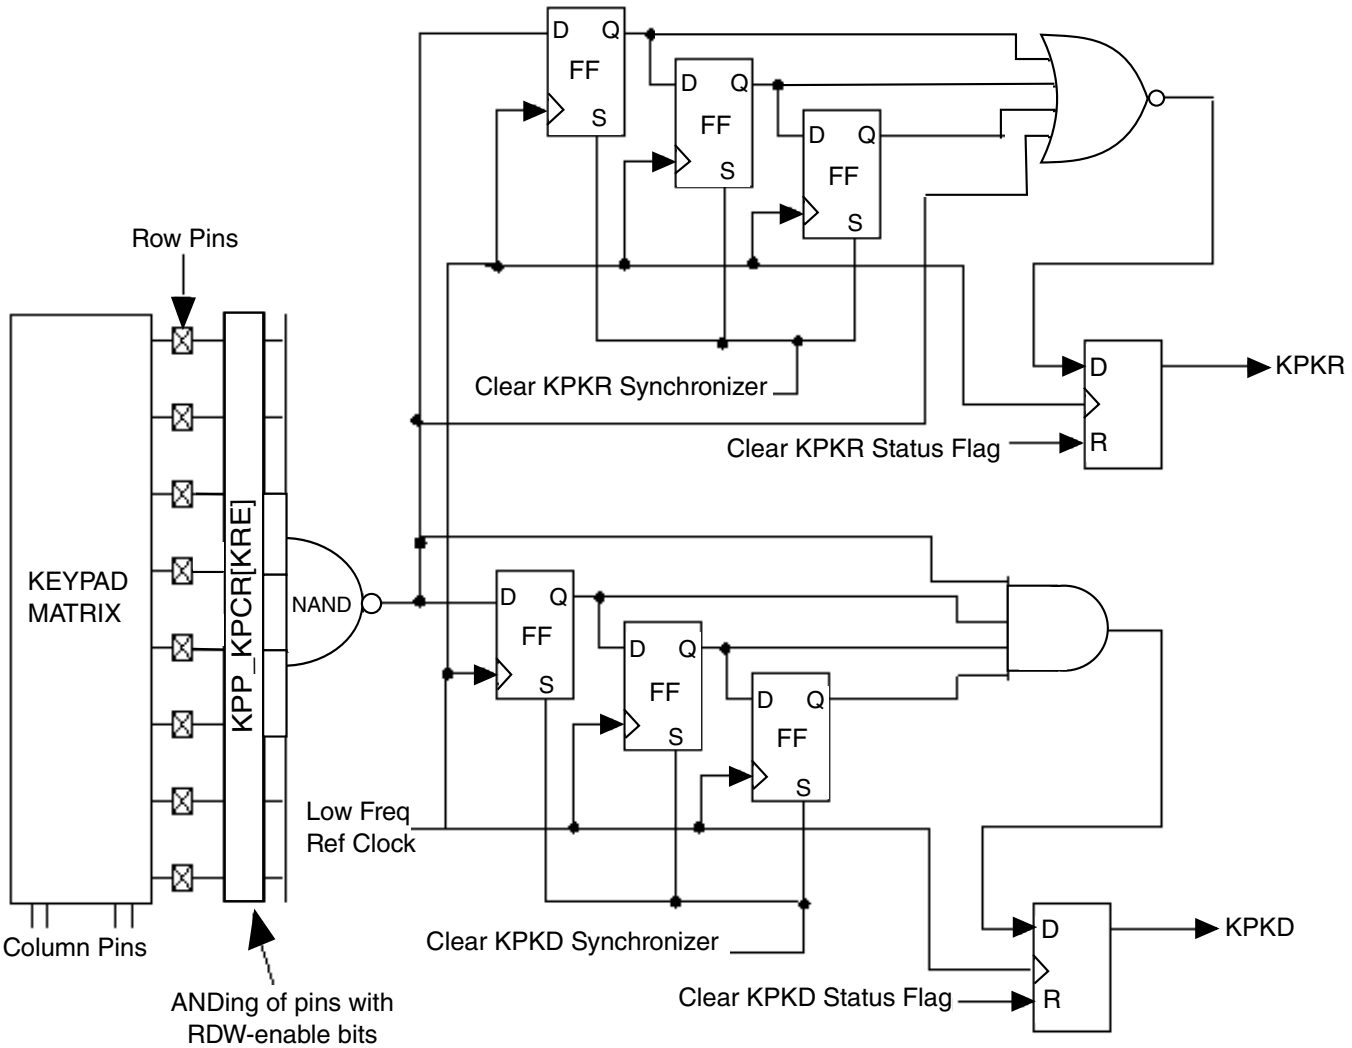

Figure 38-2. Keypad Synchronizer Functional Diagram

38.4.6 Multiple Key Closures

Using the key press and key release interrupts, the software can detect multiple keys or achieve n key rollover. The key scanning routine can be programmed accordingly (See Initialization/Application Information for more information).

The following figures illustrate the interface of a 2-contact keypad matrix with the KPP controller. With proper enabling of row lines and the performing scan-routine, multiple key presses can be detected. When keys present on the same row are pressed, corresponding row lines (multiple lines) become low when the column is driven low during a scan-routine. By reading the data-register, pressed keys can be detected.

Similarly, when keys present on same row line are pressed, the corresponding row line (only one line) becomes low when logic "0" is driven on the column line during a scan-routine.

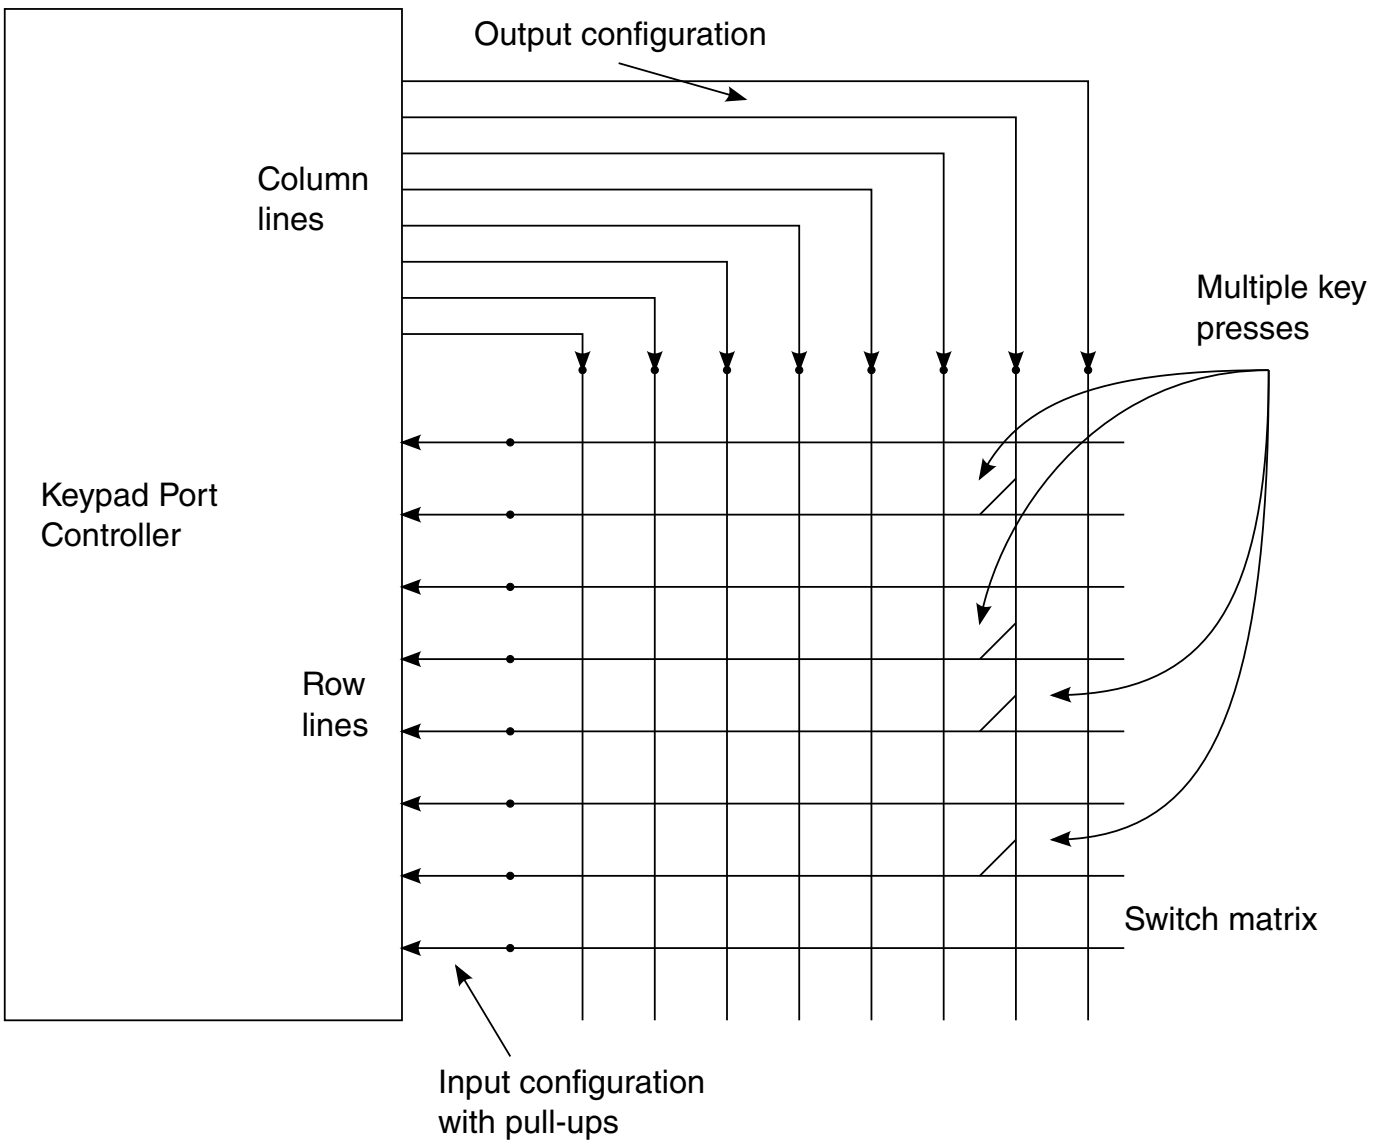

Figure 38-3. Multiple Key Presses on Same Column Line (Simplified View)

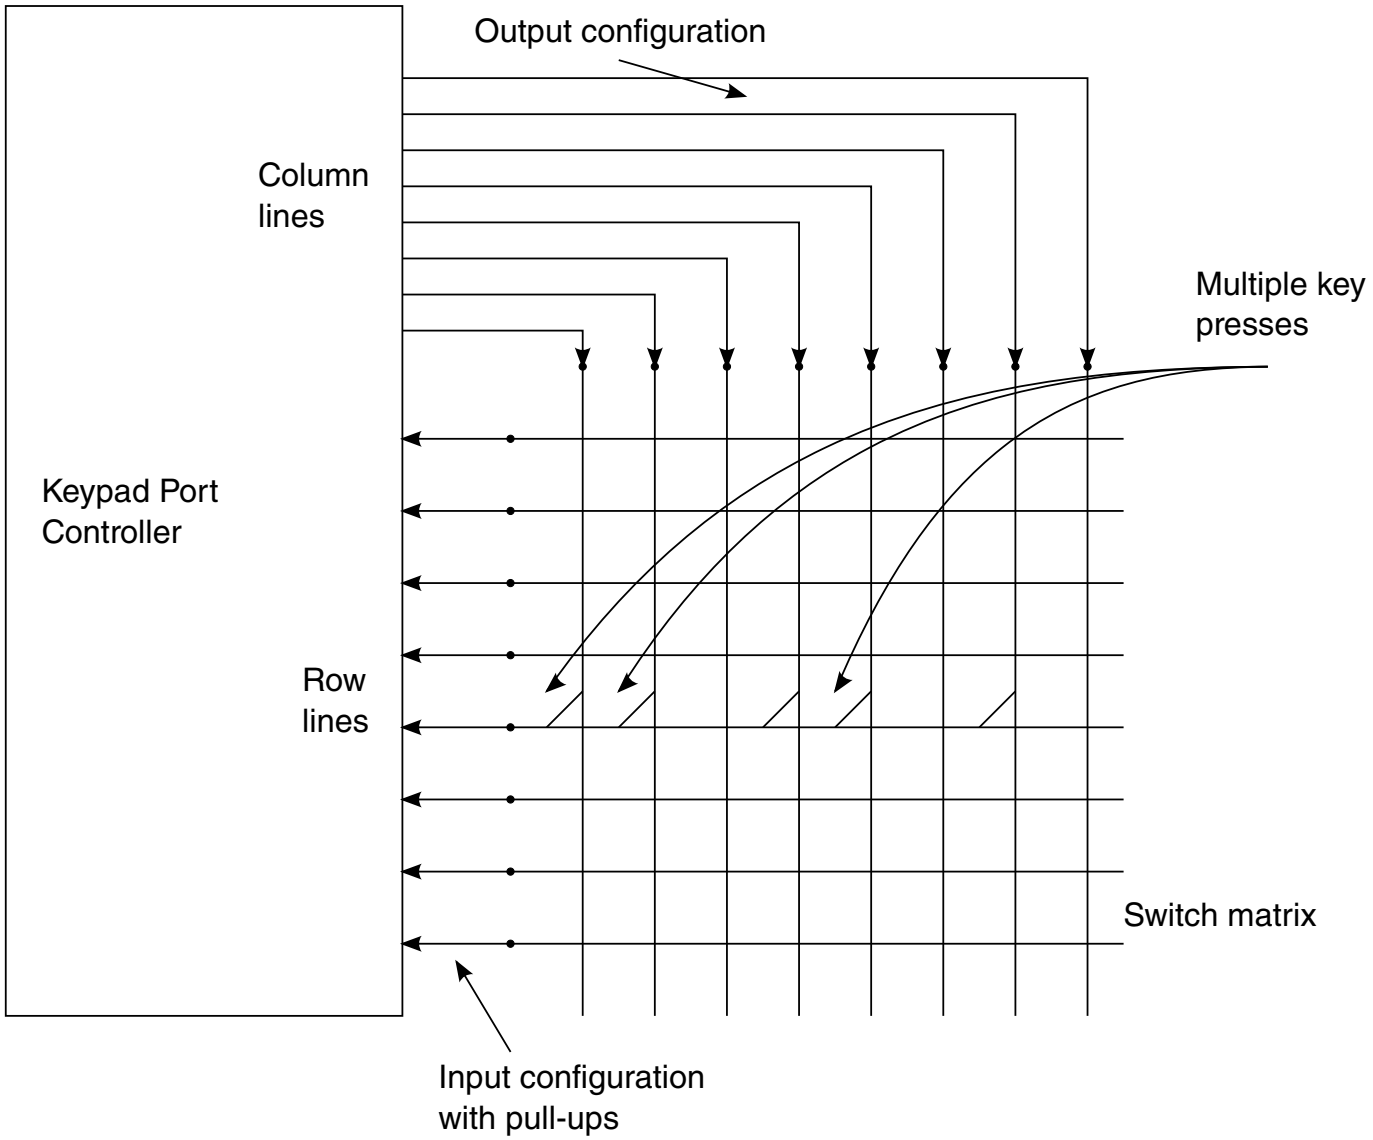

Figure 38-4. Multiple Key Presses on Same Row Line (Simplified View)

NOTE

An n key rollover is a technique with which the system can recognize the order in which keys are pressed.

38.4.6.1 Ghost Key Problem and Correction

The KPP detects if one or multiple keys are pressed or released. In the case where a simple keypad matrix with two-contact switches is used, there is a chance of "ghost" key detection when three or more keys are pressed. This is a limitation imposed by such a keypad matrix.

As seen in Figure 38-5, three keys pressed simultaneously can cause a short between the column currently "scanned" by the software and another column. Depending on the location of the third key pressed, a "ghost" key press may be detected.

However, this can be corrected by using a keypad matrix that provides "ghost" key protection. Such a matrix implements a one-way "diode" at all keypad points between rows and columns. This way, the multiple pressing of three keys will not cause a short at a fourth key (see Figure 38-6).

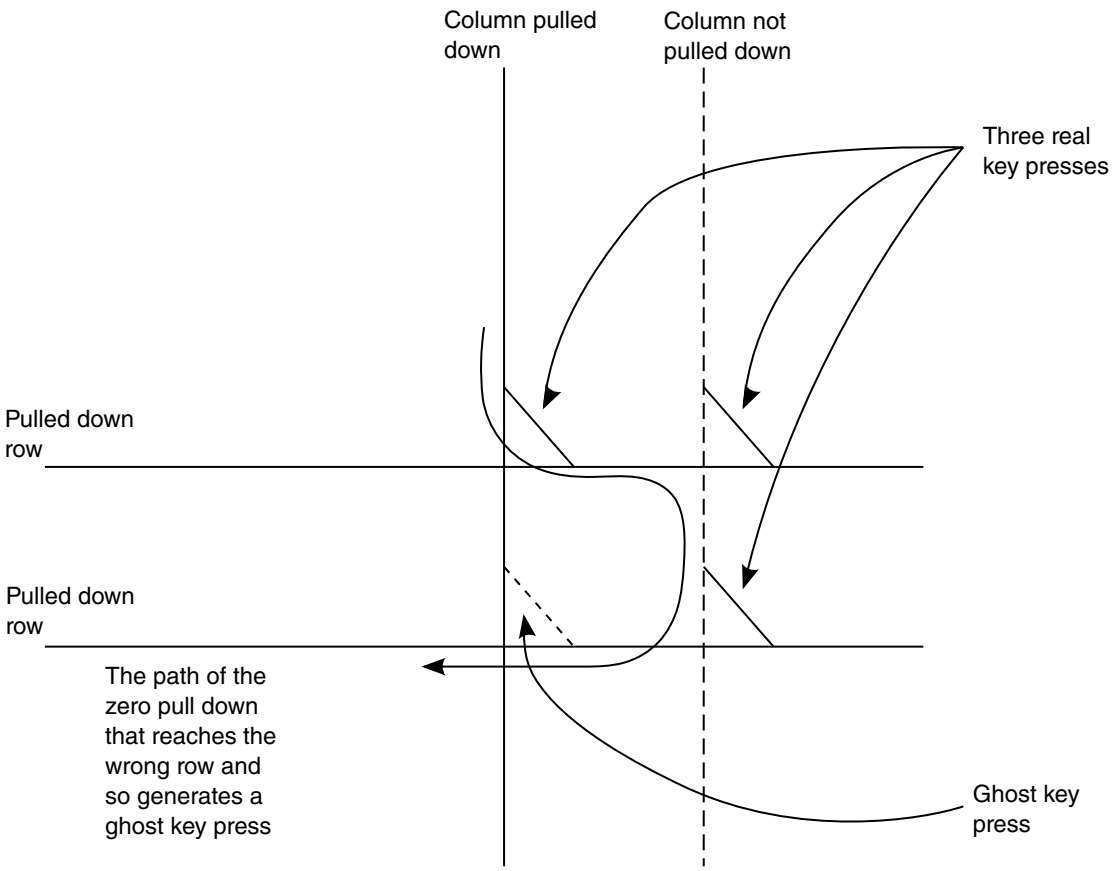

Figure 38-5. Decoding Wrong Three- Key-Presses

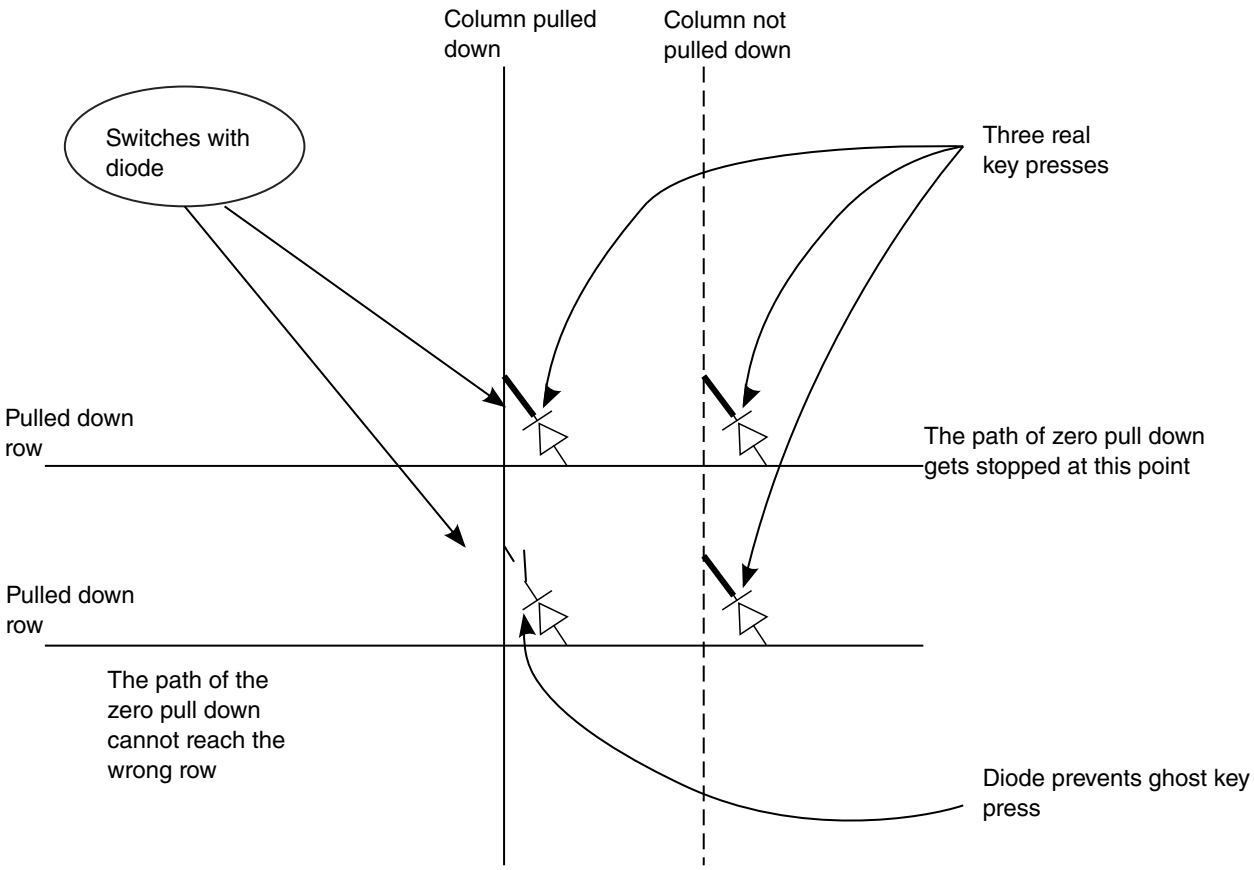

Figure 38-6. Matrix with "Ghost" Key Protections

38.4.7 3-Point Contact Keys Support

The KPP supports interfacing to a matrix consisting of 3-point contact keys. As shown in Figure 38-7, two points of such a key are connected to keypad lines, while a third point is connected to ground (low logic).

The keypad lines should be configured as input and a pull-up should to be present on these lines. When such a key is pressed, corresponding keypad lines go low and an interrupt is generated. There is no need to perform a scanning routine for identification of pressed key as it can be done by reading the keypad data-register. A limitation with such a matrix is that for every key at least one keypad row line should be used.

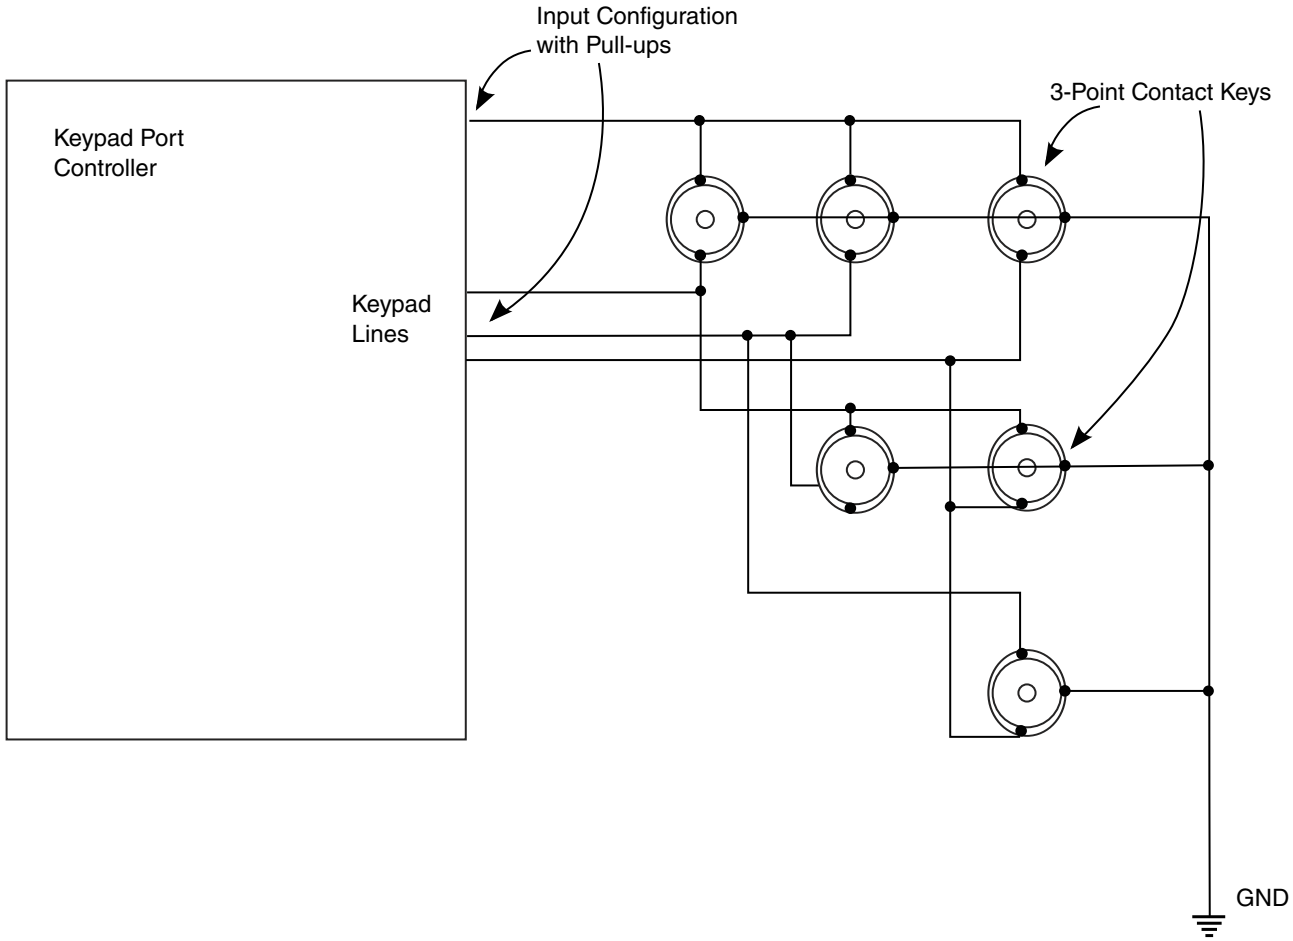

Figure 38-7. KPP Interface with 3-point Contact Key Matrix (Simplified View)

38.5 Initialization/Application Information

38.5.1 Typical Keypad Configuration and Scanning Sequence

Perform the following steps to configure the keypad:

1. Enable the number of rows in the keypad (KPP_KPCR[KRE]).
2. Write 0s to KPP_KPDR[KCD].
3. Configure the keypad columns as open-drain (KPP_KPCR[KCO]).
4. Configure columns as output (KPP_KDDR[KCDD]) and rows as input (KPP_KDDR[KRDD]).
5. Clear the KPKD Status Flag and Synchronizer chain.
6. Set the KDIE control bit, and clear the KRIE control bit (avoid false release events).

7. (The system is now in standby mode, and awaiting a key press.)

38.5.2 Key Press Interrupt Scanning Sequence

Perform the following steps to perform a keypad scanning routine:

1. Disable both (depress and release) keypad interrupts.
2. Write 1s to KPP_KPDR[KCD], setting column data to 1s.
3. Configure columns as totem pole outputs (for quick discharging of keypad capacitance).
4. Configure columns as open-drain.
5. Write a single column to 0, and other columns to 1.
6. Sample row inputs and save data. Multiple key presses can be detected on a single column.
7. Repeat Steps 2-6 for remaining columns.
8. Return all columns to 0 in preparation for standby mode.
9. Clear KPKD and KPKR status bit(s) by writing to a "1"; set the KPKR synchronizer chain by writing a "1" to the KPP_KRSS register; and clear the KPKD synchronizer chain by writing a "1" to the KDSC register.
10. Re-enable the appropriate keypad interrupt(s) so that the KDIE detects a key hold condition, or the KRIE detects a key-release event.

38.5.3 Additional Comments

The order of key press detection can be done in software only. Therefore, the software may need to run the scan routines at very short intervals of time per the application's demands. The reason that such functionality cannot be put in the KPP is that the block is limited by the number of external pins.

For the keys that require a very precise order (such as game keys), individual GPIO pins may be more useful.

38.6 KPP Memory Map/Register Definition

The KPP contains four registers.

KPP memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
20B_8000	Keypad Control Register (KPP_KPCR)	16	R/W	0000h	38.6.1/3525
20B_8002	Keypad Status Register (KPP_KPSR)	16	R/W	0400h	38.6.2/3526
20B_8004	Keypad Data Direction Register (KPP_KDDR)	16	R/W	0000h	38.6.3/3527
20B_8006	Keypad Data Register (KPP_KPDR)	16	R/W	0000h	38.6.4/3528

38.6.1 Keypad Control Register (KPP_KPCR)

The Keypad Control Register determines which of the eight possible column strobes are to be open drain when configured as outputs, and which of the eight row sense lines are considered in generating an interrupt to the core.

It is up to the programmer to ensure that pins being used for functions other than the keypad are properly disabled. The KPP_KPCR register is byte- or half-word-addressable.

Address: 20B_8000h base + 0h offset = 20B_8000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read Write	KCO								KRE							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

KPP_KPCR field descriptions

Field	Description
15–8 KCO	Keypad Column Strobe Open-Drain Enable. Setting a column open-drain enable bit (KCO7-KCO0) disables the pull-up driver on that pin. Clearing the bit allows the pin to drive to the high state. This bit has no effect when the pin is configured as an input. **NOTE:** Configuration of external port control logic (for example, IOMUX) should be done properly so that the KPP controls an open-drain enable of the pin. 0 **TOTEM_POLE** — Column strobe output is totem pole drive. 1 **OPEN_DRAIN** — Column strobe output is open drain.
KRE	Keypad Row Enable. Setting a row enable control bit in this register enables the corresponding row line to participate in interrupt generation. Likewise, clearing a bit disables that row from being used to generate an interrupt. This register is cleared by a reset, disabling all rows. The row-enable logic is independent of the programmed direction of the pin. Writing a "0" to the data register of the pins configured as outputs will cause a keypad interrupt to be generated if the row enable associated with that bit is set. 0 Row is not included in the keypad key press detect. 1 Row is included in the keypad key press detect.

38.6.2 Keypad Status Register (KPP_KPSR)

The Keypad Status Register reflects the state of the key press detect circuit. The KPP_KPSR register is byte- or half-word-addressable.

Address: 20B_8000h base + 2h offset = 20B_8002h

Bit	15	14	13	12	11	10	9	8
Read	0						KRIE	KDIE
Write								
Reset	0	0	0	0	0	1	0	0

Bit	7	6	5	4	3	2	1	0
Read	0				0	0	KPKR	KPKD
Write					KRSS	KDSC	w1c	w1c
Reset	0	0	0	0	0	0	0	0

KPP_KPSR field descriptions

Field	Description
15–10 Reserved	This read-only field is reserved and always has the value 0.
9 KRIE	Keypad Release Interrupt Enable. The software should ensure that the interrupt for a Key Release event is masked until it has entered the key pressed state, and vice versa, unless this activity is desired (as might be the case when a repeated interrupt is to be generated). The synchronizer chains are capable of being initialized to detect repeated key presses or releases. If they are not initialized when the corresponding event flag is cleared, false interrupts may be generated for depress (or release) events shorter than the length of the corresponding chain. 0 No interrupt request is generated when KPKR is set. 1 An interrupt request is generated when KPKR is set.
8 KDIE	Keypad Key Depress Interrupt Enable. Software should ensure that the interrupt for a Key Release event is masked until it has entered the key pressed state, and vice-versa, unless this activity is desired (as might be the case when a repeated interrupt is to be generated). The synchronizer chains are capable of being initialized to detect repeated key presses or releases. If they are not initialized when the corresponding event flag is cleared, false interrupts may be generated for depress (or release) events shorter than the length of the corresponding chain. 0 No interrupt request is generated when KPKD is set. 1 An interrupt request is generated when KPKD is set.
7–4 Reserved	This read-only field is reserved and always has the value 0.
3 KRSS	Key Release Synchronizer Set. Self-clear bit. The Key release synchronizer is set by writing a logic one into this bit. Reads return a value of "0". 0 No effect 1 Set bits which sets keypad release synchronizer chain

Table continues on the next page...

KPP_KPSR field descriptions (continued)

Field	Description
2 KDSC	Key Depress Synchronizer Clear. Self-clear bit. The Key depress synchronizer is cleared by writing a logic "1" into this bit. Reads return a value of "0". 0 No effect 1 Set bits that clear the keypad depress synchronizer chain
1 KPKR	Keypad Key Release. The keypad key release (KPKR) status bit is set when all enabled rows are detected high after synchronization (the KPKR status bit will be set when cleared by a reset). The KPKR bit may be used to generate a maskable key release interrupt. The key release synchronizer may be set high by software after scanning the keypad to ensure a known state. Due to the logic function of the release and depress synchronizer chains, it is possible to see the re-assertion of a status flag (KPKD or KPKR) if it is cleared by software prior to the system exiting the state it represents. Reset value of register is "0" as long as reset is asserted. However when reset is de-asserted, the value of the register depends upon the external row pins and can become "1". 0 No key release detected 1 All keys have been released
0 KPKD	Keypad Key Depress. The keypad key depress (KPKD) status bit is set when one or more enabled rows are detected low after synchronization. The KPKD status bit remains set until cleared by the software. The KPKD bit may be used to generate a maskable key depress interrupt. If desired, the software may clear the key press synchronizer chain to allow a repeated interrupt to be generated while a key remains pressed. In this case, a new interrupt will be generated after the synchronizer delay (4 cycles of the low frequency reference clock (ipg_clk_32k) elapses if a key remains pressed. This functionality can be used to detect a long key press. This allows detection of additional key presses of the same key or other keys. Due to the logic function of the release and depress synchronizer chains, it is possible to see the re-assertion of a status flag (KPKD or KPKR) if it is cleared by the software prior to the system exiting the state it represents. 0 No key presses detected 1 A key has been depressed

38.6.3 Keypad Data Direction Register (KPP_KDDR)

The bits in the KPP_KDDR control the direction of the keypad port pins. The upper eight bits in the register affect the pins designated as column strobes, while the lower eight bits affect the row sense pins. Setting any bit in this register configures the corresponding pin as an output. Clearing any bit in this register configures the corresponding port pin as an input. For the Keypad Row DDR, an internal pull-up is enabled if the corresponding bit is clear. This register is cleared by a reset, configuring all pins as inputs. The KPP_KDDR register is byte- or half-word addressable.

NOTE

When a pin is used as row pin for keypad purposes, all corresponding pull-ups should be enabled at the upper level (for example, IOMUX) when the bit in KRDD is cleared.

Address: 20B_8000h base + 4h offset = 20B_8004h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read Write	KCDD								KRDD							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

KPP_KDDR field descriptions

Field	Description
15–8 KCDD	Keypad Column Data Direction Register. Setting a bit configures the corresponding COL*n* pin as an output (where *n* = 7 through 0). 0 **INPUT** — COLn pin is configured as an input. 1 **OUTPUT** — COLn pin is configured as an output.
KRDD	Keypad Row Data Direction. Setting a bit configures the corresponding ROW*n* pin as an output (where *n* = 7 through 0). 0 **INPUT** — ROWn pin configured as an input. 1 **OUTPUT** — ROWn pin configured as an output.

38.6.4 Keypad Data Register (KPP_KPDR)

This 16-bit register is used to access the column and row data. Data written to this register is stored in an internal latch, and for each pin configured as an output, the stored data is driven onto the pin. A read of this register returns the value on the pin for those bits configured as inputs. Otherwise, the value read is the value stored in the register.

The KPP_KPDR register is byte- or half-word addressable. This register is not initialized by a reset. Valid data should be written to this register before any bits are configured as outputs.

Address: 20B_8000h base + 6h offset = 20B_8006h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read Write	KCD								KRD							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

KPP_KPDR field descriptions

Field	Description
15–8 KCD	Keypad Column Data. A read of these bits returns the value on the pin for those bits configured as inputs. Otherwise, the value read is the value stored in the register. 0 Read/Write "0" from/to column ports 1 Read/Write "1" from/to column ports
KRD	Keypad Row Data. A read of these bits returns the value on the pin for those bits configured as inputs. Otherwise, the value read is the value stored in the register. 0 Read/Write "0" from/to row ports 1 Read/Write "1" from/to row ports

Field	Description

Chapter 39
LVDS Display Bridge (LDB)

39.1 Overview

The LVDS Display Bridge (LDB) connects the IPU (Image Processing Unit) to an External LVDS Display Interface.

The purpose of the LDB is to support flow of synchronous RGB data from the IPU to external display devices through the LVDS interface. This support covers all aspects of these activities:

- Connectivity to relevant devices - Displays with LVDS receivers.
- Arranging the data as required by the external display receiver and by LVDS display standards.
- Synchronization and control capabilities.

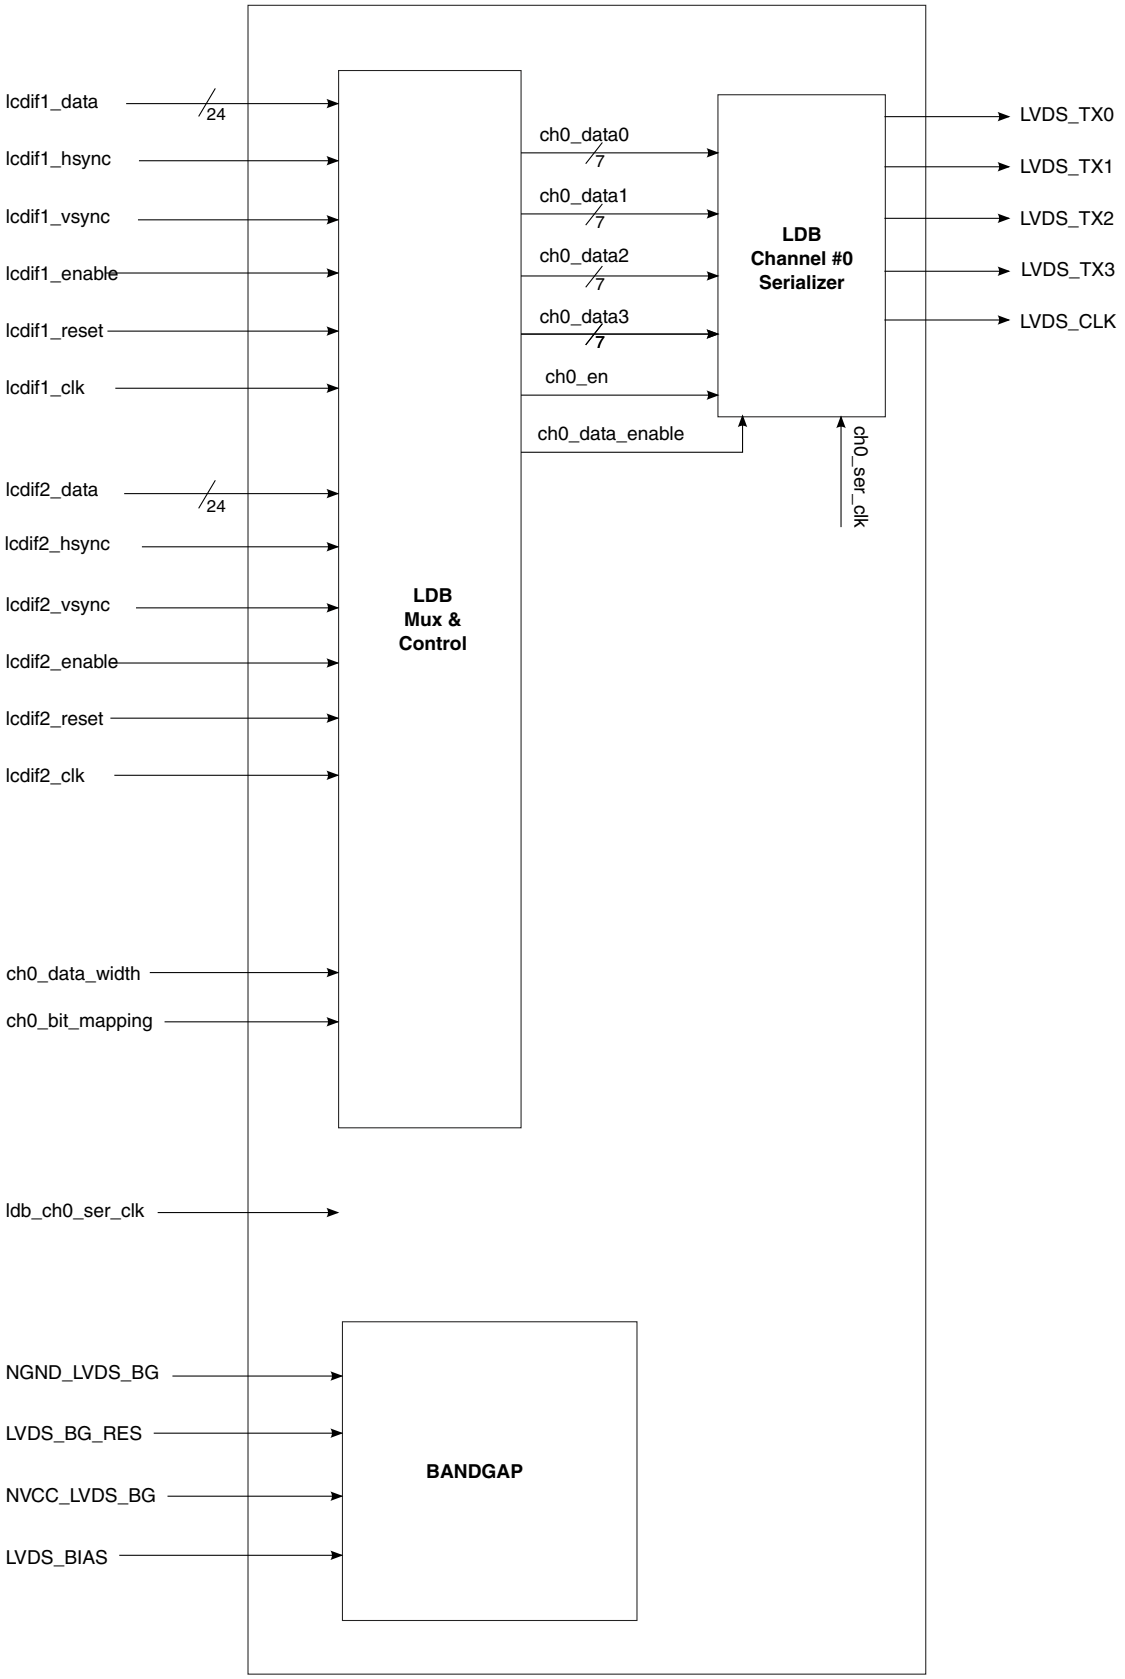

Figure 39-1. LDB Block Diagram

Table 39-1. LDB - Block Description

Block	Description
LDB Mux and Control	Gets control signals from SoC and determines parameters of LDB
Channel Serializers	LDB has 2 channel serializers. The serializer does parallel to serial conversion 7:1 to 3 or 4 data lines
Bandgap	Provides reference current to the LVDS I/O pads.

Table 39-2. LDB IP Parametric Table

Name	IPU
Function	Connectivity to displays with LVDS interface
External I/O Pins Those are LVDS I/O pads	LVDS Display port: 2 channels, consists of: • 1 clock pair • 4 data pairs Each pair contains - LVDS special differential pad (PadP, PadM). total of 20 I/O pads.
SoC Buses	None. Only configuration signals.
Interrupts	None
DMA Requests	None
Number of instantiations	1
Clock sources and range	IPU_DI0_CLK, IPU_DI1_CLK- Display interface clock: 20-170 MHz DI0_SERIAL_CLK, DI1_SERIAL_CLK - Serializer clock: 140-595 MHz

39.1.1 Relevant Standards

Below are the relevant standards to LDB:

1. ANSI EIA-644-A. Electrical Characteristics of Low Voltage Differential Signaling (LVDS) Interface Circuits.
2. SPWG Notebook Panel Specification (V3.8 from 03/2007) .
3. PSWG standards (Panel Standardization Working Group) - set of standards for panels using LVDS. All are available from http://www.vesa.org.
4. DISM Standard JEIDA-59-1999

39.2 External Signals

The following table describes the external signals of LDB:

Table 39-3. LDB External Signals

Signal	Description	Pad	Mode	Direction
LVDS0_CLK_N	LVDS0 Negative Clock Signal	LVDS0_CLK_N	No Muxing	I/O
LVDS0_CLK_P	LVDS0 Positive Clock Signal	LVDS0_CLK_P	No Muxing	I/O
LVDS0_DATA[3:0]_N	LVDS0 Negative Data Signals	LVDS0_TX[3:0]_N	No Muxing	I/O
LVDS0_DATA[3:0]_P	LVDS0 Positive Data Signals	LVDS0_TX[3:0]_P	No Muxing	I/O
LVDS1_CLK_N	LVDS1 Negative Clock Signal	LVDS1_CLK_N	No Muxing	I/O
LVDS1_CLK_P	LVDS1 Positive Clock Signal	LVDS1_CLK_P	No Muxing	I/O
LVDS1_DATA[3:0]_N	LVDS1 Negative Data Signals	LVDS1_TX[3:0]_N	No Muxing	I/O
LVDS1_DATA[3:0]_P	LVDS1 Positive Data Signals	LVDS1_TX[3:0]_P	No Muxing	I/O

39.3 Clocks

A table with the LDB Clock Sources can be found here.

Table 39-4. LDB Clock Sources

Name	Symbol	Source	Rate	Comments
IPU DI0 interface pixel clock	IPU_DI0_CLK	Clock control Module	Up to 170 MHz	See note below [1]
IPU DI1 interface pixel clock	IPU_DI1_CLK	Clock control Module	Up to 170 MHz	This input also goes to IPU DI1 as input. See note below
CH0 interface serializer clock	DI0_SERIAL_CLK	Clock control Module	Up to 595 MHz	This is x7 the rate of the DI0 interface pixel clock. See note below.
CH1 interface serializer clock	DI1_SERIAL_CLK	Clock control Module	Up to 595 MHz	This is x7 the rate of the DI1 interface pixel clock. See note below

1. In case of single-channel or separate-channels use-case, the IPU DI_CLK is identical to the LVDS DI_CLK. In case of split-channel use-case, the IPU DI_CLK has x2 higher frequency than that of the LVDS DI_CLK. Still both need to be synchronized

39.4 Input and Output Ports

39.4.1 Input Parallel Display Ports

One or two parallel RGB input ports are supported (configurable). Only synchronous access mode is supported.Each RGB data interface contains the following:

- RGB Data of 18 or 24 bits

NOTE

In 18 bits mode, if the RGB bus width is 24 bits, the RGB data are {6'b00000, R[5:0], G[5:0], b[5:0]}.

- Pixel clock
- Control signals: HSYNC, VSYNC, DE, and 1 additional optional general purpose control.

Total of up to 28 bits per data interface are transferred per pixel clock cycle.

Rates supported:

- Overall: LDB supports rates needed by WUXGA 16:10 aspect ratio (1920 x 1200 @ 60 frames per second, data rate supported up to 170 MHz)
- For single input data interface case: Up to 170 MHz pixel clock (WUXGA 1920x1200)
- For dual input data interface case: Up to 85 MHz per interface. (WXGA 1366x768 @ 60 frames per second, 35% blanking).

39.4.2 Output LVDS Ports

There is 2 LVDS channels. The output of each is used to communicate RGB data and controls to external LCD displays.

The LVDS ports may be used as follows:

- Single channel output
- Dual channel output (one input source, two channels outputs for two displays)
- Split channel output (one input source, splitted to 2 channels on output)
- Separate 2 channel output (2 input sources from IPU).

The output LVDS port complies to the EIA-644-A standard.

39.5 Processing

LDB data processing stages are as follows:

- Receive input data from 1 or 2 (configurable) parallel input interfaces. 18/24 RGB data + up to 4 controls and map them to LVDS channels.
  - If needed (dual-channel) split the input bus to two half-rate busses.

- Re-arrange the input data according to channel configuration, and muxing scheme.
- Serialize the 22/28 bit input bus (per channel) on 3-4 output serial data lines (7:1)

39.5.1 Mapping of Input Data Busses

Mapping of Parallel input interfaces (DI0, DI1) to output LVDS channels (Channel 0, Channel 1). See Table 39-5.

Table 39-5. Channel Mapping

Use Case	LVDS Channel 0	LVDS Channel 1
Single Channel DI0	DI0	Disabled
Single Channel DI1 on Channel 1	Disabled	DI1
Separate Channels	DI0	DI1
Dual Channels DI0	DI0	DI0
Dual Channels DI1	DI1	DI1
Split Channel DI0	DI0 (first pixel)	DI0 (second pixel)
Split Channel DI1	DI1 (first pixel)	DI1 (second pixel)

39.5.2 Bit Mapping

LDB supports two mapping standards:

- SPWG mapping
- JEIDA mapping

Table 39-6. SPWG/PSWG/VESA 18/24 bpp Data Mapping

Serializer input	Slot 0	Slot 1	Slot 2	Slot 3	Slot 4	Slot 5	Slot 6
LVDSn_DATA0	G0	R5	R4	R3	R2	R1	R0
LVDSn_DATA1	B1	B0	G5	G4	G3	G2	G1
LVDSn_DATA2	DE	VS	HS	B5	B4	B3	B2
LVDSn_DATA3 (for 24 bpp only)	CTL	B7	B6	G7	G6	R7	R6

Table 39-7. JEIDA 24bpp Data Mapping

Serializer input	Slot 0	Slot 1	Slot 2	Slot 3	Slot 4	Slot 5	Slot 6
LVDSn_DATA0	G2	R7	R6	R5	R4	R3	R2
LVDSn_DATA1	B3	B2	G7	G6	G5	G4	G3
LVDSn_DATA2	DE	VS	HS	B7	B6	B5	B4
LVDSn_DATA3	CTL	B1	B0	G1	G0	R1	R0

NOTE

Several options of control usage can be available. some display devices use only DE, some others use all 3 controls, some use only HS, VS. "CTL" is an optional general purpose control which is usually unused by display.

39.6 LDB Memory Map/Register Definition

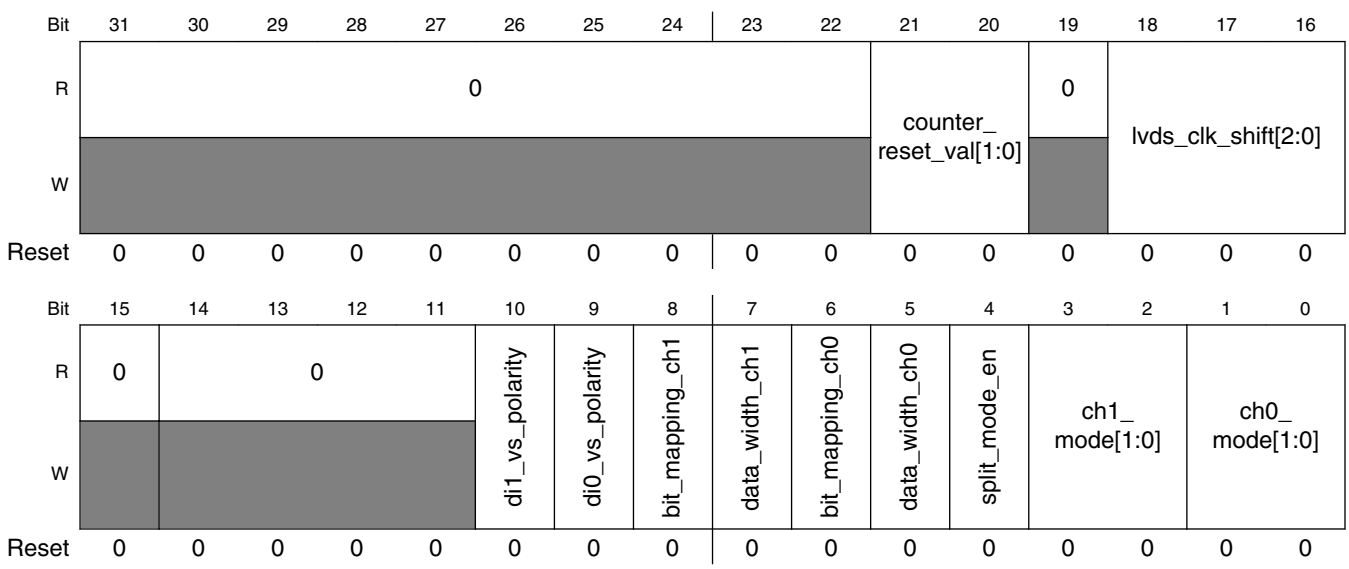
LDB memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
20E_0008	LDB Control Register (LDB_CTRL)	32	R/W	0000_0000h	39.6.1/3537

39.6.1 LDB Control Register (LDB_CTRL)

The register is implemented in the IOMUX Controller block (IOMUXC), as the register IOMUXC_GPR2.

Address: 20E_0008h base + 0h offset = 20E_0008h



LDB_CTRL field descriptions

Field	Description
31–22 Reserved	This read-only field is reserved and always has the value 0.
21–20 counter_reset_val[1:0]	Reset value for the LDB counter which determines when the shift registers are loaded with data. **NOTE:** Used for debug purposes only. In normal functional operation must be '00' 00 Reset value is 5 01 Reset value is 3 10 Reset value is 4 11 Reset value is 6
19 Reserved	This read-only field is reserved and always has the value 0.
18–16 lvds_clk_shift[2:0]	Shifts the LVDS output clock in relation to the data. **NOTE:** Used for debug purposes only. In normal functional operation must be '000' 000 Output clock is '1100011' (normal operation) 001 Output clock is '1110001' 010 Output clock is '1111000' 011 Output clock is '1000111' 100 Output clock is '0001111' 101 Output clock is '0011111' 110 Output clock is '0111100' 111 Output clock is '1100011'
15 Reserved	This read-only field is reserved and always has the value 0.
14–11 Reserved	This read-only field is reserved and always has the value 0.
10 di1_vs_polarity	Vsync polarity for IPU's DI1 interface. 0 ipu_di1_vsync is active high. 1 ipu_di1_vsync is active low.
9 di0_vs_polarity	Vsync polarity for IPU's DI0 interface. 0 ipu_di0_vsync is active high. 1 ipu_di0_vsync is active low.
8 bit_mapping_ch1	Data mapping for LVDS channel 1. 0 Use SPWG standard. 1 Use JEIDA standard.
7 data_width_ch1	Data width for LVDS channel 1. **NOTE:** This bit must be set when using JEIDA standard (bit_mapping_ch1 is set) 0 Data width is 18 bits wide (lvds1_tx3 is not used) 1 Data width is 24 bits wide.
6 bit_mapping_ch0	Data mapping for LVDS channel 0. 0 Use SPWG standard. 1 Use JEIDA standard.

Table continues on the next page...

LDB_CTRL field descriptions (continued)

Field	Description
5 data_width_ch0	Data width for LVDS channel 0. **NOTE:** This bit must be set when using JEIDA standard (bit_mapping_ch0 is set) 0 Data width is 18 bits wide (lvds0_tx3 is not used) 1 Data width is 24 bits wide.
4 split_mode_en	Enable split mode. **NOTE:** In this mode both channels should be enabled and working with the same DI (ch0_mode and ch1_mode should both be either '01' or '11') 0 Split mode is disabled. 1 Split mode is enabled.
3–2 ch1_mode[1:0]	LVDS channel 1 operation mode 00 Channel disabled. 01 Channel enabled, routed to DI0 10 Channel disabled. 11 Channel enabled, routed to DI1.
ch0_mode[1:0]	LVDS channel 0 operation mode 00 Channel disabled. 01 Channel enabled, routed to DI0 10 Channel disabled. 11 Channel enabled, routed to DI1.

Chapter 40
MIPI - Camera Serial Interface Host Controller (MIPI_CSI)

40.1 Overview

The CSI-2 Host Controller is a digital core that implements all protocol functions defined in the MIPI CSI-2 Specification, providing an interface between the System and the MIPI D-PHY, allowing the communication with a MIPI CSI-2 compliant Camera Sensor.

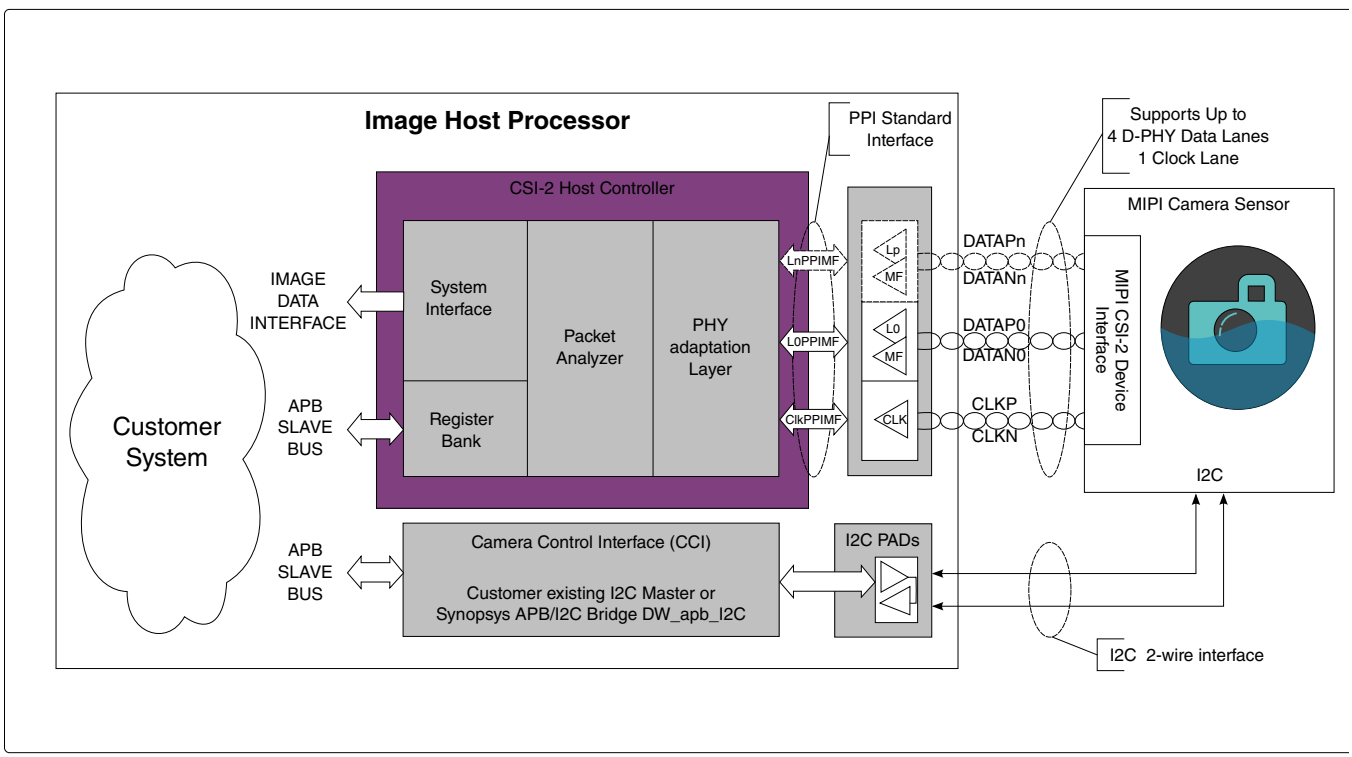


Figure 40-1. Block Diagram presenting the CSI-2 Host Controller function.

40.2 Features

The MIPI CSI-2 Host Controller supports the following features:

- Compliant with MIPI Alliance Standard for Camera Serial Interface 2 (CSI-2), Version 1.00 - 29 November 2005
- Interface with MIPI D-PHY following PHY Protocol Interface (PPI), as defined in MIPI Alliance Specification for D-PHY, Version 1.00.00 - 14 May 2009
- Supports up to 4 D-PHY Rx Data Lanes
- Dynamically configurable multi-lane merging
- Long and Short packet decoding
- Timing accurate signaling of Frame and Line synchronization packets
- Support for several frame formats such as:
  - General Frame or Digital Interlaced Video with or without accurate sync timing
  - Data type (Packet or Frame level) and Virtual Channel interleaving
- 32-bit Image Data Interface delivering data formatted as recommended in CSI-2 Specification;
- Supports all primary and secondary data formats:
  - RGB, YUV and RAW color space definitions
  - From 24-bit down to 6-bit per pixel
  - Generic or user-defined byte-based data types
- Error detection and correction:
  - PHY level
  - Packet level
  - Line level
  - Frame level

40.3 Architecture

The following figure presents the overall architecture of the CSI-2 Host Controller. The main blocks are the following:

- PHY Adaptation Layer, which is responsible for managing the D-PHY interface, including PHY error handling;
- Packet Analyzer, where data lane merging is implemented if required, together with header decoding, error detection and correction, frame size error detection and CRC error detection;
- Image Data Interface. This block separates CSI-2 packet header information and reorders data according to memory storage format, and it also generates timing

accurate video synchronization signals. Several error detections are also performed at frame-level and line-level;

- Register Bank, accessible through a standard AMBA-APB slave interface, providing access to the CSI-2 Host Controller registers for configuration and control. There is also a fully programmable interrupt generator to inform the system upon certain events;

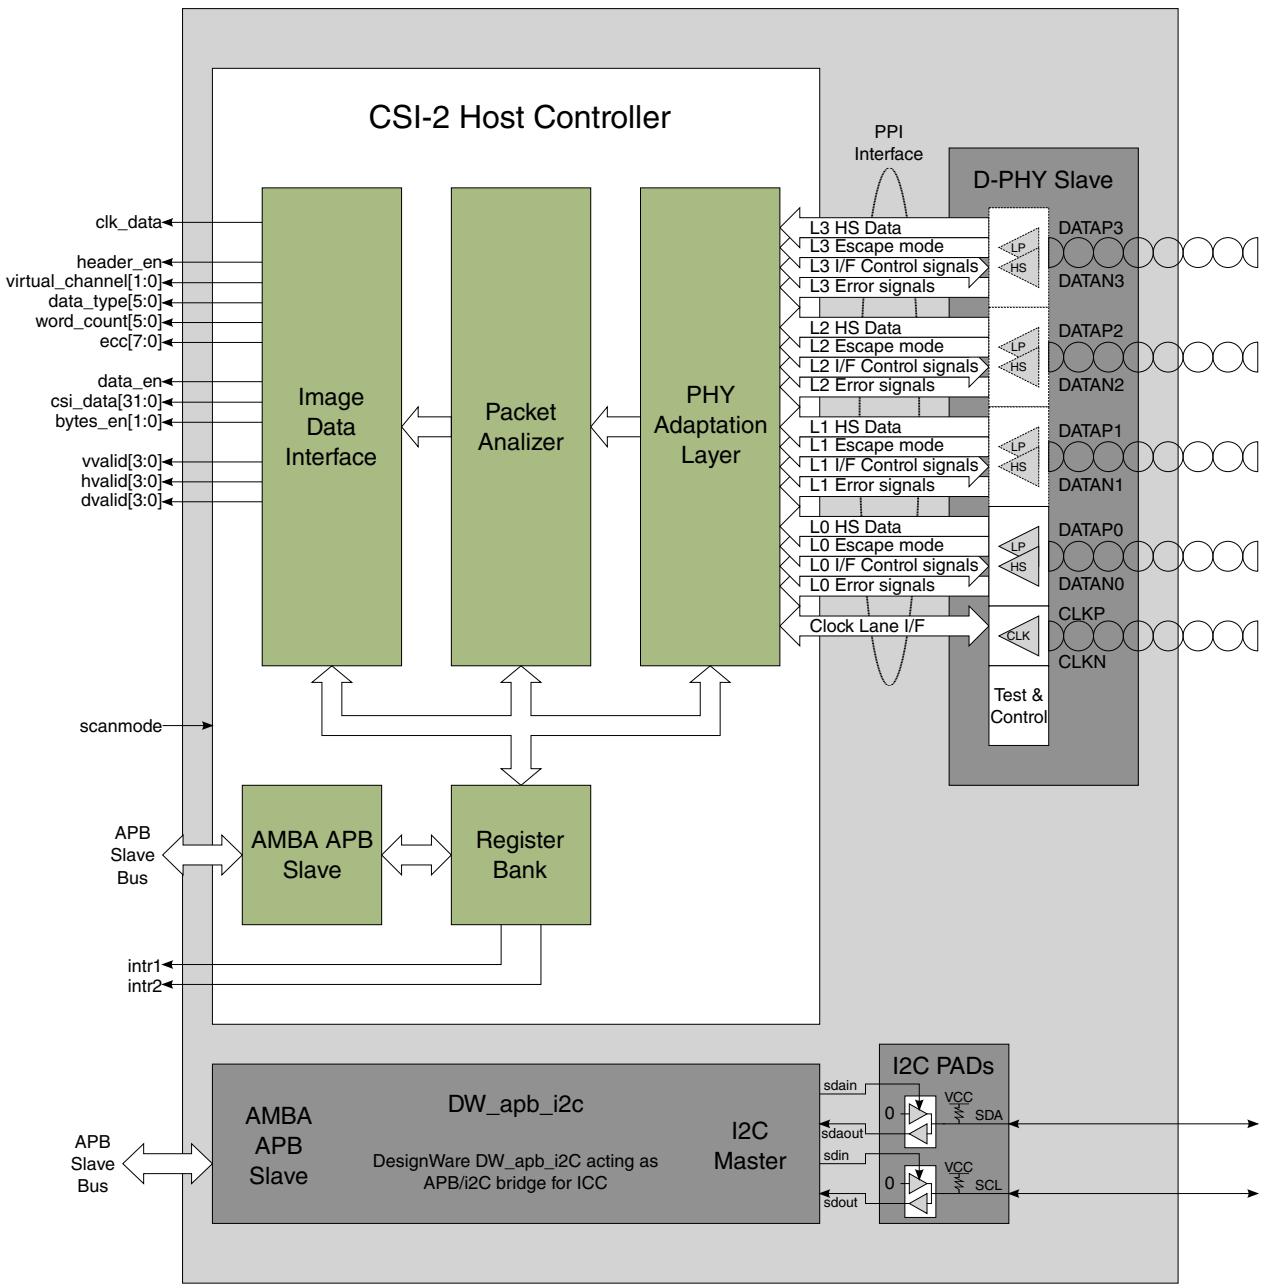

Figure 40-2. Architecture of the CSI-2 Host Controller.

40.3.1 Startup Sequence

The following information is provided as a guideline to allow a safe startup of the system operation.

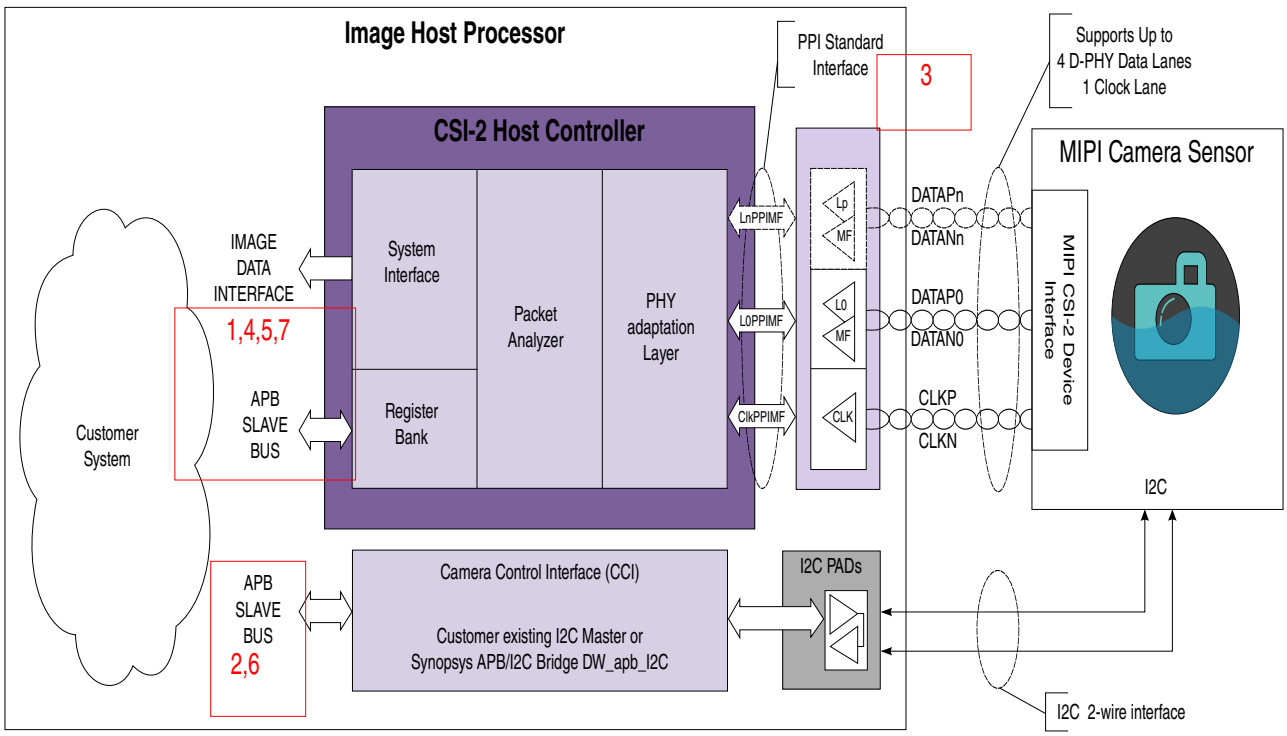

Figure 40-3. Block diagram presenting the recommended Startup Sequence.

1. Deassert CSI2 presetn signal (global reset);
2. **Configure MIPI Camera Sensor to have all Tx lanes in PL-11 state (STOPSTATE) if required** - According to D-PHY Specification the D-PHY master should be initialized at LP-11 state (STOPSTATE), nevertheless a CCI command may be required to switch-on the MIPI interface;
3. **D-PHY initialization** - Access the D-PHY programming interface to initialize and program the D-PHY according to the selected operating mode of the D-PHY. This is D-PHY dependent, and this programming should be carried out according to the D-PHY databook;
4. **CSI2 Controller programming** - Program the CSI2 Host Controller registers according to the operating mode required:
   - **Number of Lanes (register N_LANES);**
   - **Deassert PHY shutdown (register PHY_SHUTDOWNZ);**
   - **Deassert PHY reset (register PHY_RSTZ);**
   - **Deassert CSI reset (register CSI2_RESETN);**

- **(Optional) Program Data IDs for matching error reporting (registers DATA_IDS_1 and DATA_IDS_2);**
- **(Optional) Program the interrupt masks (registers MASK1 and MASK2);**

5. **CSI2 Controller programming** - Read the PHY status register (PHY_STATE) to confirm that all data and clock lanes of the D-PHY are in Stop State (i.e. ready to receive data);
6. **Configure the MIPI Camera Sensor** - Access Camera Sensor using CCI interface to initialize and configure the Camera Sensor to start transmitting a clock on the D-PHY clock lane;
7. **CSI2 Controller programming** - Read the PHY status register (PHY_STATE) to confirm that the D-PHY is receiving a clock on the D-PHY clock lane;

NOTE

Additional steps may be required to correctly configure the specific D-PHY and MIPI Camera Sensor(s) that are part of the system, as well as any other requirements that is integral part of the relevant MIPI Specifications.

40.3.2 Interrupt mechanism

The CSI-2 Host Controller provides an interrupt mechanism that is usable mostly for monitoring errors and debugging.

There are two interrupt signals, *intr1* and *intr2*, which are synchronous with the AMBA-APB clock signal. Registers MASK1 and MASK2 are used to select which bits of registers ERR1 and ERR2 are able to generate interrupts by asserting signals *intr1* and *intr2*, respectively. Both ERR1 and ERR2 will always contain the information of events, irrespective of the state of MASK1 and MASK2. Registers ERR1 and ERR2 will self-clear after a read access. Interrupt signals *intr1* and *intr2* will be de-asserted upon read access of register ERR1 and ERR2, respectively.

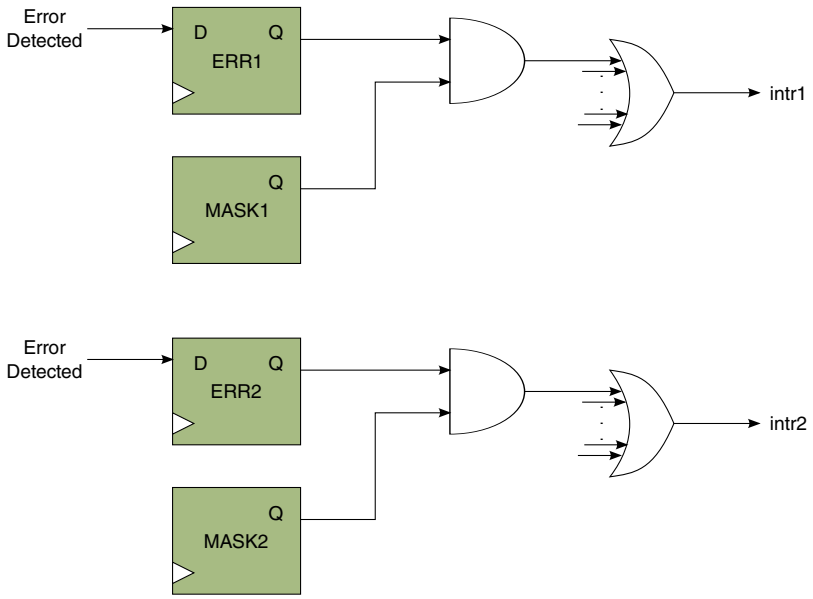

Figure 40-4. Block Diagram presenting the Interrupt mechanism.

40.3.3 Signals

Table 40-1. D-PHY External interface signals

Pin Name	Width	Direction	Description
AVDD	1	Input	D-PHY Analog power supply.
VDD	1	Input	D-PHY Digital power supply.
AVDDREF	1	Input	D-PHY Analog supply for reference generator.
AGND	1	Input	D-PHY Analog supply ground return.
VSS	1	Input	D-PHY Digital supply ground return.
AGNDREF	1	Input	D-PHY Analog supply ground return for reference generator.
REXT	1	Input	D-PHY External resistor connection.
CSI2_CLKP	1	Input	D-PHY Positive D-Phy differential clock line Receiver input
CSI2_CLKN	1	Input	D-PHY Negative D-Phy differential clock line Receiver input
CSI2_DATAP0	1	Input	D-PHY Positive D-Phy differential data line Receiver input , Lane 0
CSI2_DATAN0	1	Input	D-PHY Negative D-Phy differential data line Receiver input , Lane 0
CSI2_DATAP1	1	Input	D-PHY Positive D-Phy differential data line Receiver input , Lane 1
CSI2_DATAN1	1	Input	D-PHY Negative D-Phy differential data line Receiver input , Lane 1

Table continues on the next page...

Table 40-1. D-PHY External interface signals (continued)

CSI2_DATAP2	1	Input	D-PHY Positive D-Phy differential data line Receiver input , Lane 2
CSI2_DATAN2	1	Input	D-PHY Negative D-Phy differential data line Receiver input , Lane 2
CSI2_DATAP3	1	Input	D-PHY Positive D-Phy differential data line Receiver input , Lane 3
CSI2_DATAN3	1	Input	D-PHY Negative D-Phy differential data line Receiver input , Lane 3

40.4 Timing Interfaces

40.4.1 Image Data Interface

At the Image Data Interface, signal *header_en* is used to indicate that new data is being transferred. It rises when a new packet becomes available at the interface and falls as soon as a packet finishes. Between two consecutive packets, there is always a fall and a rise of *header_en*, since the CSI-2 transmitter must enter Low-Power State between an End of Transmission and the following Start of Transmission.

An example of transferring two short packets is presented in the following figure. The fields of the header packet become available simultaneously to the rise of *header_en*, which falls after one clock cycle, as no new data is to be transferred. This is the behavior of the circuit, independently of the number of active lanes.

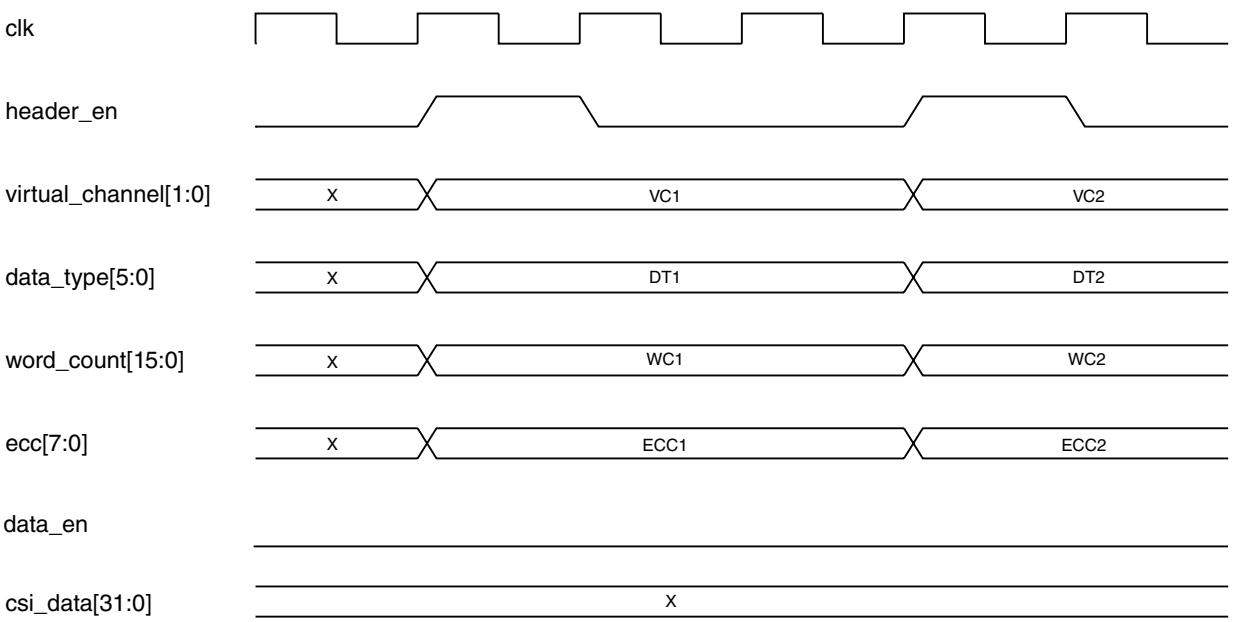

Figure 40-5. Image Data Interface example with two short packets.

When transferring long packets, the data provided by the payload on all lanes is transferred separately on *csi_data* bus, while the header fields remain stable until the transfer of the packet has completed.

Signal *data_en* is used to indicate that a new 32-bit word is available in *csi_data*, and it can only be set if *header_en* is also set. The following Figure shows an example of transferring a long packet received from 4 data lanes. Since a new 32-bit word is transferred at each clock cycle, signal *data_en* remains set until all data is transferred.

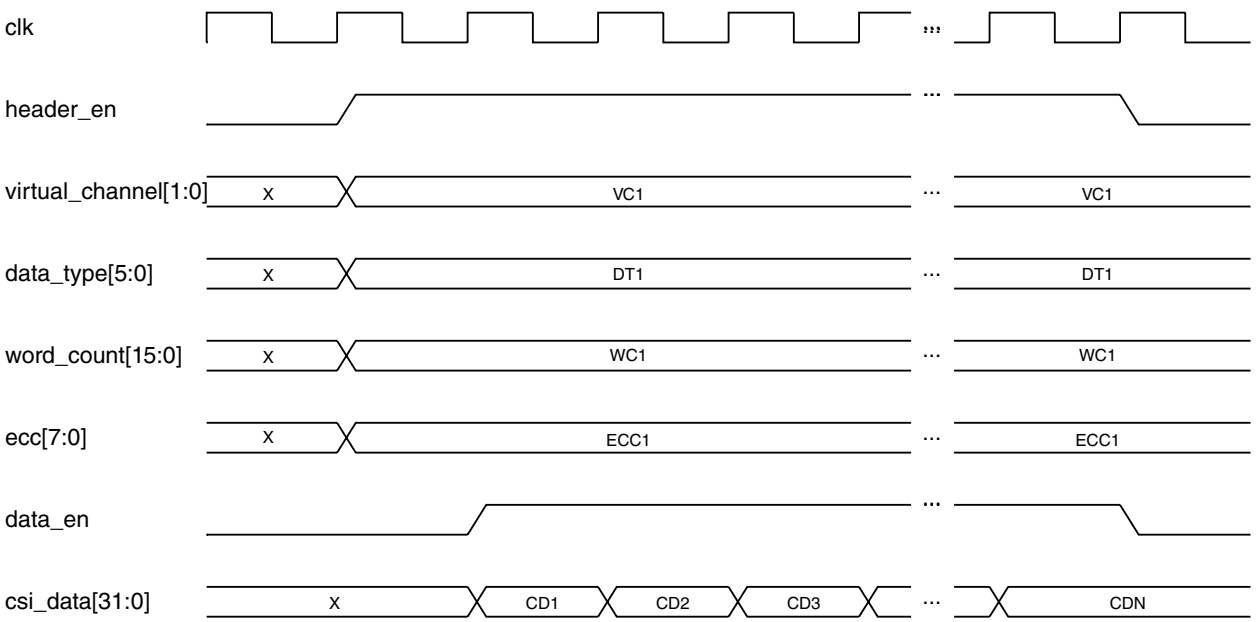

Figure 40-6. Timing interface for a long packet, receiving data from 4 lanes.

If less than 4 lanes are used, a 32-bit word might take more than one clock cycle to be received. In this case, *data_en* is set only when a new word has been fully received and becomes available at the interface. As shown in the following figure, when data is received from two lanes a new word is released every two clock cycles. Both *header_en* and *data_en* return to 0 as soon as all the data has been transferred.

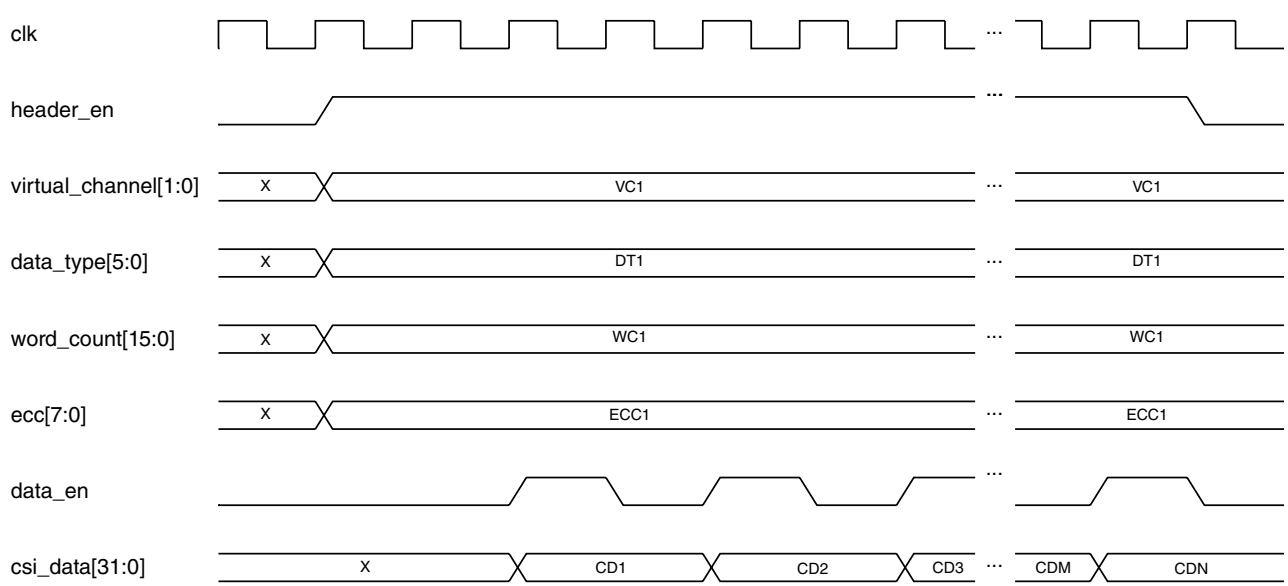

Figure 40-7. Timing interface for a long packet, receiving data from 2 lanes.

If data is transferred using only 1 lane, a new 32-bit word becomes available every four clock cycles. In the case of 3 lanes, a new word is available at clock cycle except every fourth.

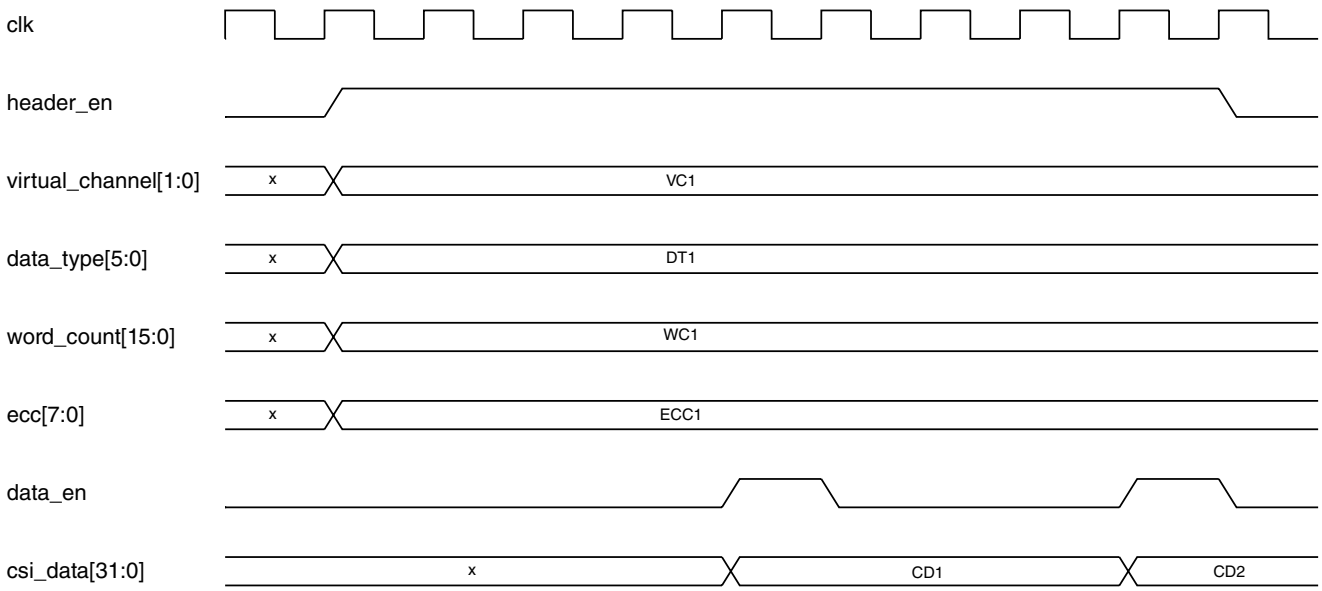

Figure 40-8. Timing interface for a long packet, receiving data from 1 lane.

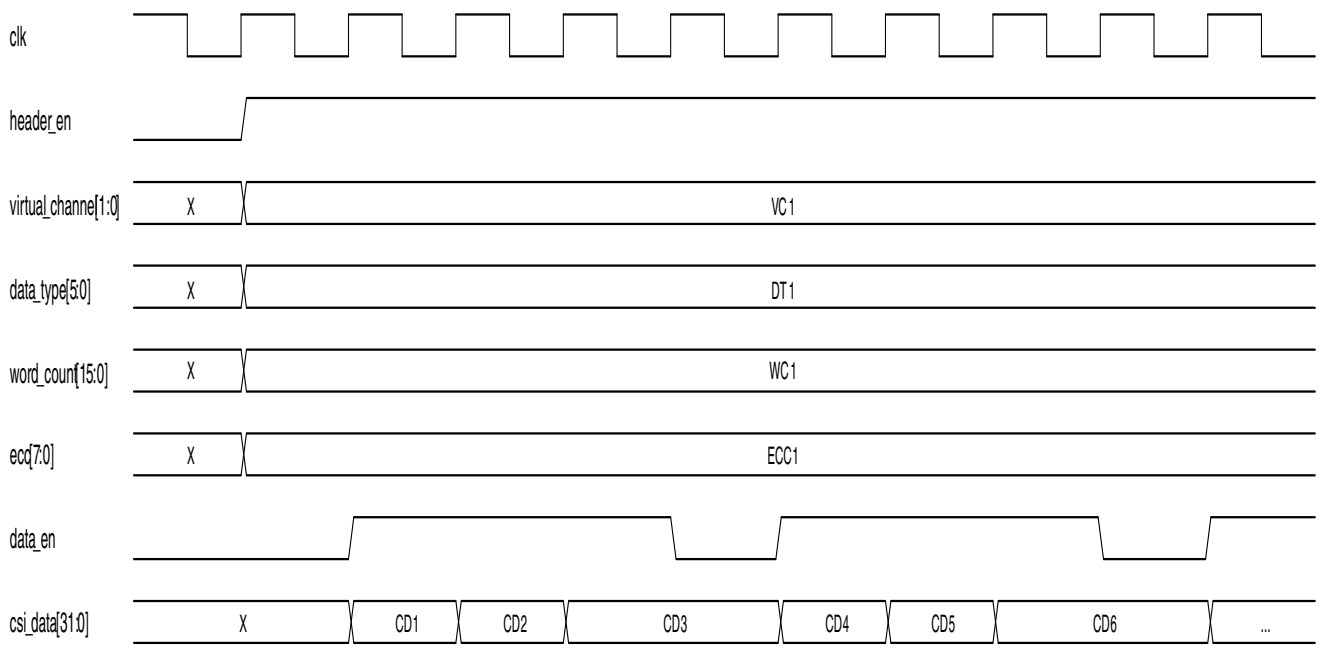

Figure 40-9. Timing interface for a long packet, receiving data from 3 lanes.

Signals *dvalid*, *hvalid* and *vvalid*, are used provide information about Frame Start, Frame End, Line Start and Line End packets. These signals are included in the interface for synchronization purposes.

dvalid is used to indicate when data is being transferred, excluding header information. Data sent through Blank or Null packets do not activate *dvalid*.

hvalid is set on detection of Line Start packets and unset by Line End ones. These packets can be used as a reference for synchronization, even though relevant data can be more or less delayed between them, as it might be surrounded by Blanking Periods, before and after the data. Because Line Start and Line End packets are optional, in case they are not available, *hvalid* adopts the same behavior of *dvalid*, and is not activated by Blank or Null packets. In the case a new Line Start packet is received without a Line End packet being received, a pulse will be generated in *hvalid* to signal that a new Line Start packet was received.

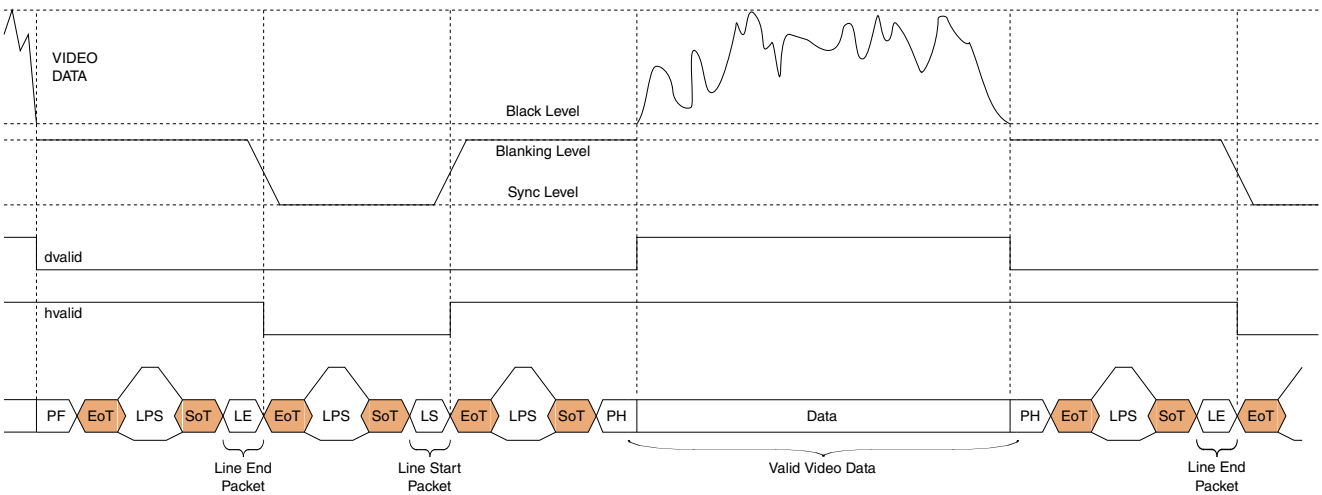

Figure 40-10. HVALID synchronization signal.

vvalid is set on detection of Frame Start packets and unset by Frame End ones. As these packets are mandatory, *vvalid* is always reliable for video applications to synchronize frame updating. In the case a new Frame Start packet is received without a Frame End packet being received, a pulse will be generated in *hvalid* to signal that a new Frame Start packet was received.

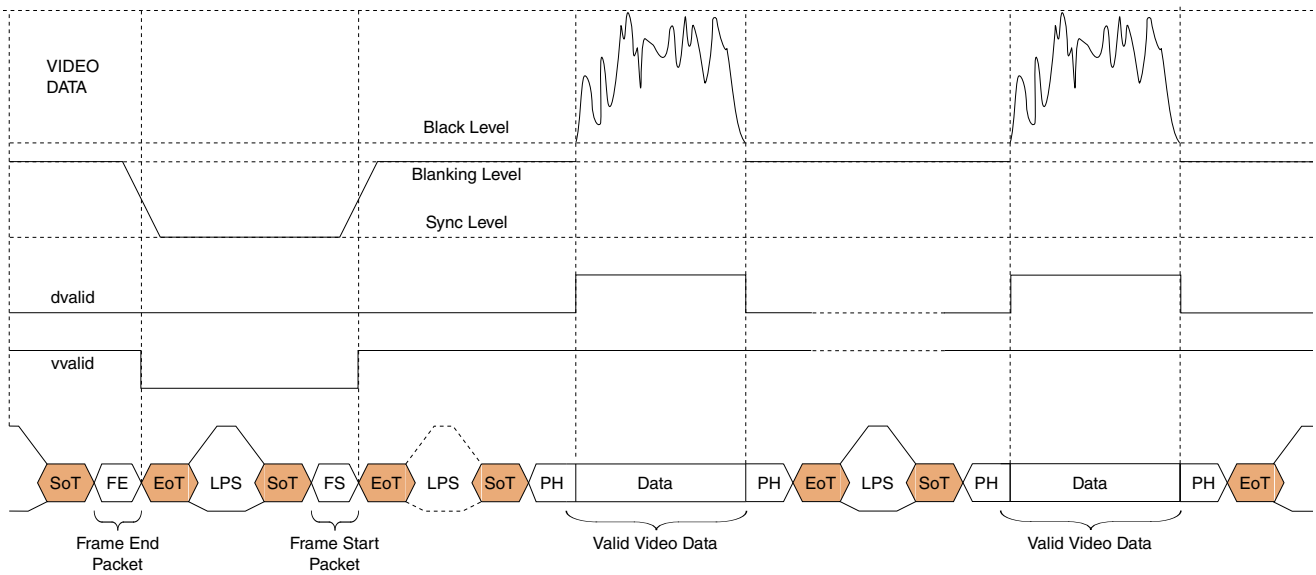

Figure 40-11. VVALID synchronization signal.

40.5 Payload Data Output Format

The Image Data Interface delivers payload data in a common data storage format, as suggested in CSI-2 Specification and described below.

The following sections describe how different data formats are transferred in output bus *csi_data*.

40.5.1 General/Arbitrary Data Reception

In the generic case and for arbitrary data, the first byte of payload data transmitted maps the least significant byte of the 32-bit memory word and the fourth byte of payload data transmitted maps to the most significant byte of the 32-bit memory word.

The following Figure illustrates the generic CSI-2 byte to 32-bit memory word mapping rule.

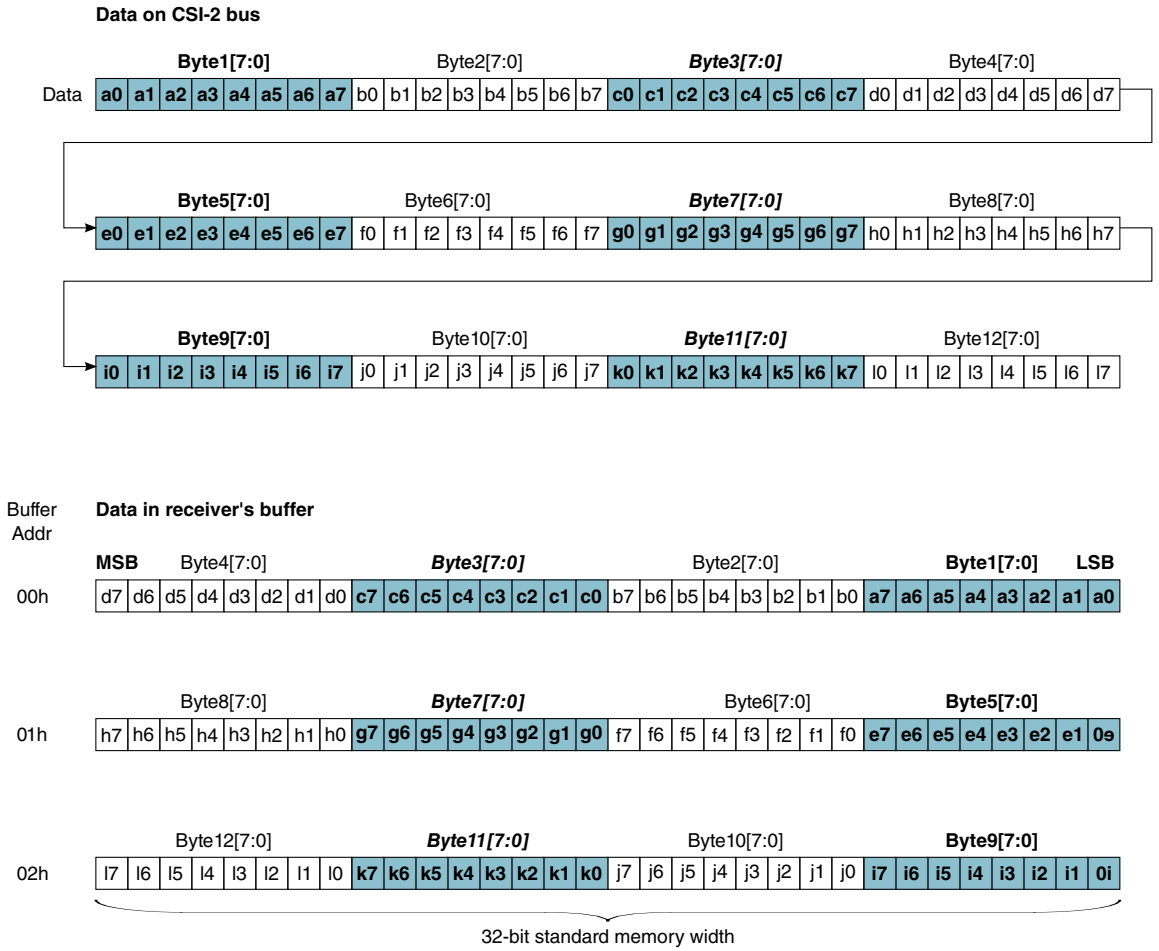

Figure 40-12. General/Arbitrary Data Reception.

40.5.2 RGB888 Data Reception

The RGB888 data format byte to 32-bit memory word mapping follows the generic CSI-2 rule.

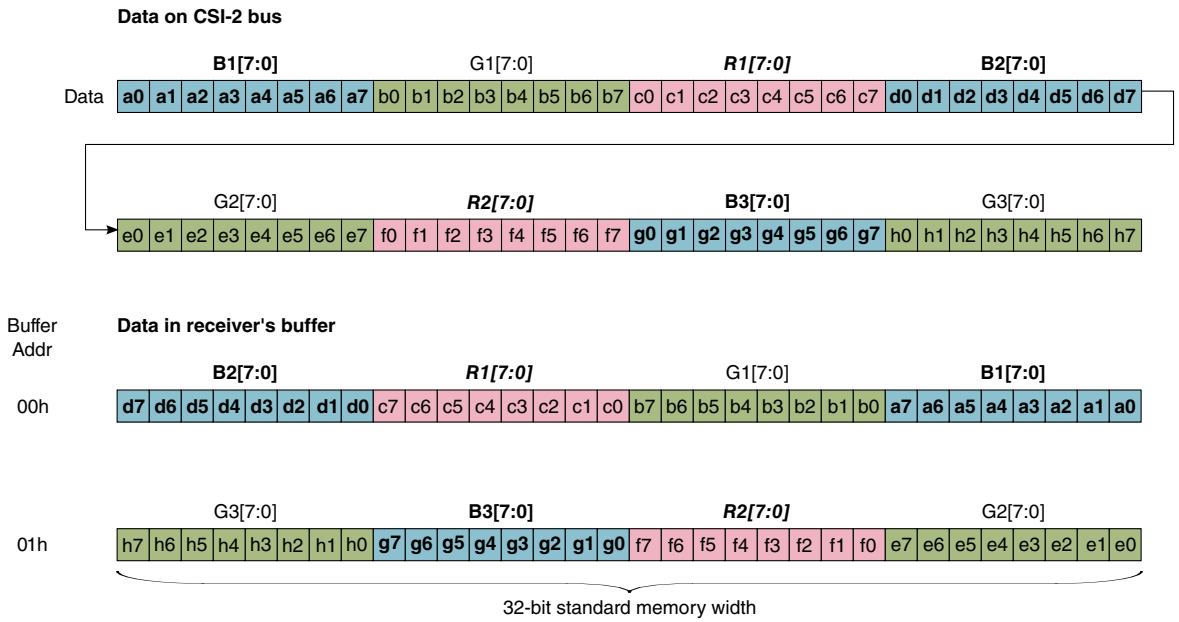

Figure 40-13. RGB888 Data Format Reception.

40.5.3 RGB666 Data Reception

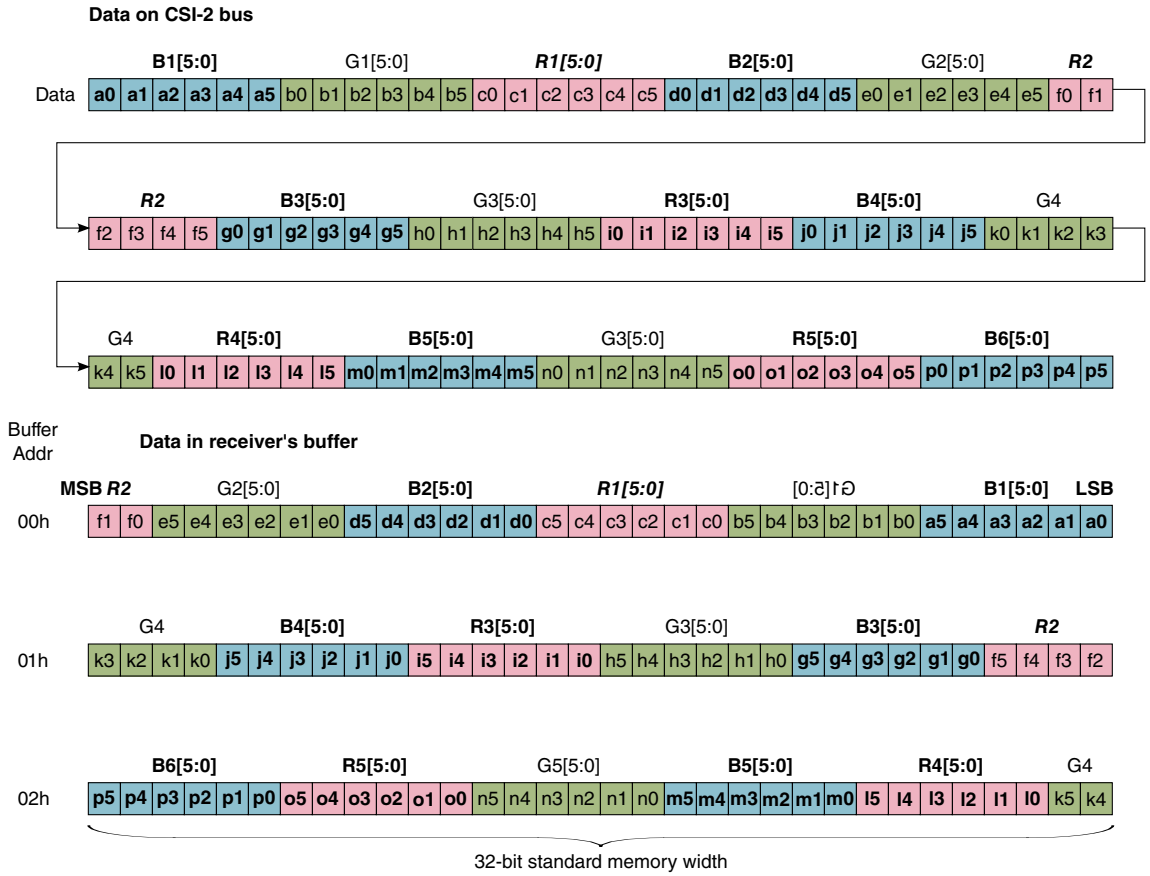

Figure 40-14. RGB666 Data Format Reception.

40.5.4 RGB565 Data Reception

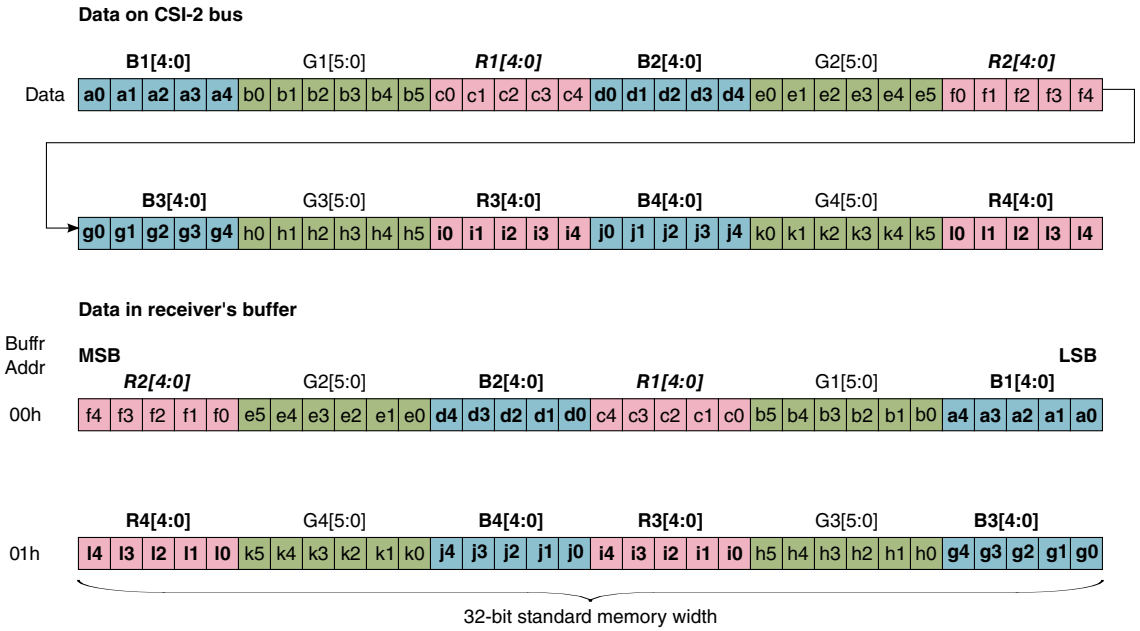

Figure 40-15. RGB565 Data Format Reception.

40.5.5 RGB555 Data Reception

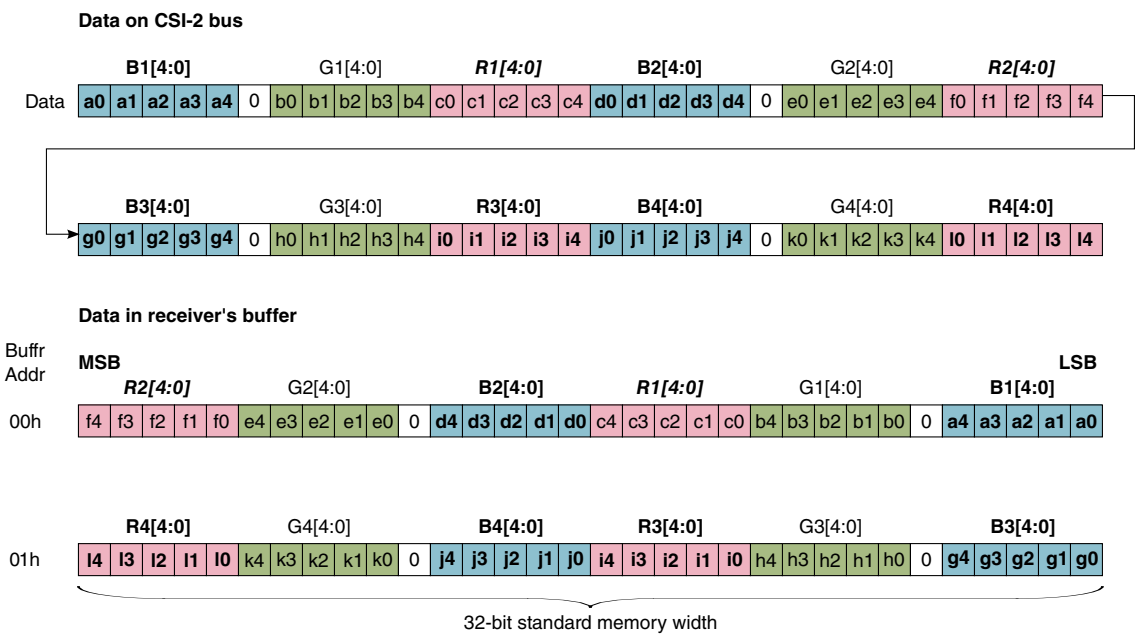

Figure 40-16. RGB555 Data Format Reception.

40.5.6 RGB444 Data Reception

The RGB444 data format byte to 32-bit memory word mapping has a special transform as shown in the following Figure:

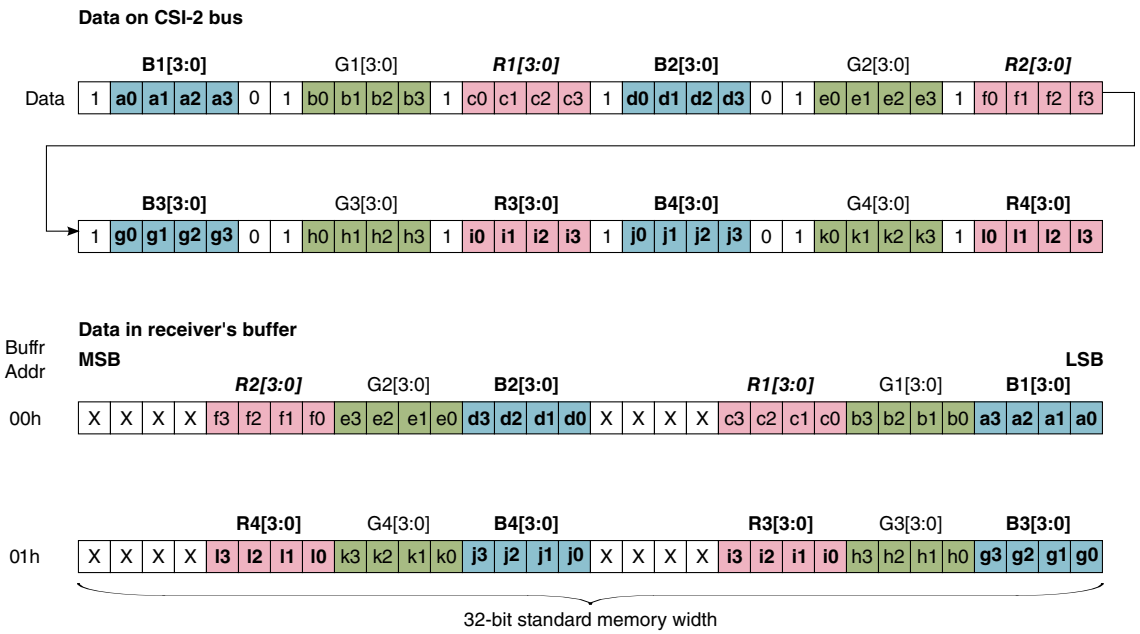

Figure 40-17. RGB444 Data Format Reception.

40.5.7 YUV422 8-bit Data Reception

The YUV422 8-bit data format the byte to 32-bit memory word mapping does not follow the generic CSI-2 rule.

For YUV422 8-bit data format the first byte of payload data transmitted maps the most significant byte of the 32-bit memory word and the fourth byte of payload data transmitted maps to the least significant byte of the 32-bit memory word.

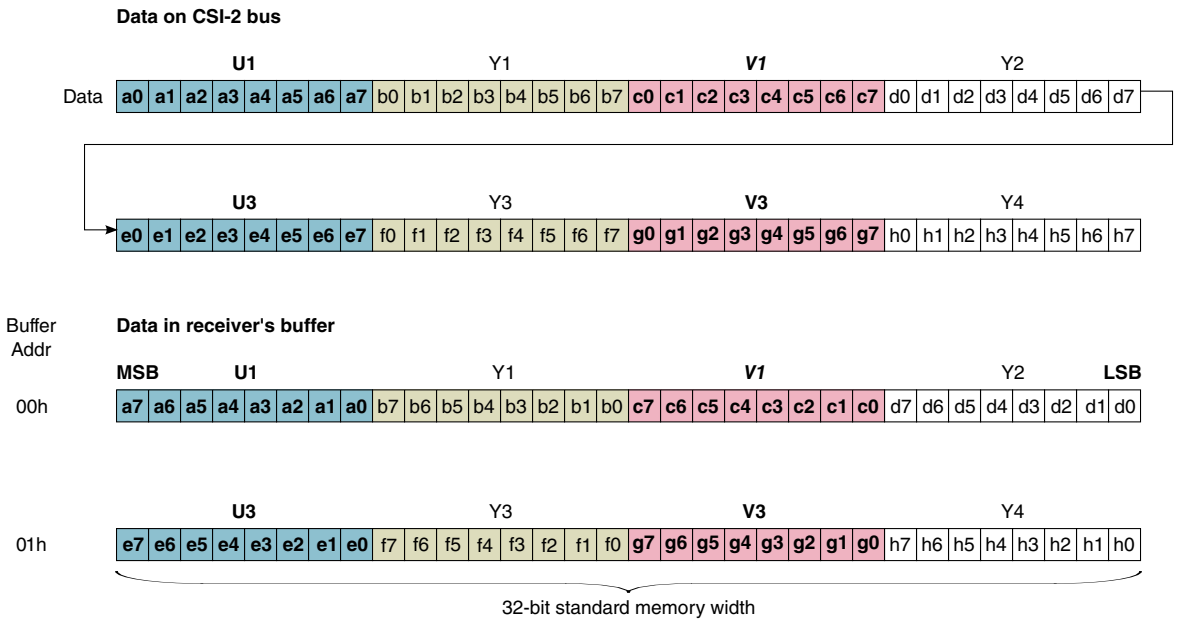

Figure 40-18. YUV422 8-bit Data Format Reception.

40.5.8 YUV422 10-bit Data Reception

The YUV422 10-bit data format the byte to 32-bit memory word mapping follows the generic CSI-2 rule.

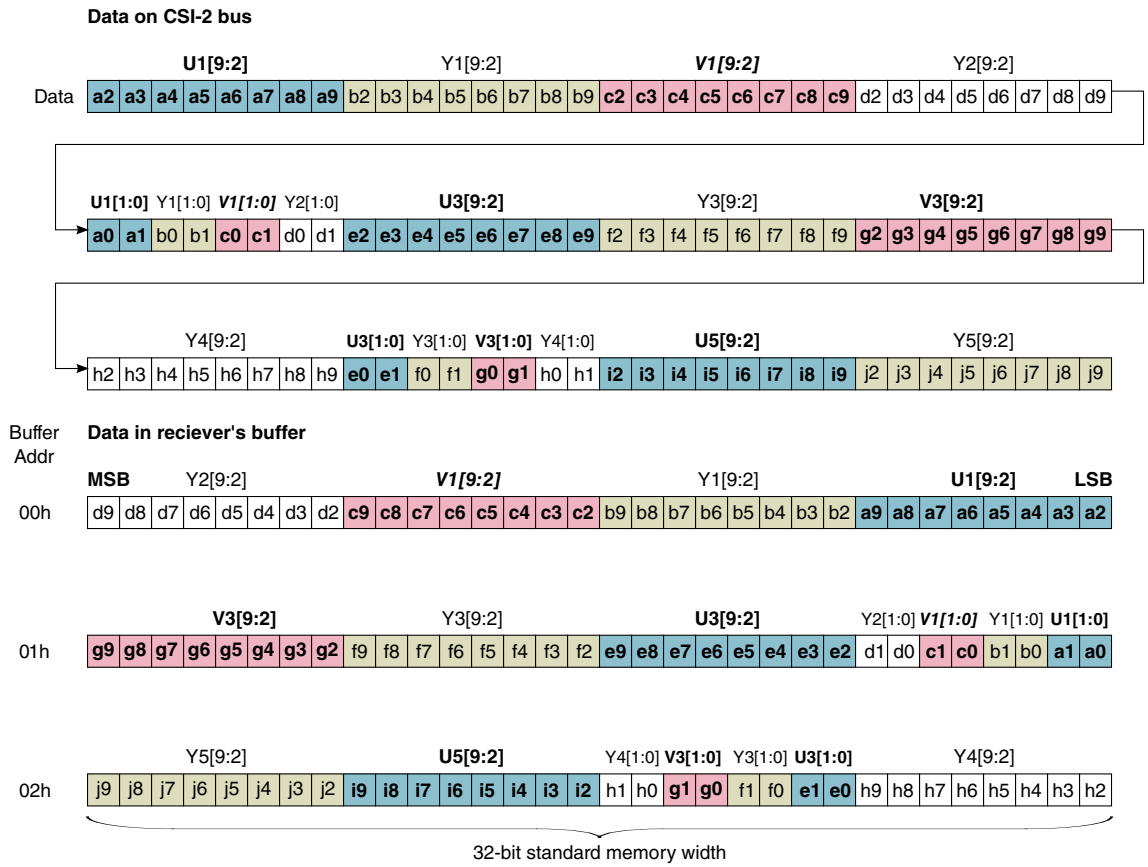

Figure 40-19. YUV422 10-bit Data Format Reception.

40.5.9 YUV420 8-bit (Legacy) Data Reception

The YUV420 8-bit (legacy) data format the byte to 32-bit memory word mapping does not follow the generic CSI-2 rule.

For YUV422 8-bit (legacy) data format the first byte of payload data transmitted maps the MS byte of the 32-bit memory word and the fourth byte of payload data transmitted maps to the LS byte of the 32-bit memory word.

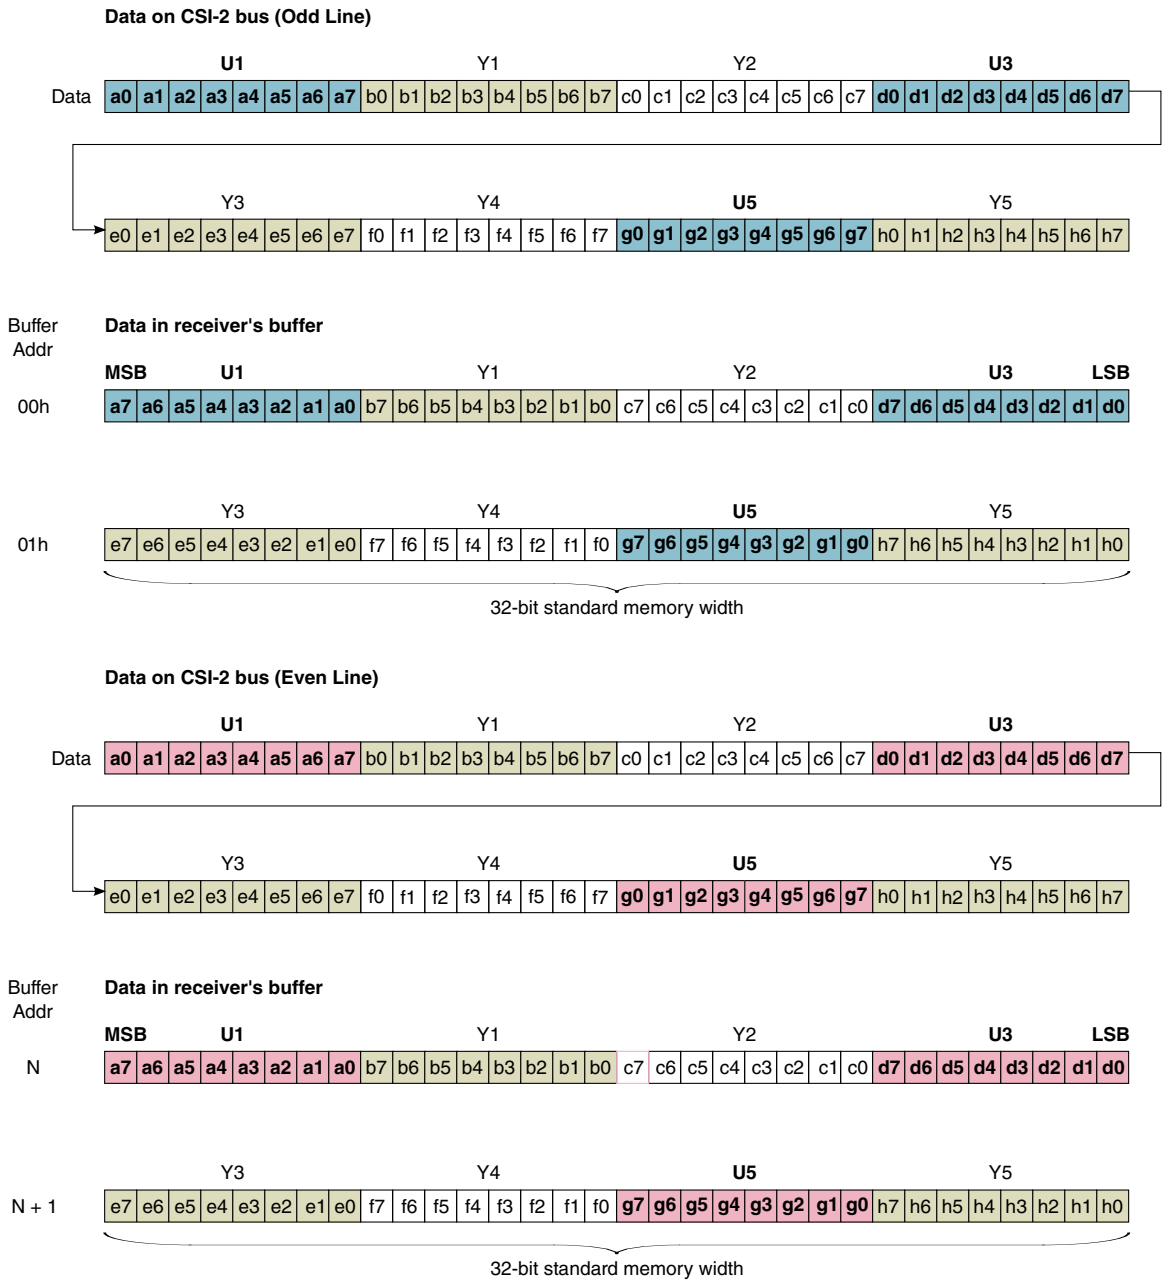

Figure 40-20. YUV420 8-bit Legacy Data Format Reception.

40.5.10 YUV420 8-bit Data Reception

The YUV420 8-bit data format the byte to 32-bit memory word mapping follows the generic CSI-2 rule.

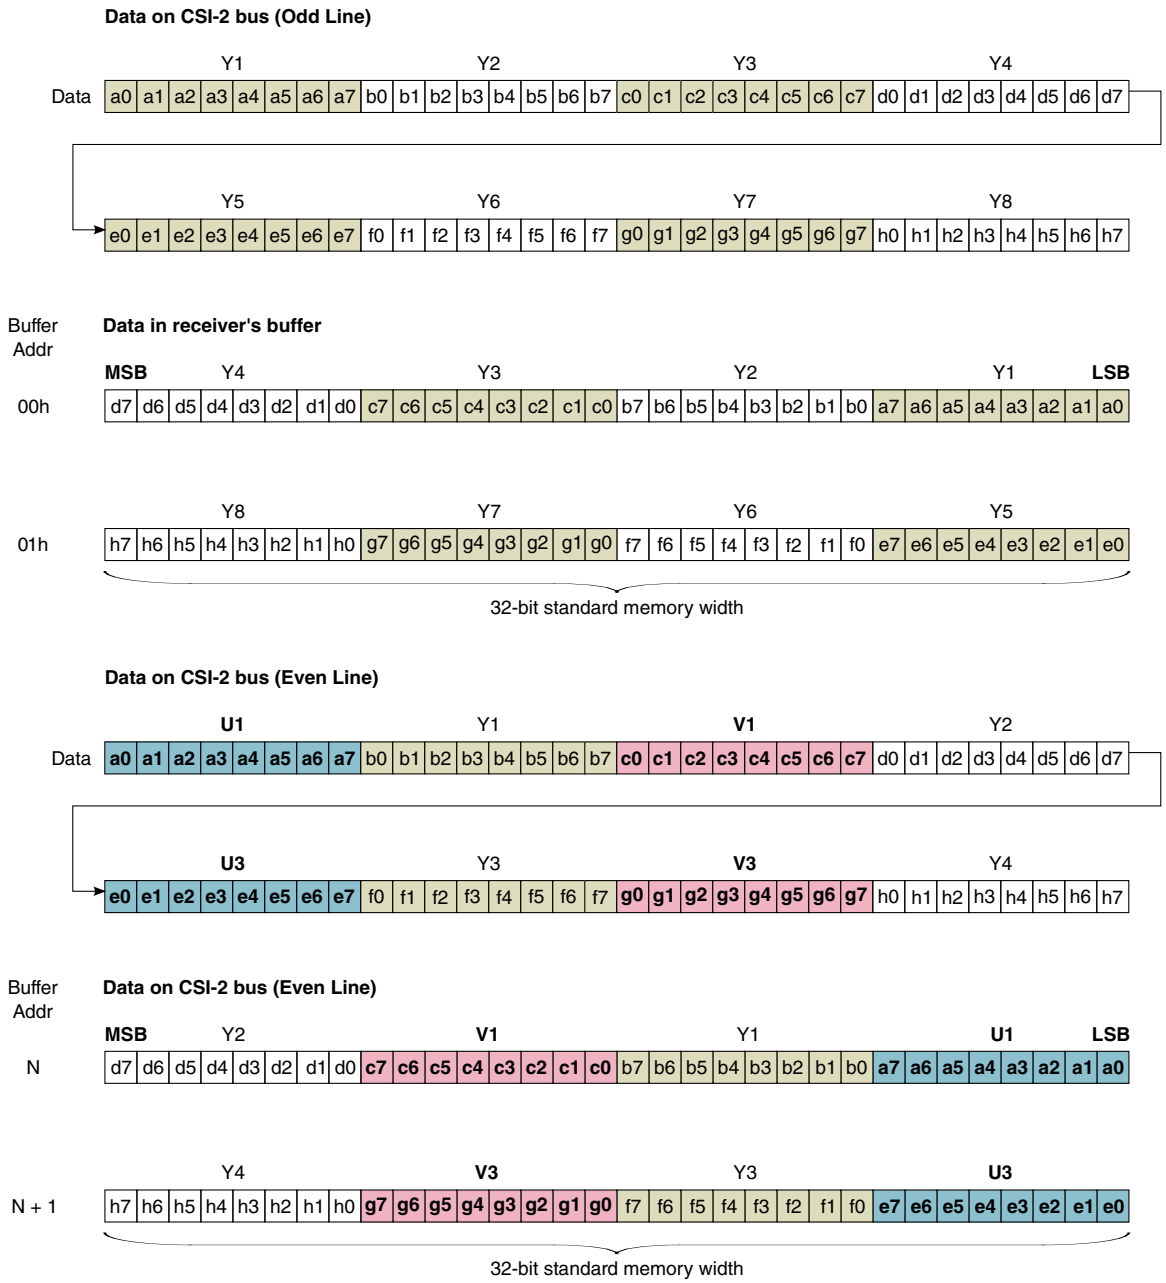

Figure 40-21. YUV420 8-bit Data Format Reception.

40.5.11 YUV420 10-bit Data Reception

The YUV420 10-bit data format the byte to 32-bit memory word mapping follows the generic CSI-2 rule.

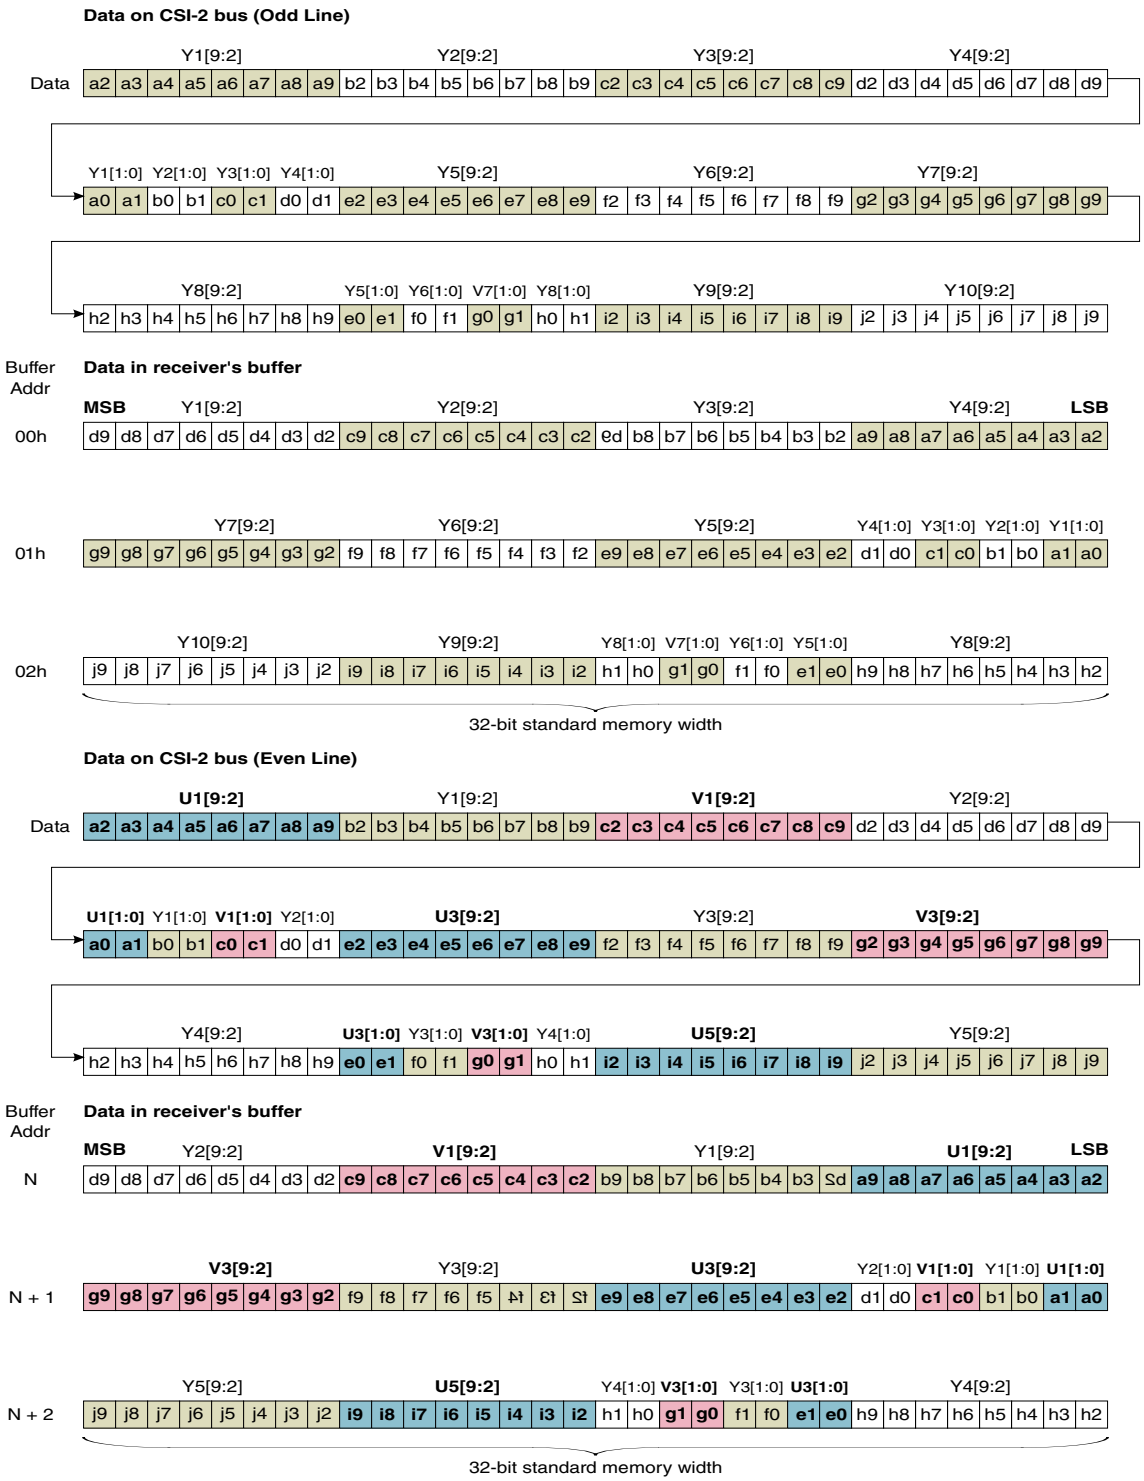

Figure 40-22. YUV420 10-bit Data Format Reception.

40.5.12 RAW6 Data Reception

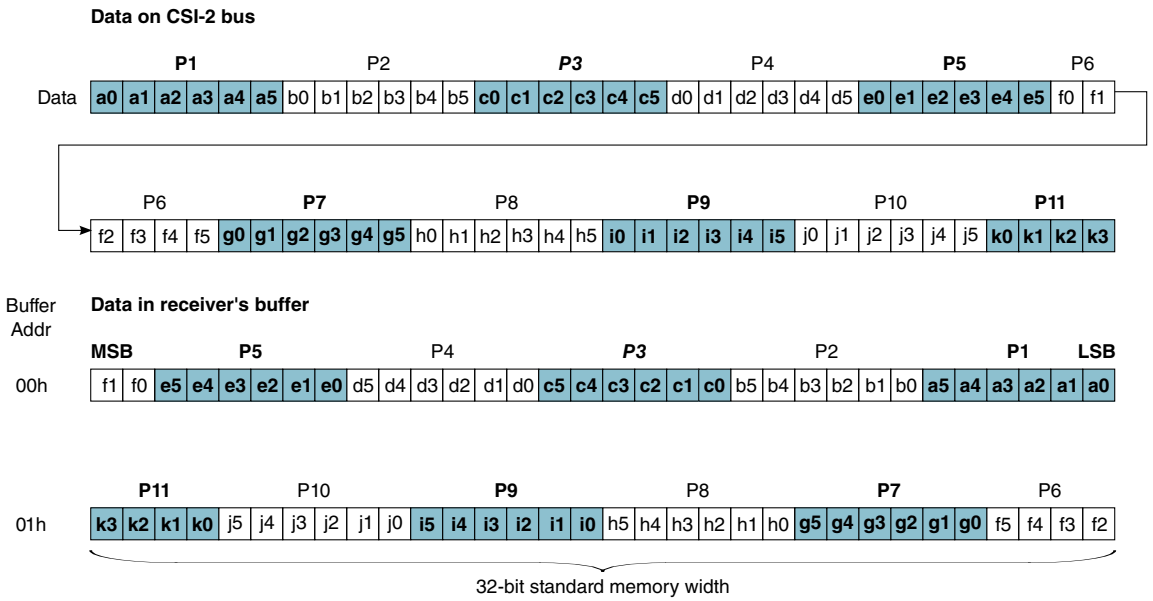

Figure 40-23. RAW6 Data Format Reception.

40.5.13 RAW7 Data Reception

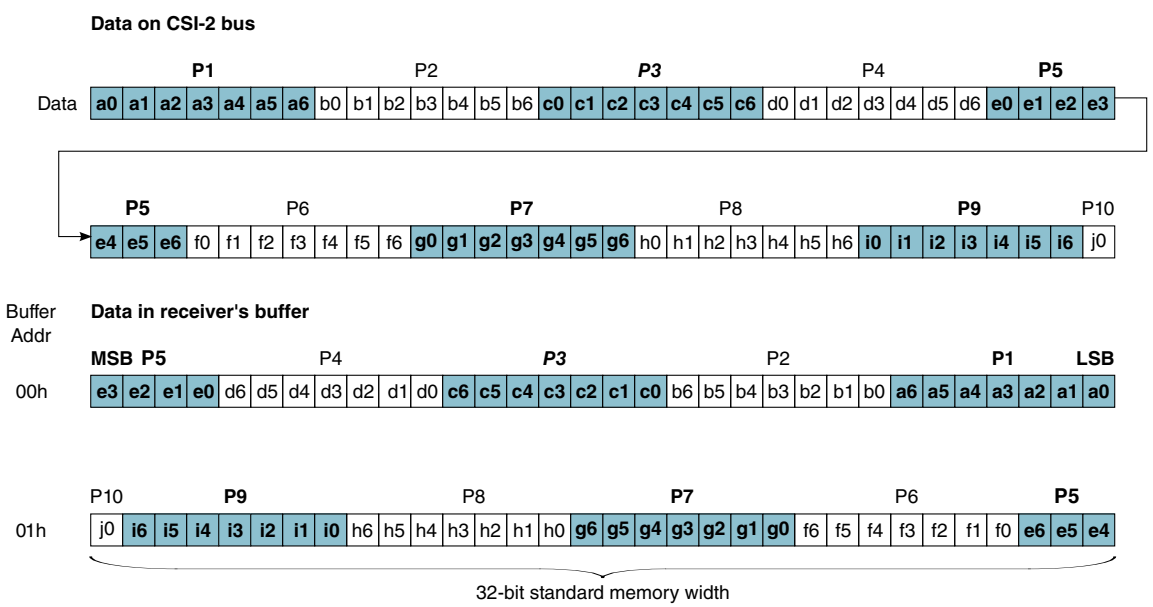

Figure 40-24. RAW7 Data Format Reception.

40.5.14 RAW8 Data Reception

The RAW8 data format the byte to 32-bit memory word mapping follows the generic CSI-2 rule.

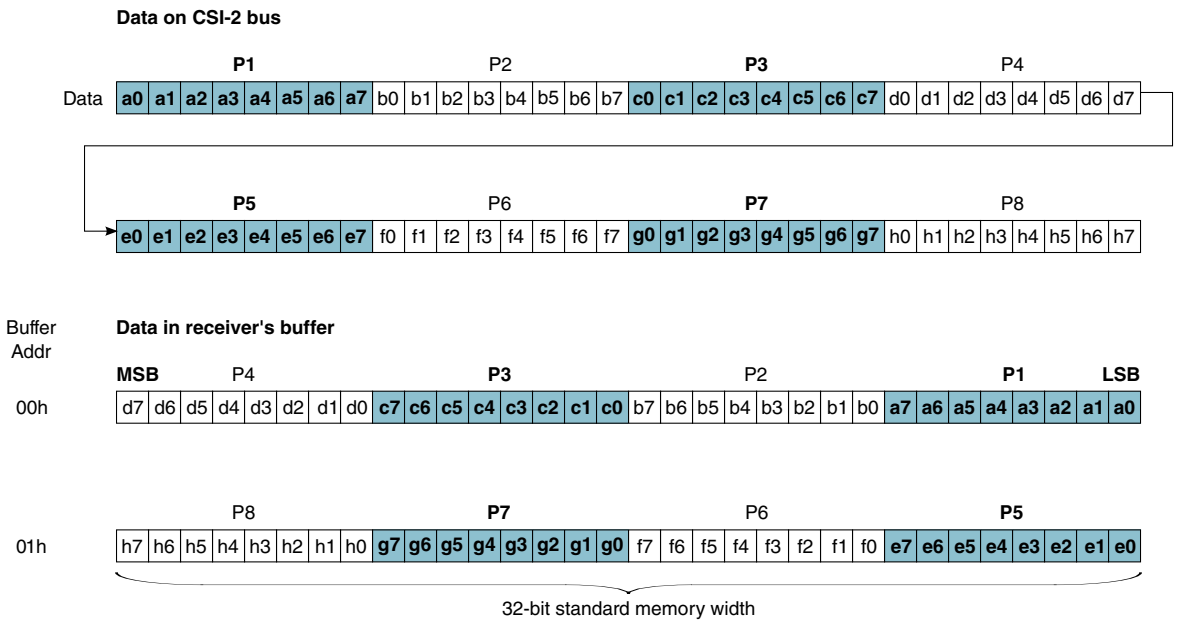

Figure 40-25. RAW8 Data Format Reception.

40.5.15 RAW10 Data Reception

The RAW10 data format the byte to 32-bit memory word mapping follows the generic CSI-2 rule.

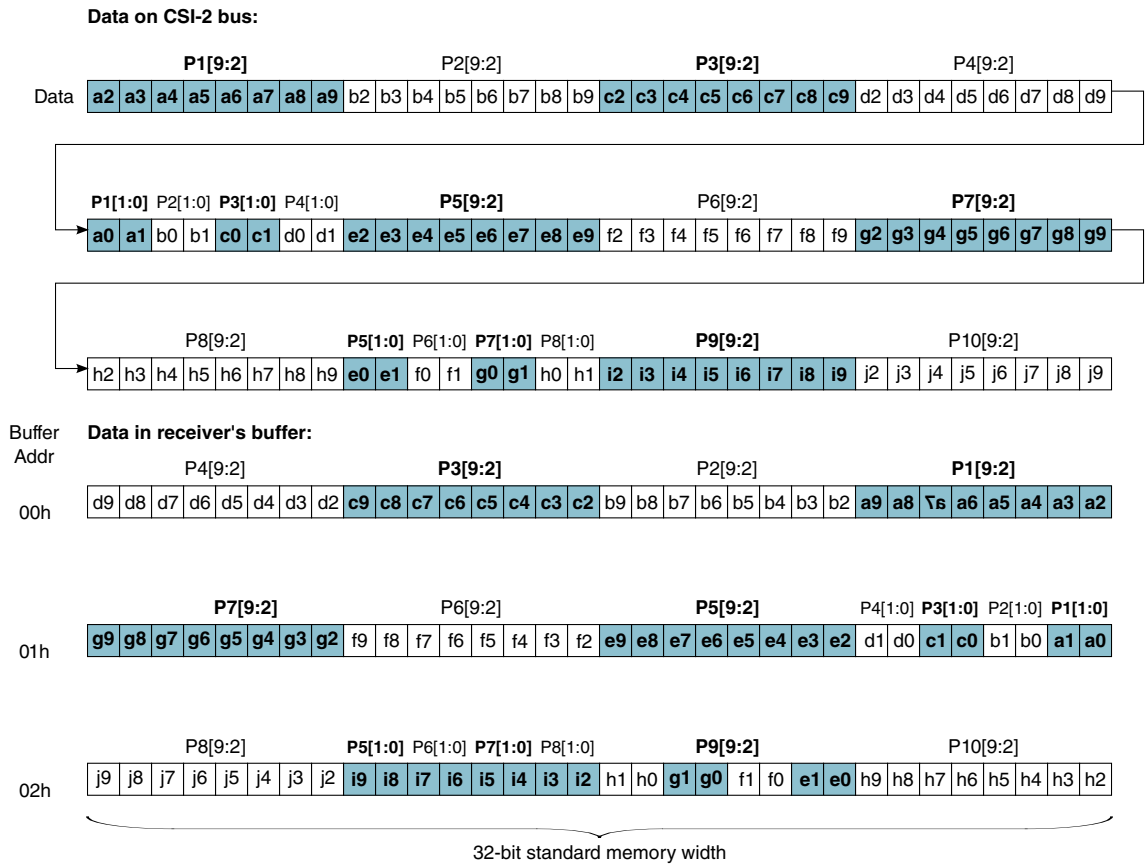

Figure 40-26. RAW10 Data Format Reception.

40.5.16 RAW12 Data Reception

The RAW12 data format the byte to 32-bit memory word mapping follows the generic CSI-2 rule.

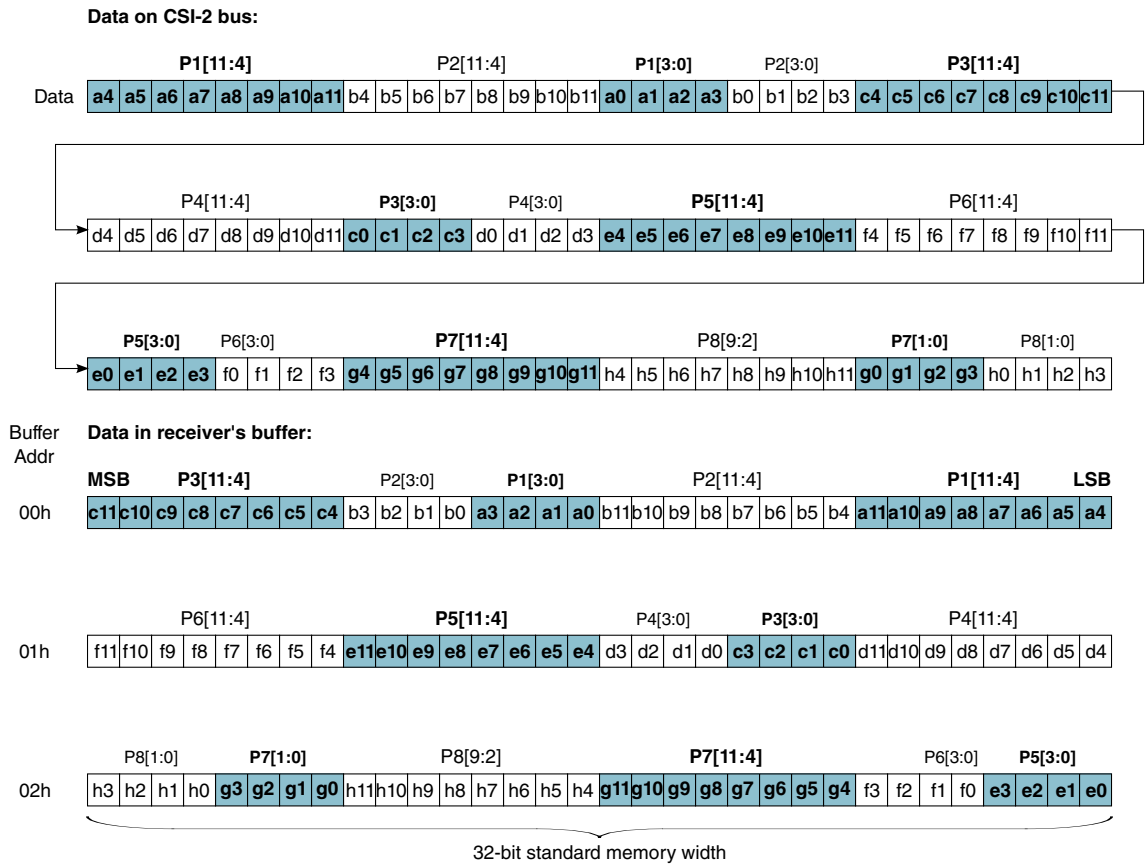

Figure 40-27. RAW12 Data Format Reception.

40.5.17 RAW14 Data Reception

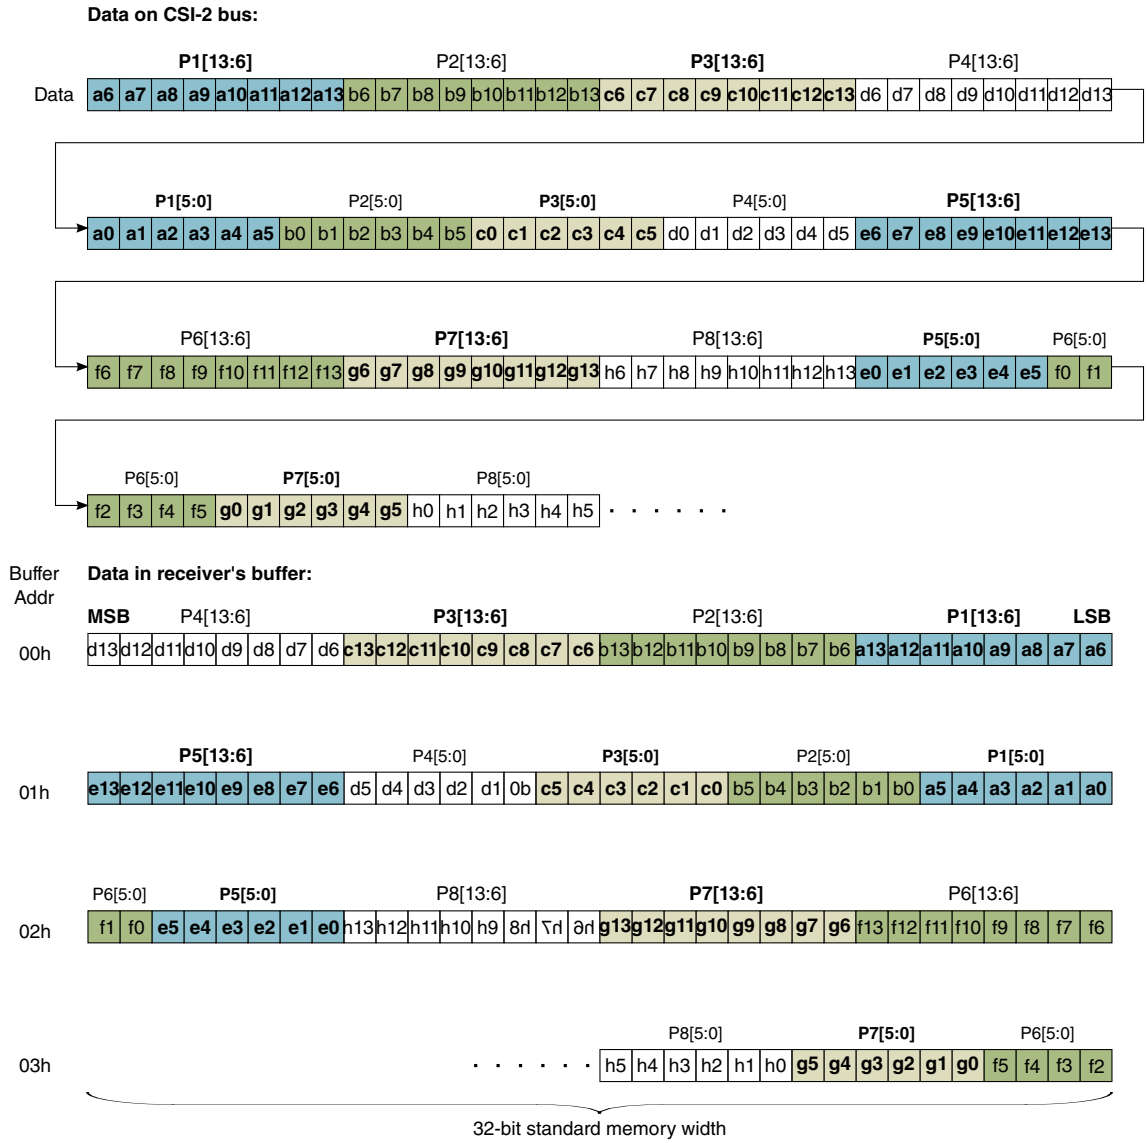

Figure 40-28. RAW 14 Data Format Reception.

40.6 MIPI_CSI Memory Map/Register Definition

MIPI_CSI memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page

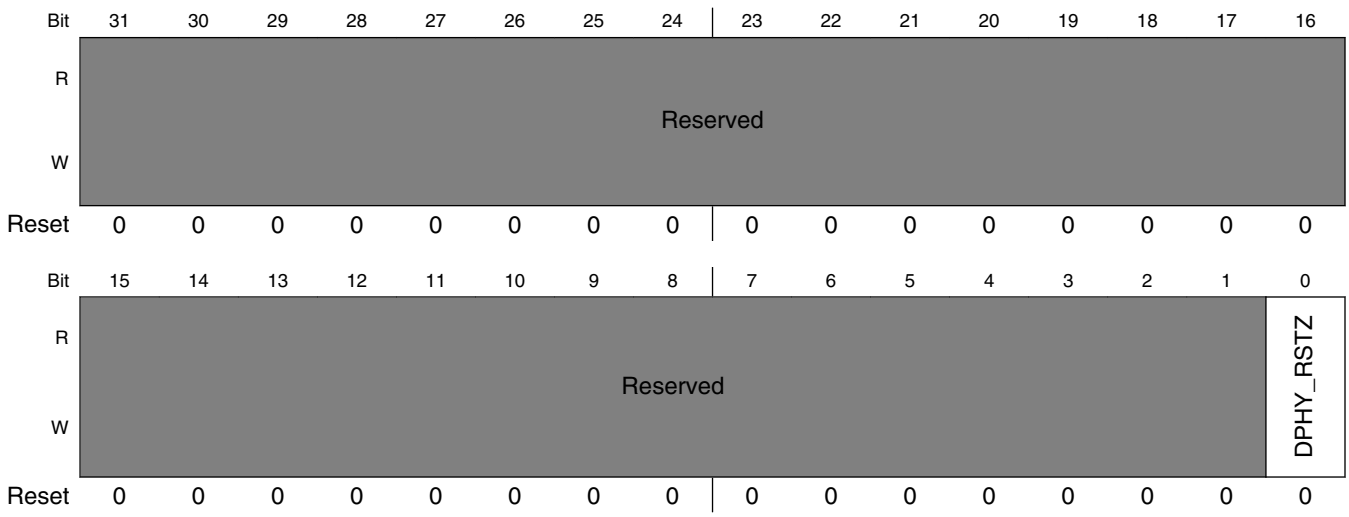
R W	Reserved															PHY_ SHUTDOWNZ
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MIPI_CSI_PHY_SHUTDOWNZ field descriptions

Field	Description
31–1 -	This field is reserved. Reserved
0 PHY_ SHUTDOWNZ	Shutdown input. This line is used to place the complete module in power down. All analog blocks are in power down mode and digital logic is cleared. Active Low **Default Value:** 0

40.6.4 Phy reset control (MIPI_CSI_DPHY_RSTZ)

Address: 21D_C000h base + Ch offset = 21D_C00Ch

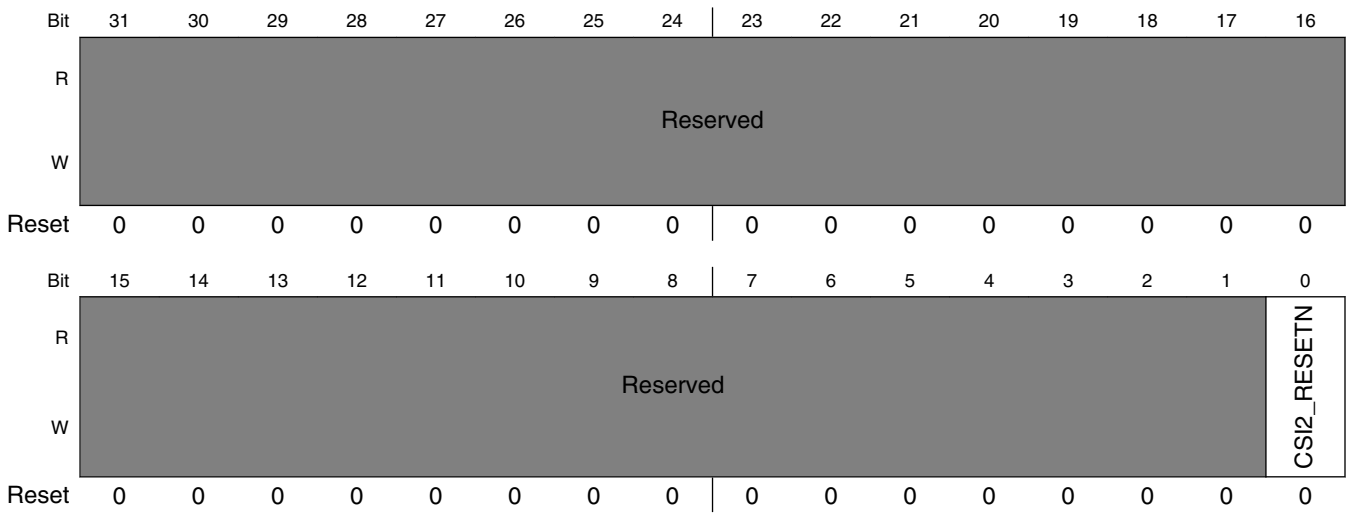


MIPI_CSI_DPHY_RSTZ field descriptions

Field	Description
31–1 -	This field is reserved. Reserved
0 DPHY_RSTZ	DPHY reset output. Active Low **Default Value:** 0

40.6.5 CSI2 controller reset (MIPI_CSI_CSI2_RESETN)

Address: 21D_C000h base + 10h offset = 21D_C010h



MIPI_CSI_CSI2_RESETN field descriptions

Field	Description
31–1 -	This field is reserved. Reserved
0 CSI2_RESETN	CSI-2 controller reset output. Active Low **Default Value:** 0

40.6.6 General settings for all blocks (MIPI_CSI_PHY_STATE)

Address: 21D_C000h base + 14h offset = 21D_C014h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Chapter 41
MIPI DSI Host Controller (MIPI_DSI)

41.1 Overview

The DSI Host Controller is a digital core that implements all protocol functions defined in the MIPI DSI Specification, providing an interface between the System and the MIPI D-PHY, and allowing communication with a MIPI DSI-compliant Display.

41.2 Features

The MIPI DSI Host Controller supports the following features:

Compliant with MIPI Alliance Specification for Display Serial Interface (DSI), Version 1.01.00 - 21 February 2008;

- Fully Compliant with MIPI Alliance Standard for Display Pixel Interface (DPI-2), Version 2.00 15 September 2005 with Pixel Data bus width up to 24bits
- Compliant with MIPI Alliance Standard for Display Bus Interface (DBI-2) Version 2.00 - 29 November 2005. Supported DBI types are:
  - Type B
  - 16bit, 9bit and 8bit Data bus width
- DBI and DPI interface can coexist but only one is operational
- Support all commands defined in MIPI Alliance Specification for Display Command Set (DCS), Version 1.02.00 - 23 July 2009

Interface with MIPI D-PHY following PHY Protocol Interface (PPI), as defined in MIPI Alliance Specification for D-PHY, Version 1.00.00 - 14 May 2009;

Supports up to 2 D-PHY Data Lanes:

- Bidirectional Communication and Escape Mode Support through Data Lane 0.
- Programmable display resolutions, from 160x120(QQVGA) to 1280x720(XVGA).
- Multiple Peripheral Support capability, configurable Virtual Channels.

- Video Mode Pixel Formats, 16bpp(RGB565), 18 bpp(RGB666) packed, 18 bpp(RGB666) loosely, 24 bpp(RGB888).
- Supports the transmission of all generic commands;
- ECC and Checksum capabilities;
- End of Transmission Packet (EoTp) support;
- Supports ultra low power mode
- Schemes for fault recovery.

41.2.1 System Overview

The DSI Host Controller is a digital core that implements all protocol functions defined in the MIPI DSI Specification, providing an interface between the System and the MIPI D-PHY, allowing the communication with a MIPI DSI compliant Display.

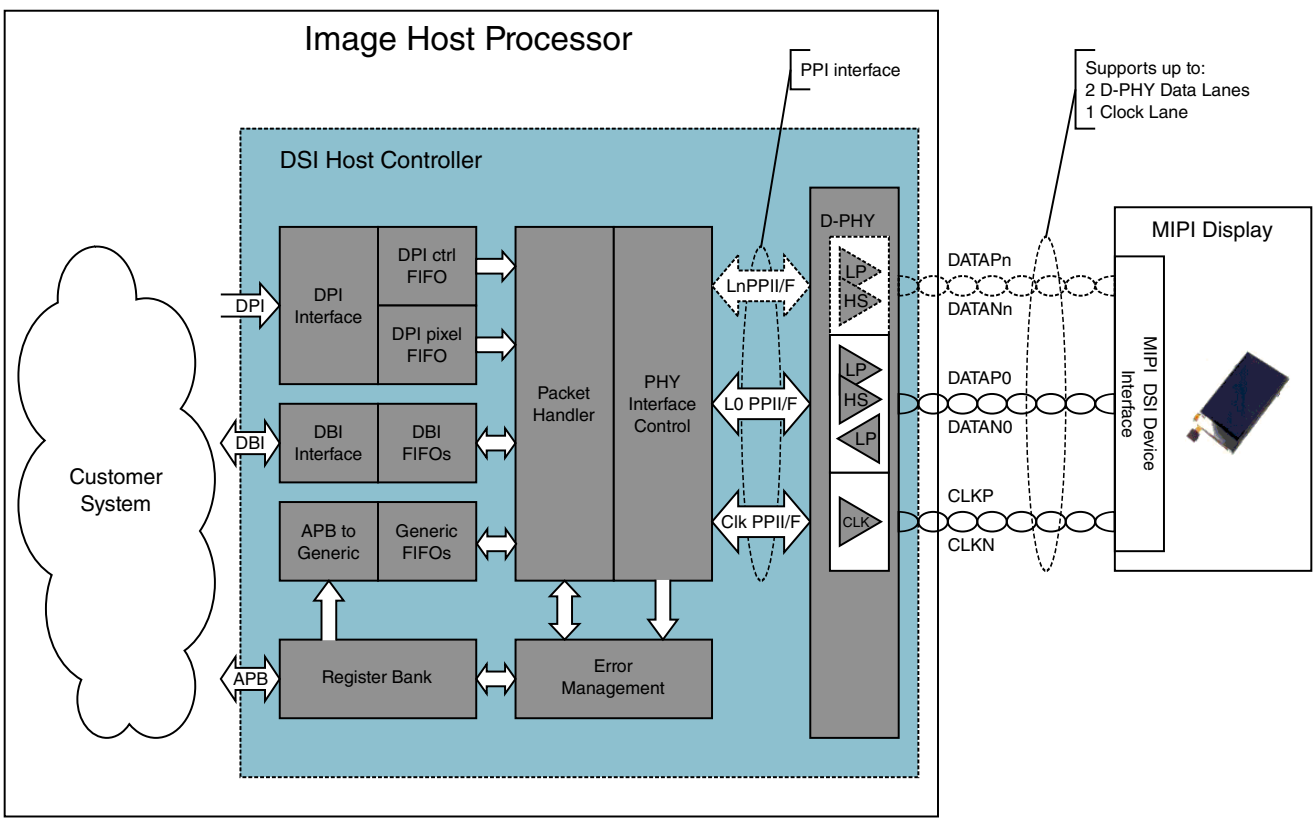

Figure 41-1. Block Diagram.

41.3 Clocks

The table found here describes the clock sources for MIPI.

Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 41-1. MIPI Clocks

Clock name	Clock Root	Description
ac_clk_125m	ahb_clk_root	Bus clock
pixel_clk	axi_clk_root	Pixel clock
cfg_clk	video_27m_clk_root	Configuration clock
ips_clk	ipg_clk_root	Peripheral clock
ips_clk_s	ipg_clk_root	Peripheral access clock
pll_refclk	video_27m_clk_root	Video reference clock (27MHz)

41.4 Architecture

This section describes the DSI Host Controller block interfaces, protocols, functionality, and implementation.

41.4.1 Architecture Overview

The following figure presents the overall architecture of the DSI Host Controller. The main blocks are the following:

DPI interface captures data and control signals from the DPI interface and conveys them in a FIFO for video control signals and another one for the pixel data.

DBI interface encapsulates DCS commands in DSI packets that are then conveyed into command and payload FIFOs. For commands that require a response from the device, the block uses an incoming data FIFO to acquire data from peripheral.

Register Bank is accessible through a standard AMBA-APB slave interface, providing access to the DSI Host Controller registers for configuration and control. There is also a fully programmable interrupt generator to inform the system upon certain events.

PHY Interface Control is responsible for managing the D-PHY PPI interface. It acknowledges current operation and enables LP transmission/reception or a High Speed transmission. It also performs data splitting between available D-PHY Lanes for High Speed transmission.

Packet Handler schedules activity inside the link. It performs several functions based on the interfaces that are currently operational (DPI and/or DBI) and the video transmission mode that is used (burst mode or non-burst mode with sync pulses or sync events). It

builds long or short packet generating correspondent ECC and CRC codes. This block also handles packet reception: Validates packet header by checking ECC, performs header correction for single bit erros and notifies and abort reception for multiple header errors. Depending on the packet type, generic read response or DCS command, route the output data to the respective port (generic or DBI)

APB to Generic block bridges APB operations into FIFOs holding the Generic commands. The block interfaces with 3 FIFOS, a command FIFO, a write payload FIFO and a read payload FIFO.

Error Management notifies and monitors error conditions on the DSI link. It controls timers used to determine if a time out condition occurred and triggers interruption for errors.

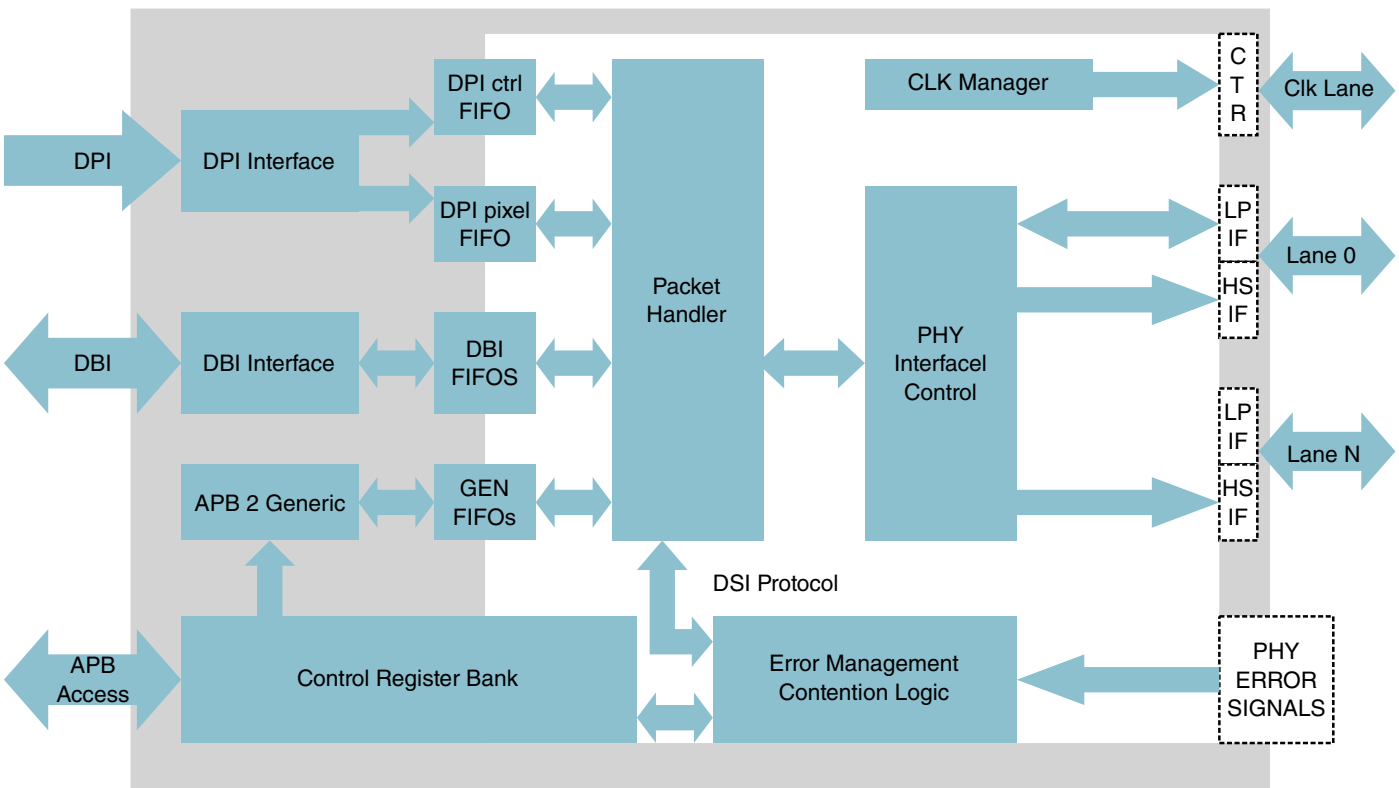

Figure 41-2. DSI Host Controller Architecture

41.4.2 DBI-2 interface

The DBI-2 interface encapsulates DCS commands in DSI packets to be transmitted through the D-PHY link. Some commands require a response from the device and the interface provides read data from the device/peripheral.

The support DBI types is Type B interface

The selection type maps the related pins on the DSI core pinout. DBI interface used RGB additive color mixing method and the pixel data format is selected on register DBI_CFG register. The field **in_dbi_conf** defines the input pixel data format and field **out_dbi_conf** defines the output pixel data that is determined by the display device. This interface needs to be associated with a particular DSI Virtual Channel that is programmed on field **dbi_vid**.

The following figures show how the pixel to byte conversion is done for each mode. All the diagrams are representing the case were the interface is working as type B.

The DBI interface type B signals list .

DBICSX: Chip select, it is low active .

DBIRDX: Read signal, the read data should be captured at the DBIRDX rising edge .

DBIWRX: Write signal, the write data will be switch at DBIWRX falling edge.

DBIDATIN[15:0]: Write data

DBIDCX: Data commnad select, Data is indicated when high and command is indicated when low .

DBITE: Tearing effect.

DBI interface receives commands and decodes information for the command packetizing format. Depending on the command type, DSI core output the related DSI packet type (DCS short write packet; DCS read packet or DCS long write). If the DCS commands have variable size this needs to be configured on the DBI_CMDSIZE register. The following table presents DCS packet types:

Table 41-2. DSI packet types for DCS commands

DCS command	Command ID	DCS parameter	DSI packet type
enter_idle_mode	0x39h	0	6'h05
enter_invert_mode	0x21h	0	6'h05

Table continues on the next page...

Table 41-2. DSI packet types for DCS commands (continued)

DCS command	Command ID	DCS parameter	DSI packet type
get_scan_line	0x45h	2(read)	6'h06
get_signal_mode	0x0Eh	1(read)	6'h06
read_DDB_continue	0xA8h	n(read)	6'h06
read_DDB_start	0xA1h	n(read)	6'h06
read_memory_continue	0x3Eh	n(read)	6'h06
read_memory_start	0x2Eh	n(read)	6'h06

All packets that have 1 or 0 parameters index to the command are considered short packet and all other shall be considered long packets.

There are several register fields to configure DBI input pixel data and DBI pixel data retrieval. It is required to have prior knowledge of display supported feature to avoid incorrectly core configuration. Some guidelines are presented below to clarify how core uses the configuration for its operation.

Field **in_dbi_conf** in register DBI_CFG configures the color depth and the pixel format used by the input interface. Field **out_dbi_conf** configures the colour depth and the pixels format used by the output interface. Here the colour depth is directly related with formats supported by the peripheral. If the peripheral returns pixel data with a specific colour depth this colour depth should be consistent with the register configuration. If this is not respected, the byte to pixel converter will use an incorrect pixel mapping and it will corrupt output data.

Field **out_dbi_conf** should not be programmed for a higher number of interface pins than **in_dbi_conf**. As an example an incorrect pin configuration happens if **in_dbi_conf** defines 9 bit interface and **out_dbi_conf** defines 16 bit since pins 16 to 10 will not be available.

Field **lut_size_conf** configures the size of the DCS write_LUT command; this command will program the peripheral's colour space conversion table. This register is directly related with the capabilities of the peripheral. If the peripheral supports a colour depth of 16/18/24 bits per pixel it is expected that this register is configured for 48/128/192 bytes respectively. These coefficients should be loaded to the peripheral before normal operation of pixel data transmission is started. The DCS specification only refers to the conversion of formats equal or above 12bpp. This means that any format outside this scope might not be convertible to a higher colour depth mode by the peripheral. Taking this in consideration, when **in_dbi_conf** selects a colour depth below 12bpp, the **out_dbi_conf** should be configured such that colour depth has not a higher value. As an example, if **in_dbi_conf** is configured for 8bits/8bpp interface and **out_dbi_conf** is configured for 8bits/12bpp, this results in an incorrect configuration because the DCS

specification does not contemplates conversions from 8bpp to 12bpp. This configuration is possible inside the core but might lead into incorrect results. Nevertheless it is left for the system to configure these registers according with the desired operation.

For Read back commands the DBI specification states that the reading process does not use any acknowledge mechanism to know that the requested data is ready. There are mechanisms for the system to get this information by polling the Command Status Register CMD_PKT_STATUS. This register, besides other information, contains the status on the DBI read back payload FIFO and also contains a special busy flag **dbi_rd_cmd_busy** that can be used to understand if the read command is complete. By using the DBI read back FIFO status bits that report if the FIFO is full or empty the processor can read these bits to understand if it can read another byte/sample from the interface (probing the empty flag) or when it should stop reading bytes/samples from the interface. In addition, the Read Command Busy flag is asserted when a read command is issued by the interface and cleared once the reading process ends and the read data is fully stored inside the read back FIFO. The system needs to issue the read command and then periodically probe this status bit to acknowledge if the read back operation is complete. Once this information is available the system can assume that the entire data is stored inside the read back FIFO and the interface can deliver all the desired data.

41.4.3 DPI-2 Interface

The DPI-2 interface captures data and control signals and conveys them to FIFO interfaces that will transmit them to the DSI link. Two different streams of data are presented at the interface: video control signals and pixel data. Depending on the interface color coding, the pixel data is handled differently throughout the dpipixdata bus.

Interface pixel color coding is presented in the table below.

Table 41-3. DPI interface pixel color coding mapping.

Signal Line	16-bit			18-bit		24-bit
	Config1	Config2	Config3	Config1	Config2

The DPI interface can be configured to increase flexibility and promote correct usage of this interface for several systems. These configuration options are described below:

- Polarity control. All the control signals are programmable to change polarity according to system requirements.
- After core reset, DPI waits for the first VSYNC active transition to start signals sampling, including pixel data and preventing image transmission in the middle of a frame.
- If interface pixel color coding is 18 bits and the 18 bit loosely packet stream is enabled, the number of lines programmed in the pixels per lines configuration is a multiple of four. This means that in this mode the 2 LSB in the configuration will be always inferred as zero. Specification states that in this mode the pixel line size should be a multiple of 4.
- To avoid pixel underflows and overflows the configured number of pixel will originate the respective memory spaces. This will happen even if the dpidataen pin is active during more or less time than necessary.
- In order to keep the memory organized in respect to the packet scheduling the number of pixels per packet parameter will be used to separate the memory space of different video packets.

For the **dpishutd** and **dpicolorm** sampling and transmission the DPI video signalling must be active. This means that if video signals like VSYNC and HSYNC are not being actively generated the DPI commands these are not transmitted through the DSI link. The

DSI commands packets have the highest priority in the class of Non Video packets. Because of such constraint and in order for commands to be correctly transmitted, the first VSYNC active pulse needs to happen for the commands sampling and transmission. When shutting down the display, it is necessary for DPI video to keep active for one frame after the command being issued. This guarantees that the commands are correctly transmitted before actually disabling the Video generation in the DPI interface.

41.4.4 Error control and timeout timers

The DSI host controller implements a set of timers and conditions to notify errors.

The core has a set of registers to control the timers that will be used to determine if a time out has occurred. It also contains a set of interruption status registers that are cleared upon read operation. These registers also trigger an interruption pin that can be used by the system to act upon an error within the DSI connection.

41.4.5 Timeout timers

Bit **to_hs_tx** on register ERROR_ST1 is set when a High Speed Transmission Time Out occurs rising an interrupt pin.

The time out is configured in **hstx_to_cnt** field of register TO_CNT_CFG. A 16 bit counter measures the time when High Speed is active. If that counter reaches the value defined by register **hstx_to_cnt**, bit **to_hs_tx** is asserted.

Bit to_lp_rx on register ERROR_ST1 is set signaling contention detection when a Low Power Reception Time Out occurs rising an interrupt pin. The time out is configured in **lprx_to_cnt** field of register TO_CNT_CFG. A 16 bit counter measures the time when Low Power reception is active. If that counter reaches the value defined by register **lprx_to_cnt**,bit **to_lp_rx** is asserted.

Time units for this 16bit counters are configured in cycles defined in **TO_CLK_DIVISION** field in register CLKMGR_CFG. The value written to **TO_CLK_DIVISION** defines the time unit for the Time out limits using Lane byte clock as input. This mechanism increases the range to define these limits.

41.4.6 Error control

Two registers ERROR_ST0 and ERROR_ST1 are associated with error condition reporting. This resister can trigger interrupt pins to inform the system about the occurrence of errors.

The coreConsultant GUI allows different interrupt pin configuration that can support:

- No interrupt pin on DSI core for notification of error although system can check for error by reading error status registers ERROR_ST0 and ERROR_ST0.
- DSI core has one interrupt pin interrupt that is set High when an error occurs either in register ERROR_ST1 or ERROR_ST2.
- DSI core has 2 interrupts associated with each error status register. Pins interrupt0 and interrupt1 are respectively associated with ERROR_ST1 and ERROR_ST2. This mechanism allows faster association of interrupts with the status register that generated the error.

The triggering of the interrupt pins, when defined, can be masked by programming the mask registers ERROR_MSK0 and ERROR_MSK1. When any bit of this registers is set to 1 it will inhibit the interrupt for that specific error. Nevertheless the error bit will always be set on the respective ERROR_ST register. Registers ERROR_ST1 and ERROR_ST2 are always cleared when read.

The figure below illustrates the location of some of the errors.

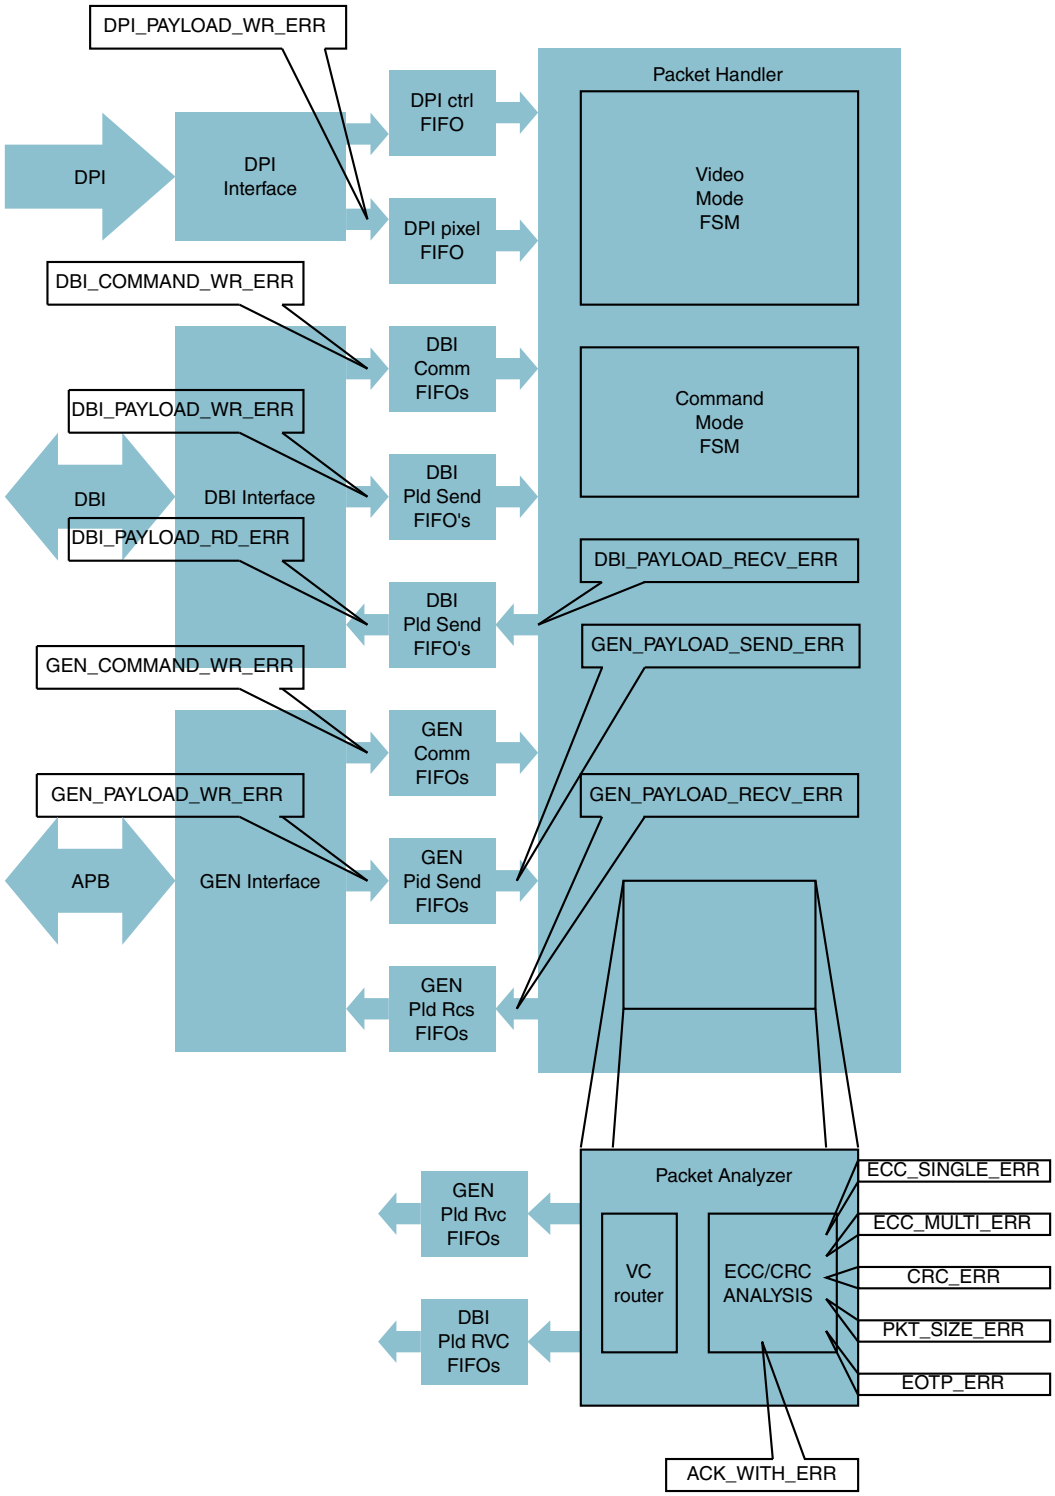

Figure 41-16. Error sources diagram

41.4.7 Generic packets

DSI host Core support generic packets transmission and reception as described in the DSI-2 specification. These packets are channeled through the APB register bank.

Register GEN_PLD_DATA is used to write payload of generic packets and when read it returns the payload of a read back operation. Register GEN_HDR contains the generic packet header type and header data. Writing to this register triggers the transmission of the packet implying that for long generic packets data needs to be written in advance on register GEN_PLD_DATA.

The valid packets available to be transmitted through the Generic interface are:

Table 41-4. Generic interface available packets

Generic Write Short Packet 0 Parameters	Generic Write Short Packet 1 Parameters	Generic Write Short Packet 2 Parameters	Generic Read Short Packet 0 Parameters
Generic Read Short Packet 1 Parameters	Generic Read Short Packet 2 Parameters	Maximum Read Packet Configuration	Generic Long Write Packet
DCS Write Short Packet 0 Parameters	DCS Write Short Packet 1 Parameters	DCS Read Short Packet 0 Parameters	DCS Write Long Packet

A set of bits in register CMD_PKT_STATUS report the status of the FIFOs associated with generic packet support.

Generic packets are always transported using one of the DSI transmission modes: Video Mode or Command Mode. If none of these modes are selected the packets will not be transmitted through the link and the related FIFOs will eventually get overflowed.

If system does not requires Generic packets support this functionality can be disabled in coreConsultant GUI and the interfaces with the 2-port RAMs that buffer command, payload and read data are removed.

41.4.8 Signals

A Clock Lane and a Data Lane (Lane0) with TX HS features are always required. Data Lanes can be up to a maximum of 2.

Table 41-5. D-PHY external interface

Pin Name	Width	Direction	Description
DPHY Supply			
AVDD	1	Input	D-PHY Analog power supply.
VDD	1	Input	D-PHY Digital power supply.
AVDDREF	1	Input	D-PHY Analog supply for reference generator.

Table continues on the next page...

Table 41-5. D-PHY external interface (continued)

Pin Name	Width	Direction	Description
AGND	1	Input	D-PHY Analog supply ground return.
VSS	1	Input	D-PHY Digital supply ground return

41.5 Programming

41.5.1 DSI and D-PHY initialization sequence

This chapter describes the procedure for DSI and D-PHY initialization. This process is based on APB register interface access.

- By default register PHY_RSTZ is activating the PHY resets **physhutdownz**, **phyrstz** and disabling **enableclk** and register PHY_TEST_CTRL0 is by default asserting the **testclr** pin. All the PHY reset pins are being activated by default.
- Configure Register PHY_IF_CFG with correct the number of lanes to be used by the controller.
- Configure the TX_ESC clock frequency to a frequency lower than 20MHz that is the maximum allowed frequency for D-PHY ESCAPE mode. This is done by writing in Register CLKMGR_CFG, field TX_ESC_CLK_DIVISION.
  TX_ESC_CLK_DIVISION divides Byte Clock and generates a TX_ESC clock for the D-PHY. (Note: Byte clock is limited to 125MHz (1GHz/8bits) and by writing TX_ESC_CLK_DIVISION=0x07 TX_ESC clock will always be lower than 20MHz)
- Configure the DPHY PLL clock frequency through the TEST Interface to operate at 1GHz, assuming that the REF_CLK is provided with a frequency of 27MHz

- Write @ PHY_TST_CTRL0 - 32'h00000000 this disables the **testclr** pin enabling the interface to write new values to the DPHY internal registers.
- Write @ PHY_TST_CTRL1 - 32'h00010044 this enables the **testen** pin bit 17 of this Core register and configures the **testdatain** to 8'h44. This operation initiate the configuration process of the test code number 0x44.
- Write @ PHY_TEST_CTRL0 - 32'h0000002 followed by a new write to PHY_TEST_CTRL0 - 32'h00000000. This operation toggles the **testclk** (bit 2) and the **testdin** will be sampled on the falling edge of **testclk** latching a new test code.
- Write @ PHY_TEST_CTRL1 - 32'h00000074 disabling the testen pin and configuring **testdatain** to 8'h74. This operation prepares the interface to load in test code 0x44 the 0x74 value.
- Write @ PHY_TEST_CTRL0 - 32'h00000002 followed by a new write to PHY_TEST_CTRL0 - 32'h00000000. This operation toggles the **testclk** and the **testdin** will be sampled on the rising edge of **testclk** latching a new content data to the configured test code.

- Write @ PHY_RSTZ - 32'h00000007. This operation asserts **physhutdownz**, **phyrstz** and **enableclk** releasing the PHY from power down. The PHY will startup the PLL locking procedure to 1GHz operation.
- Read @ PHY_STATUS - 32'hxxxxxxx1, until bit 0 **phylock** is detected at 1 signaling that PLL is locked and that a stable byte clock is being provided to the DSI host controller.
- Read @ PHY_STATUS - 32'hxxxxx1x1, until bit 2 **phystopstateclklane** is read '1' identifying that Clock Lane is in Stop State. Clock lane need to be in Stop state so that the D-PHY can switch to other operational states such as the High Speed mode.
- Write register PHY_IF_CTRL bit 0 to generate High Speed clock (**txrequestHSclk**).
- Only after: 1) PLL locked and 2) Clock lane in Stop-State; the PHY will drive the correct LP sequence to configure the receiver end for HS.
- D-PHY starts transmitting HS clock on the Clock Lane.

41.6 MIPI_DSI Memory Map/Register Definition

MIPI_DSI memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
21E_0000	Version of the DSI host ctrl (MIPI_DSI_VERSION)	32	R	0000_0000h	41.6.1/3620
21E_0004	Core power up (MIPI_DSI_PWR_UP)	32	R/W	0000_0000h	41.6.2/3620
21E_0008	Number of active data lanes (MIPI_DSI_CLKMGR_CFG)	32	R/W	0000_0000h	41.6.3/3621

Table continues on the next page...

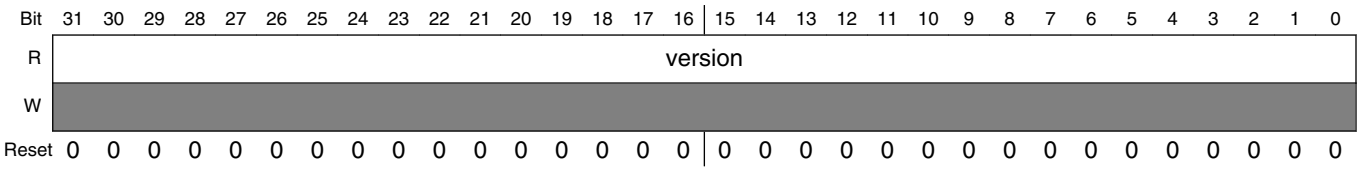
41.6.1 Version of the DSI host ctrl (MIPI_DSI_VERSION)

Size: 32 bits

Offset: 0x0

Memory Access: R

Address: 21E_0000h base + 0h offset = 21E_0000h



MIPI_DSI_VERSION field descriptions

Field	Description
version	Version of the DSI host controller

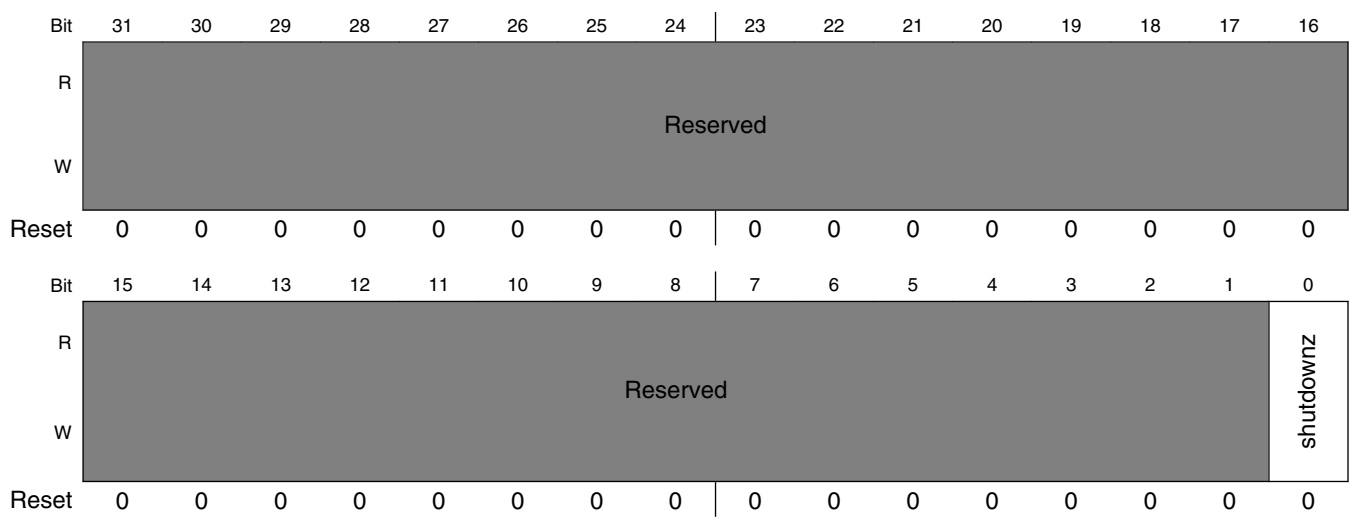
41.6.2 Core power up (MIPI_DSI_PWR_UP)

Size: 32 bits

Offset: 0x4

Memory Access: R/W

Address: 21E_0000h base + 4h offset = 21E_0004h



MIPI_DSI_PWR_UP field descriptions

Field	Description
31–1 -	This field is reserved. Reserved
0 shutdownz	Core power up 0 reset; 1 power up)

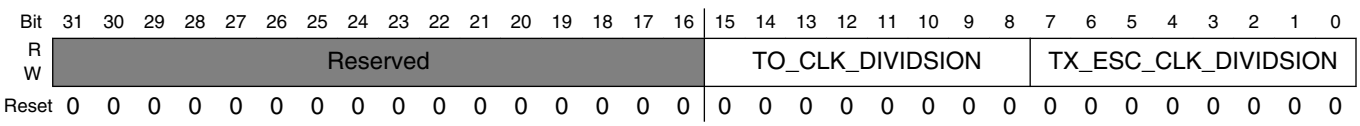
41.6.3 Number of active data lanes (MIPI_DSI_CLKMGR_CFG)

Size: 32 bits

Offset: 0x8

Memory Access: R/W

Address: 21E_0000h base + 8h offset = 21E_0008h



MIPI_DSI_CLKMGR_CFG field descriptions

Field	Description
31–16 -	This field is reserved. Reserved
15–8 TO_CLK_ DIVIDSION	Division factor for Time Out clock used as timing unit in the configuration of HS to LP and LP to HS transition error.
TX_ESC_CLK_ DIVIDSION	Division factor for TX ESCAPE clock source (lanebyteclk pin), values 0 and 1 stop TX_ESC clock generation.

41.6.4 DPI interface configuration (MIPI_DSI_DPI_CFG)

Size: 32 bits

Offset: 0xc

Memory Access: R/W

Address: 21E_0000h base + Ch offset = 21E_000Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	Reserved															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	Reserved					en18_loosely	colorm_active_low	shutd_active_low	hsync_active_low	vsync_active_low	dataen_active_low	dpi_color_coding			dpi_vid	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MIPI_DSI_DPI_CFG field descriptions

Field	Description
31–11 -	This field is reserved. Reserved
10 en18_loosely	Enable 18 loosely packet pixel stream.
9 colorm_active_low	Set to configure Color Mode pin (dpicolcorm) as Active low
8 shutd_active_low	Set to configure Shut Down pin (dpishutdn) as Active low
7 hsync_active_low	Set to configure Horizontal Synchronism pin (dpihsync) as Active low
6 vsync_active_low	Set to configure Vertical Synchronism pin (dpivsync) as Active low
5 dataen_active_low	Set to configure Data enable pin (dpidaten) as Active low
4–2 dpi_color_coding	DPI color coding. 0 16bit config1 1 16bit config2; 2 16bit config3; 3 18bit config1; 4 18bit config2; 5 to 7 24 bit.
dpi_vid	Configures the DPI Virtual Channel ID that will be indexed to the Video mode packets.

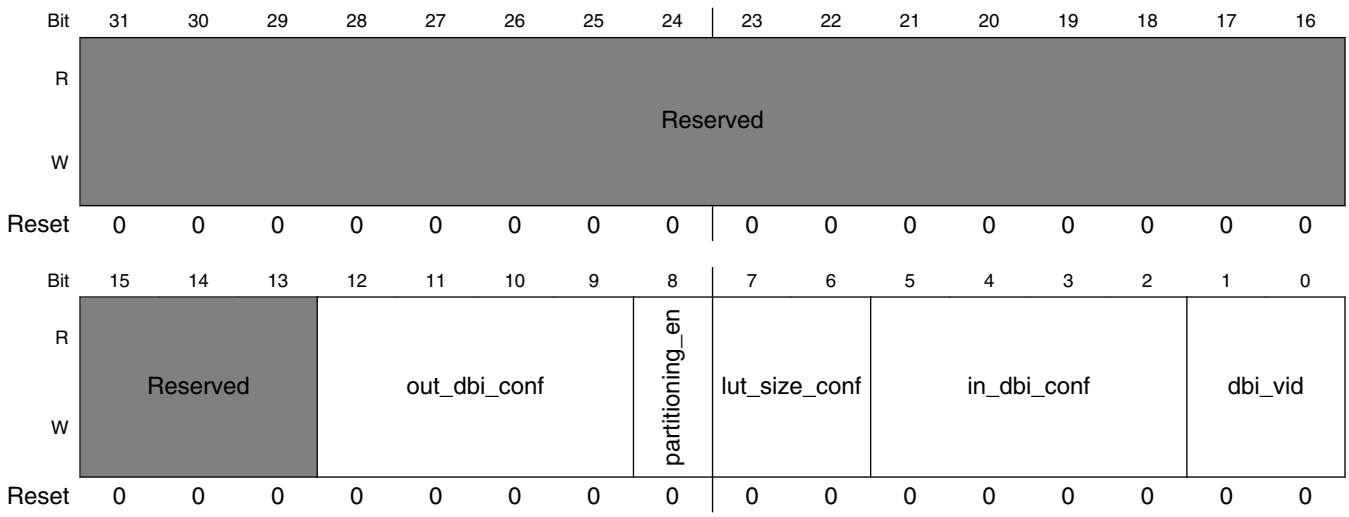
41.6.5 DBI interface configuration (MIPI_DSI_DBI_CFG)

Size: 32 bits

Offset: 0x10

Memory Access: R/W

Address: 21E_0000h base + 10h offset = 21E_0010h



MIPI_DSI_DBI_CFG field descriptions

Field	Description
31–13 -	This field is reserved. Reserved
12–9 out_dbi_conf	Configures the DBI output pixel data configuration; 0 8bit 8bpp; 1 8bit 12bpp; 2 8bit 16bpp; 3 8bit 18bpp; 4 8bit 24bpp; 5 9bit 18bpp; 6 16bit 8bpp; 7 16bit 12bpp; 8 16bit 16bpp; 9 16bit 18bpp, option1; 10 16bit 18bpp, option2; 11 16bit 24bpp, option1; 12 16bit 24bpp, option2
8 partitioning_en	Enables write memory continue through input command (system needs to ensure correct partitioning of Long Write commands)

Table continues on the next page...

MIPI_DSI_DBI_CFG field descriptions (continued)

Field	Description
7–6 lut_size_conf	Configures the size used to transport Write Lut commands; 0 16-bit color display; 1 18-bit color display; 2 24-bit color display; 3 16-bit color display
5–2 in_dbi_conf	Configures DBI input pixel data configuration; 0 8bit 8bpp; 1 8bit 12bpp; 2 8bit 16bpp; 3 8bit 18bpp; 4 8bit 24bpp; 5 9bit 18bpp; 6 16bit 8bpp; 7 16bit 12bpp; 8 16bit 16bpp; 9 16bit 18bpp, option1; 10 16bit 18bpp, option2; 11 16bit 24bpp, option1; 12 16bit 24bpp, option2
dbi_vid	Configures the DBI Virtual Channel ID that will be indexed to the DCS packets.

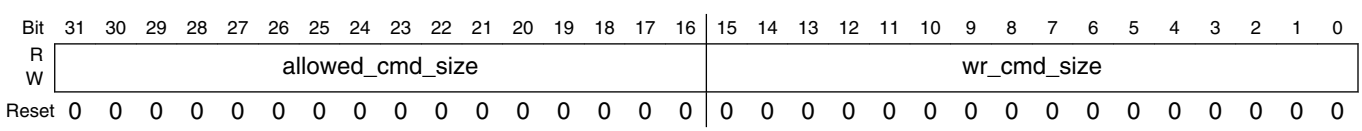
41.6.6 DBI command size configuration (MIPI_DSI_DBIS_CMDSIZE)

Size: 32 bits

Offset: 0x14

Memory Access: R/W

Address: 21E_0000h base + 14h offset = 21E_0014h



MIPI_DSI_DBIS_CMDSIZE field descriptions

Field	Description
31–16 allowed_cmd_size	Configures the maximum allowed size of a DCS write memory command. This register is used to partition a write memory command into several write memory continues. It is only used if bit 'partitioning_en' is disabled. Size of DSI packet payload is the actual payload size minus 1 since the DCS command is in the DSI packet payload.

Table continues on the next page...

MIPI_DSI_DBIS_CMDSIZE field descriptions (continued)

Field	Description
wr_cmd_size	Configures the size of the DCS write memory commands. Size of DSI packet payload is the actual payload size minus 1 since the DCS command is in the DSI packet payload.

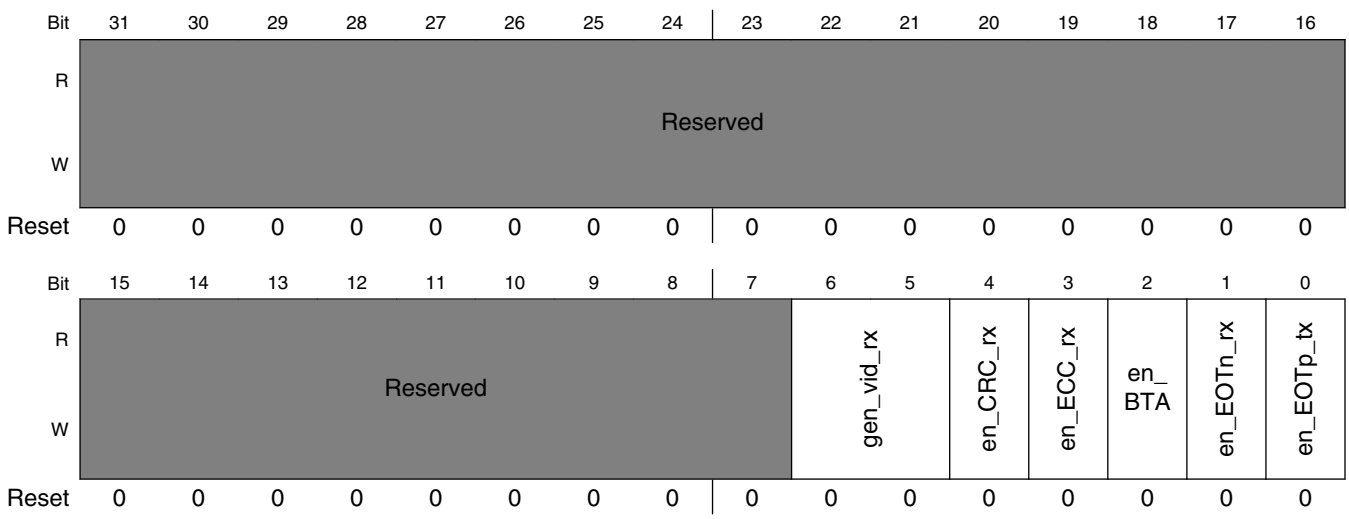
41.6.7 Packet handler configuration (MIPI_DSI_PCKHDL_CFG)

Size: 32 bits

Offset: 0x18

Memory Access: R/W

Address: 21E_0000h base + 18h offset = 21E_0018h



MIPI_DSI_PCKHDL_CFG field descriptions

Field	Description
31–7 -	This field is reserved. Reserved
6–5 gen_vid_rx	Generic interface read-back Virtual Channel identification
4 en_CRC_rx	Enables CRC reception and error reporting
3 en_ECC_rx	Enables ECC reception, error correction and reporting
2 en_BTA	Enables Bus Turn-Around request
1 en_EOTn_rx	Enables EOTp reception
0 en_EOTp_tx	Enables EOTp transmission

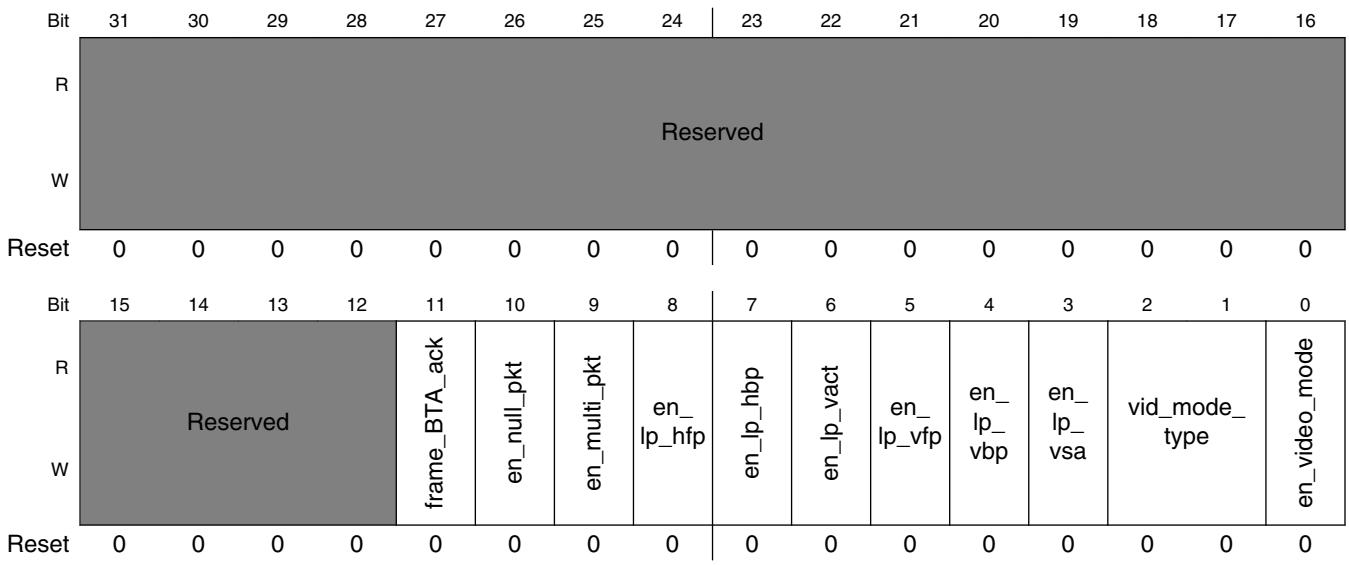
41.6.8 Video Mode Configuration (MIPI_DSI_VID_MODE_CFG)

Size: 32 bits

Offset: 0x1c

Memory Access: R/W

Address: 21E_0000h base + 1Ch offset = 21E_001Ch



MIPI_DSI_VID_MODE_CFG field descriptions

Field	Description
31–12 -	This field is reserved. Reserved
11 frame_BTA_ack	Enables the request for an acknowledge response at the end of a frame
10 en_null_pkt	Enables the tranmission of null packets in the HACT period
9 en_multi_pkt	Enables the tranmission of multi video packets in the HACT period
8 en_lp_hfp	Enables return to Low Power inside HFP period when timing allows
7 en_lp_hbp	Enables return to Low Power inside HBP period when timing allows
6 en_lp_vact	Enables return to Low Power inside VACT period when timing allows
5 en_lp_vfp	Enables return to Low Power inside VFP period when timing allows
4 en_lp_vbp	Enables return to Low Power inside VBP period when timing allows

Table continues on the next page...

MIPI_DSI_VID_MODE_CFG field descriptions (continued)

Field	Description
3 en_lp_vsa	Enables return to Low Power inside VSA period when timing allows
2–1 vid_mode_type	Selects video mode transmission type. 0: Non-burst with Sync pulses; 1: Non-burst with Sync events; 2-3: Burst with Sync pulses.
0 en_video_mode	Enables DPI Video mode transmission

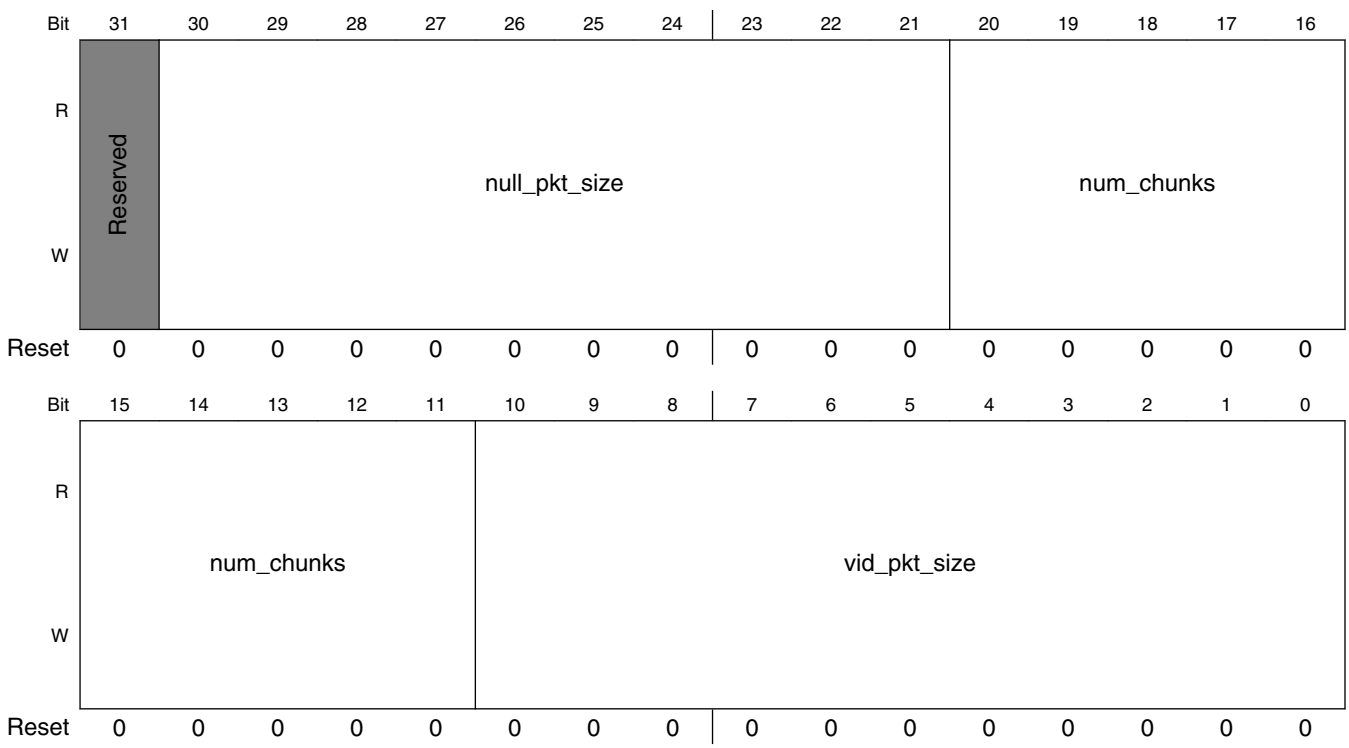
41.6.9 Video packet configuration (MIPI_DSI_VID_PKT_CFG)

Size: 32 bits

Offset: 0x20

Memory Access: R/W

Address: 21E_0000h base + 20h offset = 21E_0020h



MIPI_DSI_VID_PKT_CFG field descriptions

Field	Description
31 -	This field is reserved. Reserved

Table continues on the next page...

MIPI_DSI_VID_PKT_CFG field descriptions (continued)

Field	Description
30–21 null_pkt_size	Configures the number of bytes in a null packet
20–11 num_chunks	Configures the number of chunks to be transmitted during a Line period. (A chunk is a video packet or a null packet)
vid_pkt_size	Configures the number of pixel on a single video packet. (If using 18 bit mode and not enabling loosely packet stream this value must be a multiple of 4)

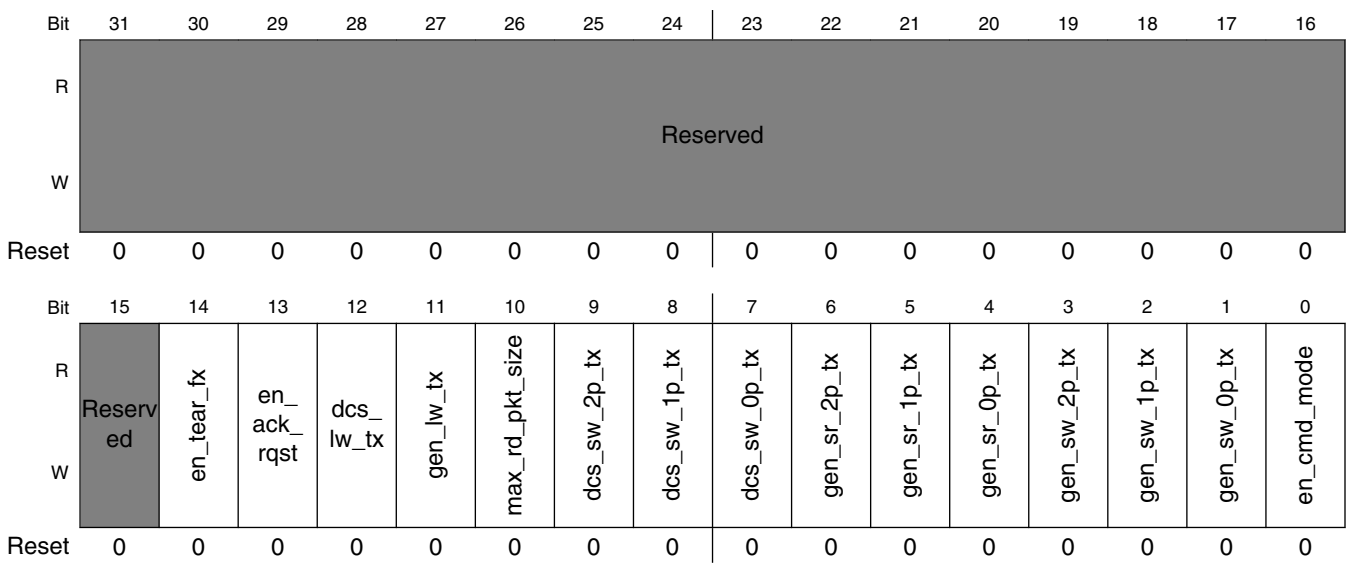
41.6.10 Command mode configuration (MIPI_DSI_CMD_MODE_CFG)

Size: 32 bits

Offset: 0x24

Memory Access: R/W

Address: 21E_0000h base + 24h offset = 21E_0024h



MIPI_DSI_CMD_MODE_CFG field descriptions

Field	Description
31–15 -	This field is reserved. Reserved
14 en_tear_fx	Enables the tearing effect acknowledge request
13 en_ack_rqst	Enables the acknowledge request after each packet transmission

Table continues on the next page...

MIPI_DSI_CMD_MODE_CFG field descriptions (continued)

Field	Description
12 dcs_lw_tx	Configures the DCS Long Write Packet command transmission type. 0 High Speed; 1 Low Power
11 gen_lw_tx	Configures the Generic Long Write Packet command transmission type. 0 High Speed; 1 Low Power
10 max_rd_pkt_size	Configures the Maximum Read Packet Size command transmission type. 0 High Speed; 1 Low Power
9 dcs_sw_2p_tx	Configures the DCS Short Write Packet with 2 Parameters command transmission type. 0 High Speed; 1 Low Power
8 dcs_sw_1p_tx	Configures the DCS Short Write Packet with 1 Parameters command transmission type. 0 High Speed; 1 Low Power
7 dcs_sw_0p_tx	Configures the DCS Short Write Packet with 0 Parameters command transmission type. 0 High Speed; 1 Low Power
6 gen_sr_2p_tx	Configures the Generic Short Read Packet with 2 Parameters command transmission type. 0 High Speed; 1 Low Power
5 gen_sr_1p_tx	Configures the Generic Short Read Packet with 1 Parameters command transmission type. 0 High Speed; 1 Low Power
4 gen_sr_0p_tx	Configures the Generic Short Read Packet with 0 Parameters command transmission type. 0 High Speed; 1 Low Power
3 gen_sw_2p_tx	Configures the Generic Short Write Packet with 2 Parameters command transmission type. 0 High Speed; 1 Low Power
2 gen_sw_1p_tx	Configures the Generic Short Write Packet with 1 Parameters command transmission type. 0 High Speed; 1 Low Power
1 gen_sw_0p_tx	Configures the Generic Short Write Packet with 0 Parameters command transmission type. 0 High Speed; 1 Low Power

Table continues on the next page...

MIPI_DSI_CMD_MODE_CFG field descriptions (continued)

Field	Description
0 en_cmd_mode	Enables the Command Mode Protocol for transmissions.

41.6.11 Line timer configuration (MIPI_DSI_TMR_LINE_CFG)

Size: 32 bits

Offset: 0x28

Memory Access: R/W

Address: 21E_0000h base + 28h offset = 21E_0028h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MIPI_DSI_VTIMING_CFG field descriptions

Field	Description
31–27 -	This field is reserved. Reserved
26–16 v_active_lines	Configures the Vertical Active period measured in horizontal lines
15–10 vfp_lines	Configures the Vertical Front Porch period measured in horizontal lines
9–4 vbp_lines	Configures the Vertical Back Porch period measured in horizontal lines
vsa_lines	Configures the Vertical Synchronism Active period measured in horizontal lines

41.6.13 D-PHY timing configuration (MIPI_DSI_PHY_TMR_CFG)

Size: 32 bits

Offset: 0x30

Memory Access: R/W

Address: 21E_0000h base + 30h offset = 21E_0030h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MIPI_DSI_PHY_TMR_CFG field descriptions

Field	Description
31–28 -	This field is reserved. Reserved
27–20 phy_hs2lp_time	Configures the maximum time that the PHY takes to go from High Speed to Low Power transmission measured in lane byte clock cycles
19–12 phy_lp2hs_time	Configures the maximum time that the PHY takes to go from Low Power to High Speed transmission measured in lane byte clock cycles
bta_time	Configures the maximum time required to perform the Bus Turn Around operation measured in lane byte clock cycles

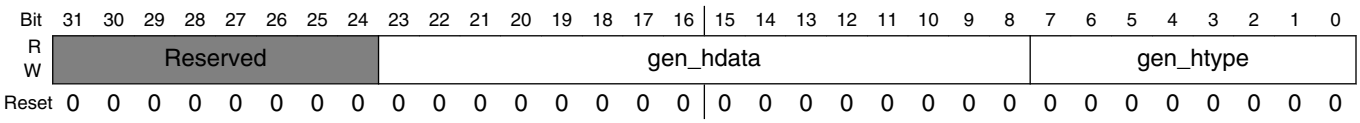
41.6.14 Generic packet Header configuration (MIPI_DSI_GEN_HDR)

Size: 32 bits

Offset: 0x34

Memory Access: R/W

Address: 21E_0000h base + 34h offset = 21E_0034h



MIPI_DSI_GEN_HDR field descriptions

Field	Description
31–24 -	This field is reserved. Reserved
23–8 gen_hdata	Configures the packet data to be transmitted through the generic interface
gen_htype	Configures the packet type to be transmitted through the generic interface. Writing to this register triggers packet transmission (Payload must be written in advance)

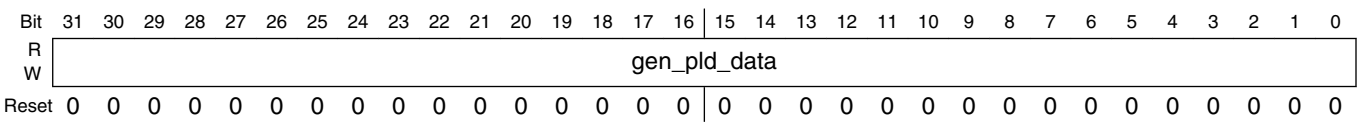
41.6.15 Generic payload data in/out (MIPI_DSI_GEN_PLD_DATA)

Size: 32 bits

Offset: 0x38

Memory Access: R/W

Address: 21E_0000h base + 38h offset = 21E_0038h



MIPI_DSI_GEN_PLD_DATA field descriptions

Field	Description
gen_pld_data	This register contains the input/output generic packet data. Write access to it writes the content of the packet payload. Read access reads the incoming generic read data

41.6.16 Command packet status (MIPI_DSI_CMD_PKT_STATUS)

Size: 32 bits

Offset: 0x3c

Memory Access: R/W

Address: 21E_0000h base + 3Ch offset = 21E_003Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	Reserved

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MIPI_DSI_CMD_PKT_STATUS field descriptions

Field	Description
31–16 -	This field is reserved. Reserved
15 reserved2	This field is reserved. Reserved
14 dbi_rd_cmd_busy	Set when a read command is issued and cleared once the entire response is stored in the FIFO
13 dbi_pld_r_full	Reports the full status of the DBI read payload FIFO
12 dbi_pld_r_empty	Reports the empty status of the DBI read payload FIFO
11 dbi_pld_w_full	Reports the full status of the DBI write payload FIFO
10 dbi_pld_w_empty	Reports the empty status of the DBI write payload FIFO
9 dbi_cmd_full	Reports the full status of the DBI command FIFO
8 dbi_cmd_empty	Reports the empty status of the DBI command FIFO
7 reserved1	This field is reserved. Reserved
6 gen_rd_cmd_busy	Set when a read command is issued and cleared once the entire response is stored in the FIFO
5 gen_pld_r_full	Reports the full status of the generic read payload FIFO
4 gen_pld_r_empty	Reports the empty status of the generic read payload FIFO

Table continues on the next page...

MIPI_DSI_CMD_PKT_STATUS field descriptions (continued)

Field	Description
3 gen_pld_w_full	Reports the full status of the generic write payload FIFO
2 gen_pld_w_ empty	Reports the empty status of the generic write payload FIFO
1 gen_cmd_full	Reports the full status of the generic command FIFO
0 gen_cmd_empty	Reports the empty status of the generic command FIFO

41.6.17 Time Out timers configuration (MIPI_DSI_TO_CNT_CFG0)

Size: 32 bits

Offset: 0x40

Memory Access: R/W

Address: 21E_0000h base + 40h offset = 21E_0040h

phy_testdin	PHY test interface input 8-bit data bus for internal register programming and test functionalities access

Chapter 42
MIPI HSI Host Controller (MIPI_HSI)

42.1 Overview

MIPI_HSI is an interface intended to connect an application processor to a cellular modem controller in cellular handsets, but it can be used in other applications.

This document describes the micro-architecture for the MIPI_HSI host controller and the block level functionality and implementation in detail.

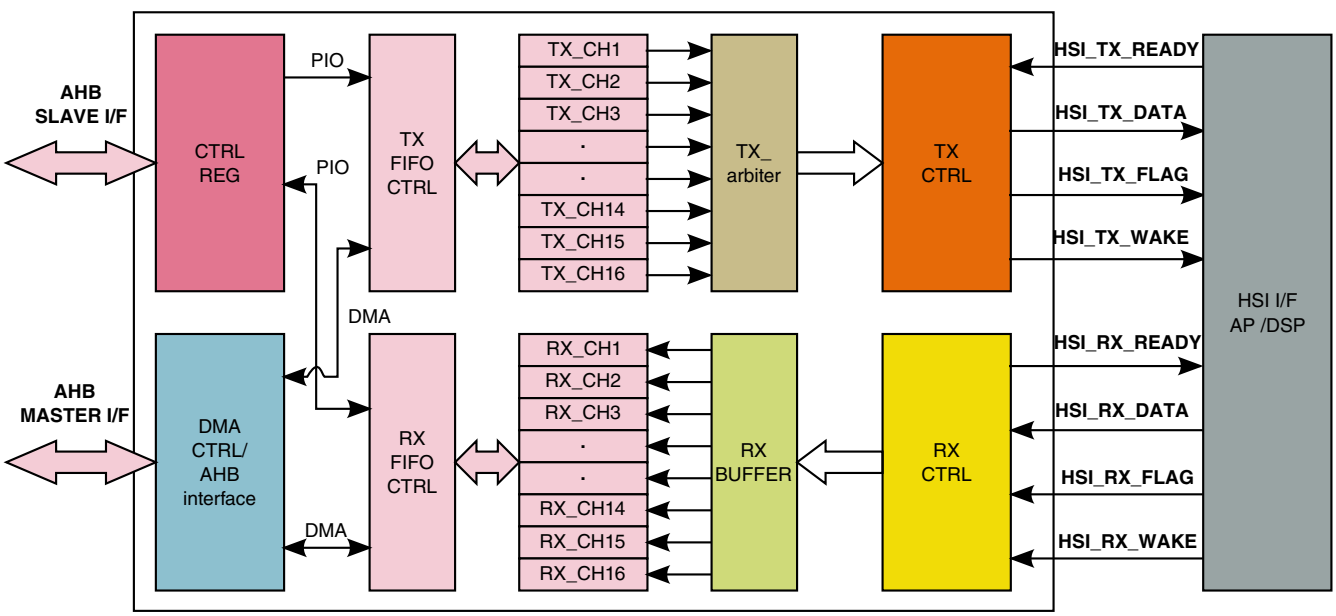

Figure 42-1. Top-Level Architecture

42.1.1 Features

The features of MIPI_HSI include the following:

- AHB slave interface support for PIO and configure.
- Supports PIO and DMA access mode
- Supports AHB Master interface to SOC interconnect
- Compatible with the MIPI_HSI specification version1.0 & MIPI_HSI Physical Layer v1.01.00 specification
- Full-Duplex High Speed Serial interface
- Supports 16 logical channels for both transmit and receive operations
- Each channel is configurable and can be enabled and disabled
- Bandwidth for each channel is programmable
- Supports both stream mode and frame mode for data transmission and reception
- Maximum bandwidth up to 100Mbs in both transmit and receive directions
- Configurable transmit and receive FIFO
- Programmable transmission bit rate
- Support round-robin arbitration for transmission mode
- Run-time configurability of channel ID bits
- Data time out feature supported for receive operation

42.2 External Signals

42.2.1 External Signals Overview

MIPI_HSI has 8 associate I/O signals.

- HSI_RX_DATA: Serial data bus
- HSI_RX_FLAG: Flag signal. If data on HSI_RX_DATA is toggling then flag stays constant and if data is constant then flag should toggle. It can be used with HSI_RX_DATA.
- HSI_RX_READY: Link data flow control signal. It indicates HSI RX is ready to receive.
- HSI_RX_WAKE: Link Control signal used to wake up the receiver.
- HSI_TX_DATA: Serial data out
- HSI_TX_FLAG: Flag signal. If data on HSI_TX_DATA is toggling, then flag stays constant and if data is constant, then flag should toggle.
- HSI_TX_READY: Link data flow control signal. It indicates HSI RX of other die is ready.
- HSI_TX_WAKE: Assertion of this signal shows that HSI TX wants to transfer some data. This signal is used to wake up HSI RX of other die.

42.2.2 Ports Table

See the following table for the signal properties of the I/Os.

Table 42-1. Properties of I/O Signals

Name	Port	Function	Reset State	Pull up
HSI_RX_DATA	I	Serial data bus	N/A	N/A
HSI_RX_FLAG	I	Flag signal. If data on HSI_RX_DATA is toggling then flag stays constant and if data is constant then flag should toggle. It can be used with HSI_RX_DATA.	N/A	N/A
HSI_RX_READY	O	Link data flow control signal. It indicates HSI RX is ready to receive	N/A	N/A
HSI_RX_WAKE	I	Link Control signal used to wake up the receiver so that transmitter starts a transmission	N/A	N/A
HSI_TX_DATA	O	Serial data out	0	N/A
HSI_TX_FLAG	O	Flag signal. If data on tx_data is toggling, then flag stays constant and if data is constant, then flag should toggle.	0	N/A
HSI_TX_READY	I	Link data flow control signal. It indicates HSI RX of other die is ready	N/A	N/A
HSI_TX_WAKE	O	Assertion of this signal shows that HSI TX wants to transfer some data. This signal is used to wake up HSI RX of other die	0	N/A

42.3 Clocks

The table found here describes the clock sources for MIPI HSI.

Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 42-2. MIPI HSI Clocks

Clock name	Clock Root	Description
h_clk	ahb_clk_root	AHB clock
tx_ref_clk	hsi_tx_clk_root	Tx reference clock

42.4 Functional Description

The following sections provide a brief functional description of the major system blocks, including the Data Channel Buffer, DMA AHB interface, register bank as well as AHB slave Bus interface, dual-port memory wrapper, clock & reset manager and clock generator.

42.4.1 DMA AHB /PIO AHB slave and Data Channel Buffer

The HSI uses one configurable data buffer so data can be transferred between the system bus (AHB slave Bus or AHB Master Bus) and the HSI controller.

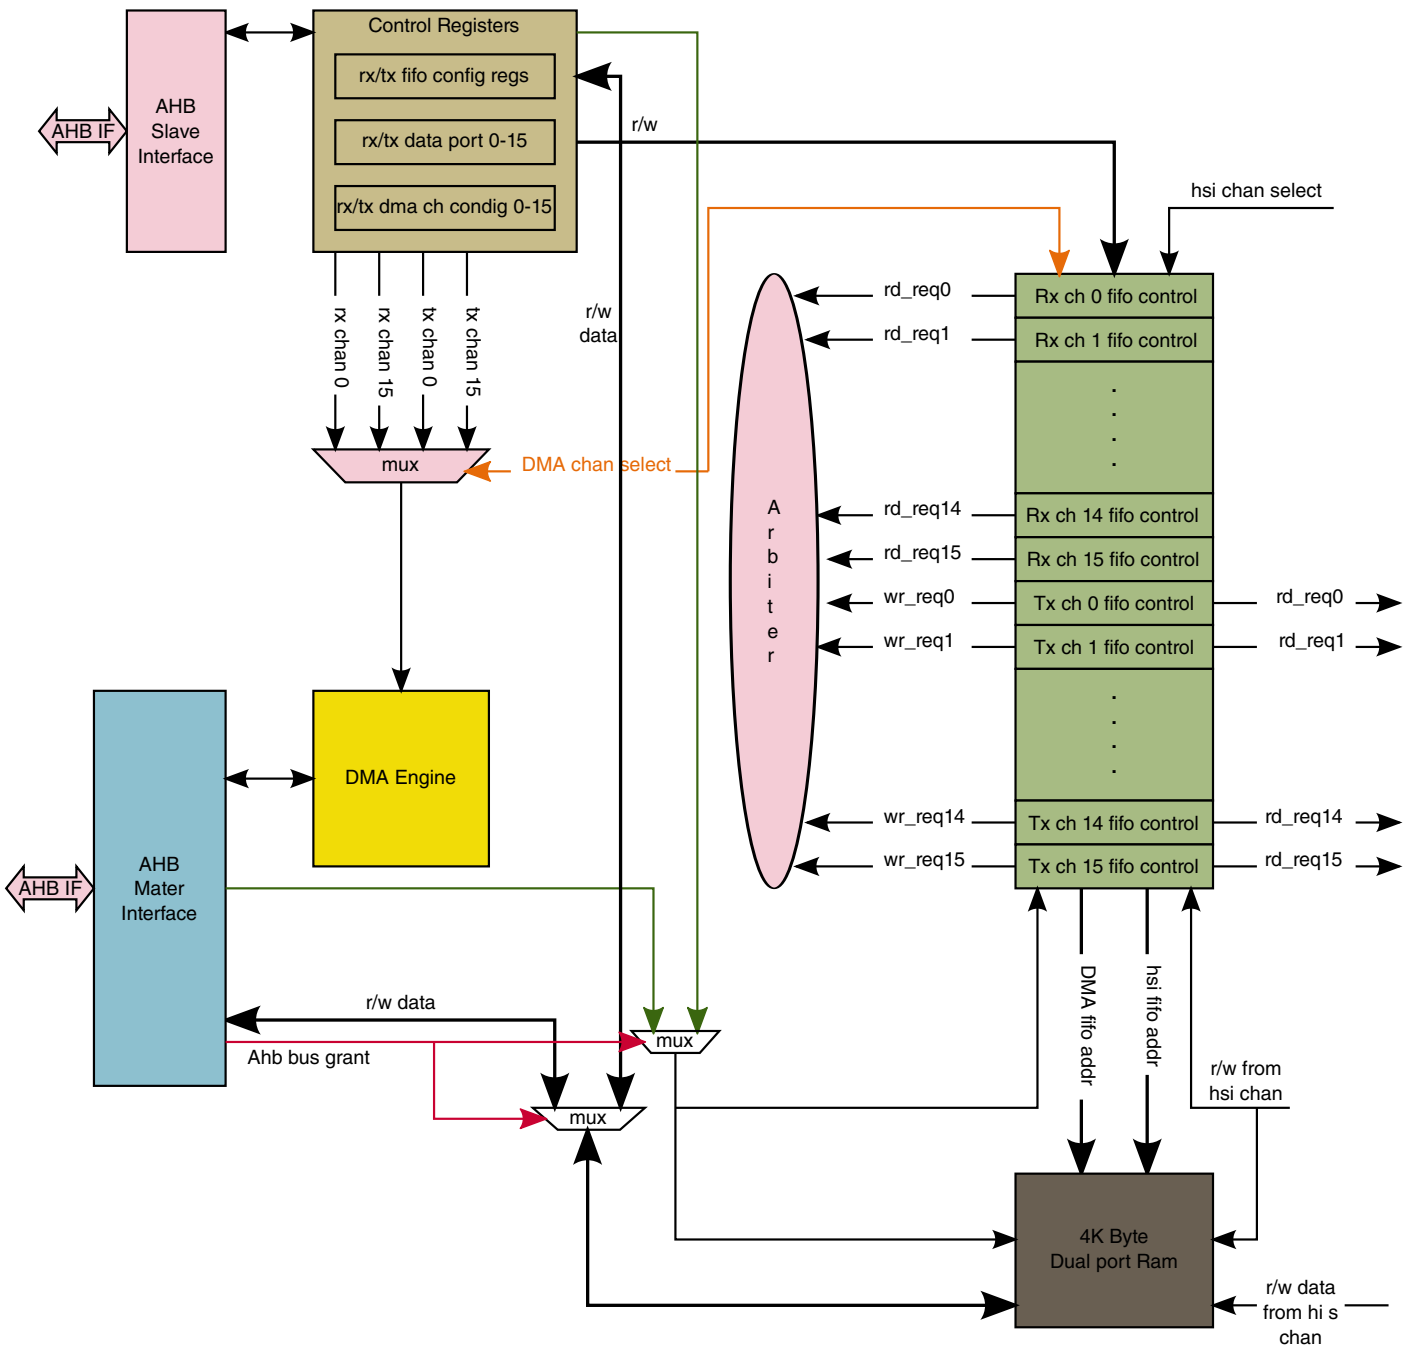

Figure 42-2. HSI DMA AHB/PIO AHB slave and data channel Buffer Scheme

42.4.1.1 AHB Slave Interface

This interface is compatible with AMBA AHB2.0 interface.

42.4.1.2 AHB Master Interface

This block access bus data by burst 8, burst 4 or single. AHB bus error is support.

42.4.1.3 Control Registers

This block has all the control registers of HSI Controller.

42.4.1.4 DMA Engine

This block generate DMA commands and send it to AHB master interface. These DMA commands are generated according current DMA channel configuration registers. AHB Master Interface should access AHB bus according the commands.

42.4.1.5 Rx/Tx FIFO controller

There are 32 sets of Rx/Tx FIFO Controller. Each FIFO Controller is corresponding to a Rx/Tx channel and a DMA channel. The depth for Each FIFO Controller is configurable. Once the number of data in the FIFO is less (for Tx) or more (for Rx) than the burst length of the corresponding DMA channel, it will send wr_req/rd_req signal to the Arbiter.

42.4.1.6 Arbiter

The arbiter arbitrates the requests from all 32 FIFO controllers according round robin priority.

42.4.1.7 4K Bytes Dual Port RAM

This block is used to save all FIFO data.

42.4.1.8 Typical Software Operation Flow for DMA

1. Configure Tx/Rx FIFO Size Configuration Registers. The total size of the FIFOs should not more than 1K DWords.

2. Enable RDMA/TDMA channel Complete Irq and Error Irq.

3. Configure RDMA/TDMA Start Address, Burst Size and Trans_length for each DMA channel. After that, set the RDMA/TDMA Enable bit. Once the Enable bit is set, the DMA channel will start to work right away.

4. Wait HSI Controller Irq and check RDMA/TDMA Complete Irq Stat bit.

42.4.1.9 Typical Software Operation Flow 1 for Data Port

1. Read corresponding Tx/Rx FIFO Status Register to make sure FIFO isn't empty/full.

2. Read/write Tx/Rx channel Data Port registers to access channel FIFO data.

42.4.1.10 Typical Software Operation Flow 2 for Data Port

1. Configure corresponding Tx/Rx FIFO Threshold Register.

2. Enable Tx/Rx FIFO Threshold interrupt.

3. Wait Tx/Rx FIFO Threshold interrupt.

4. Read/write Tx/Rx channel Data Port registers to access channel FIFO data.

42.4.2 HSI Reset

There are two kinds of reset signals within HSI:

1. Hardware reset
2. Software reset for all

These signals are fed into this module and stable signals are generated inside the module to reset all other modules. The module also gates off all the inside signals.

This module controls all the reset signals within the HSI.

42.5 HSI Memory Map/Register Definition

This section includes the module memory map and detailed descriptions of all registers.

NOTE

The HSI registers are 32 bits wide and only support 32-bit access.

NOTE

The term reset refers to power-on-reset. It will be specified whenever the software reset value differs from the power-on-reset.

MIPI_HSI memory map

MIPI_HSI_CTRL field descriptions

Field	Description
31 SFTRST	Set this bit to zero to enable normal HSI operation. Set this bit to one (default) to disable clocking with the HSI and hold it in its reset (lowest power) state. This bit can be turned on and then off to reset the HSI block to its default state.
30 CLKGATE	This bit must be set to zero for normal operation. When set to one it gates off the clocks to the block.

Table continues on the next page...

MIPI_HSI_CTRL field descriptions (continued)

Field	Description
29–28 Reserved	This field is reserved. Reserved, always set to zero.
27 DMA_DISABLE	This bit must be set to zero for any DMA operation. When set to one it disables all the DMA channels.
26–24 RX_DLY_SEL	These values denote the tap delay values for reception of data and flag. 000 0ns ; 001 1ns ; 010 2ns ; 011 3ns ; 100 4ns ; 101 5ns ; 110 6ns ; 111 7ns ;
23–16 RX_FRAME_ BRST_CNT	This value is to limit the continuous Frame transmission count in Pipelined Data flow. The Receiver Frame Burst counter shall be able to support up to 256 frames of continuous transfer. 7'h00 256 frames transmission count is set. 7'h01 1 frames transmission count is set. 7'h02 2 frames transmission count is set. 7'hff 255 frames transmission count is set.
15–14 Reserved	This field is reserved. Reserved.
13–12 RX_TAIL_BIT_ CNT	The value determines the length of the Tailing bit counter. The receiver shall start Receiver Tailing bit counter after the nth frame programmed in Rx Frame Burst counter is received. The receiver shall then drive ready to logic one if the receiver Tailing-bit counter has completed with no errors detected, and the receiver has enough room for at least one new frame. 00 800-> tx_refclk 01 400-> tx_refclk 10 200-> tx_refclk 11 100-> tx_refclk
11–8 DATA_ TIMEOUT_CNT	This value determines the interval by which DATA timeouts are detected. This data timeout counter logic is used only for Receive operations. The counter should start counting when data in any of the RX channel fifo is less than the threshold value and resets to zero when there is a threshold reached interrupt from any of the RX buffers. The counter value should be zero, when RX fifo is empty. An interrupt will be asserted to the host driver, when the counter value reaches the data timeout counter value. 1110 HSI Tx Clock x 2 ^ 27 0001 HSI Tx Clock x 2 ^ 14 0000 HSI Tx Clock x 2 ^ 13

Table continues on the next page...

MIPI_HSI_CTRL field descriptions (continued)

Field	Description
7–5 Reserved	This field is reserved. Reserved.
4 TX_BREAK	Setting this bit to one triggers a transmission break at HSI Tx. Once this bit is set to one, the HSI controller will send a series of zeros on HSI_TX_DATA port according to the tx break count. It will be automatically cleared, when the send is finished.
TX_CLK_ DIVISOR	This register holds the divisor of the base clock (tx_refclk) frequency for HSI Tx clock (internal clock used to drive Transmitter interface). 1000 tx_refclk divided by 256 0111 tx_refclk divided by 128 0110 tx_refclk divided by 64 0101 tx_refclkdivided by 32 0100 tx_refclk divided by 16 0011 tx_refclk divided by 8 0010 tx_refclk divided by 4 0001 tx_refclk divided by 2 0000 tx_refclk divided by 1

42.5.2 HSI Tx Config Register (MIPI_HSI_TX_CONF)

This register contains the configurations of tx channel enable/disable, tx wakeup and tx trans mode.

Address: 220_8000h base + 4h offset = 220_8004h

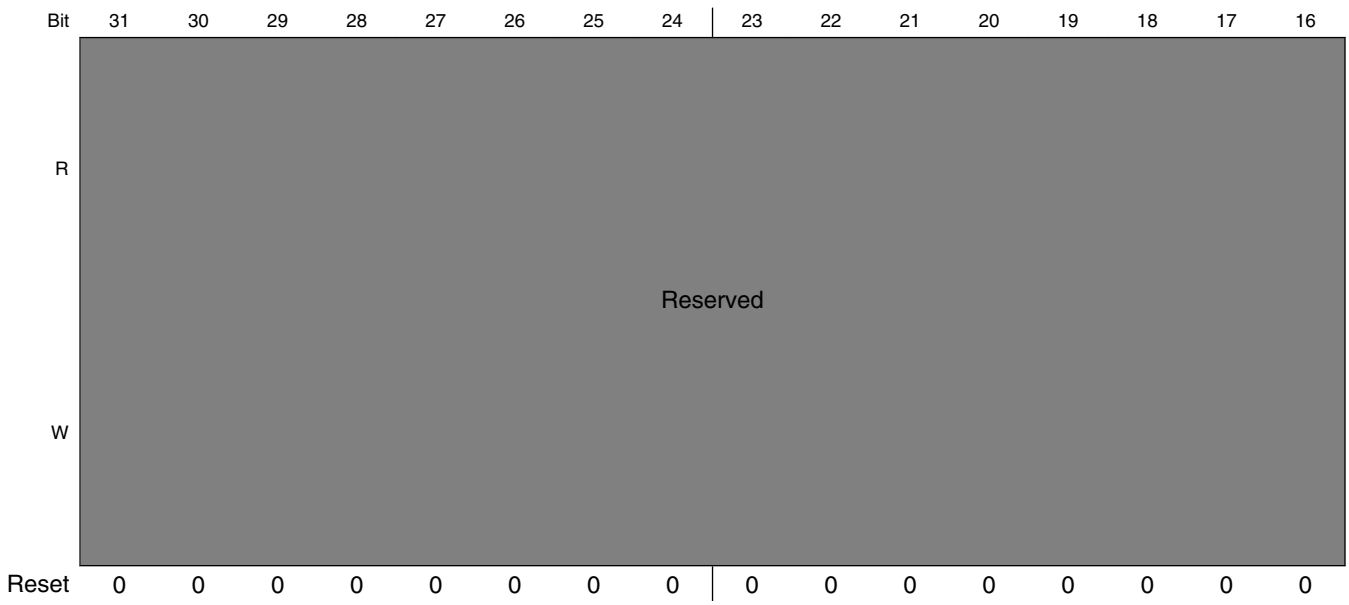
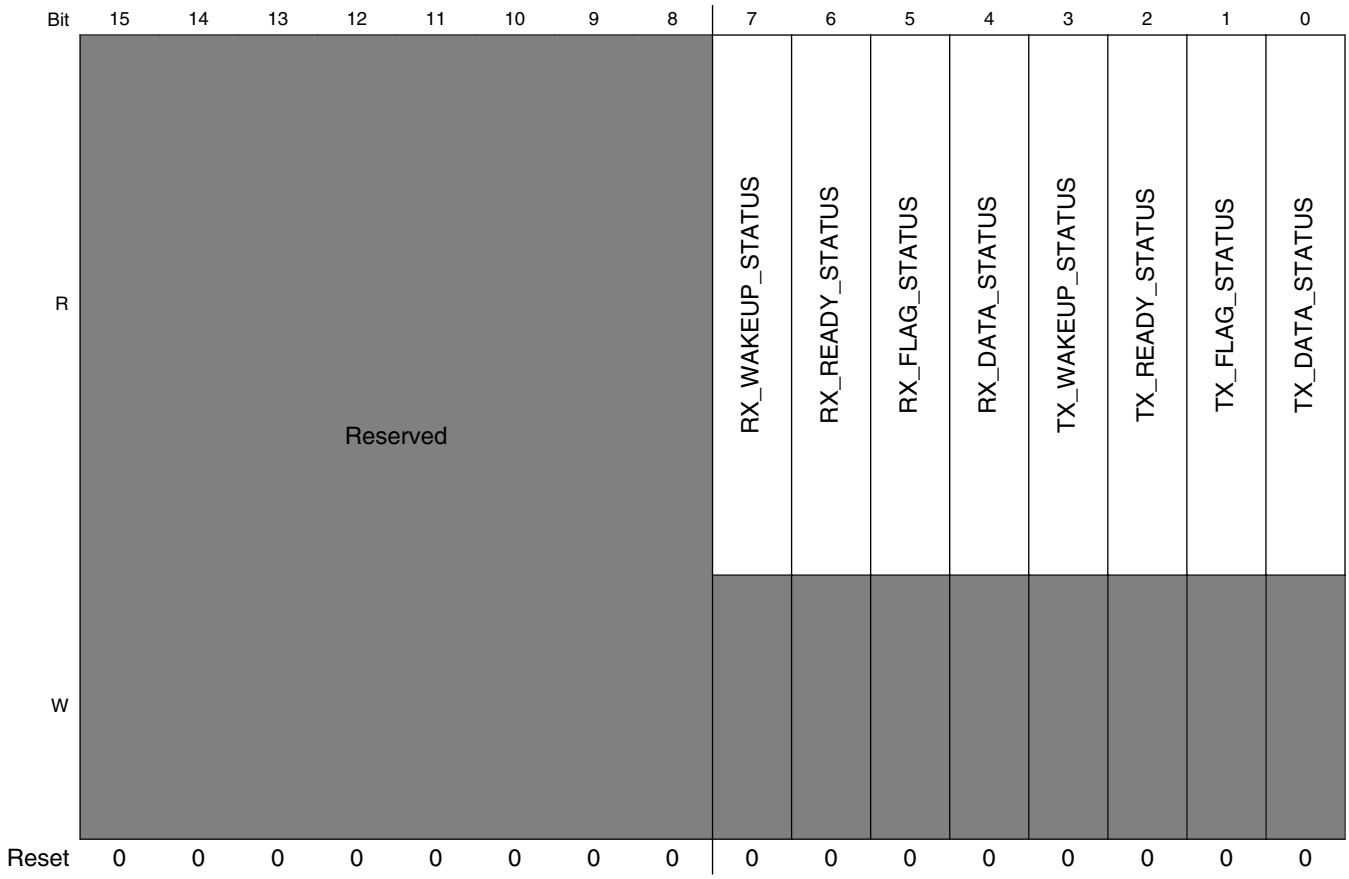
42.5.9 HSI Line Status Register (MIPI_HSI_LINE_ST)

This register contains the HSI controller line status for debug.

Address: 220_8000h base + 20h offset = 220_8020h





MIPI_HSI_LINE_ST field descriptions

Field	Description
31–8 Reserved	This field is reserved. Reserved, always set to zero.
7 RX_WAKEUP_ STATUS	This field reflects the rx_wake pin(only for debug).
6 RX_READY_ STATUS	This field reflects the rx_rdy pin(only for debug).
5 RX_FLAG_ STATUS	This field reflects the rx_flag pin(only for debug).
4 RX_DATA_ STATUS	This field reflects the rx_data pin(only for debug).
3 TX_WAKEUP_ STATUS	This field reflects the tx_wake pin(only for debug).
2 TX_READY_ STATUS	This field reflects the tx_ready pin(only for debug).

Table continues on the next page...

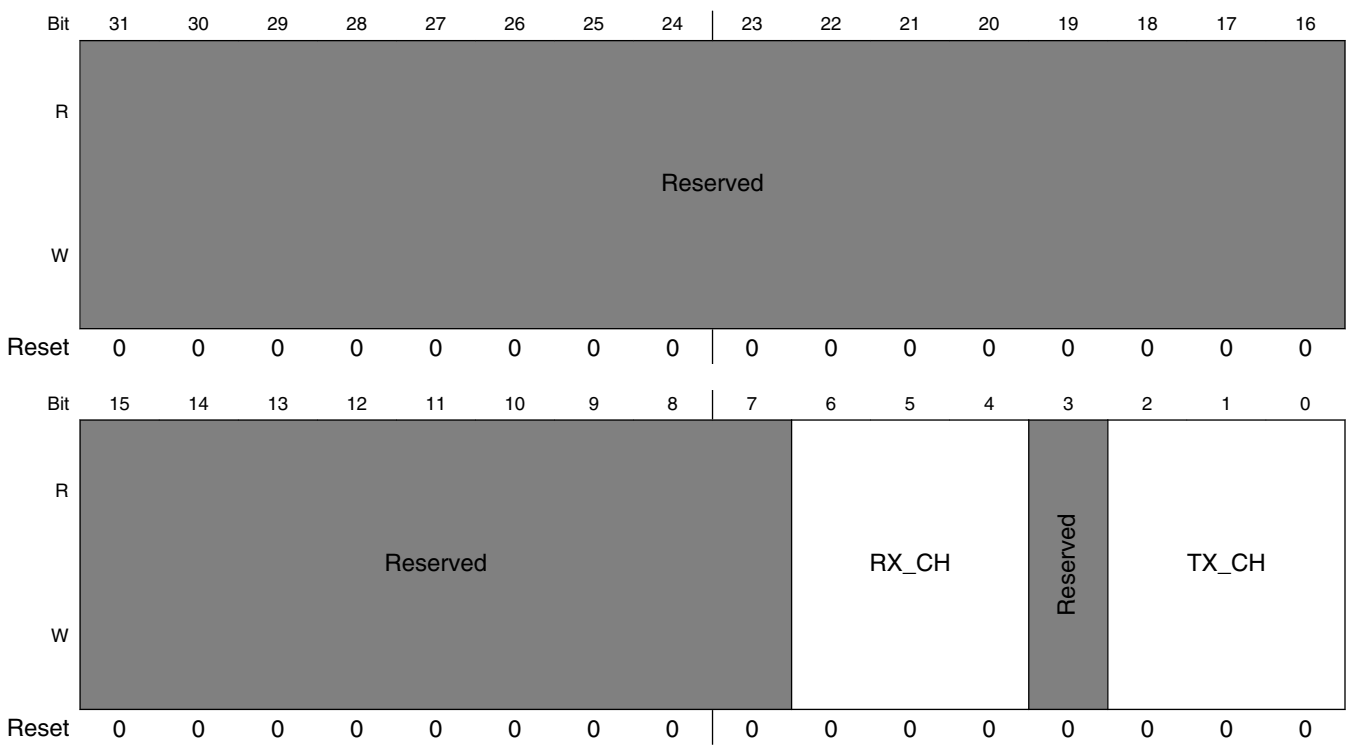
MIPI_HSI_LINE_ST field descriptions (continued)

Field	Description
1 TX_FLAG_ STATUS	This field reflects the tx_flag pin(only for debug).
0 TX_DATA_ STATUS	This field reflects the tx_data pin(only for debug).

42.5.10 HSI ID Bits Register (MIPI_HSI_ID_BIT)

This register contains the configurations of tx channel enable/disable, , tx wakeup and tx trans mode.

Address: 220_8000h base + 24h offset = 220_8024h



MIPI_HSI_ID_BIT field descriptions

Field	Description
31–7 Reserved	This field is reserved. Reserved, always set to zero.
6–4 RX_CH	This bit sets the number of channel ID bits per frame or stream for a Receive operation.

Table continues on the next page...

MIPI_HSI_CH_SFTRST field descriptions

Field	Description
31 TX_CH15	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Tx Channel 15 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
30 TX_CH14	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Tx Channel 14 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
29 TX_CH13	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Tx Channel 13 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
28 TX_CH12	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Tx Channel 12 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
27 TX_CH11	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Tx Channel 11 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
26 TX_CH10	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Tx Channel 10 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
25 TX_CH9	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Tx Channel 9 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.

Table continues on the next page...

MIPI_HSI_CH_SFTRST field descriptions (continued)

Field	Description
24 TX_CH8	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Tx Channel 8 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
23 TX_CH7	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Tx Channel 7 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
22 TX_CH6	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Tx Channel 6 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
21 TX_CH5	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Tx Channel 5 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
20 TX_CH4	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Tx Channel 4 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
19 TX_CH3	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Tx Channel 3 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
18 TX_CH2	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Tx Channel 2 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
17 TX_CH1	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Tx Channel 1 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
16 TX_CH0	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Tx Channel 0 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
15 RX_CH15	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Rx Channel 15 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
14 RX_CH14	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Rx Channel 14 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
13 RX_CH13	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Rx Channel 13 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
12 RX_CH12	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Rx Channel 12 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
11 RX_CH11	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Rx Channel 11 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
10 RX_CH10	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Rx Channel 10 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
9 RX_CH9	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Rx Channel 9 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
8 RX_CH8	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Rx Channel 8 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
7 RX_CH7	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Rx Channel 7 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
6 RX_CH6	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Rx Channel 6 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
5 RX_CH5	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Rx Channel 5 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
4 RX_CH4	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Rx Channel 4 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
3 RX_CH3	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Rx Channel 3 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
2 RX_CH2	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Rx Channel 2 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.

Table continues on the next page...

MIPI_HSI_CH_SFTRST field descriptions (continued)

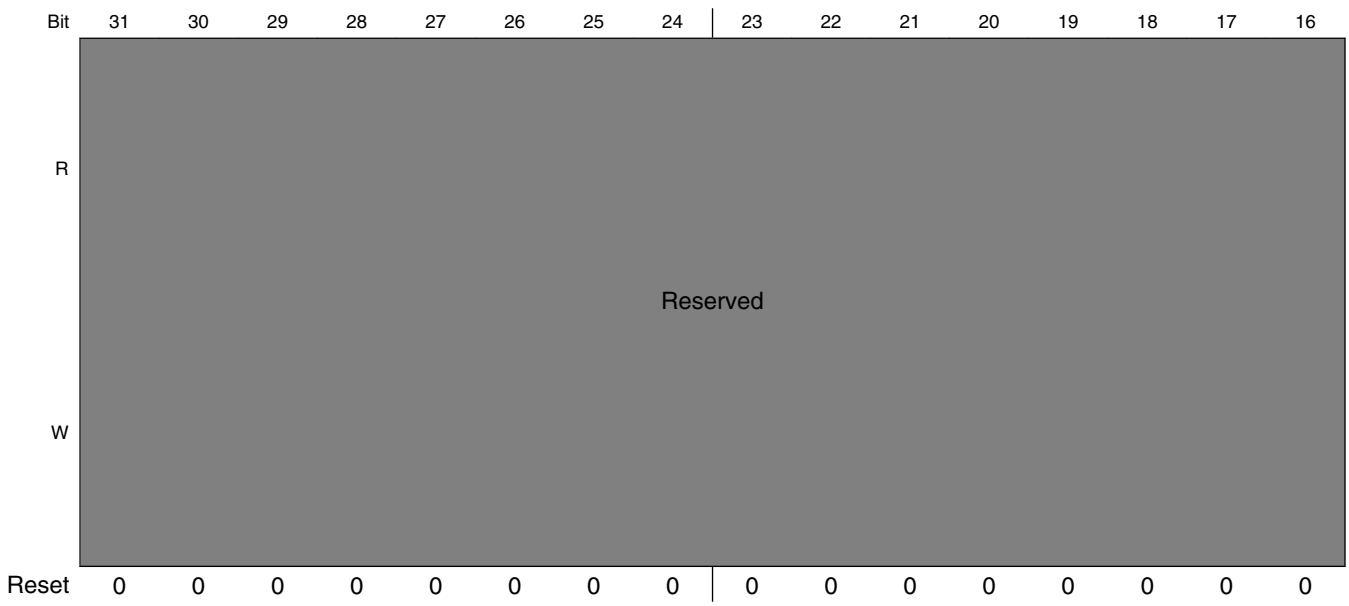
Field	Description
1 RX_CH1	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Rx Channel 1 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
0 RX_CH0	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Rx Channel 0 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.

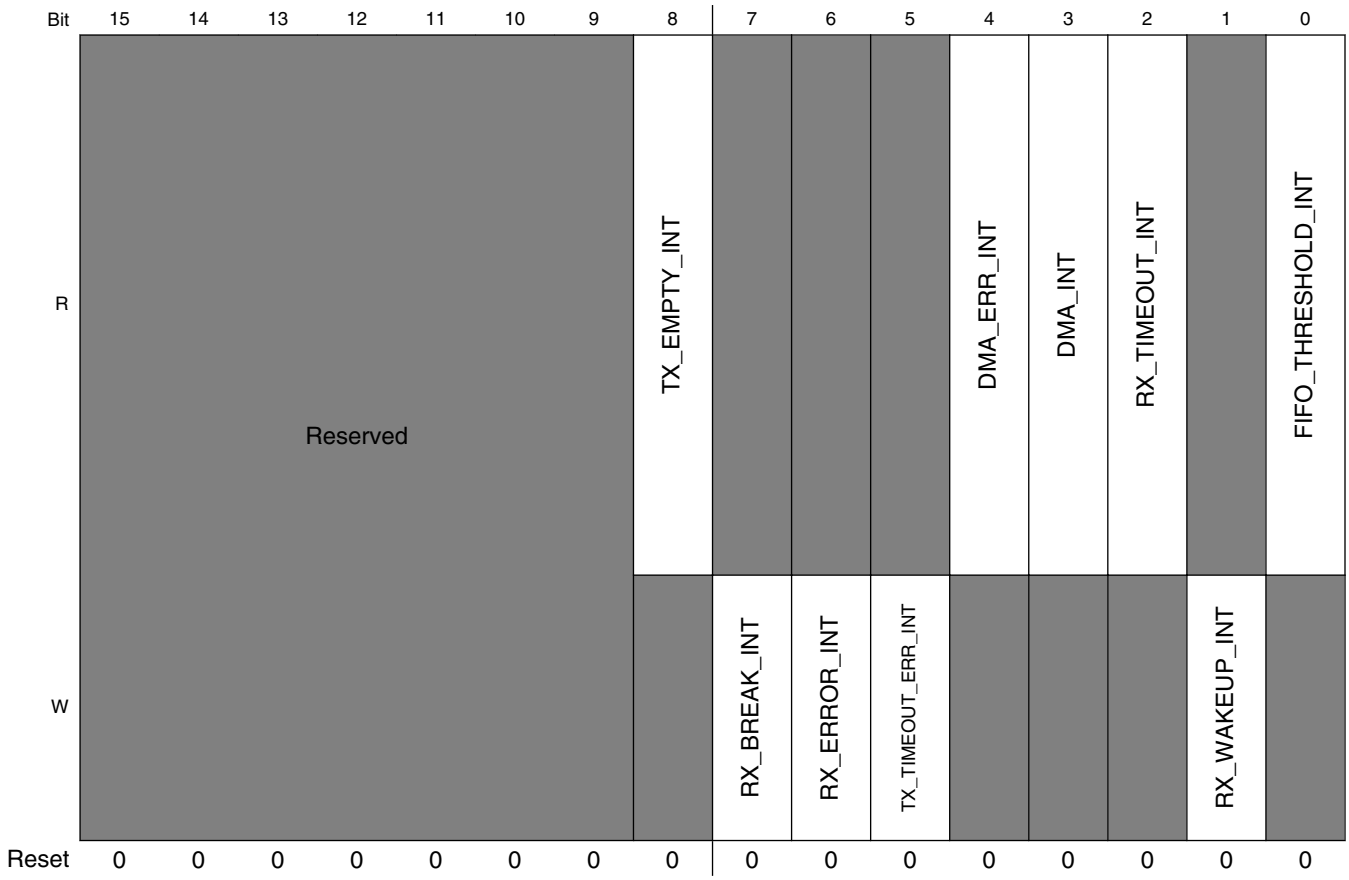
42.5.13 HSI Interrupt Status Register (MIPI_HSI_IRQSTAT)

This is HSI controller Interrupt Status Register.

This register contains the HSI controller Interrupt Status.

Address: 220_8000h base + 30h offset = 220_8030h





MIPI_HSI_IRQSTAT field descriptions

Field	Description
31–9 Reserved	This field is reserved. Reserved, always set to zero.
8 TX_EMPTY_INT	1 All tx channel empty and tx state IDLE Interrupt Status 0 not All tx channel empty and tx state IDLE Interrupt Status
7 RX_BREAK_INT	0 No Error. 1 Error.
6 RX_ERROR_INT	0 No Error. 1 Error.
5 TX_TIMEOUT_ERR_INT	0 No Error. 1 Error.
4 DMA_ERR_INT	If any bit in the DMA Error Interrupt Status Register is set, then this bit is set. on seeing this bit set, the ocp driver will read the Error Interrupt Status Register. 0 No Error. 1 Error.
3 DMA_INT	This bit is set when a Transmit or Receive Operation is completed for DMA.

Table continues on the next page...

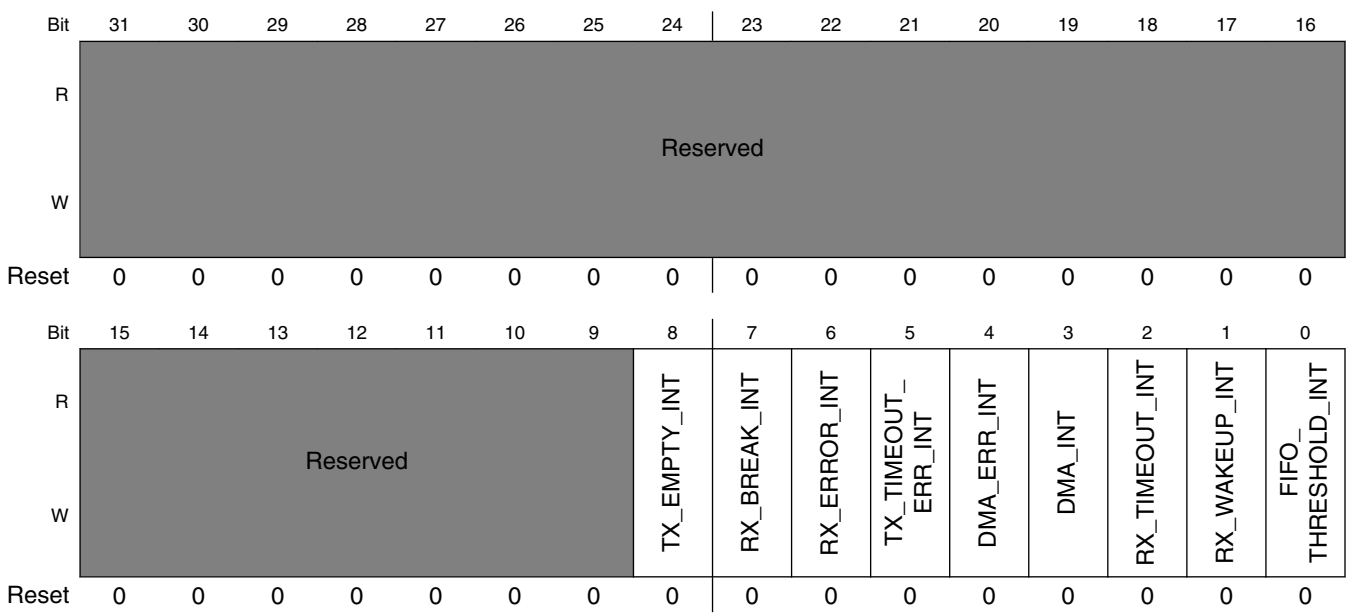
MIPI_HSI_IRQSTAT field descriptions (continued)

Field	Description
2 RX_TIMEOUT_INT	If any bit in the HSI Error Interrupt Status Register is set, then this bit is set. on seeing this bit set, the ocp driver will read the Error Interrupt Status Register. 0 No Error. 1 Error.
1 RX_WAKEUP_INT	1 Receiver Wakeup event is occurred 0 Receiver Wakeup event is not occurred
0 FIFO_THRESHOLD_INT	1 Threshold amount of data reached in TX/Rx FIFO Interrupt Status 0 Threshold amount of data not reached in TX/Rx FIFO Interrupt Status

42.5.14 HSI Interrupt Status Enable Register (MIPI_HSI_IRQSTAT_EN)

This register contains the HSI controller Interrupt Status Enable.

Address: 220_8000h base + 34h offset = 220_8034h



MIPI_HSI_IRQSTAT_EN field descriptions

Field	Description
31–9 Reserved	This field is reserved. Reserved, always set to zero.

Table continues on the next page...

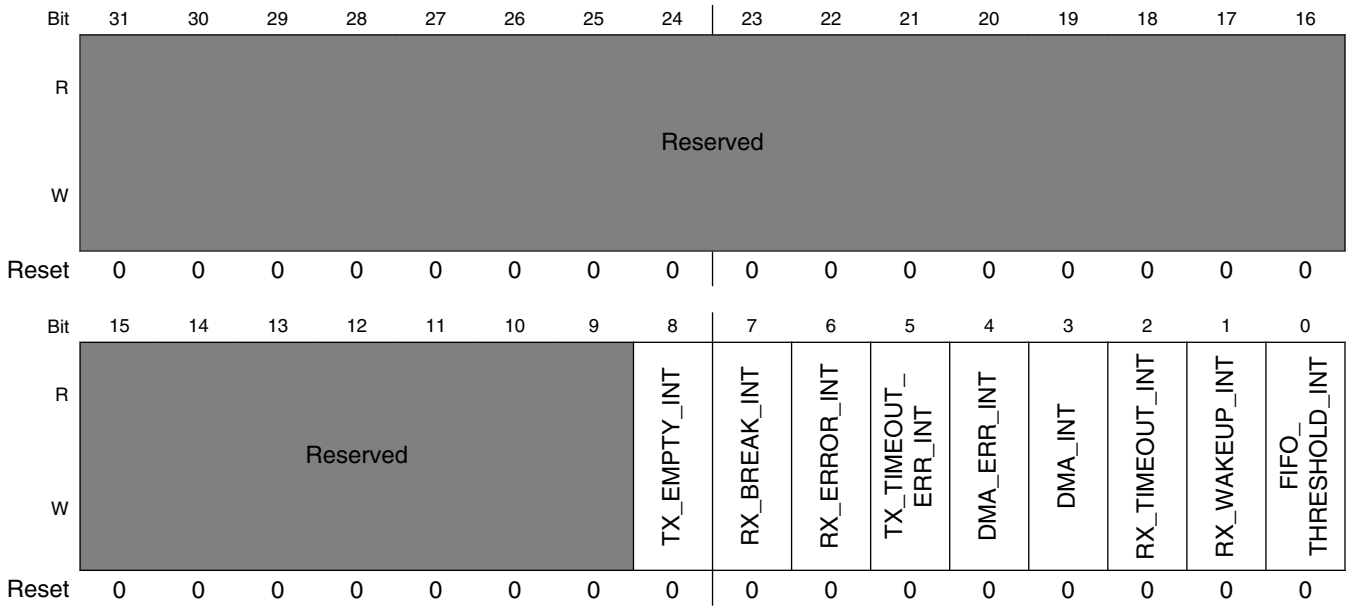
MIPI_HSI_IRQSTAT_EN field descriptions (continued)

Field	Description
8 TX_EMPTY_INT	1 Interrupt status enabled for TX_EMPTY_INT_STATUS interrupt. 0 Interrupt status masked TX_EMPTY_INT_STATUS interrupt.
7 RX_BREAK_INT	1 Interrupt status enabled for RX_BREAK status interrupt. 0 Interrupt status masked RX_BREAK status interrupt.
6 RX_ERROR_INT	1 Interrupt status enabled for RX_ERROR status interrupt. 0 Interrupt status masked RX_ERROR status interrupt.
5 TX_TIMEOUT_ERR_INT	1 Interrupt status enabled for TX_TIMEOUT_ERR status interrupt. 0 Interrupt status masked TX_TIMEOUT_ERR status interrupt.
4 DMA_ERR_INT	1 Interrupt status enabled for DMA_ERROR_INT_STATUS interrupt. 0 Interrupt status masked DMA_ERROR_INT_STATUS interrupt.
3 DMA_INT	1 Interrupt status enabled for DMA_INT_STATUS interrupt. 0 Interrupt status masked DMA_INT_STATUS interrupt.
2 RX_TIMEOUT_INT	1 Interrupt status enabled for RX_TIMEOUT_INT_STATUS interrupt. 0 Interrupt status masked RX_TIMEOUT_INT_STATUS interrupt.
1 RX_WAKEUP_INT	1 Interrupt status enabled for RX_WAKEUP_INT_STATUS interrupt. 0 Interrupt status masked RX_WAKEUP_INT_STATUS interrupt.
0 FIFO_THRESHOLD_INT	1 Interrupt status enabled for FIFO_THRESHOLD_INT_STATUS interrupt. 0 Interrupt status masked FIFO_THRESHOLD_INT_STATUS interrupt.

42.5.15 HSI Interrupt Signal Enable Register (MIPI_HSI_IRQSIG_EN)

This register contains the HSI controller Interrupt Signal Enable.

Address: 220_8000h base + 38h offset = 220_8038h



MIPI_HSI_IRQSIG_EN field descriptions

Field	Description
31–9 Reserved	This field is reserved. Reserved, always set to zero.
8 TX_EMPTY_INT	Setting this bit will enable interrupt generation on interrupt line. 1 Interrupt signal enabled for HSI TX_EMPTY interrupt. 0 Interrupt signal masked for HSI TX_EMPTY interrupt.
7 RX_BREAK_INT	Setting this bit will enable interrupt generation on interrupt line. 1 Interrupt signal enabled for RX_BREAK interrupt. 0 Interrupt signal masked for RX_BREAK interrupt.
6 RX_ERROR_INT	Setting this bit will enable interrupt generation on interrupt line. 1 Interrupt signal enabled for RX Error interrupt. 0 Interrupt signal masked for RX Error interrupt.
5 TX_TIMEOUT_ERR_INT	Setting this bit will enable interrupt generation on interrupt line. 1 Interrupt signal enabled for TX Timeout Error interrupt. 0 Interrupt signal masked for TX Timeout Error interrupt.

Table continues on the next page...

MIPI_HSI_IRQSIG_EN field descriptions (continued)

Field	Description
4 DMA_ERR_INT	Setting this bit will enable interrupt generation on interrupt line. 1 Interrupt signal enabled for DMA Error interrupt. 0 Interrupt signal masked for DMA Error interrupt.
3 DMA_INT	Setting this bit will enable interrupt generation on interrupt line. 1 Interrupt signal enabled for DMA Completed interrupt. 0 Interrupt signal masked for DMA Completed interrupt.
2 RX_TIMEOUT_ INT	Setting this bit will enable interrupt generation on interrupt line. 1 Interrupt signal enabled for RX TIMEOUT interrupt. 0 Interrupt signal masked for RX TIMEOUT interrupt.
1 RX_WAKEUP_ INT	Setting this bit will enable interrupt generation on interrupt line. 1 Interrupt signal enabled for HSI RX Wakeup interrupt. 0 Interrupt signal masked for HSI RX Wakeup interrupt.
0 FIFO_ THRESHOLD_ INT	Setting this bit will enable interrupt generation on interrupt line. 1 Interrupt signal enabled for HSI FIFO_THRESHOLD interrupt. 0 Interrupt signal masked for HSI FIFO_THRESHOLD interrupt.

42.5.16 HSI FIFO Threshold Interrupt Status Register (MIPI_HSI_FIFO_THR_IRQSTAT)

This register contains the HSI controller FIFO Threshold Interrupt Status.

Address: 220_8000h base + 3Ch offset = 220_803Ch

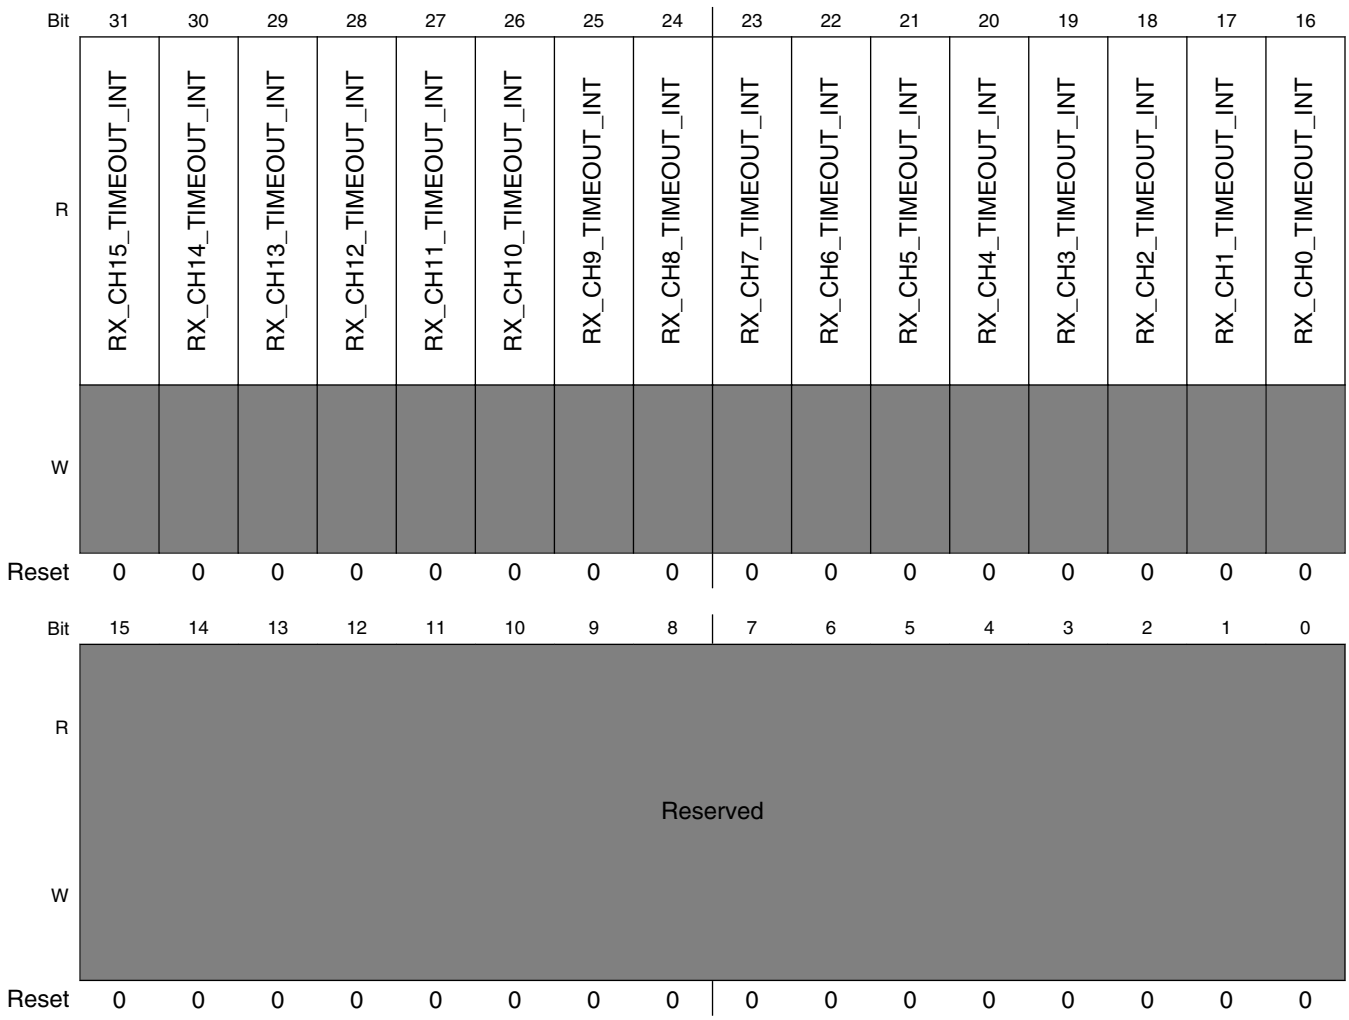
MIPI_HSI_RX_CH*n*_DP field descriptions

Field	Description
DATA	Software could Write/Read this bits to access Rx Channel n.

42.5.21 HSI Error Interrupt Status Register (MIPI_HSI_ERR_IRQSTAT)

This register contains the HSI controller Error Interrupt Status.

Address: 220_8000h base + D0h offset = 220_80D0h



MIPI_HSI_ERR_IRQSTAT field descriptions

Field	Description
31 RX_CH15_ TIMEOUT_INT	This status bit is set when data timeout counter for ch15 reaches the data timeout counter value. On receiving the interrupt the host driver should read 1Dword of data from Rx ch15 buffer and then read HSI Status register to find the further status of the Rx ch15 Buffer. The host driver has to read the Rx ch15 fifo on Dword basis, till the fifo is completely empty.

Table continues on the next page...

MIPI_HSI_ERR_IRQSTAT field descriptions (continued)

Field	Description
30 RX_CH14_ TIMEOUT_INT	This status bit is set when data timeout counter for ch14 reaches the data timeout counter value. On receiving the interrupt the host driver should read 1Dword of data from Rx ch14 buffer and then read HSI Status register to find the further status of the Rx ch14 Buffer. The host driver has to read the Rx ch14 fifo on Dword basis, till the fifo is completely empty.
29 RX_CH13_ TIMEOUT_INT	This status bit is set when data timeout counter for ch13 reaches the data timeout counter value. On receiving the interrupt the host driver should read 1Dword of data from Rx ch13 buffer and then read HSI Status register to find the further status of the Rx ch13 Buffer. The host driver has to read the Rx ch13 fifo on Dword basis, till the fifo is completely empty.
28 RX_CH12_ TIMEOUT_INT	This status bit is set when data timeout counter for ch12 reaches the data timeout counter value. On receiving the interrupt the host driver should read 1Dword of data from Rx ch12 buffer and then read HSI Status register to find the further status of the Rx ch12 Buffer. The host driver has to read the Rx ch12 fifo on Dword basis, till the fifo is completely empty.
27 RX_CH11_ TIMEOUT_INT	This status bit is set when data timeout counter for ch11 reaches the data timeout counter value. On receiving the interrupt the host driver should read 1Dword of data from Rx ch11 buffer and then read HSI Status register to find the further status of the Rx ch11 Buffer. The host driver has to read the Rx ch11 fifo on Dword basis, till the fifo is completely empty.
26 RX_CH10_ TIMEOUT_INT	This status bit is set when data timeout counter for ch10 reaches the data timeout counter value. On receiving the interrupt the host driver should read 1Dword of data from Rx ch10 buffer and then read HSI Status register to find the further status of the Rx ch10 Buffer. The host driver has to read the Rx ch10 fifo on Dword basis, till the fifo is completely empty.
25 RX_CH9_ TIMEOUT_INT	This status bit is set when data timeout counter for ch9 reaches the data timeout counter value. On receiving the interrupt the host driver should read 1Dword of data from Rx ch9 buffer and then read HSI Status register to find the further status of the Rx ch9 Buffer. The host driver has to read the Rx ch9 fifo on Dword basis, till the fifo is completely empty.
24 RX_CH8_ TIMEOUT_INT	This status bit is set when data timeout counter for ch8 reaches the data timeout counter value. On receiving the interrupt the host driver should read 1Dword of data from Rx ch8 buffer and then read HSI Status register to find the further status of the Rx ch8 Buffer. The host driver has to read the Rx ch8 fifo on Dword basis, till the fifo is completely empty.
23 RX_CH7_ TIMEOUT_INT	This status bit is set when data timeout counter for ch7 reaches the data timeout counter value. On receiving the interrupt the host driver should read 1Dword of data from Rx ch7 buffer and then read HSI Status register to find the further status of the Rx ch7 Buffer. The host driver has to read the Rx ch7 fifo on Dword basis, till the fifo is completely empty.
22 RX_CH6_ TIMEOUT_INT	This status bit is set when data timeout counter for ch6 reaches the data timeout counter value. On receiving the interrupt the host driver should read 1Dword of data from Rx ch6 buffer and then read HSI Status register to find the further status of the Rx ch6 Buffer. The host driver has to read the Rx ch6 fifo on Dword basis, till the fifo is completely empty.
21 RX_CH5_ TIMEOUT_INT	This status bit is set when data timeout counter for ch5 reaches the data timeout counter value. On receiving the interrupt the host driver should read 1Dword of data from Rx ch5 buffer and then read HSI Status register to find the further status of the Rx ch5 Buffer. The host driver has to read the Rx ch5 fifo on Dword basis, till the fifo is completely empty.
20 RX_CH4_ TIMEOUT_INT	This status bit is set when data timeout counter for ch4 reaches the data timeout counter value. On receiving the interrupt the host driver should read 1Dword of data from Rx ch4 buffer and then read HSI Status register to find the further status of the Rx ch4 Buffer. The host driver has to read the Rx ch4 fifo on Dword basis, till the fifo is completely empty.

Table continues on the next page...

MIPI_HSI_ERR_IRQSTAT field descriptions (continued)

Field	Description
19 RX_CH3_ TIMEOUT_INT	This status bit is set when data timeout counter for ch3 reaches the data timeout counter value. On receiving the interrupt the host driver should read 1Dword of data from Rx ch3 buffer and then read HSI Status register to find the further status of the Rx ch3 Buffer. The host driver has to read the Rx ch3 fifo on Dword basis, till the fifo is completely empty.
18 RX_CH2_ TIMEOUT_INT	This status bit is set when data timeout counter for ch2 reaches the data timeout counter value. On receiving the interrupt the host driver should read 1Dword of data from Rx ch2 buffer and then read HSI Status register to find the further status of the Rx ch2 Buffer. The host driver has to read the Rx ch2 fifo on Dword basis, till the fifo is completely empty.
17 RX_CH1_ TIMEOUT_INT	This status bit is set when data timeout counter for ch1 reaches the data timeout counter value. On receiving the interrupt the host driver should read 1Dword of data from Rx ch1 buffer and then read HSI Status register to find the further status of the Rx ch1 Buffer. The host driver has to read the Rx ch1 fifo on Dword basis, till the fifo is completely empty.
16 RX_CH0_ TIMEOUT_INT	This status bit is set when data timeout counter for ch0 reaches the data timeout counter value. On receiving the interrupt the host driver should read 1Dword of data from Rx ch0 buffer and then read HSI Status register to find the further status of the Rx ch0 Buffer. The host driver has to read the Rx ch0 fifo on Dword basis, till the fifo is completely empty.

Field	Description
27 RX_CH11_ TIMEOUT_INT_ EN	Setting this bit will enable interrupt generation on interrupt line. 1 Interrupt signal enabled for data timeout for ch11 interrupt. 0 Interrupt signal masked for data timeout for ch11 interrupt.
26 RX_CH10_ TIMEOUT_INT_ EN	Setting this bit will enable interrupt generation on interrupt line. 1 Interrupt signal enabled for data timeout for ch10 interrupt. 0 Interrupt signal masked for data timeout for ch10 interrupt.
25 RX_CH9_ TIMEOUT_INT_ EN	Setting this bit will enable interrupt generation on interrupt line. 1 Interrupt signal enabled for data timeout for ch9 interrupt. 0 Interrupt signal masked for data timeout for ch9 interrupt.
24 RX_CH8_ TIMEOUT_INT_ EN	Setting this bit will enable interrupt generation on interrupt line. 1 Interrupt signal enabled for data timeout for ch8 interrupt. 0 Interrupt signal masked for data timeout for ch8 interrupt.
23 RX_CH7_ TIMEOUT_INT_ EN	Setting this bit will enable interrupt generation on interrupt line. 1 Interrupt signal enabled for data timeout for ch7 interrupt. 0 Interrupt signal masked for data timeout for ch7 interrupt.
22 RX_CH6_ TIMEOUT_INT_ EN	Setting this bit will enable interrupt generation on interrupt line. 1 Interrupt signal enabled for data timeout for ch6 interrupt. 0 Interrupt signal masked for data timeout for ch6 interrupt.
21 RX_CH5_ TIMEOUT_INT_ EN	Setting this bit will enable interrupt generation on interrupt line. 1 Interrupt signal enabled for data timeout for ch5 interrupt. 0 Interrupt signal masked for data timeout for ch5 interrupt.
20 RX_CH4_ TIMEOUT_INT_ EN	Setting this bit will enable interrupt generation on interrupt line. 1 Interrupt signal enabled for data timeout for ch4 interrupt. 0 Interrupt signal masked for data timeout for ch4 interrupt.
19 RX_CH3_ TIMEOUT_INT_ EN	Setting this bit will enable interrupt generation on interrupt line. 1 Interrupt signal enabled for data timeout for ch3 interrupt. 0 Interrupt signal masked for data timeout for ch3 interrupt.
18 RX_CH2_ TIMEOUT_INT_ EN	Setting this bit will enable interrupt generation on interrupt line. 1 Interrupt signal enabled for data timeout for ch2 interrupt. 0 Interrupt signal masked for data timeout for ch2 interrupt.
17 RX_CH1_ TIMEOUT_INT_ EN	Setting this bit will enable interrupt generation on interrupt line. 1 Interrupt signal enabled for data timeout for ch1 interrupt. 0 Interrupt signal masked for data timeout for ch1interrupt.
16 RX_CH0_ TIMEOUT_INT_ EN	Setting this bit will enable interrupt generation on interrupt line. 1 Interrupt signal enabled for data timeout for ch0 interrupt. 0 Interrupt signal masked for data timeout for ch0 interrupt.
Reserved	This field is reserved.

Table continues on the next page...

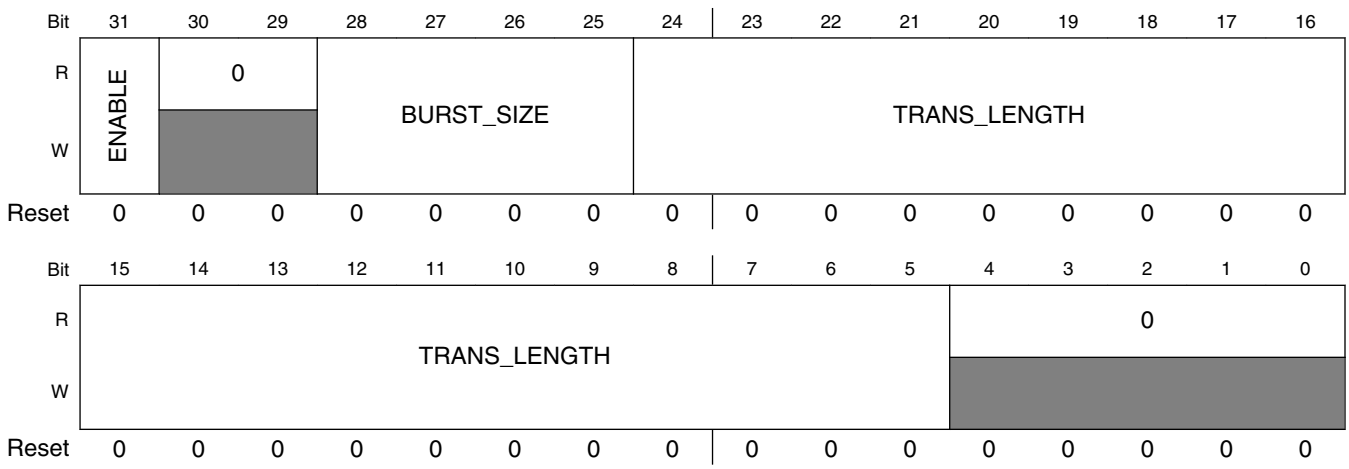
MIPI_HSI_ERR_IRQSIG_EN field descriptions (continued)

Field	Description
	Reserved, always set to zero.

42.5.24 Tx DMA Channel n Configuration Register (MIPI_HSI_TDMA*n*_CONF)

This register contains the configurations of enable/disable, burst size and transfer count for Tx DMA channel n.

Address: 220_8000h base + DCh offset + (4d × i), where i=0d to 15d



MIPI_HSI_TDMA*n*_CONF field descriptions

Field	Description
31 ENABLE	Setting this bit enables the internal Tx DMA channel n.
30–29 Reserved	This read-only field is reserved and always has the value 0.
28–25 BURST_SIZE	Burst size for Tx DMA channel n. The unit is Dword. The burst size should not be larger than relevant TRANS_LENGTH and FIFO_SIZE. h0 1Dword to transfer for each burst h1 2Dword to transfer for each burst h2 4Dword to transfer for each burst h10 1024Dword to transfer for each burst
24–5 TRANS_ LENGTH	Transfer data length for Tx DMA channel n. The unit is Dword. h1 1Dword to transfer h2 2Dwords to transfer

Table continues on the next page...

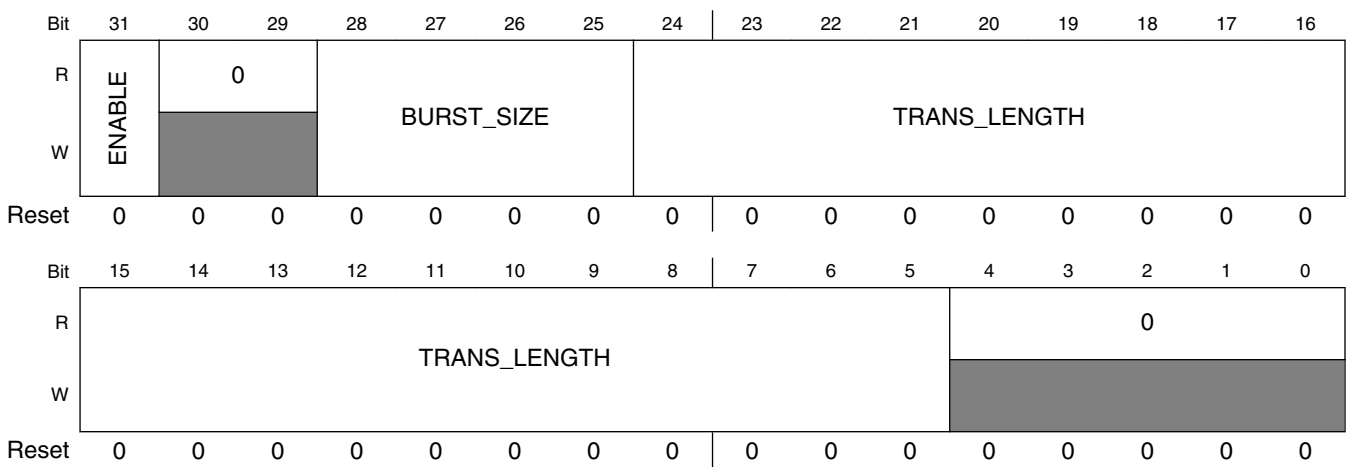
MIPI_HSI_TDMA*n*_CONF field descriptions (continued)

Field	Description
	hffffff 1048575Dwords to transfer
Reserved	This read-only field is reserved and always has the value 0.

42.5.25 Rx DMA Channel n Configuration Register (MIPI_HSI_RDMA*n*_CONF)

This register contains the configurations of enable/disable, burst size and transfer count for Rx DMA channel n.

Address: 220_8000h base + 11Ch offset + (4d × i), where i=0d to 15d



MIPI_HSI_RDMA*n*_CONF field descriptions

Field	Description
31 ENABLE	Setting this bit enables the internal Rx DMA channel n.
30–29 Reserved	This read-only field is reserved and always has the value 0.
28–25 BURST_SIZE	Burst size for Rx DMA channel n. The unit is Dword. The burst size should not be larger than relevant TRANS_LENGTH and FIFO_SIZE. h0 1Dword to transfer for each burst h1 2Dword to transfer for each burst h2 4Dword to transfer for each burst h10 1024Dword to transfer for each burst
24–5 TRANS_ LENGTH	Transfer data length for Rx DMA channel 0. The unit is Dword. h1 1Dword to transfer

Table continues on the next page...

MIPI_HSI_RDMA*n*_CONF field descriptions (continued)

Field	Description
	h2 2Dwords to transfer hffffff 1048575Dwords to transfer
Reserved	This read-only field is reserved and always has the value 0.

42.5.26 Tx DMA Channel n Start Address Register (MIPI_HSI_TDMA*n*_STA_ADDR)

This Register contains the physical Start Address HSI for Tx DMA Channel n.

Address: 220_8000h base + 15Ch offset + (4d × i), where i=0d to 15d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

MIPI_HSI_DMA_SINGLE_REQ_EN field descriptions

Field	Description
31 TDMA15	When the remain DMA data less than one DMA burst size in Tx DMA Channel 15, this bit will be set automatically
30 TDMA14	When the remain DMA data less than one DMA burst size in Tx DMA Channel 14, this bit will be set automatically

Table continues on the next page...

MIPI_HSI_DMA_SINGLE_REQ_EN field descriptions (continued)

Field	Description
29 TDMA13	When the remain DMA data less than one DMA burst size in Tx DMA Channel 13, this bit will be set automatically
28 TDMA12	When the remain DMA data less than one DMA burst size in Tx DMA Channel 12, this bit will be set automatically
27 TDMA11	When the remain DMA data less than one DMA burst size in Tx DMA Channel 11, this bit will be set automatically
26 TDMA10	When the remain DMA data less than one DMA burst size in Tx DMA Channel 10, this bit will be set automatically
25 TDMA9	When the remain DMA data less than one DMA burst size in Tx DMA Channel 9, this bit will be set automatically
24 TDMA8	When the remain DMA data less than one DMA burst size in Tx DMA Channel 8, this bit will be set automatically
23 TDMA7	When the remain DMA data less than one DMA burst size in Tx DMA Channel 7, this bit will be set automatically
22 TDMA6	When the remain DMA data less than one DMA burst size in Tx DMA Channel 6, this bit will be set automatically
21 TDMA5	When the remain DMA data less than one DMA burst size in Tx DMA Channel 5, this bit will be set automatically
20 TDMA4	When the remain DMA data less than one DMA burst size in Tx DMA Channel 4, this bit will be set automatically
19 TDMA3	When the remain DMA data less than one DMA burst size in Tx DMA Channel 3, this bit will be set automatically
18 TDMA2	When the remain DMA data less than one DMA burst size in Tx DMA Channel 2, this bit will be set automatically
17 TDMA1	When the remain DMA data less than one DMA burst size in Tx DMA Channel 1, this bit will be set automatically
16 TDMA0	When the remain DMA data less than one DMA burst size in Tx DMA Channel 0, this bit will be set automatically
15 RDMA15	When the remain DMA data less than one DMA burst size in Rx DMA Channel 15, this bit will be set automatically
14 RDMA14	When the remain DMA data less than one DMA burst size in Rx DMA Channel 14, this bit will be set automatically
13 RDMA13	When the remain DMA data less than one DMA burst size in Rx DMA Channel 13, this bit will be set automatically
12 RDMA12	When the remain DMA data less than one DMA burst size in Rx DMA Channel 12, this bit will be set automatically
11 RDMA11	When the remain DMA data less than one DMA burst size in Rx DMA Channel 11, this bit will be set automatically
10 RDMA10	When the remain DMA data less than one DMA burst size in Rx DMA Channel 10, this bit will be set automatically
9 RDMA9	When the remain DMA data less than one DMA burst size in Rx DMA Channel 9, this bit will be set automatically
8 RDMA8	When the remain DMA data less than one DMA burst size in Rx DMA Channel 8, this bit will be set automatically
7 RDMA7	When the remain DMA data less than one DMA burst size in Rx DMA Channel 7, this bit will be set automatically

Table continues on the next page...

MIPI_HSI_DMA_SINGLE_REQ_EN field descriptions (continued)

Field	Description
6 RDMA6	When the remain DMA data less than one DMA burst size in Rx DMA Channel 6, this bit will be set automatically
5 RDMA5	When the remain DMA data less than one DMA burst size in Rx DMA Channel 5, this bit will be set automatically
4 RDMA4	When the remain DMA data less than one DMA burst size in Rx DMA Channel 4, this bit will be set automatically
3 RDMA3	When the remain DMA data less than one DMA burst size in Rx DMA Channel 3, this bit will be set automatically
2 RDMA2	When the remain DMA data less than one DMA burst size in Rx DMA Channel 2, this bit will be set automatically
1 RDMA1	When the remain DMA data less than one DMA burst size in Rx DMA Channel 1, this bit will be set automatically
0 RDMA0	When the remain DMA data less than one DMA burst size in Rx DMA Channel 0, this bit will be set automatically

42.5.35 Tx Fifo Size Configuration Register 0 (MIPI_HSI_TX_FIFO_SIZE_CONF0)

This register is used to configure each Tx fifo size

Address: 220_8000h base + 200h offset = 220_8200h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

42.5.41 AHB Master Config Register (MIPI_HSI_AHB_MASTER_CONF)

This register used to configure hsi internal ahb master

Address: 220_8000h base + 228h offset = 220_8228h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	Reserved															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	Reserved						DP_HOLD_CYCLE				DMA_MODE		DMA_INSERT_IDLE_NUM			
Reset	0	0	0	0	0	0	0	1	1	0	0	0	0	0	0	0

MIPI_HSI_AHB_MASTER_CONF field descriptions

Field	Description
31–10 Reserved	This field is reserved. Reserved, always set to zero.
9–6 DP_HOLD_ CYCLE	These bits used to set the number of cycles for DP access fifo.
5–4 DMA_MODE	00 Once AHB master get hgrant from bus, it will set htrans "IDLE" for several ahb cycles. In the several cycles, once it found dataport is accessing fifo, it will release bus. 01 Once AHB master get hgrant from bus, it will set htrans "IDLE" for several ahb cycles. After the several cycles, once it found dataport is accessing fifo, it will keep on sending "IDLE" out until dataport finish accessing fifo. 1x Once AHB master get hgrant from bus, dataport can not access fifo until a dma operation done.

Table continues on the next page...

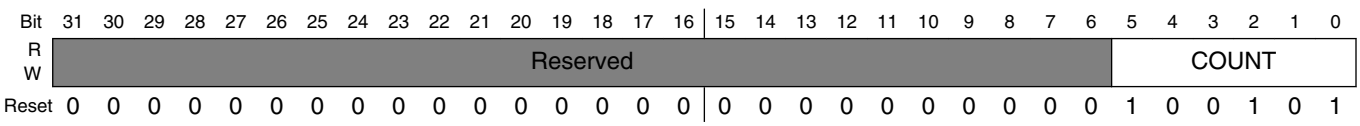
MIPI_HSI_AHB_MASTER_CONF field descriptions (continued)

Field	Description
DMA_INSERT_IDLE_NUM	These bits used to set the number of "IDLE" cycles when DMA_MODE == 2'b0x.

42.5.42 TX Break Length Register (MIPI_HSI_TX_BREAK_LEN)

This register used to set tx break length

Address: 220_8000h base + 22Ch offset = 220_822Ch



MIPI_HSI_TX_BREAK_LEN field descriptions

Field	Description
31–6 Reserved	This field is reserved. Reserved, always set to zero.
COUNT	The tx break length count. 6'h00 64 6'h01 1 6'h3f 63

Chapter 43
MediaLB (MLB)

43.1 Overview

The MLB150 implements the required functionality of a Media Local Bus (MediaLB) Device. Functionality includes:

- Transmission of commands and data when functioning as the transmitting device associated with a ChannelAddress
- Reception of data and transmission of RxStatus responses when functioning as the receiving device associated with a ChannelAddress
- MediaLB lock detection
- SystemChannel command handling

MediaLB Device functionality is implemented with an MediaLB 3-pin interface (single-ended) or MediaLB 6-pin interface (differential), however only one interface can be active at a time. The MediaLB interfaces are capable of exchanging data at speeds up to 1024xFs in 3-pin mode or 6144xFs in 6-pin mode.

A set of physical channels for exchanging data over the MediaLB bus is supported. These physical channels (4 bytes in length, or a quadlet) can be grouped into logical channels, where each logical channel is referenced using a ChannelAddress and represents a unidirectional data path between a specific MediaLB Device transmitting the data and the MediaLB Device(s) receiving the data. The MediaLB 6-pin interface provides support for up to 860 bytes of data per frame. The logical channels, configured by system software, can be any combination of channel types (synchronous, asynchronous, isochronous, or control) and direction (transmit or receive).

43.1.1 Block Diagram

The following figure is the top-level block diagram of the MLB150 behavioral models.

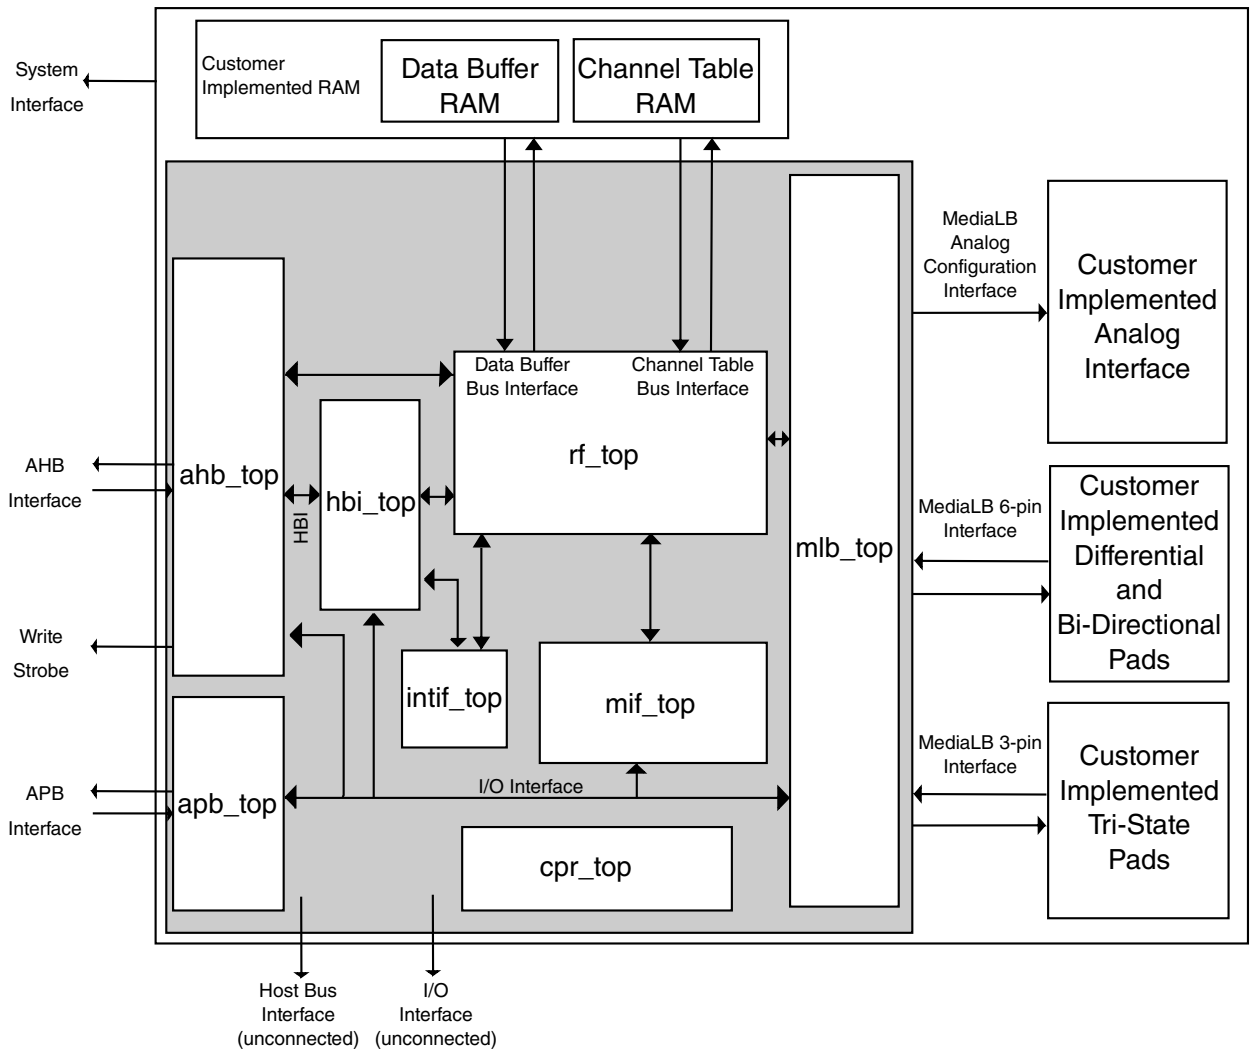


Figure 43-1. Block Diagram of MLB150

43.1.1.1 Bus Interfaces

The external bus interfaces include:

- MediaLB 3-pin Interface
- MediaLB 6-pin Interface
- MediaLB Analog Configuration Interface
- Channel Table Bus (CTB) Interface
- Data Buffer Bus (DBB) Interface
- System Interface

- AMBA Advanced High-performance Bus (AHB) Interface
- AMBA Advanced Peripheral Bus (APB) Interface

43.2 External Signals

The table found here describes the external signals of MLB150.

Table 43-1. MLB150 External Signals

Signal	Description	Pad	Mode	Direction
MLB_CLK	3-Wire clock signal	ENET_TXD1	ALT0	I
		GPIO_3	ALT7	
MLB_CLK_N	Negative clock signal	MLB_CN	No Muxing	I
MLB_CLK_P	Positive clock signal	MLB_CP	No Muxing	I
MLB_DATA	3-Wire data signal	ENET_MDC	ALT0	I/O
		GPIO_2	ALT7	
MLB_DATA_N	Negative data signal	MLB_DN	No Muxing	I/O
MLB_DATA_P	Positive data signal	MLB_DP	No Muxing	I/O
MLB_SIG	3-Wire signal	ENET_RXD1	ALT0	I/O
		GPIO_6	ALT7	
MLB_SIG_N	Negative signal	MLB_SIG_N	No Muxing	I/O
MLB_SIG_P	Positive signal	MLB_SIG_P	No Muxing	I/O

43.3 Clocks

The table found here describes the clock sources for MLB150.

Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 43-2. MLB150 Clocks

Clock name	Clock Root	Description
hclk	ahb_clk_root	AHB bus clock
ipg_clk_s	ipg_clk_root	Peripheral access clock
sys_clk	axi_clk_root	Module clock
mem_ct_CLK	axi_clk_root	Channel table bus clock
mem_db_CLK	axi_clk_root	Data buffer bus clock

43.4 Functional Description

This section describes the functional architecture of the MLB150.

The internal functional blocks of the MLB150 include:

- MediaLB Block (mlb_top) - Implements the physical and link-layer requirements of either a MediaLB 3-pin or 6-pin interface. Serial-to-parallel and parallel-to-serial data transformations are implemented, as well as MediaLB frame synchronization
- Host Bus Interface Block (hbi_top) - Provides 16-bit parallel slave access to all MOST channels and data types for the external Host Controller (HC). The HBI supports up to 64 independent channels with a minimum access latency of 40 ns per word and a maximum bandwidth of 400 Mbps
- Routing Fabric Block (rf_top) - Manages the flow of data between the MediaLB block and the HBI block, implementing a bus arbiter and muxing logic to the Channel Table RAM (CTR) and the Data Buffer RAM (DBR)
- Memory Interface Block (mif_top) - Implements a bridge between the I/O bus and the customer-implemented RAMs (i.e. Channel Table and Data Buffer)
- Interrupt Interface Block (intif_top) - Sends notifications to HBI that there are changes to the channel descriptors
- Clocks, Power, and Reset Block (cpr_top) - Implements clock and reset muxing and synchronization
- AMBA AHB Block (ahb_top) - Implements a bus bridge between the AHB master and the HBI slave interfaces
- AMBA APB Block (apb_top) - Implements a bus bridge that translates the two cycle APB interface signals to the single-cycle I/O interface signals

43.4.1 MediaLB Block

The Media Local Bus (MediaLB) block supports both a MediaLB 3-pin interface and MediaLB 6-pin interface. However, only one MediaLB interface can be active at any given time. Both MediaLB interfaces provide real-time access to all network data types including streaming, packet, control, and isochronous data.

- MediaLB 3-pin Interface - Supports the MediaLB protocol for single-ended 3-pin mode, with a maximum data rate of 1024xFs (49.152 MHz at Fs=48 kHz).
- MediaLB 6-pin Interface - Supports the MediaLB protocol for high-speed differential 6-pin mode, with a maximum data rate of 6144xFs (294.912 MHz at Fs=48 kHz).

43.4.1.1 MediaLB Channel Address to Logical Channel Mapping

The MediaLB channel addresses are mapped to the logical channels as follows.

Table 43-3. MediaLB Channel Address to Logical Channel Mapping

Channel Address	Logical Channel
0x0002	1
0x0004	2
0x0006	3
....	....
0x007C	62
0x007E	63
0x01FE	0*
* Logical Channel 0 is the System Channel and is reserved.	

43.4.2 Host Bus Interface Block

The Host Bus Interface (HBI) block provides a 16-bit parallel slave port that provides an external Host Controller (HC) with access to all MOST channels and data types.

Up to 64 independent HBI channels are available to the HC, each configurable for either transmitting or receiving a particular application data type (synchronous, isochronous, asynchronous, or control). The HBI block provides source and sink access to the full network data bandwidth.

43.4.2.1 HBI Physical Addresses

To access a particular HBI DMA channel, hardware must first translate the HBI channel address to a channel allocation table (CAT) physical address. This physical address is then used to retrieve the channel label (CL), which in turn retrieves the channel descriptor.

See Table 43-4 for more information on the mapping between the HBI channel address and physical address.

Table 43-4. HBI Channel Address to Physical Address Mapping

HBI Channel	CAT Address	CAT Offset
0x0	0x88	000

Table continues on the next page...

Table 43-4. HBI Channel Address to Physical Address Mapping (continued)

HBI Channel	CAT Address	CAT Offset
0x1	0x88	001
0x2	0x88	010
0x3	0x88	011
0x4	0x88	100
0x5	0x88	101
0x6	0x88	110
0x7	0x88	111
0x8	0x89	000
...	...	...
0x3E	0x8F	110
0x3F	0x8F	111

43.4.3 Routing Fabric Block

The Routing Fabric (RF) block manages the flow of data between the MediaLB Port and the HBI Port. Bus multiplexers and a bus arbiter are implemented in the RF block for accessing the channel table RAM (CTR) and data buffer RAM (DBR).

Each DMA controller in the routing fabric uses Channel Descriptors (stored in the CTR) to manage access to dynamic buffers in the DBR.

43.4.3.1 Data Buffer RAM

The MLB150 has an external data buffer RAM (DBR) that is 8-bit x 16k entries deep. The DBR provides dynamic circular buffering between the transmit and receive devices.

The size and location of each data buffer is defined by software in the channel descriptor table (CDT), which is located in the CTR.

Receive devices retain the write address pointer to the associated circular data buffer in the DBR, while transmit devices retain the read address pointer. The DMA controllers in the routing fabric are responsible for ensuring that the circular buffers do not overflow or underflow. Each channel type (e.g. synchronous, isochronous, asynchronous and control) has Full and Empty detection.

43.4.3.1.1 Synchronous Channels

For synchronous channels, two mechanisms prevent overflow and underflow of the data buffer:

- Hardware aligns the read pointer (RPTR) to the write pointer (WPTR) to ensure an offset of two sub-buffers.
- RPTR and WPTR are periodically synchronized to the start of the next sub-buffer (e.g. following a FRAMESYNC).

43.4.3.1.2 Isochronous Channels

For isochronous channels, hardware does not read from an empty data buffer or write to a full data buffer. The conditions used by hardware for detection include:

Data buffer Empty condition: (RPTR = WPTR) AND (BF = 0), and

Data buffer Full condition: (WPTR = RPTR) AND (BF = 1).

43.4.3.1.3 Asynchronous and Control Channels

For asynchronous and control channels, hardware does not read from an empty data buffer or write to a full data buffer. Hardware evaluates the DMA pointers (RPTR, WPTR) and packet count (RPC, WPC) to detect the data buffer condition, where:

- Data buffer Empty condition: (RPTR = WPTR) AND (RPC = WPC), and
- Data buffer Full condition: ((WPTR = RPTR) AND (WPC != RPC)) OR (WPC = (RPC - 1)).

43.4.3.2 Channel Table RAM

The MLB150 has an external Channel Table RAM (CTR) that is 128-bit x 144-entry. The CTR allows system software to dynamically configure channel routing and allocate data buffers in the DBR.

The CTR is logically divided into three sub-tables:

- Channel Descriptor Table (CDT)
- AHB Descriptor Table (ADT)
- Channel Allocation Table (CAT)

43.4.3.2.1 Address Mapping

Table 43-5. CTR Address Mapping

Label	Address	Bits 127…96	Bits 95…64	Bits 63…32	Bits 31…0
Channel Descriptor Table (CDT):					
CDT	0x00	CDT0[127:0], CL = 0			
	0x01	CDT1[127:0], CL = 1			
	0x02	CDT2[127:0], CL = 2			
	...	...			
	0x3D	CDT61[127:0], CL = 61			
	0x3E	CDT62[127:0], CL = 62			
	0x3F	CDT63[127:0], CL = 63			
AHB Descriptor Table (ADT):					
ADT*	0x40	ADT0[127:0]			
	0x41	ADT1[127:0]			
	0x42	ADT2[127:0]			
	...	...			
	0x7D	ADT61[127:0]			
	0x7E	ADT62[127:0]			
	0x7F	ADT63[127:0]			
Channel Allocation Table (CAT):					
CAT for MediaLB	0x80	CAT7	CAT6	CAT5	CAT4	CAT3	CAT2	CAT1	CAT0
	...	...	...	...	...	...	...	...	...
	0x87	CAT63	CAT62	CAT61	CAT60	CAT59	CAT58	CAT57	CAT56
CAT for HBI*	0x88	CAT71	CAT70	CAT69	CAT68	CAT67	CAT66	CAT65	CAT64
	...	...	...	...	...	...	...	...	...
	0x8F	CAT127	CAT126	CAT125	CAT124	CAT123	CAT122	CAT121	CAT120
* A fixed relationship exists between ADT entries and HBI CAT entries. When using HBI channel 0 (CAT64) on should program ADT0. When using HBI channel 1 (CAT65) on should program ADT1, and so on.									

43.4.3.2.2 Channel Allocation Table

The Channel Allocation Table (CAT) is comprised of 16 CTR entries (addresses 0x80 - 0x8F), as shown in Table 43-5. Each 16-bit CAT entry represents a logical connection to or from a transmit/receive device (e.g. MediaLB or HBI channel). All entries are indexed according to a fixed physical address assigned to every Rx/Tx channel (as shown in Table 43-6). The value stored in a CAT entry includes a 6-bit Connection Label, which provides a pointer to the CDT. To complete a logical channel and form a routing connection, system software must assign the same Connection Label to both the Rx and Tx channels.

Table 43-6. CAT Entry Map

Peripheral	Tx Channels	Rx Channels	CAT Start Index	CAT End Index	Entries
MediaLB	0 to 64	64 - Tx Channels	0	63	64
HBI	0 to 64	64 - Tx Channels	64	127	64

The format of a full CAT entry is shown in Table 43-7, with field descriptions described in Table 43-8. All reserved bits of a CAT entry field should be written as zero.

Table 43-7. CAT Entry Formats

Channel Type	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Isochronous	rsvd	FCE	rsvd	RNW	CE	CT[2:0] = 3			rsvd		CL[5:0]					
Asynchronous	rsvd		MT	RNW	CE	CT[2:0] = 2			rsvd		CL[5:0]					
Control	rsvd		MT	RNW	CE	CT[2:0] = 1			rsvd		CL[5:0]					
Synchronous	rsvd	MFE	MT	RNW	CE	CT[2:0] = 0			rsvd		CL[5:0]					

Table 43-8. CAT Field Definitions

Field	Description
CL[5:0]	Connection Label (offset into CDT)
CT[2:0]	Channel Type (Others): 111 = Reserved 110 = Reserved 101 = Reserved 100 = Reserved 011 = Isochronous 010 = Asynchronous 001 = Control 000 = Synchronous
CE	Channel Enable: 1 = Enabled 0 = Disabled
RNW	Read Not Write: 1 = Read 0 = Write
MT	Mute Enable: 1 1 = Enabled 0 = Disabled
FCE	Flow Control Enable: 2 1 = Enabled 0 = Disabled
MFE	Multi-Frame per Sub-buffer Enable: 3 1 = Enabled 0 = Disabled
rsvd	Reserved. Software writes a zero to all Reserved bits when the entry is initialized. The Reserved bits are Read-only after initialization.
1. When set for synchronous channels, the MT bit forces Rx channels to write zeros into the channel data buffer, and Tx channels to output zeros on the physical interface. When set for asynchronous and control channels, the MT bit causes DMA to halt at a packet boundary. Not valid for isochronous channels. 2. The FCE bit is used by MediaLB isochronous Rx channels only. 3. The MFE bit is used by MediaLB synchronous channels only.	

43.4.3.2.2.1 Channel Setup

Data direction in the MLB150 is in reference to the DBR. Therefore, the data direction of CAT entries corresponding to the same channel is reversed for the HBI CAT and the MediaLB CAT.

For a Tx channel (from the HC to the MediaLB interface):

- HBI CAT entry: RNW = 0 (write)
- MediaLB CAT entry: RNW = 1 (read)

Conversely, for a Rx channel (data from MediaLB to HC):

- HBI CAT entry: RNW = 1 (read)
- MediaLB CAT entry: RNW = 0 (write)

The figure below illustrates the directional relationship in the MLB150.

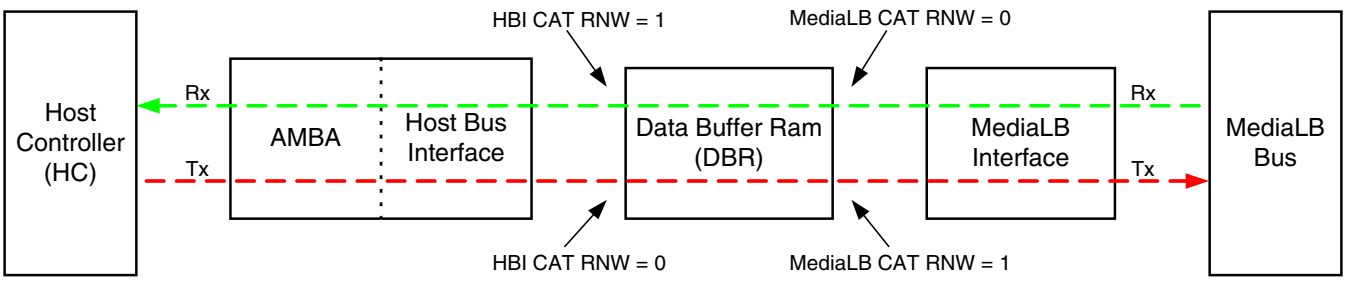

Figure 43-2. MLB DBR Directional Relationship

43.4.3.2.2.3 Channel Descriptor Table

The *Channel Descriptor Table* (CDT) is comprised of 64 CTR entries (addresses 0x00 - 0x3F), as shown in Table 43-5.

Each 128-bit CDT entry (also referred to as a *Channel Descriptor*) is referenced by a *Connection Label* and contains information about a data buffer in the DBR (e.g. buffer size, address pointers).

The format of each CDT entry (also referred to as a *Channel Descriptor*) is dependent on the channel type (e.g. synchronous, isochronous, asynchronous, or control).

NOTE

All reserved *Channel Descriptor* bits must be written to '0' by software when initialized.

43.4.3.2.3.1 Synchronous Channel Operation

The MLB150 provides two modes of operation (Standard and Multi-Frame per Sub-buffer) to provide flexibility for implementing synchronous channels.

Channels set up for Standard mode require less buffer space, but have higher interrupt rates and more stringent latency requirements. For channels configured for Standard mode, the Host Controller must transfer one full frame of streaming data in/out of each streaming channel's data buffer for each hbi_hsync period.

Channels set up for Multi-Frame per Sub-buffer mode require more buffer space, but have lower interrupt rates and less stringent latency requirements. For channels configured for Multi-Frame per Sub-buffer mode, the Host Controller must transfer N full frames of streaming data in/out of each streaming channel's data buffer for each hbi_hsync period.

To set up a channel in Multi-Frame per Sub-buffer mode:

- Program MLBC0[FCNT] to select the number of frames per sub-buffer
- Program the CAT to enable multi-frame sub-buffering (MFE = 1) for each particular channel
- Set the buffer depth in the CDT: BD = 4 × m × bpf - 1, where m = frames per sub-buffer, bpf = bytes per frame
- Repeat for additional synchronous channels

A sample synchronous data buffer is shown in the figure below. Each data buffer contains four sub-buffers and each sub-buffer contains space for 1 to 64 frames of data, determined by MLBC0.FCNT[2:0].

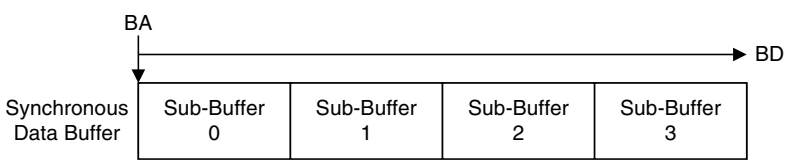

Figure 43-3. Synchronous Data Buffer Structure

43.4.3.2.3.2 Synchronous Channel Descriptors

The format and field definitions for a synchronous CDT entry are shown in the tables below respectively.

Table 43-9. Synchronous CDT Entry Format

96	Reserved				BD[11:0]											
112	Reserved		BA[13:0]													

Table 43-10. Synchronous CDT Entry Field Definitions

Field	Description	Details	Accessibility
BA	Buffer Base Address	- BA can start at any byte in the 16k DBR	r,w
BD	Buffer Depth	- BD = size of buffer in bytes - 1 - Buffer end address = BA + BD - BD = 4 x m x bpf - 1, where: m = frames per sub-buffer (for MFE = 0, m = 1) bpf = bytes per frame.	r,w
RPTR	Read Pointer	- Software initializes to zero, hardware updates - Counts the read address offset within a buffer - DMA read address = BA + RPTR	r,w,u
WPTR	Write Pointer	- Software initializes to zero, hardware updates - Counts the write address offset within a buffer - DMA write address = BA + WPTR	r,w,u
RSBC	Read Sub-buffer Counter	- Software initializes to zero, hardware updates - Counts the read sub-buffer offset - DMA uses for pointer management	r,w,u
WSBC	Write Sub-buffer Counter	- Software initializes to zero, hardware updates - Counts the write sub-buffer offset - DMA uses for pointer management	r,w,u
RSTS	Read Status	- Software initializes to zero, hardware updates - RSTS states:* xxx0 = normal operation (no mute) xxx1 = normal operation (mute) xx0x = idle	r,w,u
WSTS	Write Status	- Software initializes to zero, hardware updates - WSTS states:* xxx0 = normal operation (no mute) xxx1 = normal operation (mute) xx0x = idle	r,w,u

Table continues on the next page...

Table 43-10. Synchronous CDT Entry Field Definitions (continued)

Field	Description	Details	Accessibility
		1xxx = command protocol error	
Reserved	Reserved	- Software writes a zero to all *Reserved* bits when the entry is initialized. The *Reserved* bits are *Read-only* after initialization.	r,w,u
* Only valid for DMA pointers associated with the MediaLB block (Not valid for HBI block related pointers).			

43.4.3.2.3.3 Isochronous Channel Descriptors

The format and field definitions for an isochronous CDT entry are shown in the tables below respectively.

Table 43-11. Isochronous CDT Entry Format

Bit Offset	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	Reserved															
16	Reserved															
32	Reserved							BS[8:0]								
48	Reserved															
64	WSTS[2:0]			WPTR[12:0]												
80	RSTS[2:0]			RPTR[12:0]												
96	Reserved			BD[12:0]												
112	BF	rsvd	BA[13:0]													

Table 43-12. Isochronous CDT Entry Field Definitions

Field	Description	Details	Accessibility
BA	Buffer Base Address	- BA can start at any byte in the 16k DBR	r,w
BD	Buffer Depth	- BD = size of buffer in bytes - 1 - Buffer end address = BA + BD - Isochronous buffers must be large enough to hold at least 3 blocks (packets) of data - Buffer depth must be a integer multiple of blocks	r,w
BF	Buffer Full	- Software initializes to zero, hardware updates - DMA write hardware sets BF when the buffer is full - DMA read hardware clears BF when the buffer is empty - BF is valid only when the buffer is full or empty, otherwise ignore	r,w,u
BS	Block Size	- BS defines when to begin the DMA to the data buffer - BS = buffer block size in bytes - 1	r,w,u

Table continues on the next page...

Table 43-12. Isochronous CDT Entry Field Definitions (continued)

Field	Description	Details	Accessibility
		- For Rx channels, the DMA writes start when the number of empty bytes (SPACE) in the data buffer >= the block size - For Tx channels, the DMA reads start when the number of valid bytes (VALID) in the data buffer >= the block size	
RPTR	Read Pointer	- Software initializes to zero, hardware updates - Counts the read address offset within a buffer - DMA read address = BA + RPTR	r,w,u
WPTR	Write Pointer	- Software initializes to zero, hardware updates - Counts the write address offset within a buffer - DMA write address = BA + WPTR	r,w,u
RSTS	Read Status	- Software initializes to zero, hardware updates - RSTS states:* xx1 = active xx0 = idle	r,w,u
WSTS	Write Status	- Software initializes to zero, hardware updates - WSTS states:* xx1 = active xx0 = idle x1x = command protocol error 1xx = buffer overflow (FCE = 0 only)	r,w,u
Reserved	Reserved	- Software writes a zero to all *Reserved* bits when the entry is initialized. The *Reserved* bits are *Read-only* after initialization.	r,w,u
* Only valid for DMA pointers associated with the MediaLB block (Not valid for HBI block related pointers).			

43.4.3.2.3.4 Asynchronous and Control Channel Descriptors

The format and field definitions for asynchronous and control CDT entries are shown in the tables below respectively.

Table 43-13. Asynchronous/Control CDT Entry Format

Bit Offset	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 43-14. Asynchronous/Control CDT Entry Field Definitions

Field	Description	Details	Accessibility
BA	Buffer Base Address	- BA can start at any byte in the 16k DBR	r,w
BD	Buffer Depth	- BD = size of buffer in bytes - 1 - Buffer end address = BA + BD - BD >= max packet length - 1	r,w
RPC	Read Packet Count	- Software initializes to zero, hardware updates - Used in conjunction with WPC, RPTR and WPTR to determine if the buffer is empty or full	r,w,u
WPC	Write Packet Count	- Software initializes to zero, hardware updates - Used in conjunction with RPC, RPTR and WPTR to determine if the buffer is empty or full	r,w,u
RPTR	Read Pointer	- Software initializes to zero, hardware updates - Counts the read address offset within a buffer - DMA read address = BA + RPTR	r,w,u
WPTR	Write Pointer	- Software initializes to zero, hardware updates - Counts the write address offset within a buffer - DMA read address = BA + WPTR	r,w,u
RSTS	Read Status	- Software initializes to zero, hardware updates - Status states:* x0x00 = idle xx1xx = *ReceiverProtocolError* response received from Rx Device 1xxxx = *ReceiverBreak* command received from Rx Device	r,w,u
WSTS	Write Status	- Software initializes to zero, hardware updates - Status states:* x0x00 = idle xx1xx = command protocol error detected 1xxxx = *AsyncBreak*/*ControlBreak* command received from Tx Device	r,w,u
Reserved	Reserved	Software writes a zero to all *Reserved* bits when the entry is initialized. The *Reserved* bits are *Read-only* after initialization.	r,w,u
* Only valid for DMA pointers associated with the MediaLB block (Not valid for HBI block related pointers)			

43.4.4 Memory Interface Block

The Memory Interface (MIF) block implements a bridge between the I/O and the CTB or DBB interfaces.

The MIF block diagram is shown in the figure below. The targeted RAM (CTR or DBR) is determined by the target location bit in the memory address register (MADR.TB).

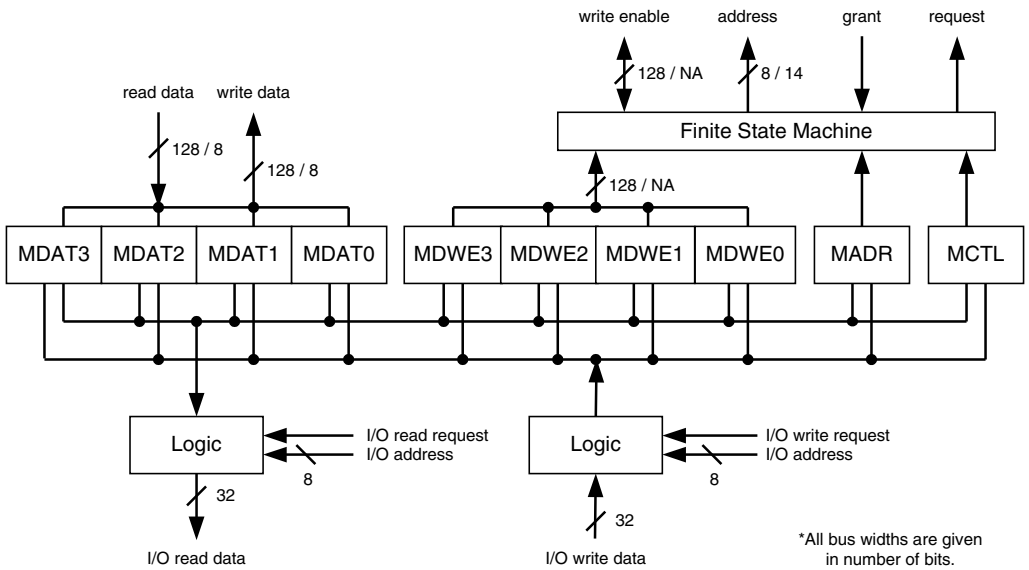

Figure 43-4. MIF Block Diagram

NOTE

The size of the read data, write data, write enable, and address buses are dependent on whether the CTB or DBB interfaces are used. In the figure above, the first number is for CTR accesses while the second is for DBR accesses (i.e. CTR bus width / DBR bus width).

43.4.4.1 CTR Access

The MIF block allows the HC to directly access the external Channel Table RAM (CTR) when MADR.TB is cleared. Any write to the MADR register triggers a single read or write cycle. Reading from the MADR register does not initiate read/write access.

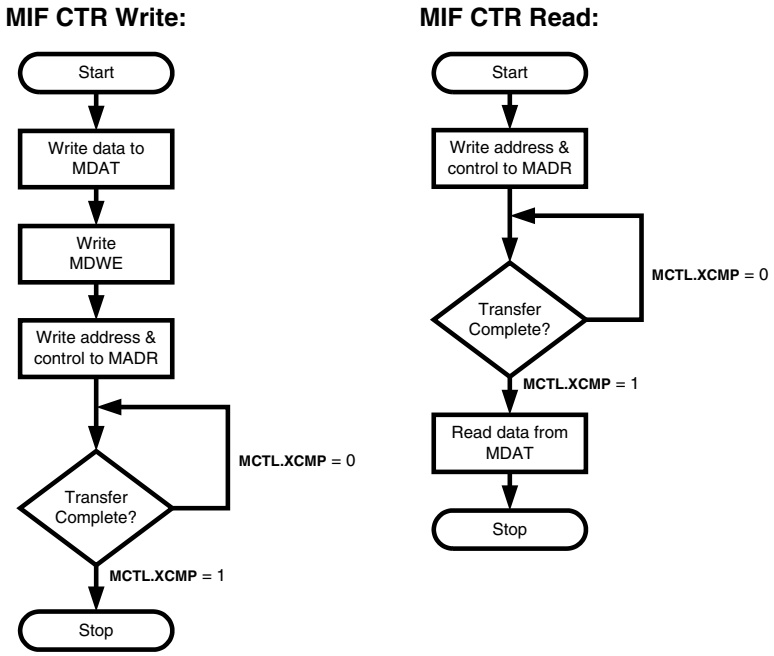

Figure 43-5. MIF CTR Read and Write Flow Diagrams

43.4.4.1.1 Direct CTR Writes

For a direct write of the CTR, the HC first loads the 128-bit data entry into the MDAT0-3 registers. Bitwise write enable control is available via the MDWE0-3 registers.

After the MDATn and MDWEn registers are set up, a write cycle is initiated by writing the address and control information to MADR as follows:

- MADR.WNR = 1
- MADR.TB = 0
- MADR.ADDR[7:0] = 8-bit Target Address

The MIF block sets MCTL.XCMP = 1 to inform the HC when the write is complete.

43.4.4.1.2 Direct CTR Reads

For a direct read of the CTR, the HC initiates a read cycle by writing the address and control information to MADR as follows:

- MADR.WNR = 0

- MADR.TB = 0
- MADR.ADDR[7:0] = 8-bit Target Address

The MIF block sets MCTL.XCMP = 1 to inform the HC when the read is complete. The HC can then read the 128-bit data entry from the MDAT0-3 registers.

43.4.4.1.3 CTR Addressing

The CTR is addressed as a 128-bit wide value. However, the MIF block can only access 32 bits of the addressed CTR data in a single access. Therefore, four 32-bit accesses through the MIF block are required to access a single 128-bit value (e.g. CDT entry).

To access a 16-bit CAT entry in the CTR, only a single access through the MIF is required. For example, to load a CAT61 entry for an isochronous Tx channel with mute and flow control enabled:

- Write MDAT2 = 7B070000h (assumes Connection Label = 7)
- MDWE2 = FFFF0000h (bitwise write enable for 16 msbs; assumes MDWE0/1/3 = 00000000h)
- MADR = 80000087h (write CTR address 87h)

43.4.4.2 DBR Access

The MIF block allows the HC to access the external Data Buffer RAM (DBR) directly when MADR.TB is set. Any write to the MADR register triggers a single read or write cycle. Reading from the MADR register does not initiate read/write access.

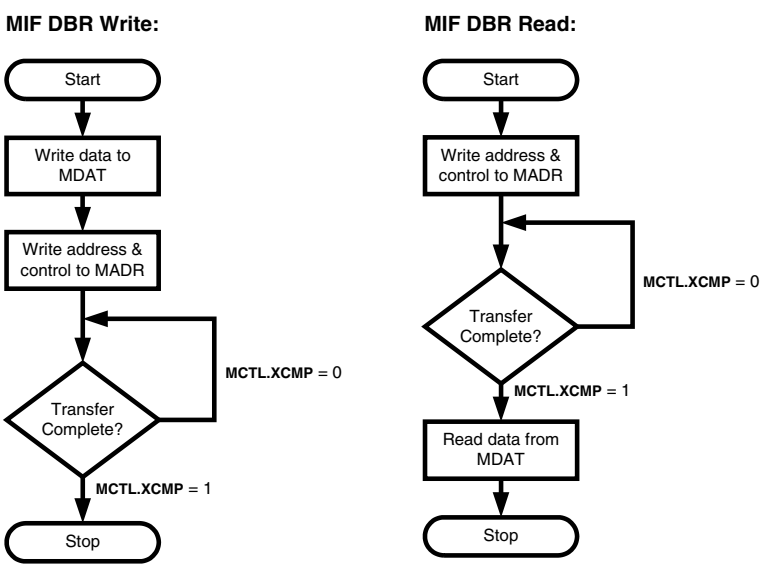

Figure 43-6. MIF DBR Read and Write Flow Diagrams

43.4.4.2.1 Direct DBR Writes

For a direct write of the DBR, the HC first loads the 8-bit data entry into the MDAT0 register at bits[7:0]. MDAT1-3 and MDWE0-3 are not used for DBR access.

After the MDAT0 register is set up, a write cycle is initiated by writing the address and control information to MADR as follows:

- MADR.WNR = 1
- MADR.TB = 1
- MADR.ADDR[13:0] = 14-bit Target Address

The MIF block sets MCTL.XCMP = 1 to inform the HC when the write is complete.

43.4.4.2.2 Direct DBR Reads

For a direct read of the DBR, the HC initiates a read cycle by writing the address and control information to MADR as follows:

- MADR.WNR = 0
- MADR.TB = 1
- MADR.ADDR[13:0] = 14-bit Target Address

The MIF block sets MCTL.XCMP = 1 to inform the HC when the read is complete. The HC can then read the 8-bit data entry from the MDAT0 register at bits[7:0].

43.4.5 Interrupt Interface Block

The Interrupt Interface (INTIF) block performs a low-priority polling algorithm of each of the HBI channel descriptors.

The INTIF alerts the HBI block when specific changes to HBI Channel Descriptors occur.

- For asynchronous and control read/write channels:
  - a packet is available to read in the channel buffer, or
  - sufficient empty space is available in the channel buffer to accept a requested packet write.
- For isochronous read/write channels:
  - the number of valid bytes in the channel buffer exceeds the block size, or
  - the number of empty bytes in the channel buffer exceeds the block size.

43.4.6 AMBA AHB Block

The AMBA AHB block manages data exchange between local channel data buffers within the MLB150 and the system memory buffer.

To support system memory buffering, a ping-pong memory structure is implemented on a per-channel basis using 128-bit descriptors for AHB Descriptor Table (ADT) entries.

NOTE

The 64 ADT entries are directly mapped to the 64 HBI physical channels.

Each logical channel is assigned a separate 128-bit descriptor, defining the data buffers in the system memory used by the DMA interface for that channel. The descriptors are stored at fixed addresses in the external CTR.

43.4.6.1 AHB Descriptor Table

The table below provides an overview of field definitions for ADT entries.

Table 43-15. ADT Field Definitions

Field	No. of Bits	Description	Accessibility
CE	1	Channel enable: 0 = Disabled 1 = Enabled	r,w,u
LE	1	Endianess select: 0 = Big Endian 1 = Little Endian	r,w
PG	1	Page pointer. Software initializes to zero, hardware writes thereafter. 0 = Ping buffer 1 = Pong buffer	r,w,u
RDY1	1	Buffer ready bit for ping buffer page: 0 = Not ready 1 = Ready	r,w
RDY2	1	Buffer ready bit for pong buffer page: 0 = Not ready 1 = Ready	r,w
DNE1	1	Buffer done bit for ping buffer page: 0 = Not done 1 = Done	r,u,c0
DNE2	1	Buffer done bit for pong buffer page: 0 = Not done 1 = Done	r,u,c0
ERR1	1	AHB error response detected for ping buffer page: 0 = No error 1 = Rrror	r,u,c0
ERR2	1	AHB error response detected for pong buffer page: 0 = No error 1 = Error	r,u,c0
PS1	1	Packet start bit for ping buffer page: 0 = No packet start 1 = Packet start Reserved for synchronous and isochronous channels.	r,w,u (both Tx and Rx)
PS2	1	Packet start bit for pong buffer page: 0 = No packet start 1 = Packet start Reserved for synchronous and isochronous channels.	r,w,u (both Tx and Rx)
MEP1	1	Most Ethernet Packet (MEP) indicator for ping buffer page: 0 = Not MEP 1 = MEP MEP1 only valid for the first page of a segmented buffer. Reserved for control, synchronous and isochronous channels.	Rsvd for Tx r,u,c0 for Rx

Table continues on the next page...

Table 43-15. ADT Field Definitions (continued)

Field	No. of Bits	Description	Accessibility
MEP2	1	MEP packet indicator for pong buffer page: 0 = not MEP 1 = MEP MEP2 only valid for the first page of a segmented buffer. Reserved for control, synchronous and isochronous channels.	Rsvd for Tx r,u,c0 for Rx
BD1*	11 to 13	Buffer depth for ping buffer page: 11 or 12-bits for asynchronous and control channels. 13-bits for synchronous and isochronous channels.	r,w
BD2*	11 to 13	Buffer depth for pong buffer page: 11 or 12-bits for asynchronous and control channels. 13-bits for synchronous and isochronous channels.	r,w
BA1	32	Buffer base address for ping buffer page	r,w
BA2	32	Buffer base address for pong buffer page	r,w
Reserved	varies	Software writes a zero to all *Reserved* bits when the entry is initialized. The *Reserved* bits are *Read-only* after initialization.	r,w,u
* The buffer depth (BD1 and BD2) for synchronous channels must consider if *Multi-Frame per Sub-buffer* mode is enabled.			

Data exchange across the AHB interface can be configured as Little Endian (LE = 1) or Big Endian (LE = 0). The figure below provides an overview of the endian options, chosen by an ADT descriptor field.

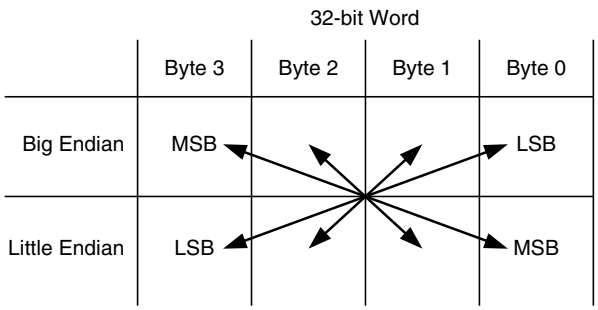

Figure 43-7. Endianness Overview

The figure below shows an example of the ping-pong system memory structure. This system memory structure is similar for all channel types and shows the relationship between the BAn, BDn, and PG descriptor fields.

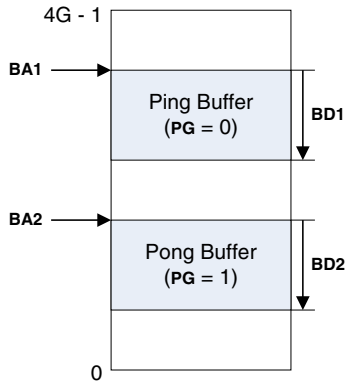

Figure 43-8. Ping-Pong System Memory Structure

Each ADT entry holds a 32-bit BAn field which defines the start of each ping or pong buffer within system memory. The BDn field is used to indicate the size for the respective ping or pong page. The maximum size is 2k-entries for asynchronous and control channels; 8k-entries for isochronous and synchronous channels.

43.4.6.2 AHB Synchronous Channel Descriptors

The table below shows the format for a synchronous ADT entry. The field definitions are defined in Table 43-15. Each synchronous channel buffer can be up to 8k-bytes deep.

Table 43-16. Synchronous ADT Entry Format

Bit Offset	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	CE	LE	PG	Reserved												
16	Reserved															
32	RDY 1	DNE 1	ERR 1	BD1[12:0]												
48	RDY 2	DNE 2	ERR 2	BD2[12:0]												
64	BA1[15:0]															
80	BA1[31:16]															
96	BA2[15:0]															
112	BA2[31:16]															

43.4.6.3 AHB Isochronous Channel Descriptors

The isochronous buffering scheme allows each ping or pong buffer to contain a single block or a multiple number of blocks. For this reason, the isochronous buffer depth (BDn) must be defined in terms of an *integer number* (n) and *block size* (BS) (e.g. BDn = n x (BS + 1) - 1).

Table 43-17 shows the format for an isochronous ADT entry. The field definitions are defined in Table 43-15. Each isochronous channel buffer can be up to 8k-bytes deep.

Table 43-17. Isochronous ADT Entry Format

Bit Offset	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	CE	LE	PG	Reserved												
16	Reserved															
32	RDY1	DNE1	ERR1	BD1[12:0]												
48	RDY2	DNE2	ERR2	BD2[12:0]												
64	BA1[15:0]															
80	BA1[31:16]															
96	BA2[15:0]															
112	BA2[31:16]															

43.4.6.4 AHB Asynchronous and Control Channel Descriptors

Every asynchronous and control packet adheres to the Port Message Protocol (PMP), which designates the first two bytes of each packet as the packet length (PML). Each packet must be no more than 2048 bytes.

Software must set the buffer ready bit (RDYn) for each buffer as it programs the DMA. As hardware processes each buffer, it sets the done bit (DNEn) and generates an interrupt to inform HC. When hardware finishes processing a buffer it can begin processing another buffer if RDYn is set. The application is responsible for setting up and configuring the channel buffer descriptor prior to every DMA access on the channel.

Two packet modes are supported by hardware for programming the DMA, single-packet mode and multiple-packet mode.

43.4.6.4.1 Single-packet Mode

The single-packet mode asynchronous and control buffering scheme supports a maximum of one packet per buffer (e.g. ping or pong). Both non-segmented and segmented data packets are allowed while using single-packet mode.

Non-segmented packets are exchanged when only one buffer (e.g. ping or pong) is needed for packet transfer. Segmented packets are exchanged when a single packet is too long for one buffer and the packet must span multiple buffers. The figure below shows the memory space usage for both non-segmented and segmented asynchronous or control packets along with the packet start bit (PSn). While using single-packet mode, buffer done (DNEn) is set in hardware when a packet is done or the buffer is full.

Table 43-18 shows the format for single-packet mode asynchronous and control ADT entries. The field definitions are defined in Table 43-15.

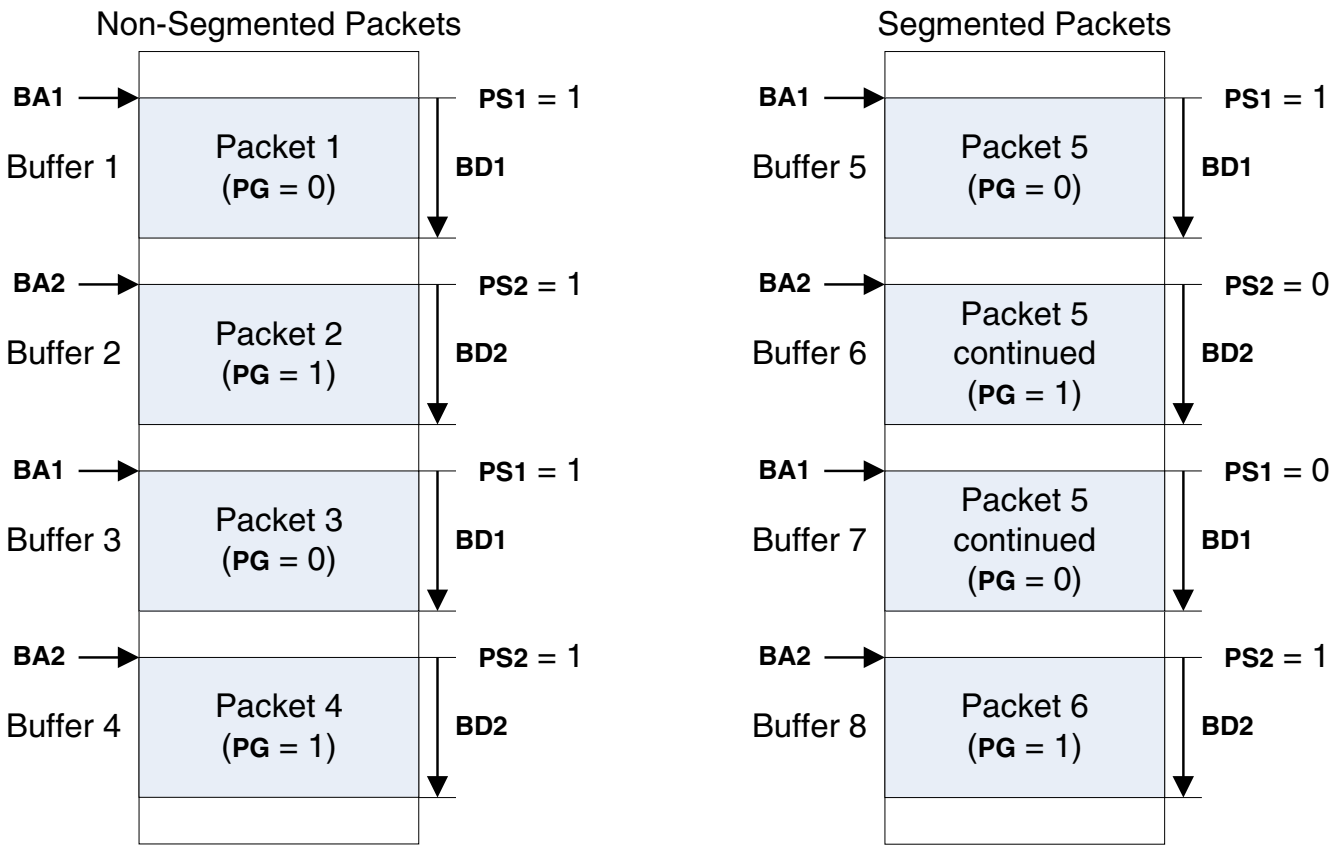

Figure 43-9. Single-packet Asynchronous or Control System Memory Structure

Table 43-18. Single-packet Asynchronous and Control Entry Format

43.4.6.4.2 Multiple-packet Mode

The multiple-packet mode asynchronous and control buffering scheme supports more than one packet per system memory buffer, as shown in the figure below. Multiple-packet mode reduces the interrupt rate for packet channels at the cost of increasing buffering and latency.

For Tx packet channels in multiple-packet mode, software sets the packet start bit (PSn) for every buffer. Setting PSn informs hardware that the first two bytes of the buffer contains the port message length (PML) of the first packet. After the first packet, hardware keeps track of where packets start and end within the current buffer. Software should not write to PSn while the buffer is active (RDYn = 1 and DNEn = 0). For Tx packet channels, the buffer is done (DNEn= 1) when the last byte of the last packet in the buffer is read from system memory. Software should set the buffer depth to contain the exact number of complete packets for that buffer. Segmented buffers are not supported for Tx packet channels in multiple-packet mode.

For Rx packet channels in multiple-packet mode, PSn has no meaning and should be ignored. Software is responsible for keeping track of where each packet starts and ends within the multiple-packet buffer via the packet PML. The buffer done bit (DNEn) is set in hardware for Rx channels when a buffer is full (see Buffer 1 in the figure below) or if a packet ends exactly 1-byte before the end of the buffer (see Buffer 2 in the figure below). Multiple-packet mode also supports segmented Rx packets spanning two or more buffers (see Buffers 3 - 6in the figure below).

Table 43-19 The table below shows the format for multiple-packet mode asynchronous and control ADT entries. The field definitions are defined in Table 43-15.

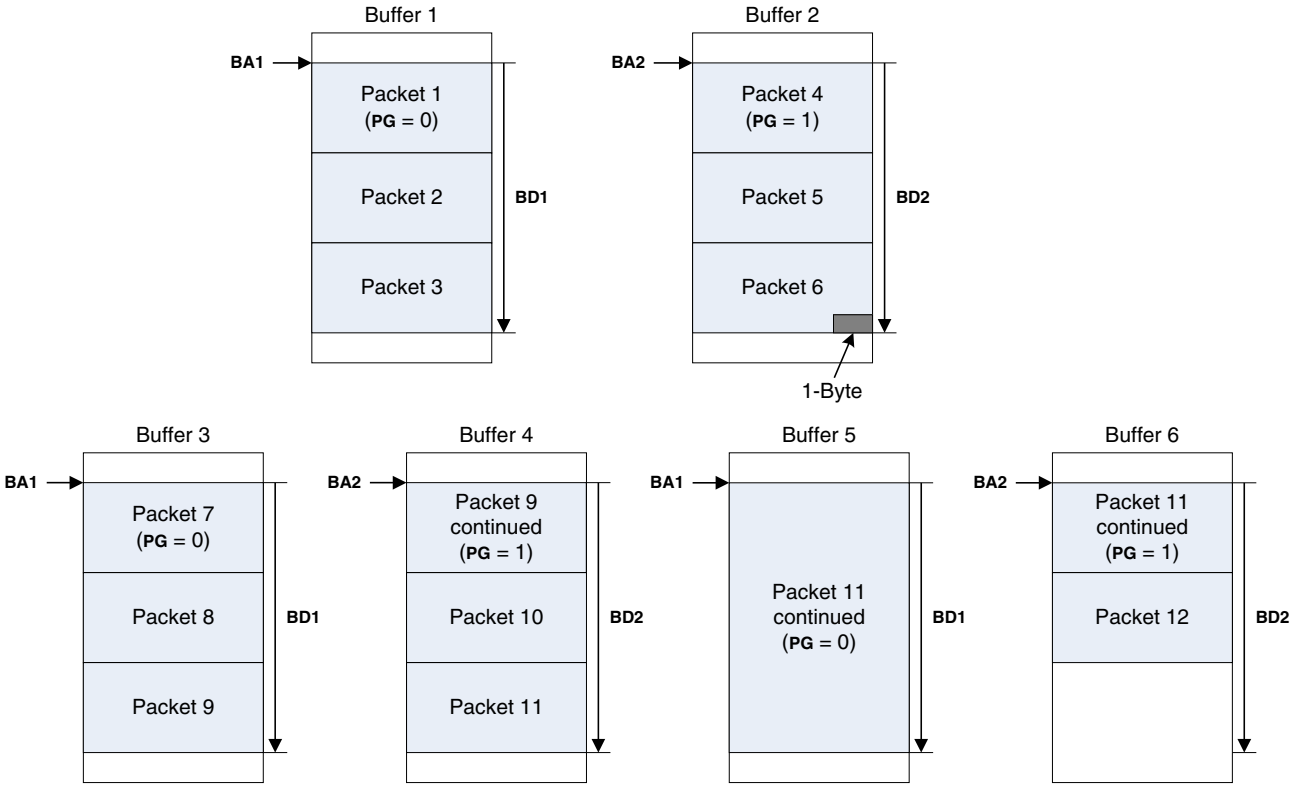

Figure 43-10. Multiple-packet Asynchronous or Control System Memory Structure

Table 43-19. Multiple-packet Asynchronous and Control Entry Format

Bit Offset	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	CE	LE	PG	Reserved												
16	Reserved															
32	RDY1	DNE1	ERR1	PS1*	BD1[11:0]											
48	RDY2	DNE2	ERR2	PS2*	BD2[11:0]											
64	BA1[15:0]															
80	BA1[31:16]															
96	BA2[15:0]															
112	BA2[31:16]															
* PSn is only valid for TX channels. Set PSn = 1 at the start of the buffer.																

43.5 Software Flow

The top-level software tasks the application must perform can be placed in two categories.

- Channel Initialization
- Channel Servicing

43.5.1 Channel Initialization

The software flow required to initialize a channel must be performed in order to ensure proper operation.

For clarity, the software flow is grouped as follows:

- Configure the Hardware
- Program the Routing Fabric Block
- Program the AMBA AHB Block DMAs
- Synchronize and Unmute Synchronous Channel

43.5.1.1 Configure the Hardware

The MLBC0, HMCR0, HMCR1 and HCTL registers are accessible directly via APB reads and writes.

1. Initialize CTR and registers
   a. Set all bit of the CTR (CAT, CDT, and ADT) to'0'.
   b. Set all bits of all registers to'0'.
2. Configure the MediaLB interface
   a. Select 3-pin or 6-pin MediaLB operation: MLBC0.MLBPEN = 0 (3-pin), MLBC0.MLBPEN = 1 (6-pin)
   b. Select MediaLB clock speed via MLBC0.MLBCLK
   c. Set MediaLB enable via MLBC0.MLBEN
3. Configure the HBI interface
   a. Set HMCR0 and HMCR1 = FFFFFFFFh to activate all channels
   b. Set the HBI enable bit: HCTL.EN = 1

43.5.1.2 Program the Routing Fabric Block

The CAT and CDT reside in the external CTR and are programmed indirectly via APB or I/O reads and writes to the MIF block.

1. Initialize all bits of the CAT to '0'
2. Select a logical channel: N = 0 - 63
3. Program the CDT for channel N

a. Set the 14-bit base address (BA)
b. Set the 12-bit or 13-bit buffer depth (BD): BD = buffer depth in bytes -1
   - i. For synchronous channels: (BD + 1) = 4 x frames per sub-buffer (m) x bytes-per-frame (bpf)
   - ii. For isochronous channels: (BD + 1) mod (BS + 1) = 0
   - iii. For asynchronous channels: (BD + 1) >= max packet length (1024 for a MOST Data Packet (MDP); 1536 for a MOST Ethernet Packet (MEP))
   - iv. For control channels: (BD + 1) >= max packet length (64)
c. For isochronous channels, set the block size (BS): BS = block size in bytes - 1
d. Set all other bits of the CDT to '0'

4. Program the CAT for the inbound DMA
   a. For Tx channels (to MediaLB) HBI is the inbound DMA
   b. For Rx channels (from MediaLB) MediaLB is the inbound DMA
   c. Set the channel direction: RNW = 0
   d. Set the channel type: CT[2:0] = 010 (asynchronous), 001 (control), 011 (isochronous), or 000 (synchronous)
   e. Set the connection label: CL[5:0] = N
   f. If CT[2:0] = 000 (synchronous), set the mute bit (MT = 1).
   g. Set the channel enable: CE = 1
   h. Set all other bits of the CAT to '0'
5. Program the CAT for the outbound DMA
   a. For Tx channels (to MediaLB) MediaLB is the outbound DMA
   b. For Rx channels (from MediaLB) HBI is the outbound DMA
   c. Set the channel direction: RNW = 1
   d. Set the channel type: CT[2:0] = 010 (asynchronous), 001 (control), 011 (isochronous), or 000 (synchronous)
   e. Set the channel label: CL[5:0] = N
   f. If CT[2:0] = 000 (synchronous), set the mute bit (MT = 1)
   g. Set the channel enable: CE = 1
   h. Set all other bits of the CAT to '0'
6. Repeat steps 2-5 to initialize all logical channels

43.5.1.3 Program the AMBA AHB Block DMAs

The ADT resides in the external CTR and is programmed indirectly via APB reads and writes to the MIF.

1. Initialize all bits of the ADT to '0'
2. Select a logical channel: N = 0 - 63
3. Program the AMBA AHB block ping page for channel N
   a. Set the 32-bit base address (BA1)

b. Set the 11-bit buffer depth (BD1): BD1 = buffer depth in bytes - 1
   - i. For synchronous channels: (BD1 + 1) = n x frames per sub-buffer (m) x bytes-per-frame (bpf)
   - ii. For isochronous channels: (BD1 + 1) mod (BS + 1) = 0
   - iii. For asynchronous channels: 5 <= (BD1 + 1) <= 4096 (max packet length)
   - iv. For control channels: 5 <= (BD1 + 1) <= 4096 (max packet length)

c. For asynchronous and control Tx channels set the packet start bit (PS1) iff the page contains the start of the packet
d. Clear the page done bit (DNE1)
e. Clear the error bit (ERR1)
f. Set the page ready bit (RDY1)

4. Program the AMBA AHB block pong page for channel N
   a. Set the 32-bit base address (BA2)
   b. Set the 11-bit buffer depth (BD2): BD2 = buffer depth in bytes - 1
      - i. For synchronous channels: (BD2 +1) = n x frames per sub-buffer (m) x bytes-per-frame (bpf)
      - ii. For isochronous channels: (BD2 + 1) mod (BS + 1) = 0
      - iii. For asynchronous channels: 5 <= (BD2 + 1) <= 4096 (max packet length)
      - iv. For control channels: 5 <= (BD2 + 1) <= 4096 (max packet length)
   c. For asynchronous and control Tx channels set the packet start bit (PS2) if the page contains the start of the packet
   d. Clear the page done bit (DNE2)
   e. Clear the error bit (ERR2)
   f. Set the page ready bit (RDY2)
5. Select Big Endian (LE = 0) or Little Endian (LE = 1)
6. Select the active page: PG = 0 (ping), PG = 1 (pong)
7. Set the channel enable (CE) bit for all active logical channels
8. Repeat steps 2-7 for all active logical channels

NOTE

All asynchronous and control packets must start with a PMP header. The first two bytes of the PMP header contains the Port Message Length (PML), which defines the length of the message that follows in bytes (not including PML itself). Hardware uses the PML to determine when a packet is complete. Asynchronous and control packets can also be segmented into two or more pages as well as contain multiple packets per page within system memory.

43.5.1.4 Synchronize and Unmute Synchronous Channel

The MLBC0 and MLBC1 registers are accessible directly via APB reads and writes.

1. Check that MediaLB clock is running (MLBC1.CLKM = 0)
2. If MLBC1.CLKM = 1, clear the register bit, wait one APB or I/O clock cycle and repeat step 1.
3. Poll for MediaLB lock (MLBC0.MLBLK = 1)
4. Wait four frames
5. Unmute synchronous channel(s)

43.5.2 Channel Servicing

After initialization, each channel will require periodic servicing.

The following software flows can be performed concurrently and in any order:

- Servicing the AMBA AHB Block (DMA) Interrupts
- Servicing the MediaLB Interrupts
- Polling for MediaLB System Commands

43.5.2.1 Servicing the AMBA AHB Block (DMA) Interrupts

The ACMR0, ACMR1, ACTL, ACSR0, and ACSR1 registers are accessible directly via APB reads and writes.

1. Program the ACMRn registers to enable interrupts from all active DMA channels
2. Select the status clear method: SCTL.SCE = 0 (hardware clears on read), SCTL.SCE = 1 (software writes a '1' to clear)
3. Select 1 or 2 interrupt signals: SCTL.SMX = 0 (one interrupt for channels 0-31 on *ahb_int[0]* and another interrupt for channels 32-63 on *ahb_int[1]*), SCTL.SMX = 1 (single interrupt for all channels on *ahb_int[0]*)
4. Wait for an interrupt from *ahb_int[1:0]*
5. Read the ACSRn registers to determine which channel or channels are causing the interrupt
6. If SCTL.SCE = 1, write the results of step 5 back to ACSR0 and ACSR1 to clear the interrupt
7. Select a logical channel (N = 0-63) with an interrupt to service
8. Read the ADT entry for channel N
    a. Determine the active page (ping or pong) via the PG bit

b. Determine which page(s) are done via the DNEn bits
c. Determine which channels encountered an AHB error via the ERRn bit
d. Determine which asynchronous and control Rx channel pages contain a packet start via the PSn bit (extract the PML)

9. Reprogram the expired or broken AHB page(s) via steps 3 and 4 in Program the AMBA AHB Block DMAs,
10. Repeat steps 6-9 for all channels with pending interrupts
11. Repeat steps 4-10 while there are active channels

NOTE

Channels that receive an AHB error response are disabled (CE = 0) by hardware.

43.5.2.2 Servicing the MediaLB Interrupts

1. Select the MediaLB Channel Status Register (MSn) to be cleared by software, writing a '0' to the appropriate bits
2. Program MIEN to enable protocol error interrupts for all active MediaLB channels (MIEN.CTX_PE = 1, MIEN.CRX_PE = 1, MIEN.ATX_PE = 1, MIEN.ARX_PE = 1, MIEN.SYNC_PE = 1, and MIEN.ISOC_PE = 1)
3. Wait for an interrupt on the *mlb_int* signal.
4. Read the MSn registers to determine which channel(s) are causing the interrupt
5. Read RSTS/WSTS of the appropriate CDT(s) to determine the interrupt type
6. Clear RSTS/WSTS errors to resume channel operation
   a. For synchronous channels: WSTS[3] = 0
   b. For isochronous channels: WSTS[2:1] = 00
   c. For asynchronous and control channels: RSTS[4]/WSTS[4] = 0 and RSTS[2]/WSTS[2] = 0

43.5.2.3 Polling for MediaLB System Commands

The MLB supports the MediaLB System Commands (e.g. MlbScan, MlbReset, MOST_Unlock). The MediaLB System Status (MSS) Register is used to detect a System Command received from the MediaLB Controller. The MLB automatically sends the appropriate system response to the MediaLB Controller.

The procedure for the application is:

1. The application periodically polls the MSS register.
2. Clear by writing a '0' to the appropriate bit in MSS register after the application finishes the service.

3. If MSS.SWSYSCMD = 1, read the MSD register to receive the system data sent from MediaLB Controller.

43.5.3 Low Power Mode

MLB doesn't provide dedicated low power mode features.

In case the clocks of digital IP need to shut down to save power, the following operations are recommended before entering low power mode:

- Finish any active MLB transfer
- Disable MLB (clear the MLBEN and MLBPEN bits in MLBC0)
- Disable HBI (clear all bits in HCMR0 and HCMR1, clear EN bit in HCTL)
- Mask AHB interrupts (clear all bits in ACMR0 and ACMR1)

For information on configuring the MLB IP if the clocks are re-enabled, see Configure the Hardware.

43.6 MLB150 Memory Map/Register Definition

The MLB150 registers are divided into 4 sections.

The first section begins at offset 0h00 and describes the MediaLB block registers.

The second section begins at offset 0h80 and it shows the address mapping of the Internal HBI Registers.

The third set begins at offset 0hC0 and implements ten 32-bit I/O registers for CTR transfers, including: data registers (MDATn), write enable registers (MDWEn), a control register (MCTL), and an address register (MADR).

The fourth set, the AMBA AHB registers, begins at offset 0h3C0. They consist of:

- one 32-bit register for control
- two 32-bit registers for interrupt status
- two 32-bit registers for channel interrupt masks

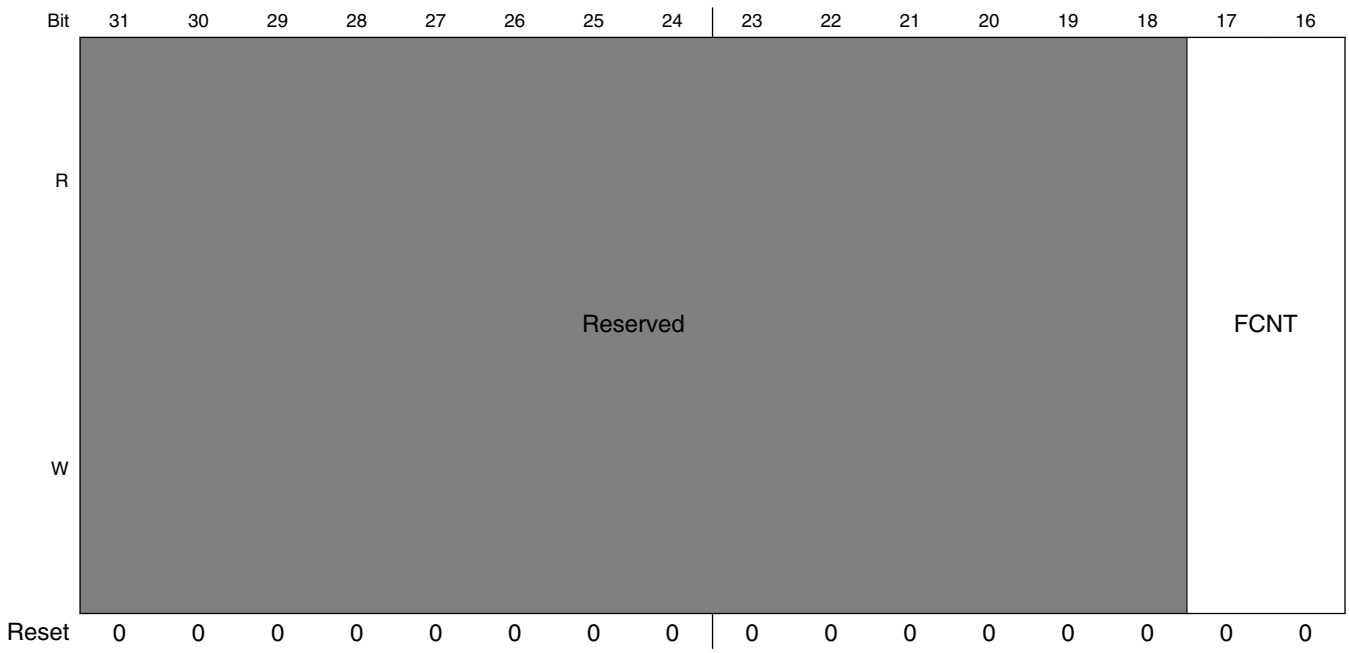
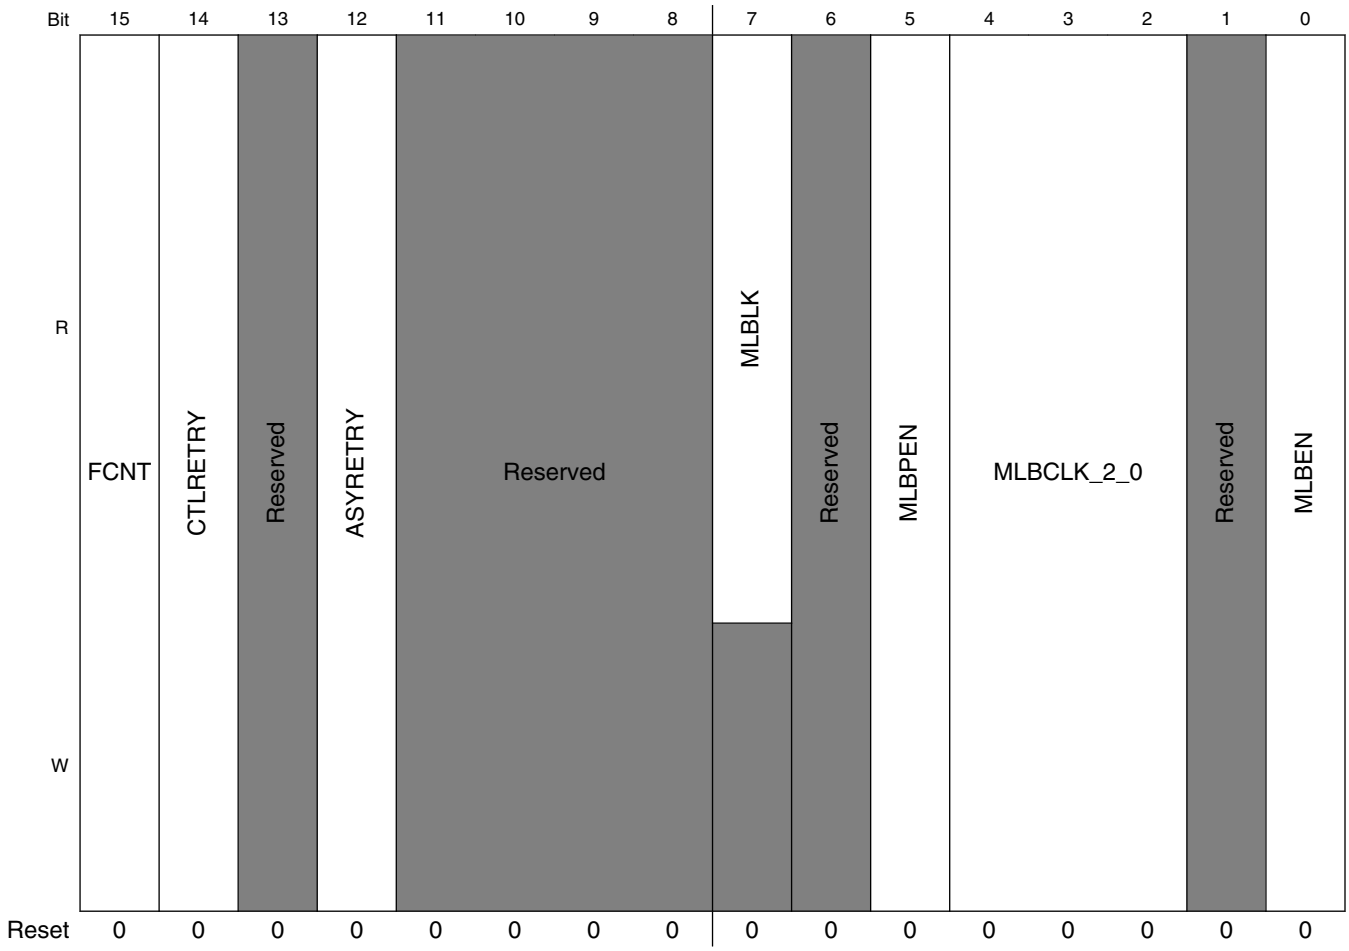
43.6.1 MediaLB Control 0 Register (MLB_MLBC0)

Address: 218_C000h base + 0h offset = 218_C000h





MLB_MLBC0 field descriptions

Field	Description
31–18 -	This field is reserved. Reserved
17–15 FCNT	The number of frames per sub-buffer for synchronous channels. 000 1 frame per sub-buffer (Operation is the same as Standard mode.) 001 2 frames per sub-buffer 010 4 frames per sub-buffer 011 8 frames per sub-buffer 100 16 frames per sub-buffer 101 32 frames per sub-buffer 110 64 frames per sub-buffer 111 Reserved
14 CTLRETRY	Control Tx packet retry. When set, a control packet that is flagged with a Break or ProtocolError by the receiver is retransmitted. When cleared, a control packet that is flagged with a Break or ProtocolError by the receiver is skipped.
13 -	This field is reserved. Reserved

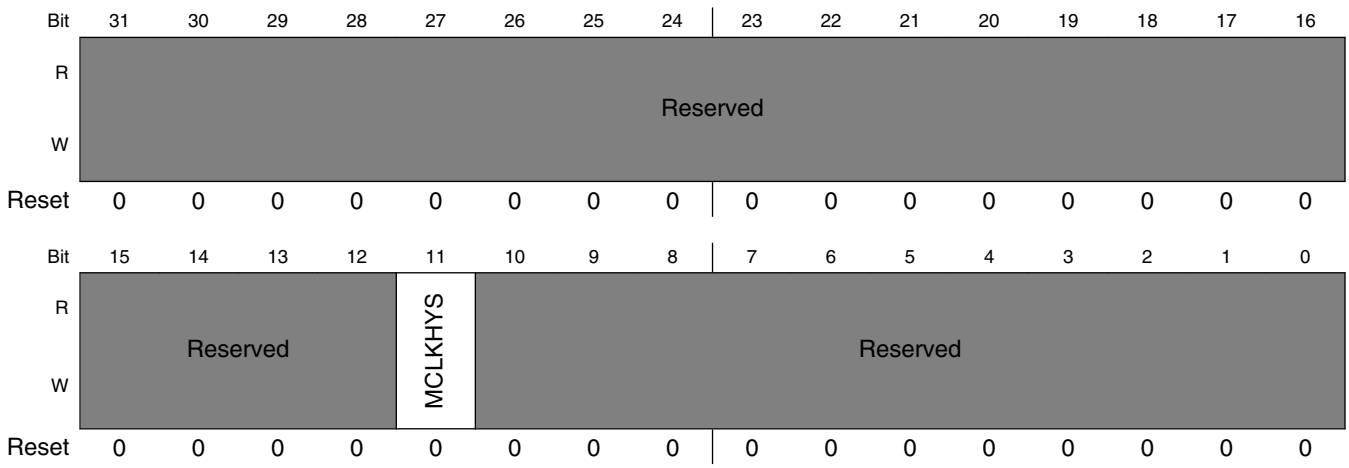
Table continues on the next page...

MLB_MLBC0 field descriptions (continued)

Field	Description
12 ASYRETRY	Asynchronous Tx packet retry. When set, an asynchronous packet that is flagged with a Break or ProtocolError by the receiver is retransmitted. When cleared, an asynchronous packet that is flagged with a Break or ProtocolError by the receiver is skipped.
11–8 -	This field is reserved. Reserved
7 MLBLK	MediaLB lock status. When set, indicates that the MediaLB block is synchronized to the incoming MediaLB frame. If **MLBLK** is clear (unlocked), **MLBLK** is set after FRAMESYNC is detected at the same position for three consecutive frames. If **MLBLK** is set (locked), **MLBLK** is cleared after not receiving FRAMESYNC at the expected time for two consecutive frames. While **MLBLK** is set, FRAMESYNC patterns occurring at locations other than the expected one are ignored. (read-only)
6 -	This field is reserved. Reserved
5 MLBPEN	MediaLB 6-pin enable. 0 MediaLB 3-pin interface enabled 1 MediaLB 6-pin interface enabled. MLB PLL and MLB PHY is enabled in this case.
4–2 MLBCLK_2_0	MLB_CLK (MediaLB clock) speed select. 000 256xFs (for **MLBPEN** = 0) 001 512xFs (for **MLBPEN** = 0) 010 1024xFs (for **MLBPEN** = 0) 011 2048xFs (for **MLBPEN** = 1) 100 3072xFs (for **MLBPEN** = 1) 101 4096xFs (for **MLBPEN** = 1) 110 6144xFs (for **MLBPEN** = 1) 111 reserved
1 -	This field is reserved. Reserved
0 MLBEN	MediaLB enable. When set, MLB_CLK (MediaLB clock), MLB_SIG (signal), and MLB_DATA (data) are received and transmitted on the appropriate MediaLB pins.

43.6.2 MediaLB 6-pin Control 0 Register (MLB_MLBPC0)

Address: 218_C000h base + 8h offset = 218_C008h

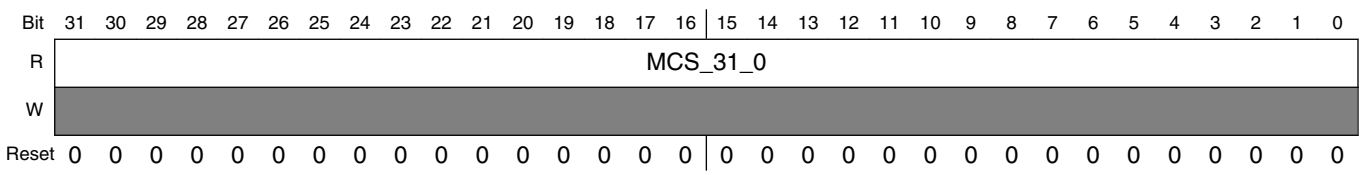


MLB_MLBPC0 field descriptions

Field	Description
31–12 -	This field is reserved. Reserved
11 MCLKHYS	MediaLB (6-pin) hysteresis enable. When set, enables hysteresis on the MLB_CLK (MediaLB clock). This value is driven on mlb_clk_hys_enable output pin and has no internal function.
-	This field is reserved. Reserved

43.6.3 MediaLB Channel Status 0 Register (MLB_MS0)

Address: 218_C000h base + Ch offset = 218_C00Ch

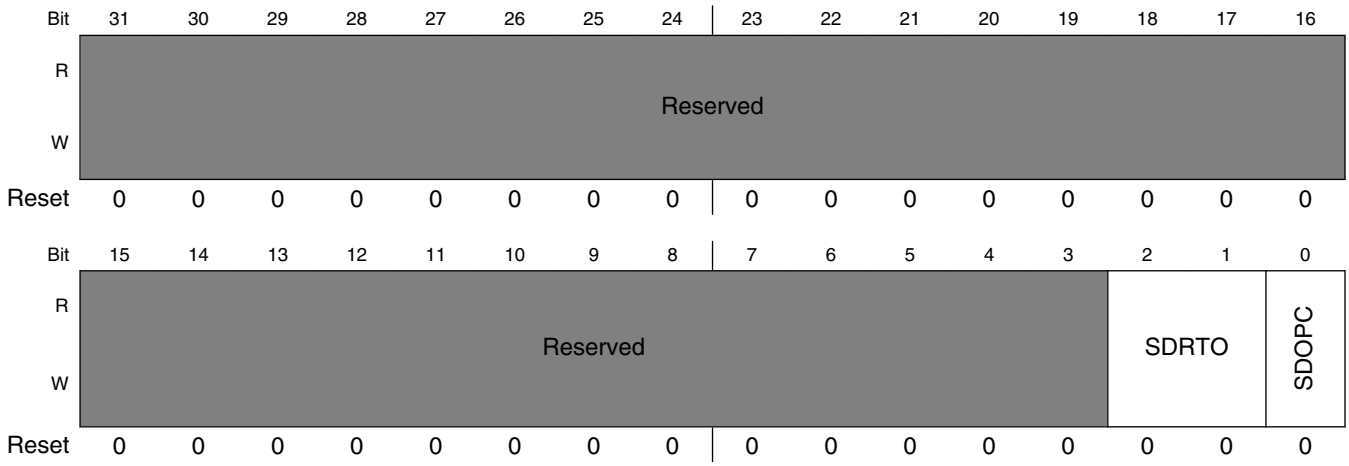


MLB_MS0 field descriptions

Field	Description
MCS_31_0	MediaLB channel status. Indicates the channel status for MediaLB channels 31 to 0. Channel status bits are set by hardware and cleared by software. Status is only set if the appropriate bits in the MIEN register are set.

43.6.4 MediaLB 6-pin Control 2 Register (MLB_MLBPC2)

Address: 218_C000h base + Dh offset = 218_C00Dh

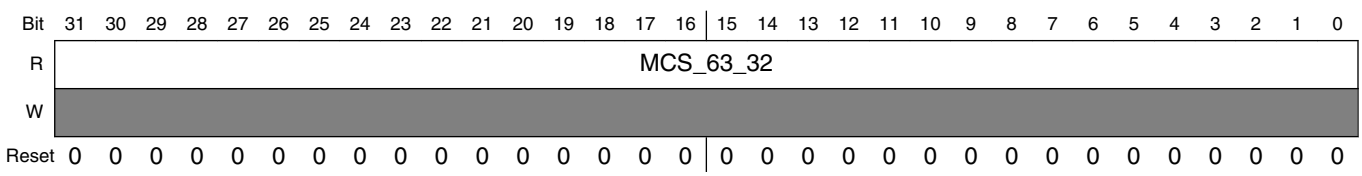


MLB_MLBPC2 field descriptions

Field	Description
31–3 -	This field is reserved. Reserved.
2–1 SDRTO	MLB 6-pin interface: Signal/Data receiver threshold offset control.
0 SDOPC	MLB 3-pin interface: Signal/Data output phase control. 0 MLB_SIG / MLB_DATA launch at rising edge of MLB_CLK(default) 1 MLB_SIG / MLB_DATA launch at falling edge of MLB_CLK

43.6.5 MediaLB Channel Status1 Register (MLB_MS1)

Address: 218_C000h base + 14h offset = 218_C014h

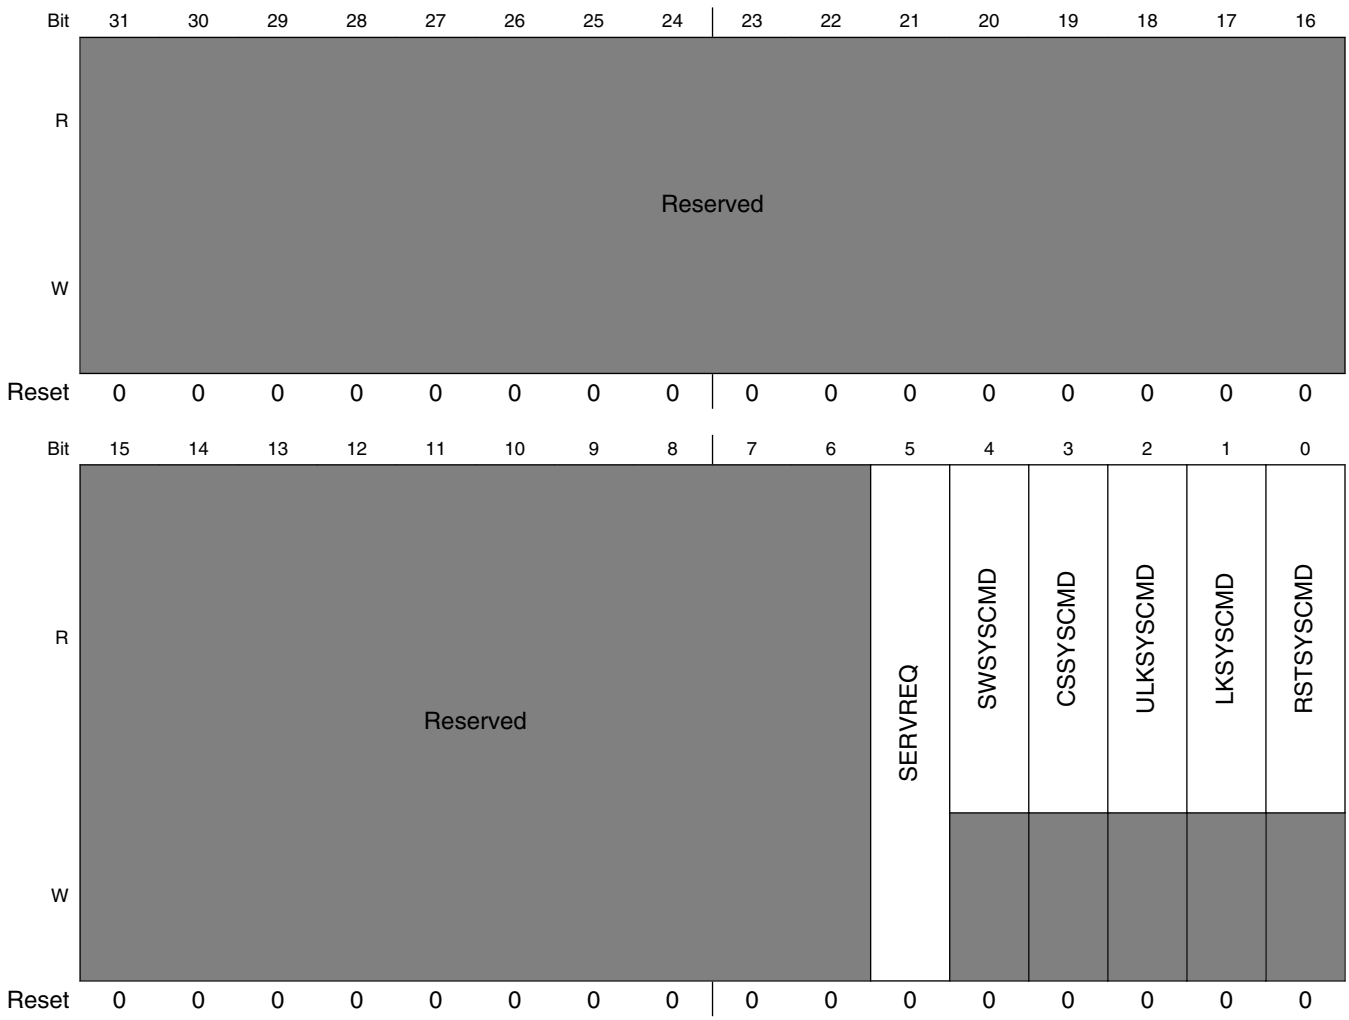


MLB_MS1 field descriptions

Field	Description
MCS_63_32	MediaLB channel status. Indicates the channel status for MediaLB channels 63 to 32. Channel status bits are set by hardware and cleared by software. Status is only set if the appropriate bits in the MIEN register are set.

43.6.6 MediaLB System Status Register (MLB_MSS)

Address: 218_C000h base + 20h offset = 218_C020h



MLB_MSS field descriptions

Field	Description
31–6 -	This field is reserved. Reserved
5 SERVREQ	Service request enabled. When set, the MediaLB block responds with a "device present, request service" system response if a matching channel scan system command is detected. When cleared, the MediaLB block responds with a "device present" system response.
4 SWSYSCMD	Software system command detected (in the system quadlet). Set by hardware, cleared by software. Data is stored in the MSD register for this command.
3 CSSYSCMD	Channel scan system command detected (in the system quadlet). Set by hardware, cleared by software. If the node address specified in *Data* quadlet matches the value in **MLBC1.NDA**, the device responds either "device present" or "device present, request service" system response in the next system quadlet.

Table continues on the next page...

MLB_MSS field descriptions (continued)

Field	Description
2 ULKSYSCMD	Network unlock system command detected (in the system quadlet). Set by hardware, cleared by software.
1 LKSYSCMD	Network lock system command detected (in the system quadlet). Set by hardware, cleared by software.
0 RSTSYSCMD	Reset system command detected (in the system quadlet). Set by hardware, cleared by software.

43.6.7 MediaLB System Data Register (MLB_MSD)

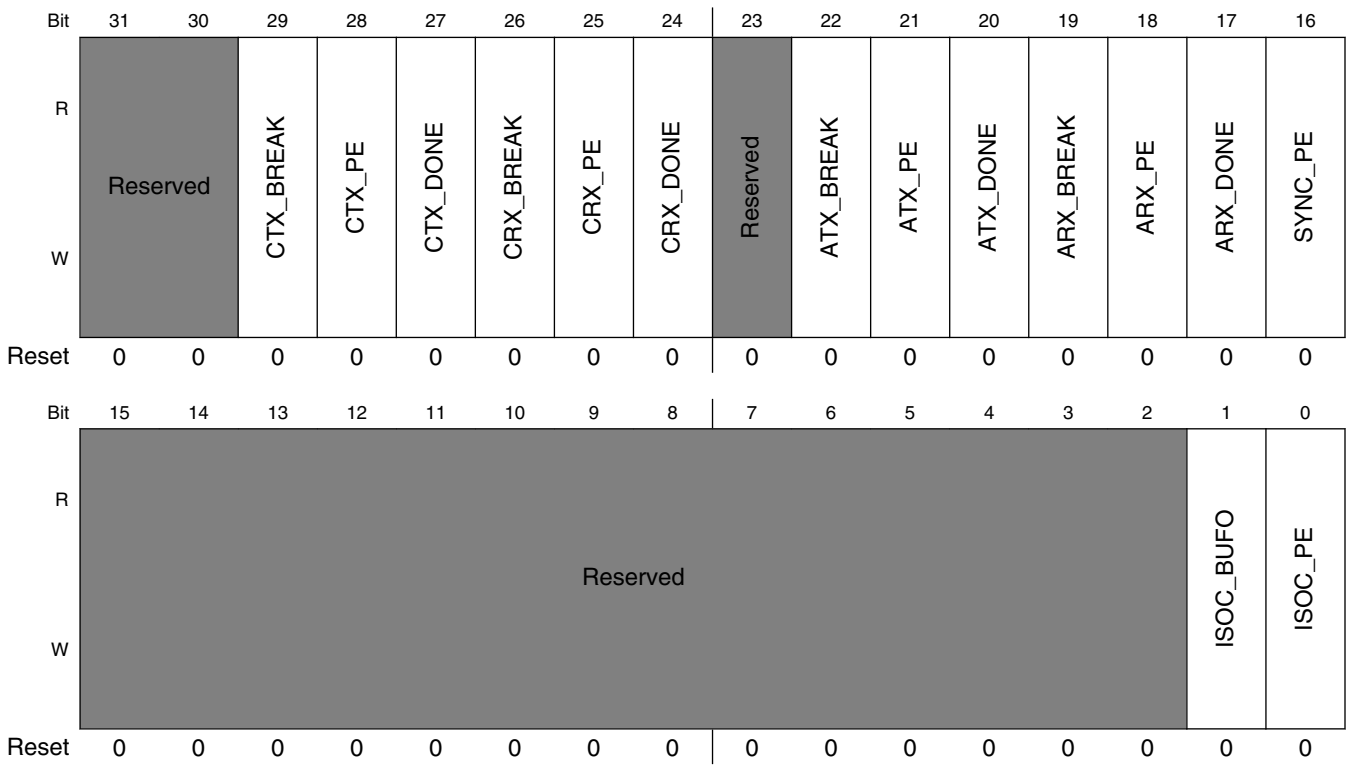
MLB_MSD field descriptions

Field	Description
31–24 SD3_7_0	System data (byte 3). Updated with MediaLB Data[31:24] when a MediaLB software system command is received in the system quadlet. If MSS.SWSYSCMD is already set, then SD3 is not updated. (read-only)
23–16 SD2_7_0	System data (byte 2). Updated with MediaLB Data[23:16] when a MediaLB software system command is received in the system quadlet. If MSS.SWSYSCMD is already set, then SD2 is not updated. (read-only)
15–8 SD1_7_0	System data (byte 1). Updated with MediaLB Data[15:8] when a MediaLB software system command is received in the system quadlet. If MSS.SWSYSCMD is already set, then SD1 is not updated. (read-only)
SD0_7_0	System data (byte 0). Updated with MediaLB Data[7:0] when a MediaLB software system command is received in the system quadlet. If MSS.SWSYSCMD is already set, then SD0 is not updated. (read-only)

43.6.8 MediaLB Interrupt Enable Register (MLB_MIEN)

Address: 218_C000h base + 2Ch offset = 218_C02Ch



MLB_MIEN field descriptions

Field	Description
31–30 -	This field is reserved. Reserved
29 CTX_BREAK	Control Tx break enable. When set, a *ReceiverBreak* response received from the receiver on a control Tx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
28 CTX_PE	Control Tx protocol error enable. When set, a *ProtocolError* generated by the receiver on a control Tx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
27 CTX_DONE	Control Tx packet done enable. When set, a packet transmitted with no errors on a control Tx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
26 CRX_BREAK	Control Rx break enable. When set, a *ControlBreak* command received from the transmitter on a control Rx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
25 CRX_PE	Control Rx protocol error enable. When set, a *ProtocolError* detected on a control Rx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
24 CRX_DONE	Control Rx packet done enable. When set, a packet received with no errors on a control Rx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
23 -	This field is reserved. Reserved
22 ATX_BREAK	Asynchronous Tx break enable. When set, a *ReceiverBreak* response received from the receiver on an asynchronous Tx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.

Table continues on the next page...

MLB_MIEN field descriptions (continued)

Field	Description
21 ATX_PE	Asynchronous Tx protocol error enable. When set, a *ProtocolError* generated by the receiver on an asynchronous Tx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
20 ATX_DONE	Asynchronous Tx packet done enable. When set, a packet transmitted with no errors on an asynchronous Tx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
19 ARX_BREAK	Asynchronous Rx break enable. When set, a *AsyncBreak* command received from the transmitter on an asynchronous Rx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
18 ARX_PE	Asynchronous Rx protocol error enable. When set, a *ProtocolError* detected on an asynchronous Rx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
17 ARX_DONE	Asynchronous Rx done enable. When set, a packet received with no errors on an asynchronous Rx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
16 SYNC_PE	Synchronous protocol error enable. When set, a *ProtocolError* detected on a synchronous Rx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
15–2 -	This field is reserved. Reserved
1 ISOC_BUFO	Isochronous Rx buffer overflow enable. When set, a buffer overflow on an isochronous Rx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set. This occurs only when isochronous flow control is disabled.
0 ISOC_PE	Isochronous Rx protocol error enable. When set, a *ProtocolError* detected on an isochronous Rx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.

43.6.9 MediaLB 6-pin Control 1 Register (MLB_MLBPC1)

Address: 218_C000h base + 38h offset = 218_C038h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

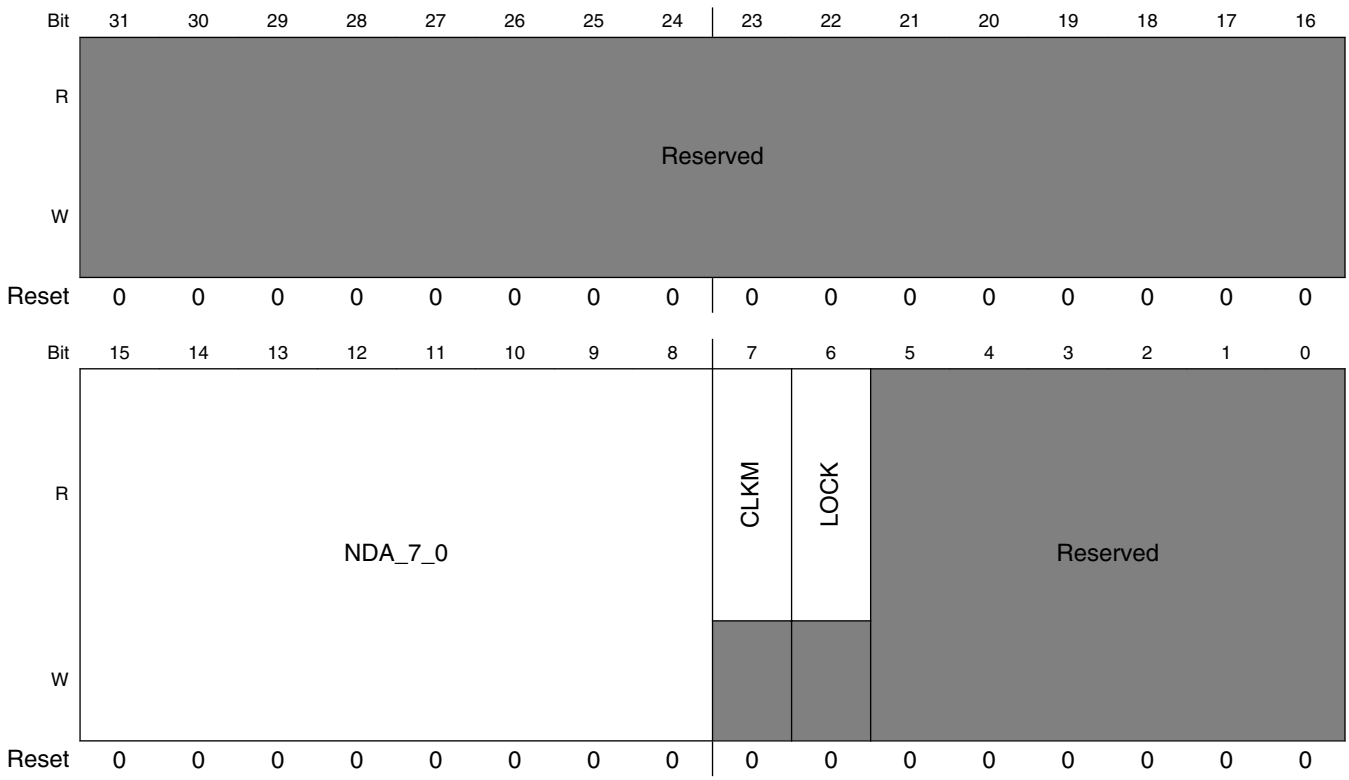
MLB_MLBPC1 field descriptions

Field	Description
31–12 -	This field is reserved. Reserved
11–8 CKRCVBIAS_3_0	Clock receiver bias control (for MediaLB 6-pin interface). Must be written to 0xC when MediaLB 6-pin is initialized (final value needs to be determined through characterization). This value is driven on MLB_CLK, MLB_CLK_N and MLB_CLK_P output pins and has no internal function.
7–4 SDXMTBIAS_3_0	Signal/Data transmitter bias control (for MediaLB 6-pin interface). Must be written to 0xC when MediaLB 6-pin is initialized (final value needs to be determined through characterization). This value is driven on MLB_DATA, MLB_DATA_N and MLB_DATA_P output pins and has no internal function.
SDRCVBIAS_3_0	Signal/Data receiver bias control (for MediaLB 6-pin interface). Must be written to 0xC when MediaLB 6-pin is initialized (final value needs to be determined through characterization). This value is driven on MLB_SIG, MLB_SIG_N and MLB_SIG_P output pins and has no internal function.

43.6.10 MediaLB Control 1 Register (MLB_MLBC1)

Address: 218_C000h base + 3Ch offset = 218_C03Ch



MLB_MLBC1 field descriptions

Field	Description
31–16 -	This field is reserved. Reserved
15–8 NDA_7_0	Node device address. Used for system commands directed to individual MediaLB nodes.
7 CLKM	MediaLB clock missing status. Set when MLB_CLK (MediaLB clock) is not toggling at the pin; cleared by software.
6 LOCK	MediaLB lock error status. Set when MediaLB is unlocked; cleared by software.
-	This field is reserved. Reserved

43.6.11 HBI Control Register (MLB_HCTL)

The HC can control and monitor general operation of the HBI block by reading and writing the HBI Control Register (HCTL) through the I/O interface. Each bit of HCTL is read/write.

Address: 218_C000h base + 80h offset = 218_C080h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

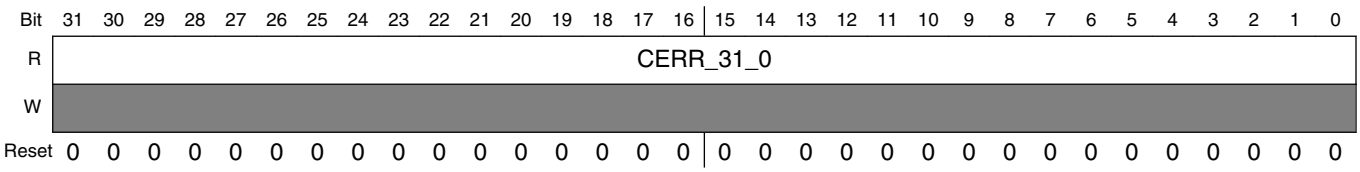
CHM_63_32	Bitwise channel mask bit 0 masked 1 unmasked

43.6.14 HBI Channel Error 0 Register (MLB_HCER0)

The HBI Channel Error Registers (HCERn) indicate which channel(s) have encountered fatal errors.

Address: 218_C000h base + 90h offset = 218_C090h



MLB_HCER0 field descriptions

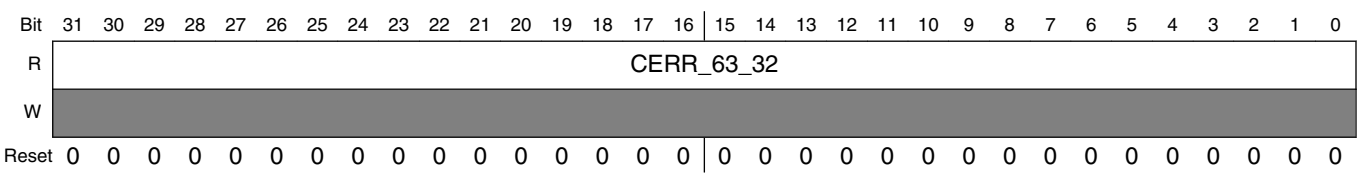
Field	Description
CERR_31_0	Bitwise channel error bit

43.6.15 HBI Channel Error 1 Register (MLB_HCER1)

HCERn status bits are set when hardware detects hardware errors on the given logical channel, including:

- Channel opened, but not enabled,
- Channel programmed with invalid channel type, or
- Out-of-range PML for asynchronous or control Tx channels

Address: 218_C000h base + 94h offset = 218_C094h



MLB_HCER1 field descriptions

Field	Description
CERR_63_32	Bitwise channel error bit

43.6.16 HBI Channel Busy 0 Register (MLB_HCBR0)

The HC can determine which channel(s) are busy by reading the HBI Channel Busy Registers (HCBRn). An HBI channel is busy if:

- it is currently loaded into one of the two AGUs
- the channel is enabled, CE = 1 from the Channel Allocation Table (Table 43-5), and
- the DMA is active

When an HBI channel is busy, hardware may write back its local copy of the channel descriptor at any time. System software should not write a CDT descriptor for a channel that is busy. Only two HBI channels can be busy at any given time. Each bit of HCBRn is read-only.

Address: 218_C000h base + 98h offset = 218_C098h

43.6.28 AHB Control Register (MLB_ACTL)

The AHB Control (ACTL) register is written by the HC to configure the AMBA AHB block for channel interrupts. ACTL contains three configuration fields, one is used to select the DMA mode, one is used to mux channel interrupts onto a single interrupt signal, and the last selects the method of clearing channel interrupts (either software or hardware).

Address: 218_C000h base + 3C0h offset = 218_C3C0h

0 SCE	Software clear enable: 0 Hardware clears interrupt after a ACSRn register read 1 Software clears interrupt

43.6.29 AHB Channel Status 0 Register (MLB_ACSR0)

The AHB Channel Status (ACSRn) registers contain interrupt bits for each of the 64 physical channels. When an ACSRn register bit is set, it indicates that the corresponding physical channel has an interrupt pending.

An AHB interrupt is triggered when either DNEn or ERRn is set within the AHB Channel Descriptor. The HC is notified of the channel interrupt via *ahb_int[1:0]*. When an interrupt occurs in ACSR0 (for channels 31 to 0) *ahb_int[0]* is set. When an interrupt occurs in ACSR1 (for channels 63 to 32) *ahb_int[1]* is set.

Interrupts in ACSR0 and ACSR1 can be optionally muxed onto a single interrupt signal, *ahb_int[0]*, if ACTL.SMX = 1. If ACTL.SCE = 0, hardware automatically clears the interrupt bit(s) after the HC reads the ACSRn register. Alternatively, if ACTL.SCE = 1, software must write a 1 to the appropriate bit(s) of ACSRn to clear the interrupt(s).

Address: 218_C000h base + 3D0h offset = 218_C3D0h

Chapter 44
Multi Mode DDR Controller (MMDC)

44.1 Overview

MMDC is a multi-mode DDR controller that supports DDR3/DDR3L x16/x32/x64 and LPDDR2 two channel x16/x32 memory types. MMDC is configurable, high performance, and optimized.

The following figure shows the MMDC block diagram.

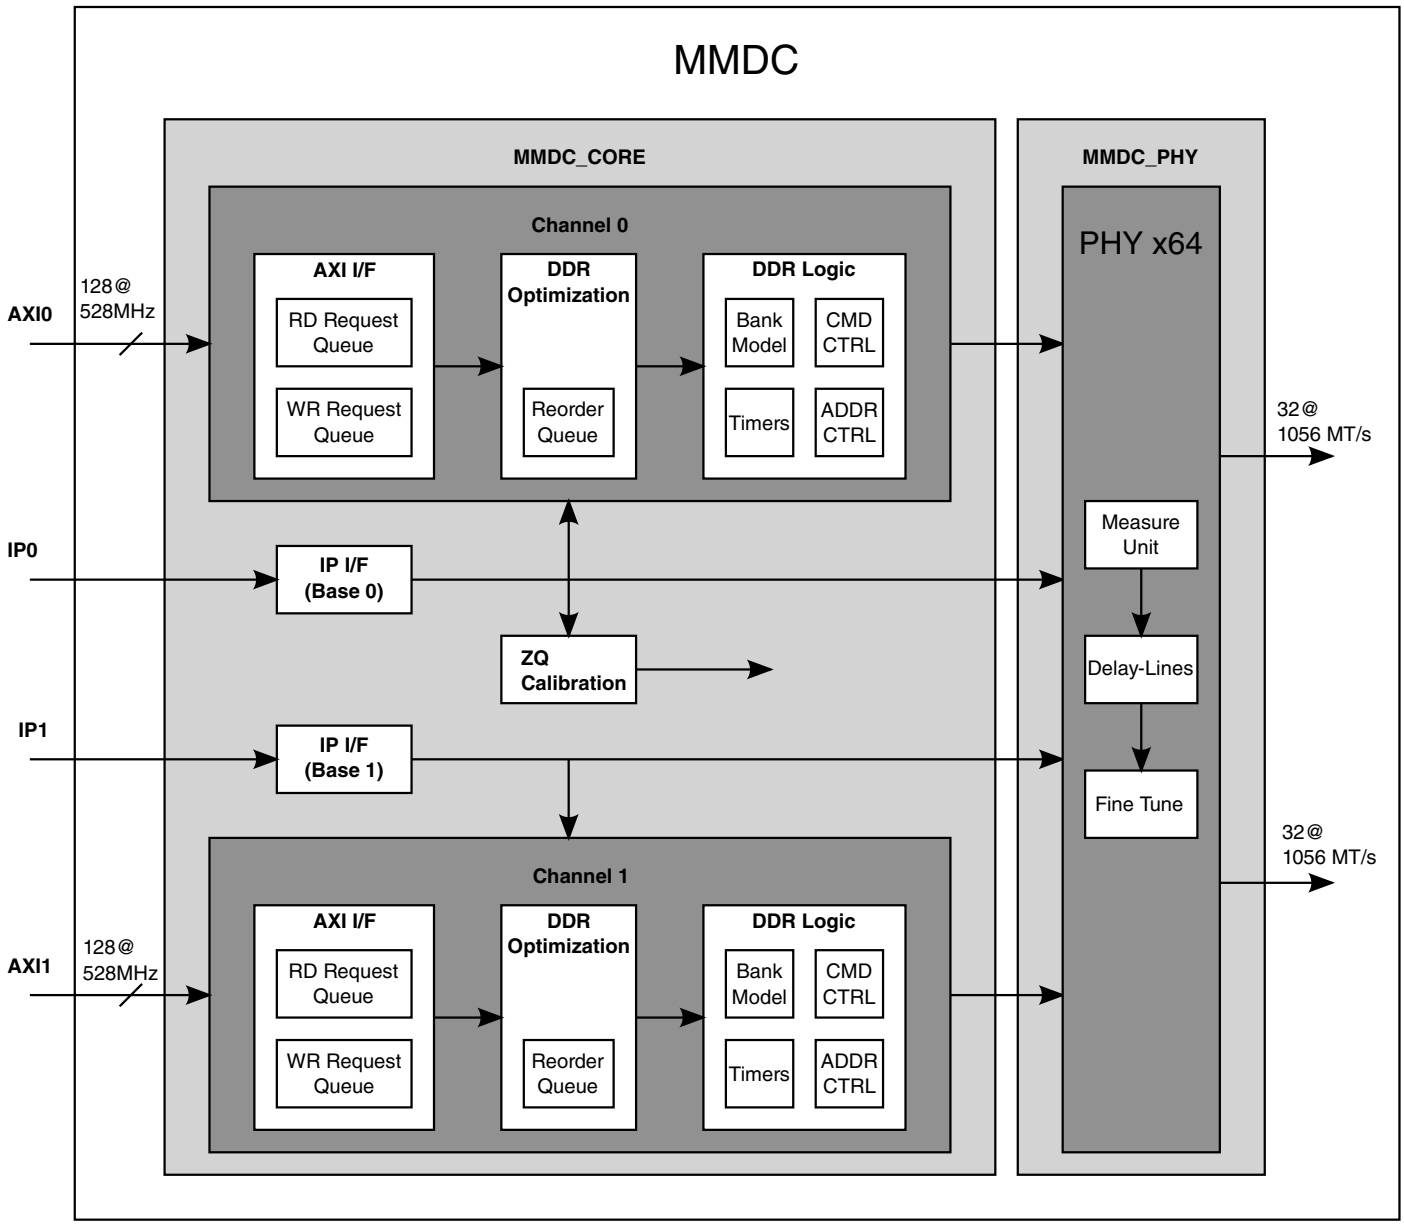

Figure 44-1. MMDC block diagram

MMDC consists of a core (MMDC_CORE) and PHY (MMDC_PHY).

- The core is responsible for communication with the system through an AXI interface, DDR command generation, DDR command optimizations, and a read/write data path.
- The PHY is responsible for the timing adjustment; it uses special calibration mechanisms to ensure data capture margin at a clock rate of up to 528 MHz.

NOTE

The core is composed of two channels, but both channels are only active in LPDDR2 mode. If DDR3 mode is selected,

channel 1 is not activated and the MMDC communicates with the system through AXI port0.

The internal memory map (configuration registers) of the MMDC can be configured through two IP channels (IP0 and IP1).

44.1.1 MMDC feature summary

The table found here summarizes the MMDC features.

Table 44-1. MMDC feature summary

Feature	Details
DDR standards	• DDR3L, DDR3 x16, x32, x64 (includes SODIMM) • LPDDR2 2-channels x16, x32 • Does not support LPDDR1MDDR or DDR2

DDR interface	• x16, x32, x64 data bus width
	• Density per DDR device of 256 Mbits–8 Gbits with the following column and row combinations:
	  • Column size of 8–12 bits
	  • Row size of 11–16 bits
	• Two chip selects per channel (one chip select for DDR3/DDR3L, LPDDR2)
	• Up to 4 Gbytes of address space with configurable partitioning between CS0 and CS1 (for LPDDR2 2ch x32 up to 2 Gbytes per channel)
	• Supports burst length of 8 (aligned) for DDR3
	• Supports burst length of 4 for LPDDR2

DDR performance	• MMDC running at up to 528 MHz (1056MT/s), see CCM block for actual clock frequencies supported. • Supports Real-Time priority by means of QoS sideband priority signals from the chip to enable various priority levels in the re-ordering mechanism: real-time, latency sensitive, normal priority. • Page hit/page miss optimizations • Consecutive read/write access optimizations • Supports deep read and write request queues to enable bank prediction. • Drives back the critical word in a read transaction as soon as it is received by the DDR device (does not wait until the whole data phase has been completed). • Keeps tracking of open memory pages • Supports bank interleaving • Special optimization in case of non-aligned wrap accesses in DDR3 mode (burst length 8) **NOTE:** Due to reordering and optimization mechanisms (per different AXI Identifier (ID)), the transactions towards the DDR device may be driven in a different ID order than was received by the AXI master. In a similar fashion, the write response, read response or read data may be driven to the AXI master in a different ID order.
AXI interface	• AXI bus compliant • Supports bus transfers of 8, 16 , 32 and 128 bits (single accesses and bursts) running at 528 MHz. • Supports AXI bursts length of up to 16 • Supports burst types of WRAP, INCR and FIXED • Supports 16 bits AXI ID • Write data interleave depth is 1 (no support for Write Data Interleave) • Supports write data before address

Table continues on the next page...

Table 44-1. MMDC feature summary (continued)

Feature	Details

	• Supports buffered/non-buffered accesses (AWCACHE[0] = 0b means a non-bufferable access and AWCACHE[0] = 1b means a bufferable access). The rest of the CACHE options are not supported
	  • To keep data access coherency between write and read access of the same master, the response signal is sent as follows:
	  • Bufferable write access—BRESP will be sent when last data of the access has entered the MMDC.
	  • Non-bufferable write access—BRESP will be sent when the data was physically written into the external memory device.
	• Supports four exclusive monitors per configurable ID for only a single access with a size of up to 64 bits
	• Supports AXI responses as follows:
	  • Okay in case the access has been successful or exclusive access failure
	  • Slave error in case of security violation
	  • Exclusive okay in case the read or the write portion of an exclusive access has been successful

DDR calibration and delay-lines.	• Supports various calibration processes which can be performed either automatically (hardware) or manually (software) towards either CS0 or CS1. (At the end of the process the delay-lines will work with one set of results.) The following calibration processes are supported:
	  • ZQ calibration for external DDR device (in DDR3 through ZQ calibration command and in LPDDR2 through MRW command)
	  • Can be handled automatically for ZQ Short (periodically) and ZQ Long (at exit from self-refresh)
	  • Can be handled manually at ZQ INIT
	  • ZQ calibration for DDR I/O pads for calibrating the DDR driving strength
	  • The sequence can be handled automatically by hardware
	  • The sequence can be handled step by step manually by software
	  • Read data calibration. Adjustment of read DQS with read data byte.
	  • Read DQS gating calibration for DDR3 only. Adjustment of DQS gate with read preamble window.
	  • Write data calibration. Adjustment of write DQS with write data byte.
	  • Write leveling calibration. Adjustment of write DQS with CK (DDR differential clock).
	  • Read fine tuning. Adjustment of up to 7 delay-line units for each read data bit.
	  • Write fine tuning. Adjustment of up to 3 delay-line units for each read data bit.
	  • Periodic delay-line measurement for keeping its accuracy during refresh interval.
	  • Additional fine tuning delay lines to adjust DDR clock delay, DDR clock duty cycle, DQS duty cycle.

Power saving	• Support of dynamic voltage, frequency change and self-refresh mode entry through hardware and software negotiation with the system (request/acknowledge handshake)
	  • Upon hardware or software self-refresh request assertion, further AXI requests are blocked (even before the assertion of the acknowledge).
	  • During self-refresh mode the system may deassert the operating clock of the MMDC for power saving.
	  • During self-refresh mode the clock (CK) that is driven to the DDR device will be gated for power saving.
	• Supports automatic self-refresh and power down entry and exit
	  • In automatic self-refresh, the internal operating clock will be gated for power saving.
	• Supports fast and slow precharge power down in DDR3
	• Automatic active and precharge power down timer per chip select (one chip select can enter power down while the other is still working)

Table continues on the next page...

Table 44-1. MMDC feature summary (continued)

Feature	Details
	• While CS (chip-select) is inactive (high) the command and address buses are not toggling for power saving. • While DM (data masking) is high the associated DQ bus is not toggling (driven to "0") for power saving.

DDR general	• Configurable timing parameters
	• Configurable refresh scheme
	• Page boundary crossing support
	  • Automatically generates precharge command and activates the next row
	• Supports various ODT control schemes
	  • Assertion or deassertion of ODT control per read or write accesses and for active or passive CS (chip-select)
	• Supports MRW and MRR commands for LPDDR2
	• Software control in LPDDR2 mode for switching to derated timing parameters and/or update the refresh rate according to temperature sensor
	• Debug and profiling capabilities

44.2 External Signals

The table found here describes the external signals of MMDC.

Table 44-2. MMDC External Signals

Signal	Description	Pad	Mode	Direction
DRAM_ADDR[15:0]	Address Bus Signals	DRAM_A[15:0]	No Muxing	O
DRAM_CAS	Column Address Strobe Signal	DRAM_CAS	No Muxing	O
DRAM_CS[1:0]	Chip Selects	DRAM_CS[1:0]	No Muxing	O
DRAM_DATA[63:0]	Data Bus Signals	DRAM_D[63:0]	No Muxing	I/O
DRAM_DQM[7:0]	Data Mask Signals	DRAM_DQM[7:0]	No Muxing	O
DRAM_ODT[1:0]	On-Die Termination Signals	DRAM_SDODT[1:0]	No Muxing	O
DRAM_RAS	Row Address Strobe Signal	DRAM_RAS	No Muxing	O
DRAM_RESET	Reset Signal	DRAM_RESET	No Muxing	O
DRAM_SDBA[2:0]	Bank Select Signals	DRAM_SDBA[2:0]	No Muxing	O
DRAM_SDCKE[1:0]	Clock Enable Signals	DRAM_SDCKE[1:0]	No Muxing	O
DRAM_SDCLK[1:0]_N	Negative Clock Signals	DRAM_SDCLK_[1:0]_B	No Muxing	O
DRAM_SDCLK[1:0]_P	Positive Clock Signals	DRAM_SDCLK_[1:0]	No Muxing	O
DRAM_SDQS[7:0]_N	Negative DQS Signals	DRAM_SDQS[7:0]_B	No Muxing	I/O
DRAM_SDQS[7:0]_P	Positive DQS Signals	DRAM_SDQS[7:0]	No Muxing	I/O
DRAM_SDWE	WE signal	DRAM_SDWE	No Muxing	O

44.3 Clocks

The table found here describes the clock sources for MMDC.

See Clock Controller Module (CCM) for clock setting, configuration and gating information.

NOTE

The terms *clocks* and *cycles* are used interchangeably and refer to the clock period of the main ddr clock (mmdc_ch0_axi_clk_root), commonly referred to as the DDR frequency.

Table 44-3. MMDC Clocks

Clock name	Clock Root	Description
aclk_fast_core_p0	mmdc_ch0_axi_clk_root	Fast clock (channel 1)
aclk_fast_core_p1	GND	Fast clock (channel 2)
ipg_clk_p0	ipg_clk_root	Peripheral clock (channel 1)
ipg_clk_p1	ipg_clk_root	Peripheral clock (channel 2)
aclk_fast_phy_p0	mmdc_ch0_axi_clk_root	Fast clock (channel 1 - PHY)
aclk_fast_phy_p1	GND	Fast clock (channel 2 - PHY)

44.4 Functional Description

This section provides a complete functional description of the block.

44.4.1 Write/Read data flow

44.4.1.1 Write data flow

1. Write requests are received into an 8 entry request FIFO. Access is received only when there are at least two available entries. Each entry holds all of the AXI attributes.
   - If the burst length is greater than 8, the access splits into two accesses: one with burst length 8 and the other with the remainder.
   - The access can be performed as soon as the entire data phase of the associated write request is completed (all data beats were received).

2. A simple round-robin arbitration between the pending read and write accesses is performed, and the pointer to this stage's winner access is sent to the re-ordering buffer.
3. The reordering mechanism is activated to find the winner access, which is the access that best utilizes the DDR bus, based on its dynamic score. For further information see Dynamic scoring mode (Arbitration Winning Conditions).
4. The winner write access at the previous stage is received and is held for dispatch to the DDR logic.
5. When the DDR command control unit is ready to accept the write request, it issues (if needed) a precharge/active command to the DDR device according to the status of the bank model and the parameters of the timers.
6. The DDR logic drives the associated data to the DDR device through the DDR PHY.

44.4.1.2 Read data flow

1. Read requests are received into a 16 entry request FIFO in MMDC if there are at least two available entries. Each entry holds all of the AXI attributes.

NOTE

If the burst length is greater than 8, the access splits into 2 accesses (one with burst length 8 and the other with the remainder).

2. A simple round-robin arbitration between the pending read and write accesses is performed and the pointer to this phase's winner access is sent to the re-ordering buffer.
3. The reordering mechanism is activated to find the winner access, which is the access that best utilizes the DDR bus, based on its dynamic score. For further information see Dynamic scoring mode (Arbitration Winning Conditions).
4. The winner read access at the previous stage is sampled and is held for dispatch to the DDR logic. This read access will be dispatched when there is at least one free slot in the read data buffer to store the data.
5. When the DDR command control unit is ready to accept the read request, it issues (if needed) a precharge/active command to the DDR device according to the status of the bank model and the parameters of the timers.
6. The MMDC PHY samples the read data, and the DDR logic transfers the data to the associated slot in the read data buffer.
7. MMDC transfers the data back to the master.

44.4.2 MMDC initialization

Because the MMDC is disabled when the chip exits reset, no clock is driven to the DDR device and the whole interface towards the DDR device is inactive. The following steps are required to activate the MMDC properly.

NOTE

To guarantee that the DRAM_RESET and DRAM_SDCKE signals are kept low during the power-up and reset sequences of the chip (as defined by JEDEC), you must connect those signals to pull-down resistors.

1. Set MDSCR[CON_REQ], which sets the configuration request; note that because the MMDC is disabled, there is no need to poll the configuration acknowledge bit at MDSCR[CON_ACK].
2. Configure the desired timing parameters at the MDCFG0, MDCFG1, MDOTC, and MDCFG2 registers.
3. Configure the DDR type and other miscellaneous parameters at the MDMISC register.
4. Configure the required delay while leaving reset, at the MDOR register.
5. Configure the DDR physical parameters (density and burst length) at the MDCTL register.
6. Perform a ZQ calibration of the MMDC module to correctly initialize drive strengths.
7. Enable MMDC with the desired chip select at MDCTL[SDE_0] (for chip select 0) and MDCTL[SDE_1] (for chip select 1). At this point, MMDC starts the reset and initialization sequence related to DRAM_RESET/DRAM_SDCKE as defined by JEDEC.
8. Complete the initialization sequence as defined by JEDEC by issuing MRS/MRW commands for (ZQ, ODT, PRE, and so on). To issue those commands, configure the appropriate command and address at the MDSCR register.
9. Program the DDR mode registers by configuring the appropriate command and address at the MDSCR register.
10. Configure the power down and self-refresh entry and exit parameters at the MDPDC and MAPSR registers.
11. Configure the ZQ scheme at the MPZQHWCTRL and MPZQLP2CTL registers.
12. Configure and activate the periodic refresh scheme at the MDREF register.
13. Deassert the configuration request by clearing MDSCR[CON_REQ].

NOTE

Steps 1 through 6 are non-blocking and can be done in any order.

Upon completion of these steps, MMDC is ready for work and to process AXI accesses.

NOTE

To achieve better timing and better precision, it is recommended that users configure the MMDC PHY delay parameters by operating either the automatic or manual calibration process. Before starting any calibration process, you must disable the periodic refresh scheme (MDREF[REF_SEL] = 11) and then issue a manual refresh command by configuring MDSCR[CMD] to 2h. For further information, see Calibration Process.

44.4.3 Configuring the MMDC registers

To safely modify MMDC's internal configuration registers, MMDC must be placed into configuration mode.

Use the following steps to enter configuration mode.

1. Issue a configuration request by setting MDSCR[CON_REQ].
2. Poll on configuration acknowledge until it is set at MDSCR[CON_ACK].

At this point, MMDC enters configuration mode and accessing the MMDC registers is permitted.

NOTE

During configuration mode, MMDC prevents further AXI accesses from being acknowledged.

Upon deassertion of MDSCR[CON_REQ], MMDC leaves configuration mode and AXI accesses are processed.

44.4.4 MMDC Address Space

44.4.4.1 Address decoding

MMDC supports up to two consecutive chip selects, each with the same density.

In LPDDR2-2ch mode, up to two chip selects per channel are supported.

It is optional to configure the partition between the chip selects through MDASP[CS0_END].

The incoming AXI address bus is 32 bits. MMDC decodes each access as follows:

1. chip select
2. bank number
3. row number
4. column number

The following registers in the MMDC define the DDR address space:

- MDMISC[DDR_4_BANK]—Defines either 4 or 8 banks in the DDR device
- MDCTL[DSIZ]—Defines the DDR data bus width of x16, x32 or x64
- MDMISC[BI]—Defines whether bank interleaving is on or off
- MDCTL[COL]—Defines the column size of the DDR device
- MDCTL[ROW]—Defines the row size of the DDR device

The following tables show address decoding examples for x16 and x32 bit DDR devices when bank interleaving is both on and off. It is assumed that the configuration is as follows: 8 banks (3 bits), 15 bit assignment for the row, and 10 bit assignment for the column. The total density is 256 MWords (512 Mbytes for x16 and 1 Gbyte for x32).

NOTE

Chip selection is done by comparing the 7 most significant address bits (ARADDR[31:25]/AWADDR[31:25]) with MDASP[CS0_END].

Table 44-4. Address decoding—bank interleaving off

A0	—	—

NOTE

In cases where this is an access to a non-initialized or disconnected chip select, behavior may be unexpected.

44.4.4.2 Chip select settings

MMDC drives the incoming access to either CS0 or CS1 by comparing the 7 most significant address bits (ARADDR[31:25]/AWADDR[31:25]) with MDASP[CS0_END].

Generally, the total density per chip-select must be a power of two and the total density must be the same for each chip-select.

Creating 4 Gbyte address space with 2 Gbyte CS density and Creating 2 Gbyte address spaces with 1 Gbyte CS density show how to create a continous address space and configure the MMDC accordingly.

44.4.4.2.1 Creating 4 Gbyte address space with 2 Gbyte CS density

If the DDR memory space allocation is 4 Gbytes, only one configuration of chip select partition is allowed. The register MDASP[CS0_END] should be set to 2 Gbytes partition (16Gb).

The figure below shows the associated memory space. In the case of DDR3 x64, this address space can be acheived by connecting four devices per chip select. Each device is x16 with density of 4 Gbytes.

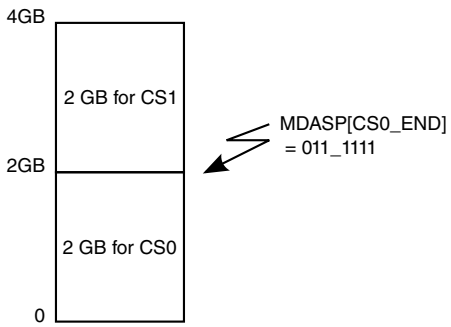

Figure 44-2. Chip select partion—2 Gbytes per chip select

44.4.4.2.2 Creating 2 Gbyte address spaces with 1 Gbyte CS density

If the DDR memory space allocation is 2 Gbytes, there are three options for configuring the chip select partition:MDASP[CS0_END] to 001_1111 (1 Gbyte), MDASP[CS0_END] to 011_1111 (2 Gbytes), and MDASP[CS0_END] to 101_1111 (3 Gbytes).

If DDR memory space allocation is 2 Gbytes, there are three options for configuring the chip select partition:

- MDASP[CS0_END] to 001_1111 (1 Gbyte)
- MDASP[CS0_END] to 011_1111 (2 Gbytes)
- MDASP[CS0_END] to 101_1111 (3 Gbytes)

The figure below shows the associated memory space:

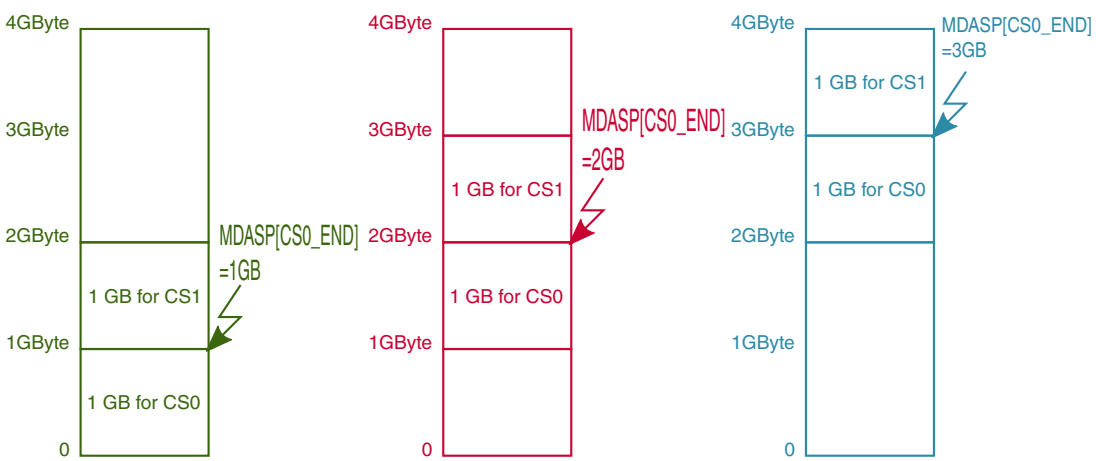

Figure 44-3. Chip select partion—1 Gbyte per chip select

44.4.4.3 Translation of AXI accesses to DDR accessess

44.4.4.3.1 Example 1

Assume the AXI read access has the following attributes:

- Wrap (arburst[1:0] = 10b)
- AXI size of 128 bits (arsize[2:0] = 100b)
- AXI length of 8 (arlen[3:0] = 0111b)
- AXI address with suffix B0h (non-aligned to AXI wrap boundary which is 16Bx8 = 128B = 0x80)

Toward DDR3(MDMISC[DDR_TYPE] = 00b) with the following attributes:

- x32 (MDCTL[DSIZ] = 01b)
- burst length of 8 (MDCTL[BL] = 1b)

In this case, the AXI wrap boundary is every 16Bx8=128B (0x80) and the DDR wrap boundary is every 4Bx8=32B(0x20).

The master expects to fetch the data that is associated with the following addresses: 0xB0, 0xC0, 0xD0, 0xE0, 0xF0, 0x80, 0x90, 0xA0.

The first aligned AXI address that is associated with suffix 0xB0 is with suffix 0x80, and the last wrap AXI address is with suffux 0xFF. Because the AXI master expects to get the first data from AXI address with suffix 0xB0, the MMDC issues the following accesses toward the DDR:

- Read access toward logic address with suffix 0xA0 (DDR boundary is 0x20 and 0xA0 is the closest to 0xB0)

NOTE

Logic address is the address of the column normalized to 1 byte.

- Read access toward logic address with suffix 0xC0
- Read access toward logic address with suffix 0xE0
- Read access toward logic address with suffix 0x80

The MMDC breaks the AXI access into four DDR accesses and returns the read data associated with address 0xB0 to the master first. The read data fetched from address 0xA0 is stored in the internal buffers and is driven back to the master at the end.

44.4.4.3.2 Example 2

Assume the AXI write access has the following attributes:

- Increment (awburst[1:0]=2'b01)

- AXI size of 64bits (awsize[2:0]=3'b011)
- AXI length of 8 (awlen[3:0]=4'b0111)
- AXI address with suffix 0xB0 (aligned as the size of the increment is 8B)

Toward DDR3(MDMISC[DDR_TYPE]=2'b00) with the following attributes:

- x64 (MDCTL[DSIZ]=2'b10)
- burst length of 8 (MDCTL[BL]=1'b1)

In this case, the AXI alignment is every 8B and the DDR boundary is every 8Bx8=64B(0x40).

The master expects to write the data to the following addresses: 0xB0, 0xB8, 0xC0, 0xC8, 0xD0, 0xD8, 0xE0, 0xE8.

The MMDC will issue the following accesses toward the DDR:

- Write access toward logic address with suffix 0x80 (DDR boundary is 0x40 and 0x80 is the closest to 0xB0) while address 0x80 to 0xAF are masked by DM (data masking signal).

NOTE

Logic address is the address of the column normalized to 1 byte.

- Write access toward logic address with suffix 0xC0 while addresses 0xF0 through 0xFF are masked by DM (data masking signal)

The MMDC will break the AXI access into two DDR accesses.

44.4.4.3.3 Example 3

Assume the AXI write access has the following attributes:

- Wrap (awburst[1:0]=2'b10)
- AXI size of 128bits (awsize[2:0]=3'b100)
- AXI length of 4 (awlen[3:0]=4'b0011)
- AXI address with suffix 0x80 (aligned)

Toward DDR3(MDMISC[DDR_TYPE]=2'b00) with the following attributes:

- x64 (MDCTL[DSIZ]=2'b10)
- burst length of 8 (MDCTL[BL]=1'b1)

In this case, the AXI wrap boundary is every 16Bx4=64B (0x40) and the DDR wrap boundary is every 8x8=64B(0x40).

The master expects to write the data to the following addresses: 0x80, 0x90, 0xA0, 0xB0.

Because the AXI wrap boundary and DDR wrap boundary are similar and the starting AXI address is aligned, the MMDC will issue only one access toward the DDR as follows:

- Write access towards logic address with suffix 0x80

NOTE

Logic address is the address of the column normalized to 1 byte.

44.4.4.3.4 Example 4

Assume the AXI write access has the following attributes:

- Increment (awburst[1:0]=2'b01)
- AXI size of 64bits (awsize[2:0]=3'b011)
- AXI length of 2 (awlen[3:0]=4'b0001)
- AXI address with suffix 0x5 (non aligned)

Toward DDR3(MDMISC[DDR_TYPE]=2'b00) with the following attributes:

- x32 (MDCTL[DSIZ]=2'b10)
- burst length of 8 (MDCTL[BL]=1'b1)

In this case the AXI alignment is every 8B (0x8) and the DDR boundary is every 4Bx8=32B(0x20).

The master expects to write the data to the following addresses: 0x5 (with WSTRB=0xE0), 0x8 (till 0xF).

The MMDC will issue one access toward the DDR as follows:

Write access toward logic address with suffix 0x0 (DDR boundary is 0x20 and 0x0 is the closest to 0x0) while address 0x0 till 0x4 are masked by DM (data masking signal) and address 0x10 till 0x1F are also masked by DM.

44.4.4.3.5 Example 5

Assume AXI write access has the following attributes:

- Increment (awburst[1:0]=2'b01)
- AXI size of 64bits (awsize[2:0]=3'b011)
- AXI length of 7 (awlen[3:0]=4'b0001)
- AXI address with suffix 0x10 (aligned)

Toward DDR3 (MDMISC[DDR_TYPE]=2'b00) with the following attributes:

- x64 (MDCTL[DSIZ]=2'b10)
- burst length of 8 (MDCTL[BL]=1'b1)

In this case the AXI alignment is every 8B (0x8) and the DDR boundary is every 8Bx8=64B(0x40).

The master expects to write the data to the following addresses: 0x10, 0x18, 0x20, 0x28, 0x30, 0x38, 0x40, 0x48.

Because the AXI access is not aligned to DDR boundary, which is every 0x40, the MMDC will issue two accesses toward the DDR as follows:

- Write access toward logic address with suffix 0x0 while address 0x0 till 0xF are masked by DM (data masking signal).

NOTE

Logic address is the address of the column normalized to 1 byte.

- Write access towards logic address with suffix 0x40 while addresses 0x50 till 0x7F are masked by DM (data masking signal).

44.4.4.4 Address mirroring

When enabling this feature, address bits DRAM_A3, DRAM_A4, DRAM_A5, DRAM_A6, DRAM_A7, DRAM_A8, DRAM_SDBA0, and DRAM_SDBA1 behave differently according to the associated chip select.

This feature facilitates PCB board routing for devices on chip select 1, which are typically populated on the opposite side of the PCB from the devices on chip select 0.

NOTE

This feature is only supported for DDR3 memories. It is not supported for LPDDR2 memories.

The following table specifies the address mirroring options:

Table 44-6. Address mirroring options

MMDC pin	Chip select 0 pin	Chip select 1 pin
DRAM_A3	DRAM_A3	DRAM_A4
DRAM_A4	DRAM_A4	DRAM_A3
DRAM_A5	DRAM_A5	DRAM_A6

Table continues on the next page...

44.4.5 LPDDR2 and DDR3 pin mux mapping

The following table shows the pin mux mapping between LPDDR2 and DDR3. The i.MX DDR I/O pads corresponds with the DDR3 standard.

- In DDR3, all DRAM_DATA, DRAM_SDQS, and DRAM_DQM data lines work with channel 0.
- In LPDDR2, DRAM_DDQS[3:0], DRAM_DATA[31:0] and DRAM_DQM[3:0] work with channel 0. DRAM_SDQS[7:4], DRAM_DATA[63:32], and DRAM_DQM[7:4] work with channel 1.

Table 44-7. LPDDR2 and DRAM pin mux mapping

44.4.6 Power Saving and Clock Frequency Change modes

44.4.6.1 Power saving general

MMDC supports multiple DDR power saving modes.

NOTE

At default, the power saving modes are disabled. These modes may dramatically decrease the power consumption of DDR memories.

1. Self-refresh entry to the entire DDR device (for both chip select 0 and 1) can be activated through two mechanisms:
   - LPMD (Low Power Mode)
     - Hardware handshaking (LPMD/LPACK) with the clock module in the system
     - Software handshaking by setting the field MAPSR[LPMD] and polling MAPSR[LPACK]
     - Automatic entry by configuring the amount of idle cycle for triggering self-refresh entry through MAPSR[PST] and by clearing MAPSR[PSD]
   - DVFS (Dynamic Voltage and Frequency Change)
     - Software handshaking by setting the field MAPSR[DVFS] and polling MAPSR[DVACK]

NOTE

If hardware or software requests for self-refresh entry were detected by the MMDC (even before the assertion of the LPACK), no write or read accesses will be acknowledged until the deassertion of those requests.

2. Automatic active/precharge power down entry to a specific chip select can be activated by configuring the ESDPDC register:
   - PWDT_0/PWDT_1 - define the number of idle cycles before entering power down, can be different value per chip select.
   - SLOW_PD - In case of DDR3 memory is configured to use slow precharge power down then this bit should be set as well.
   - BOTH_CS_PS - The MMDC can either set each chip select independently to power down, according to its idle state, or set both chip selects to power down only if both in idle state for the configured period.
   - Few parameters must be configured in addition:
     - Timing parameters at MDCFG0[tXP and tXPDLL].
     - ODT timing at MDOTC[tAOFPD, tAONPD, tANPD and tAXPD]

NOTE

It is possible to enter certain chip selects to low power consumption while the second chip select is activated.

3. Automatic precharge of all DDR banks to a specific chip select. Can be activated by configuring ESDPDC fields: PRCT_0 and PRCT_1. Each field determines a value loaded to a different chip select.

44.4.6.2 Self refresh and Frequency change entry/exit

As described in Power saving general, the MMDC supports two mechanisms that will cause the DDR device to enter self-refresh mode:

- LPMD (Low Power Mode) - For power saving purposes
- DVFS (Dynamic Voltage and Frequency Change) - For clock frequency changes

While the DDR device is in self-refresh mode, there is no need to provide periodic refresh commands.

The MMDC treats hardware/software handshaking of LPMD/DVFS in the same manner:

- Upon the assertion of LPMD/DVFS request, the following is done:
  - The MMDC blocks any further AXI accesses even before the acknowledge is asserted
  - Completes all opened AXI accesses

    - Closes (precharge) all banks in the appropriate timing
    - Drives self-refresh command by deasserting clock enable signal (DRAM_SDCKE is driven to "0") together with a refresh command. This occurs after satisfying tRP/tRPA from the precharge all command.
    - Deasserts the clock (CK) that is driven to the DDR device
    - Asserts LPMD/DVFS acknowledge (LPACK/DVACK)
    - Allows deassertion of the operating clock of the MMDC (AXI clock)
- Upon the deassertion of LPMD/DVFS request, the following is done:
    - Operating clock of the MMDC must be turned on before LPMD/DVFS is deasserted
    - Starts driving the clock (CK) to the DDR device
    - After satisfying tCKSRX from clock renewal the clock enable signal (DRAM_SDCKE) is asserted
    - LPMD/DVFS acknowledge (LPACK/DVACK) is deasserted
    - After satisfying tXS from the assertion of DRAM_SDCKE, a refresh command is driven to the DDR device.
    - If ZQ calibration is enabled then tRFC is satisfied from the refresh command and a long ZQ command is driven.
    - tZQoper idle cycles are counted after the ZQ command.
    - After satisfying tDLLK from the assertion DRAM_SDCKE, the MMDC returns to normal operation.

The figure below shows the timing diagram of the hardware/software handshaking of LPMD/DVFS:

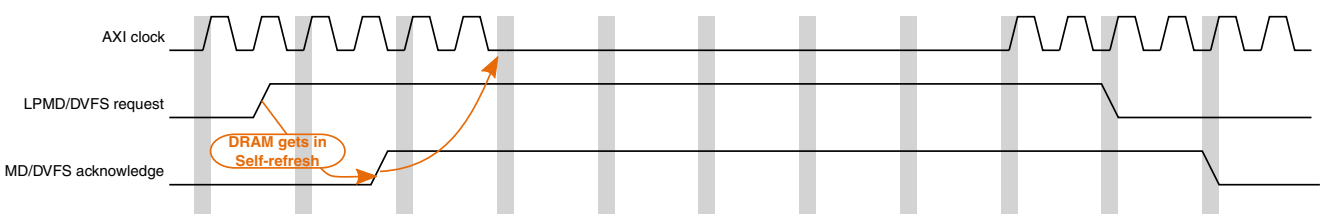

Figure 44-4. LPMD/DVFS Hardware/Software Handshaking

Note for self-refresh:

- As soon as LPMD or DVFS requests are detected by either hardware or software handshaking, the MMDC will deassert the AXI ARREADY/AWREADY signals immediately to block further requests from the system.
- In case of automatic self-refresh, the internal operating clock will be negated to save power.

44.4.7 Reset

44.4.7.1 Hard reset

When hard reset is asserted (aresetn is driven to "0") while warm reset is deasserted (warm_reset is driven to "0"), the entire MMDC will be initialized, including configuration/status registers and state machines.

In order to access the DDR device, the MMDC will then have to be reconfigured.

44.4.7.2 Warm reset

The MMDC supports warm reset signal. The warm reset signal must envelop the hard reset signal and then the MMDC will reset all the internal registers. The only registers that are not reset are those that are essential for returning it to normal operation without repeating the initialization sequence and without losing data stored in the memory (configuration/status registers won't be initialized).

For the successful operation of warm reset, the following steps must be performed:

- The MMDC must enter self-refresh mode. This can be achieved by either LPMD or DFVS requests
- Wait for LPMD or DVFS acknowledge
- Assert warm reset signal (i.e. drive warm_reset to "1")
- Assert hard reset signal (i.e. drive aresetn to "0")
- Deassert hard reset signal
- Deassert warm reset
- Get out of the LPMD/DVFS mode

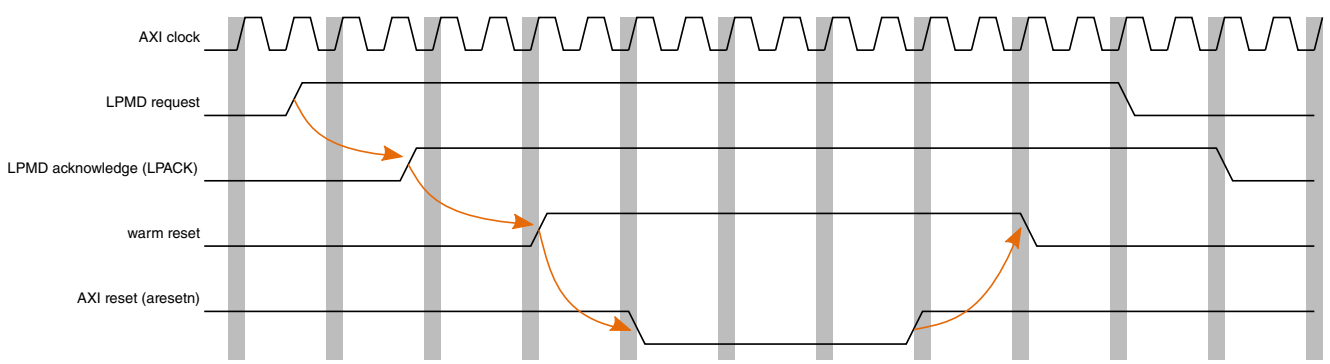

Figure 44-5. Warm Reset Diagram

44.4.7.3 Software reset

The MMDC supports software reset. When software reset is configured then the MMDC will reset all the internal registers except those that are essential for returning to normal operation without repeating the initialization sequence or without losing data stored in the memory (configuration/status registers won't be initialized).

The following steps should be performed for successful operation of software reset:

- The MMDC should enter self-refresh mode. This can be achieved by either LPMD or DFVS request.
- Wait for LPMD or DVFS acknowledge
- Assert software reset, by setting MDMISC[RST]
- Get out of the LPMD/DVFS mode

Normal operation can be resumed.

44.4.8 Refresh Scheme

The MMDC supports various automatic refresh options which can be configured via the MDREF register.

The periodic auto refresh can be triggered by the following clocks:

- 32 kHz clock
- 64 kHz clock
- MMDC operating clock

The refresh scheme of the MMDC is flexible and allows the system to configure the desired AXI accesses delay/latency in each refresh cycle.

The table below shows an example of four configurations of the refresh cycles that will be handled by the MMDC. Each configuration meets a refresh rate of 3.9µs (tREFI, refresh command every 3.9µs).

Table 44-8. MMDC Refresh Scheme

Option number	Description	REFR	REF_SEL	REF_CNT	DDR hang time
1	Issue 8 refresh commands every 31,250 ns	0x7 (8 refreshes)	0x0 (64 kHz)	not needed	tRFC x 8

Table continues on the next page...

Table 44-8. MMDC Refresh Scheme (continued)

Option number	Description	REFR	REF_SEL	REF_CNT	DDR hang time
2	Issue 4 refresh commands every 15,625ns	0x3 (4 refreshes)	0x1(32 kHz)	not needed	tRFC x 4
3	Issue 2 refresh commands every 7800ns	0x1(2 refreshes)	0x2 (REF_CNT)	7800/2.5 = 3120 (0xC30)	tRFC x 2
4	Issue 1 refresh command every 3900 ns	0x0 (1 refresh)	0x2 (REF_CNT)	3900/2.5 = 1560(0x618)	tRFC

44.4.9 Burst Length options towards DDR

The MMDC supports burst lengths which can be configured through MD+CTL[BL] as follows:

- In DDR3 mode, only burst length 8 can be used.
- In LPDDR2 mode, only burst length 4 can be used.

In DDR3 mode read/write accesses to the DDR are always 8 words (x16, x32, x64) and aligned in according to JEDEC standards.

In case of AXI INCREMENT, accesses that are not aligned the irrelevant data is masked in write accesses and ignored in read accesses. In case of AXI WRAP accesses, even if the access is not aligned, then the MMDC provides an internal optimization mechanism for better efficiency of the DDR data bus.

44.4.10 Exclusive accesses handling

The MMDC contains four exclusive monitors, each for dedicated ID as configured in MAEXIDR0 and MAEXIDR1.

- If legal read exclusive is received by the MMDC, the associated monitor is turned on.
- While the monitor is turned on upon legal write exclusive, the monitor will be turned off and the write will be completed successfully with EXOKAY.
- The following rules must be met for successful exclusive access:
  - Aligned access (the AXI address is aligned to the AXI size)
  - AXI single access (AXI burst length isn't greater than 1)
  - AXI size of up to 64 bits

- AXI non-cachable access (i.e. ARCACHE[1]/AWCACHE[1] is equal "0" or ARCACHE[1]/AWCACHE[1] is equal "1" while ARCACHE[3:2]/ AWCACHE[3:2] are equal "00")
- AXI ID that matches one of the four exclusive IDs

Exclusive read behavior (first bullet also correct for non-exclusive accesses):

- In case of security violation, the read is blocked and is not sent to DDR. There are two options for response:
  - If ARCR_SEC_ERR_EN (MAARCR[30]) is high, SLV error is issued towards the Master, otherwise OKAY response is sent to the Master.
- If AXI exclusive rules violation occurs (as described above), the read access is not blocked and is sent to DDR. The data will be fetched and be driven to the master, but the type of response may be unpredicted.
- If none of the above occurs, the read is sent to the DDR. The exclusive monitor will be turned on and the response is EXOKAY
- If additional legal AXI read exclusive is received with the same ID before the AXI exclusive write, the monitor will be updated with the latest attributes.

Exclusive write behavior (first bullet also correct for non-exclusive accesses):

- In case of security violation, the write is blocked and is not sent to DDR, but the monitor will be kept on. There are two options for response:
  - If ARCR_SEC_ERR_EN (MAARCR[30]) is high then SLV error is issued towards the Master, otherwise OKAY response is sent to the Master.
- In case of AXI exclusive rules violation (as described above), the write is blocked and is not sent to DDR. In that case the type of response may be unpredicted.
- In case the exclusive write access has different AXI attributes, but the same ID as the read exclusive access, the write is blocked and is not sent to DDR and the monitor will be turned off. There are two options for response:
  - If ARCR_EXC_ERR_EN (MAARCR[28]) is high then SLV error is issued towards the Master, otherwise OKAY response is sent to the Master.
- In case of regular (non exclusive) write access is received to the same address or overlapping addresses then the write will be sent to the DDR and the monitor will be turned off.
- In case of legal write exclusive access is received with the same attributes as the read exclusive access while the monitor is on (no write accesses occured to the same address between the read exclusive and write exclusive), then the write is sent to DDR and the response is EXOKAY. But, if the legal write exclusive is received while the monitor is off, the write is blocked and there are two options for response.
  - If ARCR_EXC_ERR_EN (MAARCR[28]) is high then SLV error is issued towards the Master, otherwise OKAY response is sent to the Master.

44.4.11 AXI Error Handling

The MMDC supports the AXI responses listed here.

- In case of AXI exclusive violation there are two options for response:
  - If MAARCR[28] is high then SLV Error is issued towards the Master, Otherwise OKAY response is sent to the Master

NOTE

In case of read error MMDC drives zeros on the read data bus

44.5 Performance

44.5.1 Arbitration and reordering mechanism

44.5.1.1 Arbitration General

The following specifies arbitration and reordering flow in MMDC towards the DDR.

- AXI read and write accesses are sampled in the associated queue.
- Read/write arbitration is handled to select the winning access.
- Winning access is sampled in the reordering queue
- Reordering mechanism is handled between valid requests that reside in the reordering queue to select the access that will be dispatched to the DDR.
  - The reordering is held in order to optimize the accesses and to maximize the utilization of the DDR bus
  - As soon as the reordered access is completed (indicated by end of response or data phase) then it is erased from the associated queue and the MMDC is ready to receive the next available access from the master

In general, the reordering/arbitration mechanism is based on dynamic priority mechanism, which compares dynamic priorities between valid entries in the reordering queue and issues the entry with highest dynamic priority towards the DDR Logic.

The selection of the winning access is based on two modes, which can be activated together, as following:

- Real time channel mode:

    - Accesses with QoS='f' (i.e. awqos[3:0]/arqos[3:0] = "f") will bypass all other requests towards the DDR
- Dynamic scoring mode:
    - The arbitration mechanism is based on dynamic priority. Relevant for the accesses with QoS smaller than 'f' or when real time channel mode is disabled.

NOTE

Due to re-ordering and optimization mechanism (per different AXI ID), the transactions towards the DDR may be driven in a different ID order they were received by the AXI master. In similar way, the write response, read response or read data may be driven to the AXI master in a different ID order.

44.5.1.2 Real time channel mode

When real time mode is enabled (i.e MAARCR[ARCR_RCH_EN] = "1") , all requests with QoS='f' (i.e. awqos[3:0]/aqqos[3:0] = "f") will bypass all other pending accesses towards the DDR. This mode is enabled by default.

44.5.1.3 Dynamic scoring mode (Arbitration Winning Conditions)

The arbitration between pending accesses in the MMDC is handled according to a dynamic priority of each access.

The dynamic priority (may be also called score) is calculated according to a sum of some factors (final_score[3:0]), where part of them may be updated dynamically. The following will specify each scoring factor:

- MAARCR[ARCR_PAG_HIT] (Page hit score) - A static score which is taken into account in case the pending access has a page hit
- MAARCR[ARCR_ACC_HIT] (Access hit score) - A static score, which is taken into account in case the current access type (read/write) is the same as the access that has been dispatched to the DDR previously
- MAARCR[ARCR_DYN_JMP] (Dynamic jump score) - A dynamic score which is given to any pending access in case it was not chosen in the arbitration. The dynamic jump counter is limited by maximum value which is set in MAARCR[ARCR_DYN_MAX] .
- QoS score which is indicated through a sideband 4bits AXI signals (awqos[3:0]/ aqqos[3:0]) and is driven by the AXI master per access

NOTE

In order to prevent an overflow in the total sum of scores, a clipping is held and selects the maximum score value of 'f' once a total scores sum is greater than 'f'.

The figure below shows the dynamic score calculations

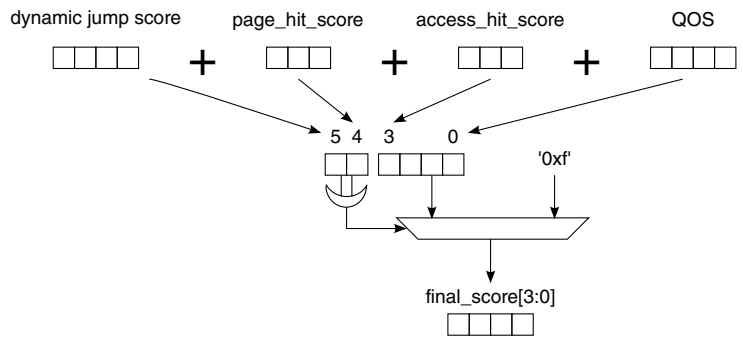

Figure 44-6. Dynamic score/priority calculation

44.5.1.4 Guarding (aging) mechanism

The guarding mechanism (may be also called aging) is used to prevent a starvation of accesses.

As soon as the dynamic jump score reaches its maximum value (MAARCR[ARCR_DYN_MAX]) then each time a pending request was not chosen in the arbitration, the "guarding" counter is incremented by 1. When the "guarding" counter reaches its predefined value, set in MAARCR[ARCR_GUARD], the associated request gets the highest priority and will be chosen in the next arbitration cycle towards the DDR unless a real time channel (i.e access with QoS ="f") is arrived.

Note: In case real time channel has arrived then the dynamic score of the non real time channels won't increment in order to prevent a case where the "guarding" counter of more than one access has reached its limit.

44.5.2 Prediction mechanism

When prediction mechanism is enabled (i.e by configuring MDMISC[MIF3_MODE]) then the MMDC predicts the chip-select, bank address and row address that is going to be issued towards the DDR before the access is physically dispatched towards DDR device.

That mechanism enables to prepare the DDR device with future accesses and improves the overall DDR performance.

This prediction mechanism operates in parallel to the reordering mechanism and may yield a prediction based on 3 levels of pending accesses:

1. Access in first stage of pipeline.
2. Valid access on AXI bus either read channel or write channel.
3. Valid access on special bus from arbitration - this access is chosen by the arbitration as the next miss access in its buffers

44.5.3 Special Optimization for accesses towards DDR3

In case an AXI read/write wrap non-aligned access is acknowledged in DDR3 mode with the same wrap boundary as the DDR wrap boundary then the MMDC will make an optimization and issue only one access towards the DDR, although all the accesses towards the DDR3 must be aligned.

For example: AXI write access with size of 128bits (awsize[2:0]=3'b100), length of 4 (awlen[3:0]=4'b0011) towards DDR3 x64 (burst length 8). In that case the AXI wrap boundary is 16Bx4=64B (0x40) and the DDR3 wrap boundary is 8Bx8=64B (0x40). If, for example, the AXI access is towards AXI address with suffix of 0x10 (non-aligned to 64B boundary) then the MMDC will get from the AXI master the data that is associated with addresses 0x10, 0x20, 0x30, 0x0. The MMDC will rearrange internally the data so it will match DDR3 alignment as following: 0x0, 0x10, 0x20, 0x30 and drive it in one access towards the DDR to address 0x0. The alternative was to issue two accesses towards the DDR with address 0x0 with different data masking

NOTE

In read wrap access the same optimization is handled, while as soon as the critical AXI word is fetched from the DDR then it is driven immediately to the AXI master without buffering. Based on the example above, the master expects to fetch first the data that is associated with address 0x10. Therefore the MMDC will issue read access from address 0x0 of the DDR and as soon as the data that is associated with address 0x10 is received then it will be driven back immediately to the master even before fetching the data of the furhter addresses.

44.6 MMDC Debug

44.6.1 Hardware debug monitor

The MMDC has a hardware debugging mechanism that monitors each access that is driven to the MMDC from channel 0. Every time this mechanism is enabled (setting of MADPCR0[DBG_EN] to "1") then each access that will be dispatched to the DDR will be also observed in the I/O pads (i.e. over ipp_do_ddr_debug[50:0]). The content of this bus is described in the table below.

Table 44-9. Hardware monitor debugging

Signal Name	Number of Bits	Description
acc_addr	[31:0]	AXI ADDRESS of the selected access
acc_type	1	access type of the selected access. "0 indicates write. "1" indicates read.
acc_id	[15:0]	AXI transaction ID of the selected access
valid_strobe	1	indication for a valid request. This signal will be asserted for 1 clock cycle

The fields above are organized as following:

MMDC_DEBUG[50:0] = {1'b0,valid_strobe,acc_id,access_type,addr}

These signals are sent to IOMUX, in IOMUX user can configure it to be output from the chip for debug usage.

44.6.2 Step By Step (SBS) software monitor

The MMDC has a Step By Step (SBS) software debugging mechanism that monitors each access that is driven to the MMDC. Every time this mechanism is trigerred then one AXI access will be dispatched to the DDR and in parallel its attributes will be observed in a status register.

Once the "step by step" is enabled (i.e. MADPCR0[SBS_EN] is "1") then all accesses to the DDR device will be halted. This SBS feature is used during DDR SDCLK frequency scaling to prevent any accesses to the DDR device during the transition. Setting MADPCR0[SBS] to "1" will dispatch the access that is pending in the head of the MMDC queue (read or write). Upon every setting of MADPCR0[SBS]:

- The AXI attributes of the access will be sampled in the associated MASBS0 and MASBS1 fields
- MADPCR0[SBS] will be cleared automatically.

Setting again MADPCR0[SBS] to "1" will dispatch the next pending access in the MMDC queue.

NOTE

Setting the ARCR_ARB_REO_DIS bit in the MMDC0_MAARCR Register disables the SBS function

44.7 MMDC Profiling

The profiling mechanism provides the ability to calculate the DDR utilization together with read and write accesses statistics towards DDR per given period of time.

MMDC supports the following profiling counters:

- MADPSR0 (Total cycles count) - Indicates the total amount of cycles of the profiling period (up to 2^32 cycles)
- MADPSR1 (Busy cycles count) - Indicates the total busy cycles during the profiling period. Busy cycles are any MMDC clock cycles where the internal state machine is not idle. If any read or write requests are pending in the FIFOs, the MMDC is not idle.
- MADPSR2 (Total read accesses count) - Indicates the total read accesses towards MMDC during the profiling period
- MADPSR3 (Total write accesses count) - Indicates the total write accesses towards MMDC during the profiling period
- MADPSR4 (Total read bytes count) - Indicates total bytes that were read from MMDC during the profiling period
- MADPSR5 (Total write bytes count) - Indicates total bytes that were written to MMDC during the profiling period

All profiling items described above are disabled by default. The following describes how to control the profiling mechanism:

- MADPCR0[DBG_EN] enables profiling.
- MADPCR0[PRF_FRZ] stops/freezes the profiling for example in case user wishes to perform DDR profiling per specific task. In order to resume profiling then MADPCR0[PRF_FRZ] should be cleared.
- MADPCR0[DBG_RST] clears all profiling counters
- MADPCR0[CYC_OVF] indicates whether an overflow occured in the total cycles counter (i.e. total amount of cycles are greater than 2^32) . This field can only cleared by writing '0'.

Read/Write statistics can be collected per specific AXI ID (16bits). The following fields in MADPCR1 register determines which AXI-ID or AXI-ID's to monitor:

- PRF_AXI_ID defines which AXI IDs are taken for profiling. Default values is 16'h0.
- PRF_AXI_ID_MASK defines which bits from PRF_AXI_ID will be compared with AXI ID of read/write access. "1" means to monitor the associated bit and "0" means don't care. Default value is 16'h0000, meaning all IDs are not monitored

So the AXI-IDs to be monitored are calculated according to the following equation:

(AXI-ID & PRF_AXI_ID_MASK) Xnor (PRF_AXI_ID & PRF_AXI_ID_MASK)

For example if AXI ID's between A100 till A1FF are wished to be monitored then the following should be configured:

- PRF_AXI_ID = A100
- PRF_AXI_ID_MASK = FF00

Table 44-10. i.MX 6Dual/6Quad AXI ID

44.8 LPDDR2 Refresh Rate Update and Timing Derating

LPDDR2 devices may have a temperature sensor that is used to determine an appropriate refresh rate and whether AC timing derating is required. The status of the temperature sensor can be read through MRR command from LPDDR2 MR4 register.

The MMDC supports refresh update and timing derating mechanism on the fly. The following steps specify how to use that mechanism:

- Perform periodic polling on MR4 LPDDR2 register using MRR command
- Read MDMRR register and analyze the MR4 indication
- In case refresh rate update and/or AC timing derating is required then it is needed to update MDREF and/or MDMR4[tRCD_DE, tRC_DE, tRAS_DE, tRP_DE, tRRD_DE] parameters

NOTE

MDMR4[tRCD_DE, tRC_DE, tRAS_DE, tRP_DE, tRRD_DE] are referred to the associated values configured at MDCFG3LP[tRC_LP, tRP_LP, tRCD_LP], MDCFG1[tRAS], MDCFG2[tRRD]

- Assert MDMR4[UPDATE_DE_REQ]
- When the MMDC switch to the new values then an acknowledge will be indicated at MDMR4[UPDATE_DE_ACK]

The enabled power saving features may be interfering with the MR4 reads. When these features are enabled the MMDC will automatically enter self-refresh and hence prevent the MR4 reads. Hence the Power Saving and refresh functionality should be disabled when SW performs the MR4 reads.

To disable the “Power Down” mode, set bit 0 of MAPSR (0x021B0404) to 1’b.
To disable the “Self-Refresh Power Down Timer” mode, set bits [15:8] of MDPDC (0x021B0004) to 0x00.

Overall Sequence to Perform MR4 reads

1. Set MAPSR to 0x00010107
2. Set MDPDC to 0x00020076
3. MRR command to read MR4

4. Write MDPDC to 0x00025576 to re-enable this feature
5. Write MAPSR to 0x00010106 to re-enable this feature

44.9 Changing MMDC SDCLK Frequency

Changing the MMDC SDCLK frequency when using either DDR3 or LPDDR2 can be done dynamically in software using the DVFS. Several important factors must be considered for each type of memory and whether transitioning between high and low frequency. The following sections highlight these factors and provide a step-by-step process when making frequency transitions on each type of memory.

44.9.1 Changing MMDC SDCLK Frequency Using DDR3/DDR3L Memories

This section provides the sequence of steps which should be followed to ensure a successful frequency transition when using DDR3/DDR3L memories.

NOTE

There are additional steps required to ensure that the ARM core and associated caches are in the correct state prior to any frequency transition or low power entry which are not detailed here. The user must assure that the ARM core or other bus masters are not accessing DDR during these transitions.

There are two general categories of frequency transitions – transitioning from high frequency to low frequency, and vice versa. High frequency is defined as all settable frequencies between 125 MHz and the maximum bus frequency, and low frequency is defined as all settable frequencies between 125 MHz and the low-power mode frequency of 24 MHz. Setting to a low frequency (below 125MHz) requires that the DDR3 device's delay line (DLL) be switched off, or be in DLL Off mode. Setting to a high frequency (above 125 MHz) requires that the DLL be switched on, or be in DLL On mode.

For further details refer to the DLL-off Mode chapter in the JEDEC standard.

A special consideration in changing the MMDC frequency on i.MX 6DualPlus/ 6QuadPlus is that all transitions are performed using the MMDC's Reorder Pass-through mode. Options for reordering and arbitration are selected by the ARCR_REO_DIS (bit 26) and ARCR_ARB_REO_DIS (bit 25) bits in the MMDC Core AXI Reordering

Control Register (MMDC0_MAARCR). Two modes have been added in MMDC to disable the reorder function. The following table shows the selection of settings for reordering based on these bits (bit[26:25]) of the MMDC0_MAARCR register.

Table 44-11. Arbitration and Reordering Control in MMDC0_MAARCR

Register Bits	Settings	Notes
ARCR_REO_DIS MMDC0_MAARCR[25]	0 - MMDC reordering controls enabled 1 - MMDC reordering controls disabled (bypassed)	**MMDC Reorder Pass-through mode**: reordering is disabled when this bit is set.
ARCR_ARB_REO_DIS MMDC0_MAARCR[26]	0 - MMDC arbitration and reordering controls enabled 1 - MMDC arbitration and reordering controls disabled (Recommended)	**Adopt_Bypass mode**: MMDC reorder and arbitration pipeline is totally bypassed when this bit is set.

When the ARCR_REO_DIS bit (MMDC0_MAARCR[25]) is set, the MMDC Reorder Pass-through mode is enabled. In this mode the DRAM access commands are still processed by the MMDC reorder and arbitration pipeline, but the commands are not reordered. When the ARCR_ARB_REO_DIS bit (MMDC0_MAARCR[26]) is set the MMDC reorder and arbitration pipeline is totally bypassed. In this Adopt_Bypass mode the DRAM access latency is reduced and performance is improved.

The MMDC Reorder Pass-through mode is used for all frequency transitions, and ARCR_REO_DIS is set prior to the transition. In addition, this mode is used after transition for all frequency settings except for the maximum setting which, for the i.MX 6DualPlus/6QuadPlus, is 528 MHz. For this frequency setting, both arbitration and reordering are bypassed in the Adopt_Bypass mode.

The below table shows the relationship between the ARCR_REO_DIS and ARCR_ARB_REO_DIS bits.

Table 44-12. ARCR_ARB_REO_DIS and ARCR_REO_DIS bits of the MMDC0_MAARCR Register

ARCR_ARB_REO_DIS	ARCR_REO_DIS	Function	Notes
0	0	Reset Value – Both arbitration and reordering enabled	This is default value out of reset
0	1	Reordering only disabled	Reorder Pass-through mode enabled
1	x	Both arbitration and reordering disabled	Adopt_Bypass mode enabled. ARCR_REO_DIS has no impact since all AXI transactions bypass the reordering logic.

The recommended setting of these two bits based on frequency transition is shown in the following table.

Table 44-13. Required ARCR_ARB_REO_DIS and ARCR_REO_DIS Settings before and after Frequency Transitions

Transition	Before Transition MMDC0_MAARCR [26:25][1]	After Transition MMDC0_MAARCR [26:25]	Comments
Initialized to 528 MHz at system boot	-	10[2]	Set to Adopt_Bypass mode after transition to 528 MHz during system boot
to other than 528MHz (including 24MHz)	01	01	Set to Reorder pass-through mode after transition
to 528MHz	01	10	Set to Adopt_Bypass mode after transition

1. Set to Reorder pass-through mode before frequency transition.
2. Set during MMDC Initialization at boot up for optimal performance.

In addition to setting the ARCR_REO_DIS bit prior to the MMDC frequency transition, the Step-by-Step (SBS) monitor (see section 46.6.2) is also enabled to block DDR accesses during the frequency transition. Setting the ARCR_ARB_REO_DIS bit disables the SBS function, therefore the Adopt_Bypass mode is used during transitions to allow the SBS logic to be enabled. The SBS function is only used during actual frequency transitions. Once frequency has switched the SBS is disabled to unblock DDR accesses.

NOTE

For DDR3 there is no need to perform any configuration of the MMDC1 registers for channel 1.

For further information please refer to EB828: MMDC and NoC Configuration for Optimal DDR3 Performance on the i.MX 6DualPlus/6QuadPlus available on NXP.com.

44.9.1.1 High Frequency to Low Frequency Transition (DLL On to DLL Off)

When switching from high frequency, including the maximum frequency, to low frequency the following steps should be executed.

NOTE

Unless specified otherwise, all registers cited in the switching procedures in this section and the following sections are in the MMDC0 bank.

1. Disable power-down timers that can conflict with this sequence, such as: MAPSR[PSD], MDPDC[PWDT_1], MDPDC[PWDT_0], MDPDC[PRCT_0], MDPDC[PRCT_1].
2. Assert the MDSCR[CON_REQ] and wait for the MDSCR[CON_ACK] assertion.
3. Execute PRECHARGE ALL banks command (MDSCR[CMD] = 3b'101).
4. Execute MRW command to MR1 and disable RTT_Nom (A9, A6, A2 = 0) and DLL ON (A0 = 1, disabling the DLL)
5. Disable reordering (MAARCR[26:25] = 2b'01).
6. Execute MRW command to MR2 in order to update CWL to 6.
7. Execute MRW command to MR0 in order to update CL to 6.
8. Enter self-refresh mode. (See Self-refresh and Frequency change entry/exit.)
9. De-assert MDSCR[CON_REQ] signal.
10. Wait for self-refresh entry acknowledge (MAPSR[LPACK] = 1).
11. Bypass the Measurement Unit (set MPMUR0[MU_BYP_EN]) and follow steps outlined in ERR005778.
12. Perform a force measure by setting MPMUR0[FRC_MSR]. Wait for force measurement acknowledge MPMUR0[FRC_MSR] =0.
13. Change to low frequency. (See Self-refresh and Frequency change entry/exit.)
14. Enable Step-by-Step Mode (MADPCR0[SBS_EN] = 1).
15. Keep reordering disabled (MAARCR[26:25] = 2b'01)
16. Exit self-refresh mode.
17. Assert MDSCR[CON_REQ] and wait for MDSCR[CON_ACK] assertion.
18. Update tCWL =6 and tCL =6 to meet the values configured in the DDR device. (MDCGFG0, MDCFG1)
19. Set read latency (MDMISC[RALAT] = 2).
20. Enable pull-down resistors on DQS (through the I/O-MUX).
21. Disable ODT resistor (MPODTCTRL = 0).
22. Disable DQS gating (MPDGCTRL0[DG_DIS] = 1).
23. Disable Step-by_Step Mode (MADPCR0[SBS_EN] = 0).
24. De-assert MDSCR[CON_REQ].
25. Enable required power-down timers that were disabled, such as: MAPSR[PSD], MDPDC[PWDT_1] , MDPDC[PWDT_0], MDPDC[PRCT_0], MDPDC[PRCT_1].

44.9.1.2 Low Frequency to High Frequency Transition (DLL Off to DLL On)

When switching from low frequency, including 24MHz low power mode, to high frequency the following steps should be executed.

1. Disable power-down timers that can conflict with this sequence, such as: MAPSR[PSD], MDPDC[PWDT_1], MDPDC[PWDT_0], MDPDC[PRCT_0], MDPDC[PRCT_1].
2. Assert MDSCR[CON_REQ] and wait for MDSCR[CON_ACK] assertion.
3. Execute PRECHARGE ALL banks command (MDSCR[CMD] = 3b'101).
4. Enter self-refresh mode. (See Self-refresh and Frequency change entry/exit.)
5. De-assert MDSCR[CON_REQ].
6. Wait for self-refresh entry acknowledge (MMDCx_MAPSR[LPACK] = 1).
7. Disable reordering (MAARCR[26:25] = 2b'01).
8. Change to high frequency. (See Self-refresh and Frequency change entry/exit.)
9. Enable Step-by-Step Mode (MADPCR0[SBS_EN] = 1).
10. Exit self-refresh mode.
11. Optionally, force ZQ automatic calibration process by setting MPZQHWCTRL[ZQ_HW_FOR] = 1 and setting MPZQHWCTRL[ZQ_MODE] = 2b'11.)
12. Enable DQS gating (MPDGCTRL0[DG_DIS] = 0)
13. Restore ODT setting in MPODTCTRL to original value.
14. Enable Measurement Unit by clearing MPMUR0[MU_BYP_EN]) per ERR005778.
15. Perform a force measure by setting MPMUR0[FRC_MSR]. Wait for force measurement acknowledge MPMUR0[FRC_MSR] = 0.
16. Disable pull-down resistors on DQS (through the I/O-MUX).
17. Restore read latency (MISC[RALAT]) to original value.
18. Restore calibration registers of MMDC BLOCK (if they were changed).
19. Assert MDSCR[CON_REQ] and wait for MDSCR[CON_ACK] assertion.
20. Execute MRW command to MR1 and enable RTT Nom (A9, A6, A2) and DLL ON (A0 = 0).
21. Execute MRW command to MR0 to reset the DLL (A8) and revert to CL values prior to entry.
22. Execute MRW command to MR2 to update CWL value.
23. Update tCWL and tCL to meet the values configured in the memory. (MDCGFG0, MDCFG1)
24. Execute a ZQ command to the DDR3 device (MDSCR[CMD] = 3b'100).
25. Disable Step-by_Step Mode (MADPCR0[SBS_EN] = 0 .
26. Transition to Adopt_ByPass mode to disable both arbitration and reordering (MAARCR[26:25] = 2b'10) if transitioning to highest frequency; otherwise switch to Reorder Pass-through mode to disable only reordering (MAARCR[26:25] = 2b'01).
27. De-assert MDSCR[CON_REQ].
28. Enable required power-down timers that were disabled, such as: MAPSR[PSD], MDPDC[PWDT_1], MDPDC[PWDT_0], MDPDC[PRCT_0], MDPDC[PRCT_1].

44.9.2 Changing MMDC Frequency Using LPDDR2

This section provides the sequence of steps which should be followed to ensure a successful frequency transition when using LPDDR2 memories.

NOTE

In the procedure sequence provided in the following sections, the user should take caution in adjusting the parameters MMDC MDCFG0[tCL] and MDCFG1[tCWL] to ensure that these parameters match the RL/WL parameter of the LPDDR2 memory devices mode register 2 (MR2). If the MDDC parameters do not match those programmed in the LPDDR2 memory device, the memory interface will become unstable.

44.9.2.1 High Frequency to Low Frequency Transition

When switching from high frequency, including the maximum frequency, to low frequency the following steps should be executed.

1. Disable power-down timers that can conflict with this sequence, such as: MAPSR[PSD], MDPDC[PWDT_1], MDPDC[PWDT_0], MDPDC[PRCT_0], MDPDC[PRCT_1].
2. Enter self-refresh mode. (See Self-refresh and Frequency change entry/exit.)
3. Wait for self-refresh entry acknowledge (MMDCx_MAPSR[LPACK] = 1).
4. Disable reordering (MAARCR[26:25] = 2b’01).
5. Enable Step-by-Step Mode (MADPCR0[SBS_EN] = 1).
6. Set read latency (MDMISC[RALAT] = 2).
7. Adjust LPDDR2 timings for low frequency operation: set MDCFG0, MDCFG1, MDCFG2, MDCFG33LP.
8. Read and store the measure count value MU_VAL=MPMUR0[MU_BYP_VAL].
9. Bypass the Measurement Unit by setting MPMUR0[MU_BYP_EN] and follow steps outlined in ERR005778.
10. Double the measure count value for the reduced frequency operation MPMUR0[MU_BYP_VAL] = 2*MU_VAL.
11. Perform a force measurement by setting MPMUR0[FRC_MSR] =1. Wait for force measurement acknowledge MPMUR0[FRC_MSR] =0.
12. Change to low frequency (See 27.4.2. DVFS Change Request Sequence Diagrams)
13. Exit self-refresh mode.
14. Enable required power down timers that were disabled, such as: MAPSR[PSD], MDPDC[PWDT_1], MDPDC[PWDT_0], MDPDC[PRCT_0], MDPDC[PRCT_1].
15. Disable Step-by-Step Mode (MADPCR0[SBS_EN] = 0).

16. Keep reordering disabled (MAARCR[26:25] = 2b’01); at max frequency disable both arbitration and reordering (MAARCR[26:25] = 2b’10).

44.9.2.2 Low Frequency to High Frequency Transition

When switching from low frequency to high frequency the following steps should be executed.

1. Disable power-down timers that can conflict with this sequence, such as: MAPSR[PSD], MDPDC[PWDT_1], MDPDC[PWDT_0], MDPDC[PRCT_0], MDPDC[PRCT_1].
2. Enter self-refresh mode. (See Self-refresh and Frequency change entry/exit.)
3. Wait for self-refresh entry acknowledge (MMDCx_MAPSR[LPACK] = 1).
4. Disable reordering (MAARCR[26:25] = 2b’01).
5. Enable SBS (MADPCR0[SBS_EN] = 1).
6. Change to high frequency.
7. Restore read latency (MISC[RALAT]) to original value.
8. Restore LPDDR2 timings for high frequency operation: set MDCFG0, MDCFG1, MDCFG2, MDCFG33LP.
9. Enable Measurement Unit by clearing MPMUR0[MU_BYP_EN]) per ERR005778.
10. Restore original MPMUR0[MU_BYP_VAL] =MU_VAL.
11. Perform a force measurement MPMUR0[FRC_MSR] =1. Wait for force measurement acknowledge MPMUR0[FRC_MSR] =0
12. Exit self-refresh mode.
13. Enable required power down timers that were disabled, such as: MAPSR[PSD], MDPDC[PWDT_1], MDPDC[PWDT_0], MDPDC[PRCT_0], MDPDC[PRCT_1].
14. Disable SBS (MADPCR0[SBS_EN] = 0).
15. Transition to Adopt_ByPass mode to disable both arbitration and reordering (MAARCR[26:25] = 2b’10) if transitioning to highest frequency; otherwise switch to Reorder Pass-through mode to disable only reordering (MAARCR[26:25] = 2b’01).

44.10 ODT Configuration

The MMDC supports two DRAM_ODT signals (DRAM_ODT for each DRAM_CS) in DDR3 mode to allow the DDR device to turn on/off its termination resistors. The MMDC suggests various configurations for the assertion of the ODT signals as well as several timing related configurations.

The following specifies the options for configuring the assertion of DRAM_ODT signals:

- Assert DRAM_ODT signal for the non active DRAM_CS in write. For example : when this bit asserted - if writing to DRAM_CS0 the DRAM_ODT of DRAM_CS1 will be asserted. This is done by setting MPODTCTRL[0] to "1"
- Assert DRAM_ODT signal for the active DRAM_CS in write by by setting MPODTCTRL[1] to "1"
- Assert DRAM_ODT signal for the non active DRAM_CS in read by by setting MPODTCTRL[2] to "1"
- Assert DRAM_ODT signal for the active DRAM_CS in read by by setting MPODTCTRL[3] to "1"

MDOTC register controls the timing for the DRAM_ODT signals assertion.

NOTE

tODTLon determines the delay between DRAM_ODT signal and the associated RTT, where according to JEDEC standard it equals WL(write latency) - 2. Therefore, the value configured to MDOTC[tODTLon] field should correspond with the value configured to MDCGFG1[tCWL].

In precharge power down mode, when all banks are closed, the assertion of ODT corresponds with tAOFPD and tAONPD which are configured in MDOTC register.

The figure below shows timing diagram of DRAM_ODT and RTT signals while MPODTCTRL[0] is set to "1" (i.e. assertion of DRAM_ODT to the non active DRAM_CS in write access command) and MDOTC[tODTLon] is set to 4.

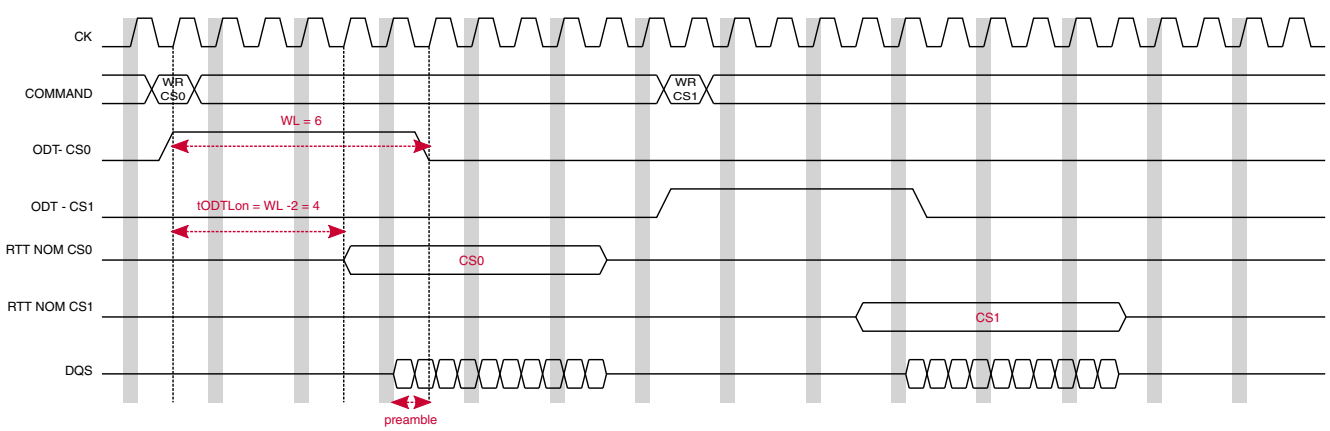

Figure 44-7. ODT - Timing Diagram DDR3 WL=6, BL=8

44.11 Calibration Process

The MMDC offers various calibration processes that are used to obtain better timing accuracy, board skew compensation and I/O pad driving strength adjustment. Each calibration process can be performed either automatically (hardware) or manually (software), though the manual method is typically reserved for debugging purposes. The following calibration processes are supported:

NOTE

Power saving features should be disabled before the calibration process begin. (Such as: MDPDC[PWDTn], MDPDC[PRCTn], MAPSR[PSD])

- ZQ calibration for external DDR device (in DDR3 through ZQ calibration command and in LPDDR2/LPDDR3 through MRW command)
  - Can be handled automatically for ZQ Short (periodically) and ZQ Long (at exit from self-refresh)
  - Can be handled manually at ZQ INIT
- ZQ calibration for i.MX DDR I/O pads for calibrating the DDR driving strength
  - The sequence can be handled automatically by hardware
  - The sequence can be handled step by step manually by software
- Read DQS gating calibration for DDR3 only. Adjustment of DQS gate with read preamble window. For further information refer to Read DQS Gating Calibration
- Read DQS gating calibration not supported for LPDDR2/LPDDR3
- Read data calibration. Adjustment of read DQS with read data byte. For further information refer to Read Calibration
- Write data calibration. Adjustment of write DQS with write data byte. For further information refer to Write Calibration
- Write leveling calibration. Adjustment of write DQS with CK (DDR differential clock). For further information refer to Write leveling Calibration
- Read fine tuning. Adjustment of up to 7 delay-line units for each read data bit.
- Write fine tuning. Adjustment of up to 3 delay-line units for each read data bit.

NOTE

Before starting any calibration process that involves the DDR3 device MPR mode or write leveling calibration, the following should be done:

- Disable the periodic refresh scheme (i.e. setting MDREF[REF_SEL] = "11") and then issue manual refresh command burst by configuring MDSCR[CMD]= 0x2. At the end of the calibration it is needed to enable the periodic refresh scheme.
- Disable the automatic power saving mode (i.e set MAPSR[PSD] = "1").

44.11.1 Delay-line

Each of the calibration processes controls several delay-lines for aligning data and strobes.

By default the delay-line is configured to generate 1/4 clock cycle of delay.

Moreover, when the operating clock is at the maximum allowed frequency, as appeared in the features list, then the delay-line is capable to issue a configurable delay of up to 1/2 clock cycle.

NOTE

At the beginning of the calibration process the initial value of the delay-line must be a valid value (i.e. the strobes must be somewhere among the associated data window) though it might not be the optimal value. The delay-line calibration should be done after Read DQS gating and write-leveling calibrations.

In order to generate an adequate delay during normal operation of the MMDC the delay-line is going through an automatic measurement process during the refresh period of the DDR device

44.11.2 ZQ calibration

The MMDC supports ZQ calibration process to calibrate the driving strength of the DDR I/O pads as well as driving ZQ commands to calibrate the external DDR device driving strength.

The first ZQ calibration (after booting the processor) is performed prior to turning on the MMDC. Subsequent ZQ calibrations may be executed in parallel to the DDR ZQ calibration. The MMDC supports 2 types of ZQ calibration commands: short and long.

The ZQ long calibration is executed during power up sequence, when exiting self-refresh mode or when exiting slow precharge power down (DLL lock can be done in parallel). The ZQ short calibration is executed periodically according to a configurable timer defined by MPZQHWCTRL[ZQ_HW_PER].

The field MPZQHWCTRL[ZQ_MODE] determines whether the MMDC will execute ZQ calibration to DDR I/O pads and/or issue ZQ short/long command to the DDR device.

The MMDC supports both automatic (hardware) and manual (software) ZQ calibration process for the DDR I/O pads.

It is possible to perform automatic (hardware) ZQ calibration only once (i.e. non-periodical) by asserting MPZQHWCTRL[ZQ_HW_FOR].

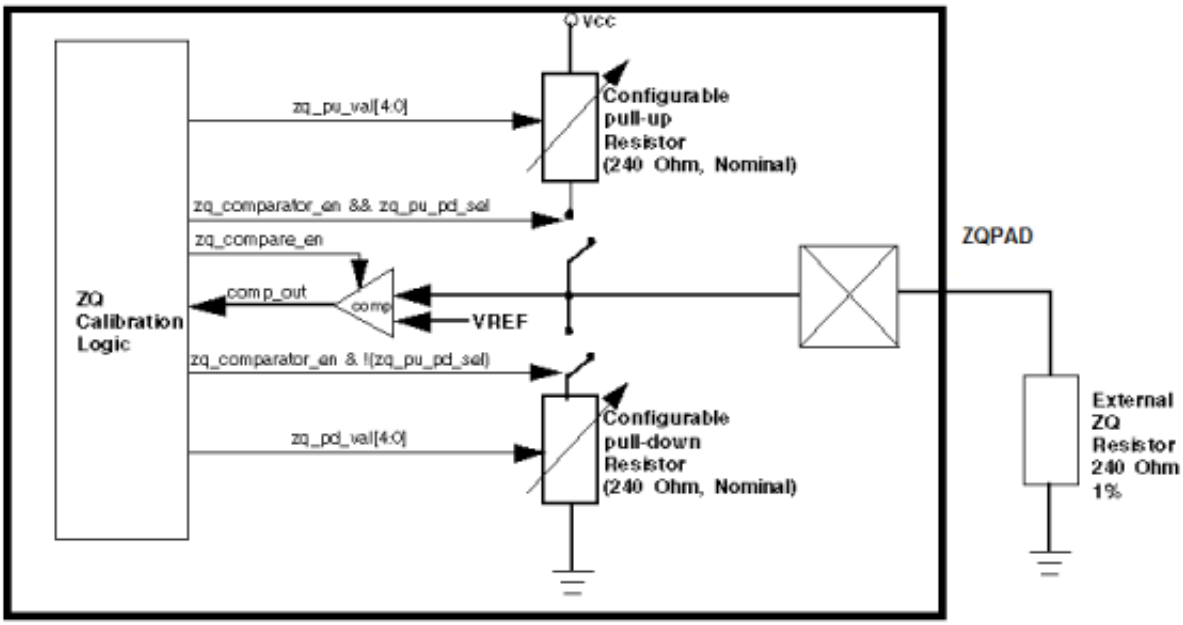

Figure 44-8. MMDC ZQ IF with PAD

44.11.2.1 ZQ automatic (hardware) calibration process

The ZQ automatic calibration occurs over multiple steps isolated by pull-up resistor calibration and by pull-down resistor calibration as follows.

44.11.2.1.1 ZQ automatic Pull-up calibration

The MMDC automatically performs a handshaking mechanism with the ZQ calibration pad as follows:

1. The MMDC drives zq_comparator_en to "1"
2. The MMDC waits few cycles according to MPZQHWCTRL[ZQ_EARLY_COMPARATOR_EN_TIMER]
3. The MMDC drives zq_pu_pd_sel to "1" for indication of pull-up calibration and drives zq_pu_val[4:0] = 5'b00000
4. MMDC drives zq_pu_val[4] to "1"
5. MMDC asserts zq_compare_en

6. MMDC waits few cycles according to MPZQSWCTRL[ZQ_CMP_OUT_SMP] before sampling the comparator output (i.e zq_comp_out). If zq_comp_out is "1" then it means that the output voltage is greater than Vdd/2 (i.e. internal resistor is less than 240 ohm) and drives bit zq_pu_val[4] to "1" else it drives zq_pu_val[4] to "0"
7. MMDC deasserts zq_compare_en
8. MMDC repeats steps 4-7 for zq_pu_val bits 3 to 0
9. MMDC drives ZQ calibration result to MPZQHWCTRL[ZQ_HW_PU_RES]
10. MMDC advances to pull-down calibration

44.11.2.1.2 ZQ automatic Pull-down calibration

1. The MMDC drives zq_pu_pd_sel to "0" for indication of pull-down calibration and drives zq_pd_val[4:0] = 5'b00000
2. MMDC drives zq_pd_val[4] to "1"
3. MMDC asserts zq_compare_en
4. MMDC waits few cycles according to MPZQSWCTRL[ZQ_CMP_OUT_SMP] before sampling the comparator output (i.e zq_comp_out). If zq_comp_out is "1" then it means that the output voltage is greater than Vdd/2 (i.e. internal resistor is less than 240 ohm) and drives bit zq_pd_val[4] to "0" else it drives zq_pd_val[4] to "1"
5. MMDC deasserts zq_compare_en
6. MMDC repeats steps 2-5 for zq_pd_val bits 3 to 0
7. MMDC drives ZQ calibration result to MPZQHWCTRL[ZQ_HW_PD_RES]
8. MMDC deassert zq_comparator_en to indicate the completion of the ZQ calibration

44.11.2.2 ZQ software calibration process

The ZQ calibration can be done also in software. However since software ZQ calibration is much slower than hardware calibration it should be used mainly for debugging.

Software should configure the ZQ calibration parameters (Pull-up or Pull-down and their value) then assert the MPZQSWCTRL[ZQ_SW_FOR] bit. Then software should wait till ZQ_SW_FOR is de-asserted and use ZQ_SW_RES status bit in order to calculate the next ZQ calibration parameters.

44.11.2.3 ZQ calibration commands

Before the MMDC can issue a ZQCL/ZQCS command to the memory it should precharge all memory banks and wait tRP period. A single ZQ command can be issued to all devices as long as the devices don't share the same ZQ resistor.

When the MMDC issues the ZQ command it should also drive A10 (long or short command) and CS (0, 1 or both).

The MMDC must keep the memory lines quiet (except for CK) for the ZQ calibration time as defined in the Jedec (512 cycles for ZQCL after reset, 256 for other ZQCL and 64 for ZQCS).

44.11.3 Read DQS Gating Calibration

The read DQS gating calibration is used to adjust the read DQS gating with the middle of the read DQS preamble. The DQS gating includes a delay of up to 7 cycles (The delay is chosen according to two fields MPDGCTRLn[DG_HC_DELn] and MPDGCTRLn[DG_DL_ABS_OFFSETn]

Each DQS has its own delay-line. The DQS gating process can be done for all DQS in parallel.

NOTE

In LPDDR2/LPDDR3 mode hardware Read DQS gating should be disabled and Pull-up/pull-down resistors on DQS/DQSn should be enabled while ODT resistors must be disconnected.

NOTE

In DDR3_x64 mode activation of the calibration is done by setting MPDGCTRL0[HW_DG_EN]

44.11.3.1 Hardware DQS Gating Calibration

- There are two modes of operations:
  - Calibration with the MPR (Multi Purpose Register)
  - Calibration with MMDC pre-defined values

44.11.3.1.1 Hardware DQS Calibration with MPR

The following steps should be executed:

1. Precharge all active banks (Can be done through MDSCR) as requried by the standard.
2. Enter the DDR device into MPR mode through MRS commands
3. Configure the MMDC to work with MPR mode by asserting MPPDCMPR2[MPR_CMP]

4. Make sure that the initial value that is configured in the read delay line absolute offset of each byte (i.e. MPRDDLCTL[RD_DL_ABS_OFFSETn]) will place the read DQS somewhere inside the read DQ window
5. Start the calibration process by asserting MPDGCTRL0[HW_DG_EN]

44.11.3.1.2 Hardware DQS Calibration with pre-defined value

In case pre-defined mode is used, (i.e. MPPDCMPR2[MPR_CMP]) is cleared, then the following steps should be executed:

1. Precharge all active banks (Can be done through MDSCR) as required by the standard.
2. Configure the pre-defined value, which reflects the value that will be written and compared through the read calibration, to MPPDCMPR1[PDV1, PDV2]
3. Issue write access to the external DDR device by setting MPSWDAR0[SW_DUMMY_WR] = 1 (MMDC will generate internally write access without intervention of the system towards bank 0, row 0, column 0)
4. Make sure that the initial value that is configured in the read delay line absolute offset of each byte (i.e. MPRDDLCTL[RD_DL_ABS_OFFSETn]) will place the read DQS somewhere inside the read DQ window
5. Start the calibration process by asserting MPDGCTRL0[HW_DG_EN]

   The following steps will be executed automatically by the MMDC for both modes (MPR and Pre-defined value):

6. MMDC waits till the read DQS delay-line is updated with the absolute delay value for all bytes at MPDGCTRLn[DG_HC_DELn] and MPDGCTRLn[DG_DL_ABS_OFFSETn] and also satisfying the Tmod + 4 requirement
7. MMDC drives read command to the external DDR devices and waits 16 or 32 cycles (according to MPDGCTRL0[DG_CMP_CYC] assuming that the data has arrived from the DDR device.
8. MMDC compares the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it indicates that the read DQS gating is asserted in illegal time point. If the comparison passes then MMDC advances to step 14
9. MMDC resets the read FIFO (to the inverted pre-defined/MPR value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
10. MMDC increments the read DQS gating delay of each byte by half cycle (i.e. MPDGCTRLn[DG_HC_DELn] + 1)
11. MMDC drives read command to the external DDR devices and waits 16 or 32 cycles (according to MPDGCTRL0[DG_CMP_CYC] assuming that the data has arrived from the DDR device.

12. MMDC compares the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8).
13. If the comparison fails then it indicates that the read DQS gating is asserted in illegal time point and it is needed to repeat steps 9-12. If the comparison passes then MMDC stores the value of the temporary low boundary and advances to next step
14. MMDC increments the read DQS gating delay-line of each byte by half cycle (i.e. MPDGCTRLn[DG_HC_DELn] + 1) and issue measurement process of the read DQS gating delay-line to update itself with the new value
15. MMDC drives read command to the external DDR devices and waits 16 or 32 cycles (according to MPDGCTRL0[DG_CMP_CYC] assuming that the data has arrived from the DDR device.
16. MMDC compares the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8)
17. If the comparison passes then it indicates that the read DQS gating is asserted inside the read preamble window and it is needed to repeat steps 14-16. If the comparison fails then MMDC stores the value of the temporary upper boundary and starts searching the adequate low and high boundaries
18. MMDC returns to the temporary low boundary minus half cycle and issue measurement process of the read DQS gating delay-line to update itself with the new value
19. MMDC drives read command to the external DDR devices and waits 16 or 32 cycles (according to MPDGCTRL0[DG_CMP_CYC] assuming that the data has arrived from the DDR device.
20. MMDC compares the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8)
21. If the comparison fails then it indicates that the read DQS gating is asserted in illegal time point and it is needed to repeat steps 22-23. If the comparison passes then MMDC stores the value of the adequate low boundary and advances to step 24
22. MMDC resets the read FIFO (to the inverted pre-defined/MPR value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
23. MMDC increments the read DQS gating delay of each byte by 1 (i.e. MPDGCTRLn[DG_DL_ABS_OFFSETn] + 1) and issue measurement process of the read DQS gating delay-line to update itself with the new value and advances to step 19
24. MMDC returns to the temporary upper boundary minus half cycle and issue measurement process of the read DQS gating delay-line to update itself with the new value
25. MMDC drives read command to the external DDR devices and waits 16 or 32 cycles (according to MPDGCTRL0[DG_CMP_CYC] assuming that the data has arrived from the DDR device.

26. MMDC compares the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8)
27. If the comparison passes then it indicates that the read DQS gating is asserted inside the read preamble window and it is needed to repeat steps 28-29. If the comparison fails then MMDC stores the value minus 1 of the adequate upper boundary and advances to step 30
28. MMDC resets the read FIFO (to the inverted pre-defined/MPR value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
29. MMDC increments the read DQS gating delay of each byte by 1 (i.e. MPDGCTRLn[DG_DL_ABS_OFFSETn] + 1) and issue measurement process of the read DQS gating delay-line to update itself with the new value and advances to step 25
30. After the MMDC finds the window boundary (lower and upper) of each read data byte then it stores the average between lower and upper boundaries at the associated MPDGCTRLn[DG_DL_ABS_OFFSETn] and issue measurement process of the read DQS delay-line to update itself with the new value.
31. MMDC indicates that the read DQS gating calibration had finished by setting MPDGCTRL0[HW_DG_EN] = 0
32. Exit the DDR device from MPR mode through MRS command
33. Read the upper boundary that was found: MPDGHWSTn[HW_DG_UPn]. This field is 11 bits, 7 LSB bits correspond to MPDGCTRLn[DG_DL_ABS_OFFSETn] upper limit value and 4 MSB bits correspond to MPDGCTRLn[DG_HC_DELn] upper limit value.
34. Set MPDGHWSTn[HW_DG_UPn][6:0] to MPDGCTRLn[DG_DL_ABS_OFFSETn].
35. Set (MPDGHWSTn[HW_DG_UPn][10:7] - 1) to MPDGCTRLn[DG_HC_DELn]. (We set the DQS gating value to be the upper limit value minus 1 half cycle)

44.11.3.2 SW read DQS gating Calibration

There are two modes of operations:

- Calibration with the MPR (Multi Purpose Register)
- Calibration with MMDC pre-defined values

44.11.3.2.1 SW read Calibration with MPR

Execute the following steps:

1. Precharge all active banks (Can be done through MDSCR) as required.
2. Enter the DDR device into MPR mode through MRS commands
3. Configure the MMDC to work with MPR mode by asserting MPPDCMPR2[MPR_CMP]

4. Ensure that the initial value that is configured in the read delay line absolute offset of each byte (i.e. MPRDDLCTL[RD_DL_ABS_OFFSET#]) will place the read DQS somewhere inside the read DQ window

44.11.3.2.2 SW read Calibration with pre-defined value

In case pre-defined mode is used, (i.e. MPPDCMPR2[MPR_CMP]) is cleared, then the following steps should be executed:

1. Precharge all active banks (Can be done through MDSCR) as required by the standard.
2. Configure the pre-defined value, which reflects the value that will be written and compared through the read calibration, to MPPDCMPR1[PDV1, PDV2]
3. Issue write access (with any legal DDR address) to external DDR device
4. Ensure that the initial value that is configured in the read delay line absolute offset of each byte (i.e. MPRDDLCTL[RD_DL_ABS_OFFSETn]) will place the read DQS somewhere inside the read DQ window

The following steps should be executed automatically by the MMDC for both modes (MPR and Pre-defined value):

1. Configure the read DQS delay-line to issue zero delay by setting MPDGCTRLn[DG_DL_ABS_OFFSETn] = 0 and MPDGCTRLn[DG_HC_DELn] = 0
2. Force the delay line to measure itself and to issue the requested read delay by configuring MPMUR[FRC_MSR] = 1
3. Wait 16 DDR cycles till the read DQS delay-line is updated with the absolute delay value for all bytes
4. Issue read command (with the legal DDR address chosen in step 3) from the external DDR device
5. Waits 16 or 32 cycles (according to MPDGCTRL0[DG_CMP_CYC]) assuming that the data has arrived from the DDR device.
6. Compare the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it indicates that the read DQS gating is asserted in illegal time point. If the comparison passes then advance to step 11.
7. MMDC resets the read FIFO (to the inverted pre-defined/MPR value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
8. Increment the read DQS gating delay of each byte by half cycle (i.e. MPDGCTRLn[DG_HC_DELn] + 1)
9. MMDC drives read command to the external DDR devices and waits 16 or 32 cycles (according to MPDGCTRL0[DG_CMP_CYC]) assuming that the data has arrived from the DDR device.

10. Compare the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it indicates that the read DQS gating is asserted in illegal time point and it is needed to repeat steps 7-10. If the comparison passes then advance to step 11.
11. Store the temporary lower boundary and start searching the temporary upper boundary
12. MMDC resets the read FIFO (to the inverted pre-defined/MPR value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
13. Increment the read DQS gating delay of each byte by half cycle (i.e. MPDGCTRLn[DG_HC_DELn] + 1)
14. MMDC drives read command to the external DDR devices and waits 16 or 32 cycles (according to MPDGCTRL0[DG_CMP_CYC] assuming that the data has arrived from the DDR device.
15. Compare the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8).
16. If the comparison passes then it indicates that the read DQS gating is asserted inside the read preamble window and it is needed to repeat steps 12-15. If the comparison fails then it is needed to store the value of the temporary upper boundary and starts searching the adequate low and high boundaries
17. Load the temporary low boundary minus half cycle into the associated MPDGCTRLn[DG_HC_DELn]
18. Reset the read FIFO (to the inverted pre-defined/MPR value) and its pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
19. Increment the read DQS gating delay of each byte by 1 (i.e. MPDGCTRLn[DG_DL_ABS_OFFSETn] + 1) and force the delay line to measure itself and to issue the requested read DQS delay by configuring MPMUR0[FRC_MSR] = 1
20. Issue read command to the external DDR devices and waits 16 or 32 cycles (according to MPDGCTRL0[DG_CMP_CYC]) assuming that the data has arrived from the DDR device.
21. Compare the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8)
22. If the comparison fails then it indicates that the read DQS gating is asserted in illegal time point and it is needed to repeat steps 18-22. If the comparisons passes then advance to the next step.
23. Store the adequate lower boundary
24. Load the temporary upper boundary minus half cycle into the associated MPDGCTRLn[DG_HC_DELn]
25. Reset the read FIFO (to the inverted pre-defined/MPR value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1

26. Increment the read DQS gating delay of each byte by 1 (i.e. MPDGCTRLn[DG_DL_ABS_OFFSETn] + 1) and force the delay line to measure itself and to issue the requested read DQS delay by configuring MPMUR[FRC_MSR] = 1
27. Issue read command to the external DDR devices and waits 16 or 32 cycles (according to MPDGCTRL0[DG_CMP_CYC] assuming that the data has arrived from the DDR device.
28. Compare the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8)
29. If the comparison passes then it is needed to repeat steps 25-28. If the comparisons fails then advance to the next step.
30. Reset the read FIFO (to the inverted pre-defined/MPR value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
31. Store the adequate upper boundary.
32. Keep the MPDGCTRLn[DG_DL_ABS_OFFSETn] value of the upper limit.
33. Set MPDGCTRLn[DG_HC_DELn] = (MPDGCTRLn[DG_HC_DELn] - 1). (We set the DQS gating value to be the upper limit value minus 1 half cycle)
34. Issue the requested read DQS delay by configuring MPMUR[FRC_MSR] = 1
35. Exit the DDR device from MPR mode through MRS command

44.11.4 Read Calibration

The read calibration is used to adjust the read DQS with read data byte. It is assumed that the read DQS gating calibration process is completed prior to the read calibration.

NOTE

In DDR3 mode, the activation of the calibration is done by setting MPRDDLHWCTL[HW_RD_DL_EN].

NOTE

In LP2_x16, LP2_x32 the activation of the calibration of each channel is done by setting MPRDDLHWCTL[HW_RD_DL_EN] and MPRDDLHWCTL[HW_RD_DL_EN].

44.11.4.1 Hardware (automatic) Read Calibration

There are two modes of operations:

- Calibration with the MPR (Multi Purpose Register)/DQ calibration(LPDDR2)
- Calibration with MMDC pre-defined values

44.11.4.1.1 Hardware (automatic) Calibration with MPR/DQ Calibration

Execute the following steps:

1. Precharge all active banks (can be done through MDSCR) as required.
2. Enter the DDR device into MPR/DQ calibration mode through MRS/MRW commands.
3. Configure the MMDC to work with MPR/DQ calibration mode by asserting MPPDCMPR2[MPR_CMP].
4. Make sure that the initial value that is configured in the read delay line absolute offset of each byte (MPRDDLCTL[RD_DL_ABS_OFFSET#]) will place the read DQS somewhere inside the read DQ window.
5. Start the calibration process by asserting MPRDDLHWCTL[HW_RD_DL_EN].

44.11.4.1.2 Hardware (automatic) Calibration with pre-defined value

In case pre-defined mode is used, i.e. MPPDCMPR2[MPR_CMP] is cleared, then the following steps should be executed:

1. Precharge all active banks (Can be done through MDSCR) as required.
2. Configure the pre-defined value, which reflects the value that will be written and compared through the read calibration, to MPPDCMPR1[PDV1, PDV2]
3. Issue write access to the external DDR device by setting MPSWDAR0[SW_DUMMY_WR] = 1 (MMDC will generate internally write access without intervention of the system towards bank 0, row 0, column 0)
4. Make sure that the initial value that is configured in the read delay line absolute offset of each byte (i.e. MPRDDLCTL[RD_DL_ABS_OFFSETn]) will place the read DQS somewhere inside the read DQ window
5. Start the calibration process by asserting MPRDDLHWCTL[HW_RD_DL_EN]

The following steps will be executed automatically by the MMDC for both modes (MPR and Pre-defined value):

1. MMDC waits till the read delay-line is updated with the absolute delay value for all bytes at MPRDDLCTL[RD_DL_ABS_OFFSETn] and also satisfying the Tmod + 4 requirement
2. MMDC drives read command to the external DDR devices and waits 16 or 32 cycles (according to MPRDDLHWCTL[HW_RD_DL_CMP_CYC]) assuming that the data has arrived from the DDR device.
3. MMDC compares the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it indicates that the initial read DQS isn't inside the read DQ window and the

MMDC generates an error for the associated byte at MPRDDLHWCTL[HW_RD_DL_ERRn] . If the comparison passes then MMDC advances to next step.

4. MMDC resets the rd fifo (to the inverted pre-defined/MPR value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
5. MMDC decrements the read delay line absolute offset of each byte by 1 (i.e. MPRDDLCTL[RD_DL_ABS_OFFSETn]) and issue measurement process of the read delay-line to update itself with the new value.
6. MMDC drives read command to the DDR external devices and waits 16 or 32 cycles (according to MPRDDLHWCTL[HW_RD_DL_CMP_CYC]) assuming that the data has arrived from the DDR device
7. MMDC compares the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it stores the low read boundary of the associated byte for each byte at MPRDDLHWST0/1[HW_RD_DL_LOWn] . If the comparison passes then MMDC repeats steps 4-6. If all read data comparisons fail then the MMDC advances to the next step
8. The MMDC start seeking the upper boundary and sets the read delay line absolute offset of each byte to the initial value + 1 as determined at step 4 and issue measurement process of the read delay-line to update itself with the new value
9. MMDC resets the rd fifo (to the inverted pre-defined value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
10. MMDC drives read command to the DDR external devices and waits 16 or 32 cycles (according to MPRDDLHWCTL[HW_RD_DL_CMP_CYC]) assuming that the data has arrived from the DDR device
11. MMDC compares the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it stores the upper read boundary of the associated byte for each byte at MPRDDLHWST0/1[HW_RD_DL_UPn] . If the comparison passes then MMDC increments the read delay line absolute offset of each byte by 1 (i.e. MPRDDLCTL[RD_DL_ABS_OFFSETn]) and issue measurement process of the read delay-line to update itself with the new value.
12. If all read data comparisons fail then the MMDC advances to the next step. otherwise, MMDC repeats steps 9-11.
13. After the MMDC finds the window boundary (lower and upper) of each read data byte then it stores the average between lower and upper boundaries at the associated MPRDDLCTL[RD_DL_ABS_OFFSETn] and issue measurement process of the read delay-line to update itself with the new value.
14. MMDC indicates that the read data calibration had finished by setting MPRDDLHWCTL[HW_RD_DL_EN] = 0

15. Exit the DDR device from MPR/DQ calibration mode through MRS/MRW commands

44.11.4.2 SW Read Calibration

There are two modes of operations:

- Calibration with the MPR (Multi Purpose Register)/DQ calibration (LPDDR2)
- Calibration with MMDC pre-defined values

44.11.4.2.1 Calibration with MPR/DQ calibration

Execute the following steps:

1. Precharge all active banks (Can be done through MDSCR) as required.
2. Enter the DDR device into MPR/DQ calibration mode through MRS/MRW commands
3. Configure the MMDC to work with MPR/DQ calibration mode by asserting MPPDCMPR2[MPR_CMP]
4. Make sure that the initial value that is configured in the read delay line absolute offset of each byte (i.e. MPRDDLCTL[RD_DL_ABS_OFFSETn]) will place the read DQS somewhere inside the read DQ window

44.11.4.2.2 Calibration with pre-defined value

In case pre-defined mode is used, i.e. MPPDCMPR2[MPR_CMP] is cleared, then the following steps should be executed:

1. Precharge all active banks (Can be done through MDSCR) as requried by the standard.
2. Configure the pre-defined value, which reflects the value that will be written and compared through the read calibration, to MPPDCMPR1[PDV1, PDV2]
3. Issue write access (with any legal DDR address) to external DDR device.
4. Make sure that the initial value that is configured in the read delay line absolute offset of each byte (i.e. MPRDDLCTL[RD_DL_ABS_OFFSETn]) will place the read DQS somewhere inside the read DQ window

The following steps will be executed manually by SW for both modes (MPR/DQ calibration and Pre-defined value):

1. Force the delay line to measure itself and to issue the requested read delay by configuring MPMUR[FRC_MSR] = 1
2. Wait 16 DDR cycles till the read delay-line is updated with the absolute delay value for all bytes

3. Issue read command (with any legal DDR address) from the external DDR device
4. Compare the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it indicates that the initial read DQS isn't inside the read DQ window. If the comparison passes then advance to next step.
5. Reset the rd fifo (to the inverted pre-defined/MPR value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
6. Decrement the read delay line absolute offset of each byte by 1 (i.e. MPRDDLCTL[RD_DL_ABS_OFFSETn])
7. Force the delay line to measure itself and to issue the requested read delay by configuring MPMUR[FRC_MSR] = 1
8. Issue read command (with the legal DDR address chosen in step 7) from the external DDR device and waits 16 or 32 cycles (according to MPRDDLHWCTL[HW_RD_DL_CMP_CYC]) assuming that the data has arrived from the DDR device
9. Compare the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it is needed to store the low read boundary of the associated byte at of each byte . If the comparison passes then repeat steps 5-8. If all read data comparisons fail then advance to the next step.
10. Start seeking the upper boundary and set the read delay line absolute offset of each byte to the initial value + 1 as determined at step 4
11. Force the delay line to measure itself and to issue the requested read delay by configuring MPMUR[FRC_MSR] = 1
12. Resets the rd fifo (to the inverted pre-defined/MPR value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
13. Issue read command (with the legal DDR address chosen in step 7) from the external DDR device
14. Compare the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it is needed to store the upper read boundary of the associated byte at of each byte. If the comparison passes then increment the read delay line absolute offset of each byte by 1 (i.e. MPRDDLCTL[RD_DL_ABS_OFFSETn])
15. Force the delay line to measure itself and to issue the requested read delay by configuring MPMUR[FRC_MSR] = 1
16. If all read data comparisons fail then advance to the next step, else repeat steps 12-15.
17. After finding the window boundary (lower and upper) of each read data byte then calculate the average between lower and upper boundaries and store the associated average at MPRDDLCTL[RD_DL_ABS_OFFSETn]

18. Force the delay line to measure itself and to issue the requested read delay by configuring MPMUR[FRC_MSR] = 1
19. Exit the DDR device from MPR/DQ calibration mode through MRS/MRW commands.

44.11.5 Write Calibration

The write calibration is used to adjust the write DQS with write data byte. It is assumed that the read calibration process is completed prior to the write calibration.

NOTE

In DDR3_x64 and LP2_1ch_x64 modes, the activation of the calibration is done by setting MPWRDLHWCTL0[HW_WR_DL_EN]

NOTE

In LP2_2ch_x16, LP2_2ch_x32 the activation of the calibration of each channel is done by setting MPWRDLHWCTL0[HW_WR_DL_EN].

44.11.5.1 HW (automatic) Write Calibration

The following steps should be executed:

1. Make sure that the initial value that is configured in the write delay line absolute offset of each byte (i.e. MPWRDLCTL[WR_DL_ABS_OFFSET#]) will place the write DQS somewhere inside the write DQ window
2. Configure the pre-defined value, which reflects the value that will be written and compared through the write calibration, to MPPDCMPR1[PDV1, PDV2]
3. Assert MPWRDLHWCTL0[HW_WR_DL_EN]

   The following steps will be executed automatically:

4. MMDC waits till the write delay-line is updated with the absolute delay value for all bytes at MPWRDCTL[WR_DL_ABS_OFFSET#]
5. MMDC drives write command to the external DDR devices (to bank 0 address 0) and waits 16 or 32 cycles (according to MPWRDLHWCTL[HW_WR_DL_CMP_CYC]) assuming that the data has arrived to the DDR device.
6. MMDC drives read command to the same address from the external DDR
7. MMDC compares the read data byte to the associated byte in the pre-defined value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it indicates that the initial write DQS isn't inside the write DQ window and the MMDC

generates an error for the associated byte at MPWRDLHWCTL[HW_WR_DL_ERR#] . If the comparison passes then MMDC advances to next step.

8. MMDC resets the rd fifo (to the inverted pre-defined value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
9. MMDC decrements the write delay line absolute offset of each byte by 1 (i.e. MPWRDLCTL[WR_DL_ABS_OFFSET#]) and issue measurement process of the write delay-line to update itself with the new value.
10. MMDC drives write command to the external DDR devices (to bank 0 address 0) and waits 16 or 32 cycles (according to MPWRDLHWCTL[HW_WR_DL_CMP_CYC]) assuming that the data has arrived to the DDR device
11. MMDC drives read command to the same address from the external DDR
12. MMDC compares the read data byte to the associated byte in the pre-defined value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it stores the low write boundary of the associated byte of each byte at MPWRDLHWST0/1[HW_WR_DL_LOW#] . If the comparison passes then MMDC repeats steps 8-11. If all data comparisons fail then the MMDC advances to the next step
13. The MMDC start seeking the upper boundary and sets the write delay line absolute offset of each byte to the initial value + 1 as determined at step 4 and issue measurement process of the write delay-line to update itself with the new value
14. MMDC resets the rd fifo (to the inverted pre-defined value) and its pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
15. MMDC drives write command to the external DDR devices (to bank 0 address 0) and waits 16 or 32 cycles (according to MPWRDLHWCTL[HW_WR_DL_CMP_CYC]) assuming that the data has arrived to the DDR device.
16. MMDC drives read command to the same address from the external DDR
17. MMDC compares the read data byte to the associated byte in the pre-defined value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it stores the upper write boundary of the associated byte of each byte at MPWRDLHWST0/1[HW_WR_DL_UP#] . If the comparison passes then MMDC increments the write delay line absolute offset of each byte by 1 (i.e. MPWRDLCTL[WR_DL_ABS_OFFSET#]) and issue measurement process of the write delay-line to update itself with the new value.
18. MMDC repeats steps 14-17. If all data comparisons fail then the MMDC advances to the next step
19. .After the MMDC finds the window boundary (lower and upper) of each write data byte then it stores the average between lower and upper boundaries at the associated MPWRDLCTL[WR_DL_ABS_OFFSET#] and issue measurement process of the write delay-line to update itself with the new value.

20. MMDC indicates that the write data calibration had finished by setting MPWRDLHWCTL[HW_WR_DL_EN] = 0

44.11.5.2 SW Write Calibration

The following steps should be executed:

NOTE

It is recommended to perform the write calibration using the HW method. The SW method is provided for debug purposes only.

1. Make sure that the initial value that is configured in the write delay line absolute offset of each byte (i.e. MPWRDLCTL[WR_DL_ABS_OFFSETn]) will place the write DQS somewhere inside the write DQ window
2. Configure the pre-defined value, which reflects the value that will be written and compared through the write calibration, to MPPDCMPR1[PDV1, PDV2]
3. Force the delay line to measure itself and to issue the requested write delay by configuring MPMUR0[FRC_MSR] = 1
4. Wait 16 DDR cycles till the write delay-line is updated with the absolute delay value for all bytes
5. Issue write command to any legal DDR address of the external DDR device
6. Issue read command, to the address written previously, from the external DDR device
7. Compare the read data byte to the associated byte in the pre-defined value for all bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it indicates that the initial write DQS isn't inside the write DQ window. If the comparison passes then advance to next step.
8. MMDC resets the rd fifo (to the inverted pre-defined value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
9. Decrement the write delay line absolute offset of each byte by 1 (i.e. MPWRDLCTL[WR_DL_ABS_OFFSETn])
10. Force the delay line to measure itself and to issue the requested write delay by configuring MPMUR0[FRC_MSR] = 1
11. Issue write command to any legal DDR address of the external DDR device
12. Issue read command, to the address written previously, from the external DDR device
13. Compare the read data byte to the associated byte in the pre-defined value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it is needed to store the low write boundary of the associated byte of each byte at

MPWRDLHWST0/1[HW_WR_DL_LOWn] . If the comparison passes then repeat steps 8-12. If all data comparisons fail then advance to the next step.

14. Start seeking the upper boundary and set the write delay line absolute offset of each byte to the initial value + 1
15. Force the delay line to measure itself and to issue the requested write delay by configuring MPMUR0[FRC_MSR] = 1
16. Reset the rd fifo (to the inverted pre-defined value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
17. Issue write command to any legal DDR address of the external DDR device
18. Issue read command, to the address written previously, from the external DDR device
19. Compare the read data byte to the associated byte in the pre-defined value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it is needed to store the upper write boundary of the associated byte of each byte at MPWRDLHWST0/1[HW_WR_DL_UPn]. If the comparison passes then increment the write delay line absolute offset of each byte by 1.
20. Force the delay line to measure itself and to issue the requested write delay by configuring MPMUR0[FRC_MSR] = 1
21. If all read data comparisons fail then advance to the next step else repeat steps 16-20.
22. .After finding the window boundary (lower and upper) of each write data byte then calculate the average between lower and upper boundaries and store the associated average at MPWRDLCTL[WR_DL_ABS_OFFSETn]
23. Force the delay line to measure itself and to issue the requested write delay by configuring MPMUR0[FRC_MSR] = 1

44.11.6 Write leveling Calibration

The write leveling calibration can generate a delay between the clock and the associate DQS of up to 3 cycles as following: (WL_DL_ABS_OFFSET/256*cycle) + (WL_HC_DEL*half cycle) + (WL_CYC_DEL*cycle). Write leveling calibration can be executed automatically(HW) or manually (SW).

The automatic calibration process can only detect the optimal DQS to clock delay to within 1 cycle. In extreme cases in which the DDR3 memory is placed far from the microcontroller (long address/command/clock trace lengths), the skew between the DQS and clock may exceed 1 cycle. If this is the case, it is the user's responsibility to both understand that their design causes the DQS to clock skew to exceed 1 cycle and to indicate this manually in the MPWLDECTRL0/1[WL_CYC_DEL#]. It is highly recommended to keep the DDR3 memory as close to the microcontroller as possible,

especially in embedded system designs. When using fly-by topology, the user should calculate the PCB flight time of the clock signal to the furthest placed DDR3 memory to ensure less than 1 cycle skew between DQS and clock.

NOTE

In LPDDR2 mode Write-leveling calibration should be disabled.

NOTE

In DDR3_x64 mode activation of the calibration is done by setting MPWLGCR[HW_WL_EN]

NOTE

It is essential to route the first bit in each data byte group (D0, D8, D16, D24, D32, D40, D48, D56) from the DDR3 memory to the same data bus bits on the controller. The DDR3 memory outputs the state of the DRAM clock during the write leveling calibration. If any of these are not routed properly, the controller will have no information regarding the state of the DRAM clock during calibration. In previous designs in which write leveling calibration was not performed, the board designer would often swap data bits within each byte group to make the data bus routing cleaner and less susceptible to noise and impedance mismatch. This can still be done with DDR3 so long as the requirement of properly routing D0, D8, D16, D24, D32, D40, D48, D56 is maintained.

44.11.6.1 Hardware Write Leveling Calibration

The following steps should be executed:

1. Configure the external DDR device to enter write leveling mode through MRS command
2. Activate the DQS output enable by setting MDSCR[WL_EN]
3. Active automatic calibration by setting MPWLGCR[HW_WL_EN]

   The following steps will be executed automatically by the MMDC:

4. MMDC enters write leveling mode, counts 25 + 15 cycles and drives the DQS pads as output while the DQ pads will remain inputs. In parallel the MMDC configures the write leveling delay line to "0" (i.e. MPWLDECTRL0[WL_DL_ABS_OFFSET#] = 0) and issue measurement process of the writ-leveling delay-line to update itself with the new value

5. MMDC drives one DQS pulse to the DDR external device
6. MMDC waits 16 cycles (to guarantee that the DQ prime data is stable) and samples the associated prime DQ bit (for example for DQS1 the MMDC samples DQ[8])
7. MMDC increments the write leveling delay line by 1/8 cycle and perform measurement process in order to load the updated value to the associated delay-line
8. MMDC repeates steps 5-7 till the write leveling delay is 1 cycle
9. MMDC checks the 8 bit prime DQ results for each DQS and finds the first transition from 0 to 1. If no transition is found then the MMDC indicates an error at MPWLGCR[HW_WL_ERR#]
10. MMDC stores the value that issues the last "0" on the prime DQ before the transition and loads it to the write leveling delay-line. The MMDC initiates a fine-tune process by incrementing the delay-line values by 1 step (which is 1/256 part of a cycle) till detecting the most accurate transition from 0 to 1
11. Upon completion of this process the MMDC de-asserts the MPWLGCR[HW_WL_EN] and update the most accurate value of the delay-line at the associated MPWLDECTRL#[WL_DL_ABS_OFFSET#]
12. MMDC perform measurement process in order to load the most accurate value to the associated delay-line
13. User should issue MRS command to exit write leveling mode
14. The user should read the results of the associated delay-line at MPWLDECTRL#[WL_DL_ABS_OFFSET#] and in case the user estimates that the reasonable delay may be above 1 cycle then the user should indicate it at MPWLDECTRL#[WL_CYC_DEL#]. Moreover the user should indicate it in MDMISC[WALAT] field. For example, if the result of the write leveling calibration is 100/256 parts of a cycle, but the user estimates that the delay is above 2 cycles then MPWLDECTRL#[WL_CYC_DEL#] should be configured to 2, so the total delay will be 2 and 100/256 parts of a cycle
15. Return the DQS output enable to functional mode by deasserting MDSCR[WL_EN]

44.11.6.2 SW Write Leveling Calibration

The following steps should be executed:

NOTE

It is recommended to perform the write calibration using the HW method. The SW method is provided for debug purposes only.

1. Configure the external DDR device to enter write leveling mode through MRS command
2. Activate the DQS output enable by setting MDSCR[WL_EN]

3. Set the write-leveling delay-line offset to "0" by configuring MPWLDECTRL0[WL_DL_ABS_OFFSET#] = 0
4. Force the delay line to measure itself and to issue the requested write-leveling delay by configuring MPMUR[FRC_MSR] = 1
5. Activate SW write-leveling calibration and issue one DQS pulse by setting MPWLGCR[SW_WL_EN] = 1 together with MPWLGCR[SW_WL_CNT_EN] = 1
6. Issue an IP read command from MPWLGCR. If MPWLGCR[SW_WL_EN] = 0 then the SW write-leveling result is valid at MPWLGCR[WL_SW_RES#].
7. Increment the write leveling delay line by 1/8 cycle—that is, add 0x20 to {MPWLDECTRL0[WL_HC_DEL#],MPWLDECTRL0[WL_DL_ABS_OFFSET#]}
8. Force the delay line to measure itself and to issue the requested write-leveling delay by configuring MPMUR[FRC_MSR] = 1
9. Activate SW write-leveling calibration and issue one DQS pulse by setting MPWLGCR[SW_WL_EN] = 1
10. Repeate steps 6-9 till the edge of CK was detected (i.e the write-leveling result switched from "0" to "1")
11. Store the value that issues the last "0" on the prime DQ before the transition and load it to the write leveling delay-line and start fine tuning process to detect the exact switch from "0" to "1"
12. Force the delay line to measure itself and to issue the requested write-leveling delay by configuring MPMUR[FRC_MSR] = 1
13. Activate SW write-leveling calibration and issue one DQS pulse by setting MPWLGCR[SW_WL_EN] = 1
14. Issue a IP read command from MPWLGCR. If MPWLGCR[SW_WL_EN] = 0 then the SW write-leveling result is valid at MPWLGCR[WL_SW_RES#].
15. Increment the write leveling delay line by 1 step (i.e add 0x01 to MPWLDECTRL0[WL_DL_ABS_OFFSET#])
16. Force the delay line to measure itself and to issue the requested write-leveling delay by configuring MPMUR[FRC_MSR] = 1
17. Issue an IP read command from MPWLGCR. If MPWLGCR[SW_WL_EN] = 0 then the SW write-leveling result is valid at MPWLGCR[WL_SW_RES#].
18. Activate SW write-leveling calibration and issue one DQS pulse by setting MPWLGCR[SW_WL_EN] = 1
19. Repeates step 15-18 till the exact edge of CK was detected (i.e the write-leveling result switched from "0" to "1")
20. Issue MRS command to exit write leveling mode
21. Return the DQS output enable to functional mode by deasserting MDSCR[WL_EN]

44.11.7 Write fine tuning

Write fine tuning is an additional circuit that provides the ability to fine tune the timing of each of the DQ/DM bits (relative to DQS) by up to 100 ps. To use the write fine tuning, select the number of delay units in each DQ/DM I/O (maximum 3 delay units of around 30-35 ps each). The delay can be configured independently for each DQ/DM. This configuration is controlled by the MPWRDQBYnDL registers.

44.11.8 Read fine tuning

Read fine tuning is an additional circuit that provides the ability to fine tune the timing of each coming dq bits (relative to coming dqs) by up to +/-100 ps.

This is done by reducing the delay between the incoming rd_dqs by 100 ps and adding a configurable delay of up to 200 ps (6 delay units of around 30-35 ps each) for each DQ input. The delay can be configured independently for each DQ. The calibration of this mechanism can be done only by writing and reading data from the memory. Controlled by register MPRDDQBY#DL.

44.11.9 Clock and DQS Fine Tuning

Trim controls have been added to the SDCLKx and SDQSx signals, as shown in the table below.

Table 44-14. Additional DRAM trim controls

Signal Name	Control Field
DRAM_SDCLK_0	IOMUX_SW_PAD_CTL_PAD_ADDR00[9:8]
DRAM_SDCLK_0_B	IOMUX_SW_PAD_CTL_PAD_ADDR00[17:16]
DRAM_SDCLK_1	IOMUX_SW_PAD_CTL_PAD_ADDR01[9:8]
DRAM_SDCLK_1_B	IOMUX_SW_PAD_CTL_PAD_ADDR01[17:16]
DRAM_SDQS0	IOMUX_SW_PAD_CTL_PAD_ADDR02[9:8]
DRAM_SDQS0_B	IOMUX_SW_PAD_CTL_PAD_ADDR02[17:16]
DRAM_SDQS1	IOMUX_SW_PAD_CTL_PAD_ADDR03[9:8]
DRAM_SDQS1_B	IOMUX_SW_PAD_CTL_PAD_ADDR03[17:16]
DRAM_SDQS2	IOMUX_SW_PAD_CTL_PAD_ADDR04[9:8]
DRAM_SDQS2_B	IOMUX_SW_PAD_CTL_PAD_ADDR04[17:16]
DRAM_SDQS3	IOMUX_SW_PAD_CTL_PAD_ADDR05[9:8]
DRAM_SDQS3_B	IOMUX_SW_PAD_CTL_PAD_ADDR05[17:16]
DRAM_SDQS4	IOMUX_SW_PAD_CTL_PAD_ADDR06[9:8]
DRAM_SDQS4_B	IOMUX_SW_PAD_CTL_PAD_ADDR06[17:16]

Table continues on the next page...

Table 44-14. Additional DRAM trim controls (continued)

DRAM_SDQS5	IOMUX_SW_PAD_CTL_PAD_ADDR07[9:8]
DRAM_SDQS5_B	IOMUX_SW_PAD_CTL_PAD_ADDR07[17:16]
DRAM_SDQS6	IOMUX_SW_PAD_CTL_PAD_ADDR08[9:8]
DRAM_SDQS6_B	IOMUX_SW_PAD_CTL_PAD_ADDR08[17:16]
DRAM_SDQS7	IOMUX_SW_PAD_CTL_PAD_ADDR09[9:8]
DRAM_SDQS7_B	IOMUX_SW_PAD_CTL_PAD_ADDR09[17:16]

The 2-bit control field allows for up to approximately 90 ps of delay to be added separately to each pad of these differential pair signals.

Table 44-15. Trim control definitions

BitField	Description
00	No additional delay
01	1 delay unit added to pad edge
10	2 delay units added to pad edge
11	3 delay units added to pad edge

44.11.10 ZQ Fine Tuning

An offset can be added to the PU /PD values determined by the ZQ calibration process. The offset range is programmable from -7 to +7, controlled by the MMDC_MPPDCMPR2[ZQ_PU_OFFSET] and MMDC_MPPDCMPR2[ZQ_PD_OFFSET] fields. The offset is enabled/disabled by MMDC_MPPDCMPR2[ZQ_OFFSET_EN]. See MMDC_MPPDCMPR2 register for more information.

44.11.11 Duty cycle adjustment

Duty cycle adjustments can be made to the SDCLKx and SDQSx signals, see the MMDCx_MPDCCR register for more information.

44.12 MMDC Memory Map/Register Definition

MMDC may be configured to several modes of operation. See Table 44-16.

Table 44-16. MMDC - Modes of Operation

Mode of Operation	Abbreviation
DDR3 x16	DDR3_x16
DDR3 x32	DDR3_x32
DDR3 x64	DDR3_x64
LPDDR2 2-channels x16	LP2_2ch_x16
LPDDR2 2-channels x32	LP2_2ch_x32

NOTE

In case of LPDDR2 2-channels mode while the external memory devices are exactly the same for both channels then it is recommended to configure the registers located at 0x021B_0000 - 0x021B_0440 and 0x021B_4000 - 0x021B_4440 to the same values

In case of DDR3_x64 then IP port1 is used only to configure the parameters related to the calibration process of Byte4 - Byte7 at addresses 0x021B_4808 - 0x021B_48C0 as shown in Table 44-17 .

Table 44-17. MMDC - Modes of Operation

Mode of Operation	Associated Memory Map
DDR3 x16, x32	0x021B_0000 - 0x021B_08C4
DDR3 x64	0x021B_0000 - 0x021B_08C4 0x021B_4808 - 0x021B_48C0
LPDDR2 2-channels x16, x32	0x021B_0000 - 0x021B_08C4 0x021B_4808 - 0x021B_48C0

Table 44-18 shows the register mode of operations.

MMDC Duty Cycle Control Register	all	DDR3_x64, LP2_2ch_x16, LP2_2ch_x32

Table 44-19 shows the maximum AXI address space for the main modes of operation.

Table 44-19. MMDC - Maximum AXI Address Space Per Operation Mode

Mode of Operation	Maximum AXI Address Space	Comment
LP2_2ch_x32	AXI port0: 0x8000_0000 - 0xFFFF_FFFFF	Up to 2GB for LPDDR2 Channel 0
	AXI port1: 0x1000_0000 - 0x7FFF_FFFFF	Up to 1.75GB for LPDDR2 Channel 1
DDR3_x64	AXI port0: 0x1000_0000 - 0xFFFF_FFFFF	All address space is associated with AXI port0

The Memory Map is shown below.

NOTE

The terms *clocks* and *cycles* are used interchangeably and refer to the clock period of the main ddr clock (mmdc_ch0_axi_clk_root), commonly referred to as the DDR frequency.

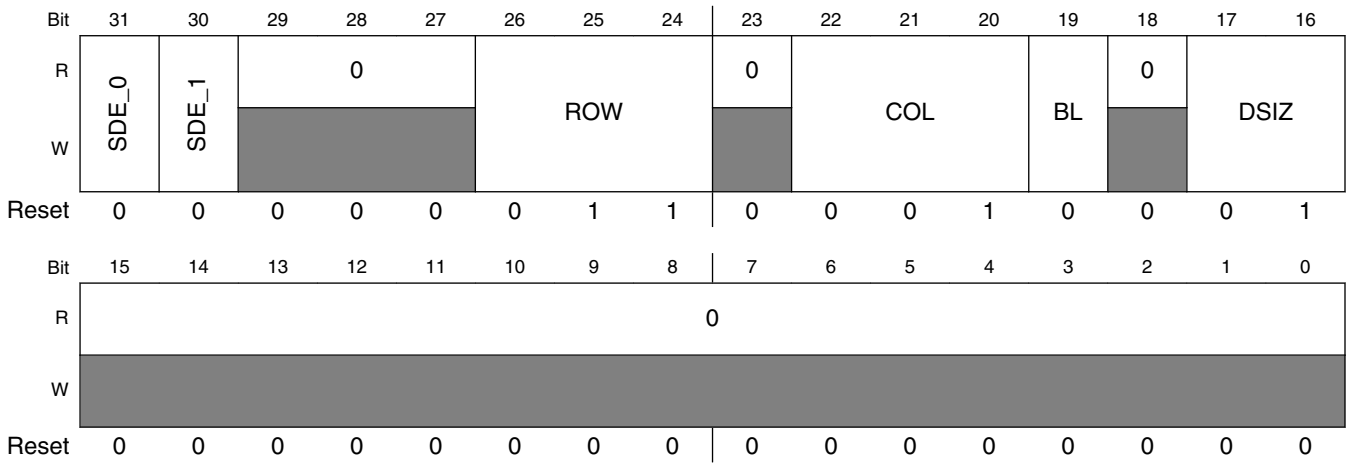
44.12.1 MMDC Core Control Register (MMDCx_MDCTL)

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 0h offset



MMDCx_MDCTL field descriptions

Field	Description
31 SDE_0	MMDC Enable CS0. This bit enables/disables accesses from the MMDC toward Chip Select 0. The reset value of this bit is "0" (i.e. No clocks and clock enable will be driven to the memory). At the enabling point the MMDC will perform an initialization process (including a delay on RESET and/or CKE) for both chip selects. The initialization length depends on the configured memory type. 0 Disabled 1 Enabled
30 SDE_1	MMDC Enable CS1. This bit enables/disables accesses from the MMDC toward Chip Select 1. The reset value of this bit is "0" (i.e. No clocks and clock enable will be driven to the memory). At the enabling point the MMDC will perform an initialization process (including a delay on RESET and/or CKE) for both chip selects. The initialization length depends on the configured memory type. 0 Disabled 1 Enabled
29–27 Reserved	This read-only field is reserved and always has the value 0.
26–24 ROW	Row Address Width. This field specifies the number of row addresses used by the memory array. It will affect the way an incoming address will be decoded. Settings 110-111 are reserved 000 11 bits Row 001 12 bits Row 010 13 bits Row 011 14 bits Row 100 15 bits Row 101 16 bits Row
23 Reserved	This read-only field is reserved and always has the value 0.
22–20 COL	Column Address Width. This field specifies the number of column addresses used by the memory array. It will determine how an incoming address will be decoded.

Table continues on the next page...

MMDCx_MDCTL field descriptions (continued)

Field	Description
	0x0 9 bits column 0x1 10 bits column 0x2 11 bits column 0x3 8 bits column 0x4 12 bits column 0x5-0xF Reserved
19 BL	Burst Length. This field determines the burst length of the DDR device. In LPDDR2 mode the MMDC supports burst length 4. In DDR3 mode the MMDC supports burst length 8. 0 Burst Length 4 is used 1 Burst Length 8 is used
18 Reserved	This read-only field is reserved and always has the value 0.
17–16 DSIZ	DDR data bus size. This field determines the size of the data bus of the DDR memory 0 16-bit data bus 1 32-bit data bus — 2 64-bit data bus 3 Reserved —
Reserved	This read-only field is reserved and always has the value 0.

44.12.2 MMDC Core Power Down Control Register (MMDCx_MDPDC)

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: LP2_2ch_x16, LP2_2ch_x32

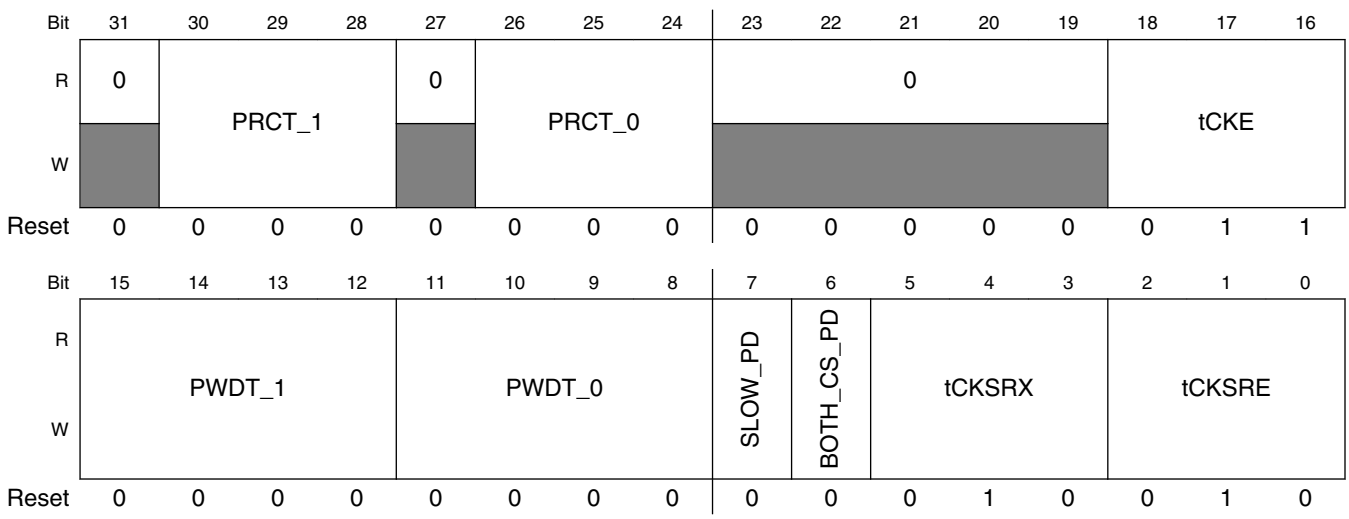
Table 44-20. PRCT field encoding

PRCT[2:0]	Precharge Timer
000	Disabled (Bit field reset value)
001	2 clocks
010	4 clocks
011	8 clocks
100	16 clocks
101	32 clocks
110	64 clocks
111	128 clocks

Table 44-21. PWDT field encoding

PWDT[3:0]	Power Down Time-out
0000	Disabled (bit field reset value)
0001	16 cycles
0010	32 cycles
0011	64 cycles
0100	128 cycles
0101	256 cycles
0110	512 cycles
0111	1024 cycles
1000	2048 cycles
1001	4096 cycles
1010	8196 cycles
1011	16384 cycles
1100	32768 cycles
1101-1111	Reserved

Address: Base address + 4h offset



MMDCx_MDPDC field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–28 PRCT_1	Precharge Timer - Chip Select 1. This field determines the amount of idle cycle for which chip select 1 will be automatically precharged. The amount of cycles are determined according to the PRCT Field Encoding table above.
27 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

MMDCx_MDPDC field descriptions (continued)

Field	Description
26–24 PRCT_0	Precharge Timer - Chip Select 0. This field determines the amount of idle cycle for which chip select 0 will be automatically precharged. The amount of cycles are determined according to the table below.
23–19 Reserved	This read-only field is reserved and always has the value 0.
18–16 tCKE	CKE minimum pulse width. This field determines the minimum pulse width of CKE. 0x0 1 cycle 0x1 2 cycles 0x6 7 cycles 0x7 8 cycles
15–12 PWDT_1	Power Down Timer - Chip Select 1. This field determines the amount of idle cycle for which chip select 1 will be automatically get into precharge/active power down. The amount of cycles are determined according to the PWDT Field Encoding table above.
11–8 PWDT_0	Power Down Timer - Chip Select 0. This field determines the amount of idle cycle for which chip select 0 will be automatically get into precharge/active power down. The amount of cycles are determined according to the PWDT Field Encoding table above.
7 SLOW_PD	Slow/fast power down. In DDR3 mode this field is referred to slow precharge power-down. LPDDR2 mode: This field is not relevant and should remain in its default reset value. **NOTE:** Memory should be configured the same. 0 Fast mode. 1 Slow mode.
6 BOTH_CS_PD	Parallel power down entry to both chip selects. When power down timer is used for both chip-selects (i.e. PWDT_0 and PWDT1 don't equal "0") , then if this bit is enabled, the MMDC will enter power down only if the amount of idle cycles of both chip selects was obtained. 0 Each chip select can enter power down independently according to its configuration. 1 Chip selects can enter power down only if the amount of idle cycles of both chip selects was obtained.
5–3 tCKSRX	Valid clock cycles before self-refresh exit. This field determines the amount of clock cycles before self-refresh exit. 0x0 0 cycle 0x1 1 cycles 0x6 6 cycles 0x7 7 cycles
tCKSRE	Valid clock cycles after self-refresh entry. This field determines the amount of clock cycles after self-refresh entry. 0x0 0 cycle 0x1 1 cycles

Table continues on the next page...

MMDCx_MDOTC field descriptions

Field	Description
31–30 Reserved	This read-only field is reserved and always has the value 0.
29–27 tAOFPD	Asynchronous RTT turn-off delay (power down with DLL frozen). This field determines the time between termination circuit starts to turn off the ODT resistance till termination has reached high impedance. LPDDR2 mode: This field is not relevant and should remain in its default reset value. 0x0 1 cycle 0x1 2 cycles 0x6 7 cycles 0x7 8 cycles
26–24 tAONPD	Asynchronous RTT turn-on delay (power down with DLL frozen). This field determines the time between termination circuit gets out of high impedance and begins to turn on till ODT resistance are fully on. LPDDR2 mode: This field is not relevant and should remain in its default reset value. 0x0 1 cycle 0x1 2 cycles

Table continues on the next page...

MMDCx_MDOTC field descriptions (continued)

Field	Description
	0x6 7 cycles 0x7 8 cycles
23–20 tANPD	Asynchronous ODT to power down entry delay. In DDR3 should be set to tCWL-1 LPDDR2 mode: This field is not relevant and should remain in its default reset value. 0x0 1 clock 0x1 2 clocks 0x2 3 clocks 0xE 15 clocks 0xF 16 clocks
19–16 tAXPD	Asynchronous ODT to power down exit delay. In DDR3 should be set to tCWL-1 LPDDR2 mode: This field is not relevant and should remain in its default reset value. 0x0 1 clock 0x1 2 clocks 0x2 3 clocks 0xE 15 clocks 0xF 16 clocks
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 tODTLon	ODT turn on latency. This field determines the delay between ODT signal and the associated RTT, where according to JEDEC standard it equals WL(write latency) - 2. Therefore, the value that is configured to tODTLon field should correspond the value that is configured to MDCGFG1[tCWL] LPDDR2 mode: This field is not relevant and should remain in its default reset value. 0x0 - 0x1 Reserved 0x2 2 cycles 0x3 3 cycles 0x4 4 cycles 0x5 5 cycles 0x6 6 cycles 0x7 Reserved
11–9 Reserved	This read-only field is reserved and always has the value 0.
8–4 tODT_idle_off	ODT turn off latency. This field determines the Idle period before turning memory ODT off. **NOTE:** LPDDR2 mode: This field is not relevant and should remain in its default reset value. 0x0 0 cycle (turned off at the earliest possible time) 0x1 1 cycle 0x2 2 cycles 0x1E 30 cycles 0x1F 31 cycles
Reserved	This read-only field is reserved and always has the value 0.

44.12.4 MMDC Core Timing Configuration Register 0 (MMDCx_MDCFG0)

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: LP2_2ch_x16, LP2_2ch_x32

Address: Base address + Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

tRRD	Active to Active command period (all banks). See DDR3 SDRAM Specification JESD79-3E (July 2010) , LPDDR2 SDRAM Specification JESD209-2B (February 2010) for a detailed description of this parameter. 0x0 1cycle 0x1 2cycles 0x2 3cycles 0x3 4cycles 0x4 5cycles 0x5 6cycles 0x6 7cycles 0x7 Reserved

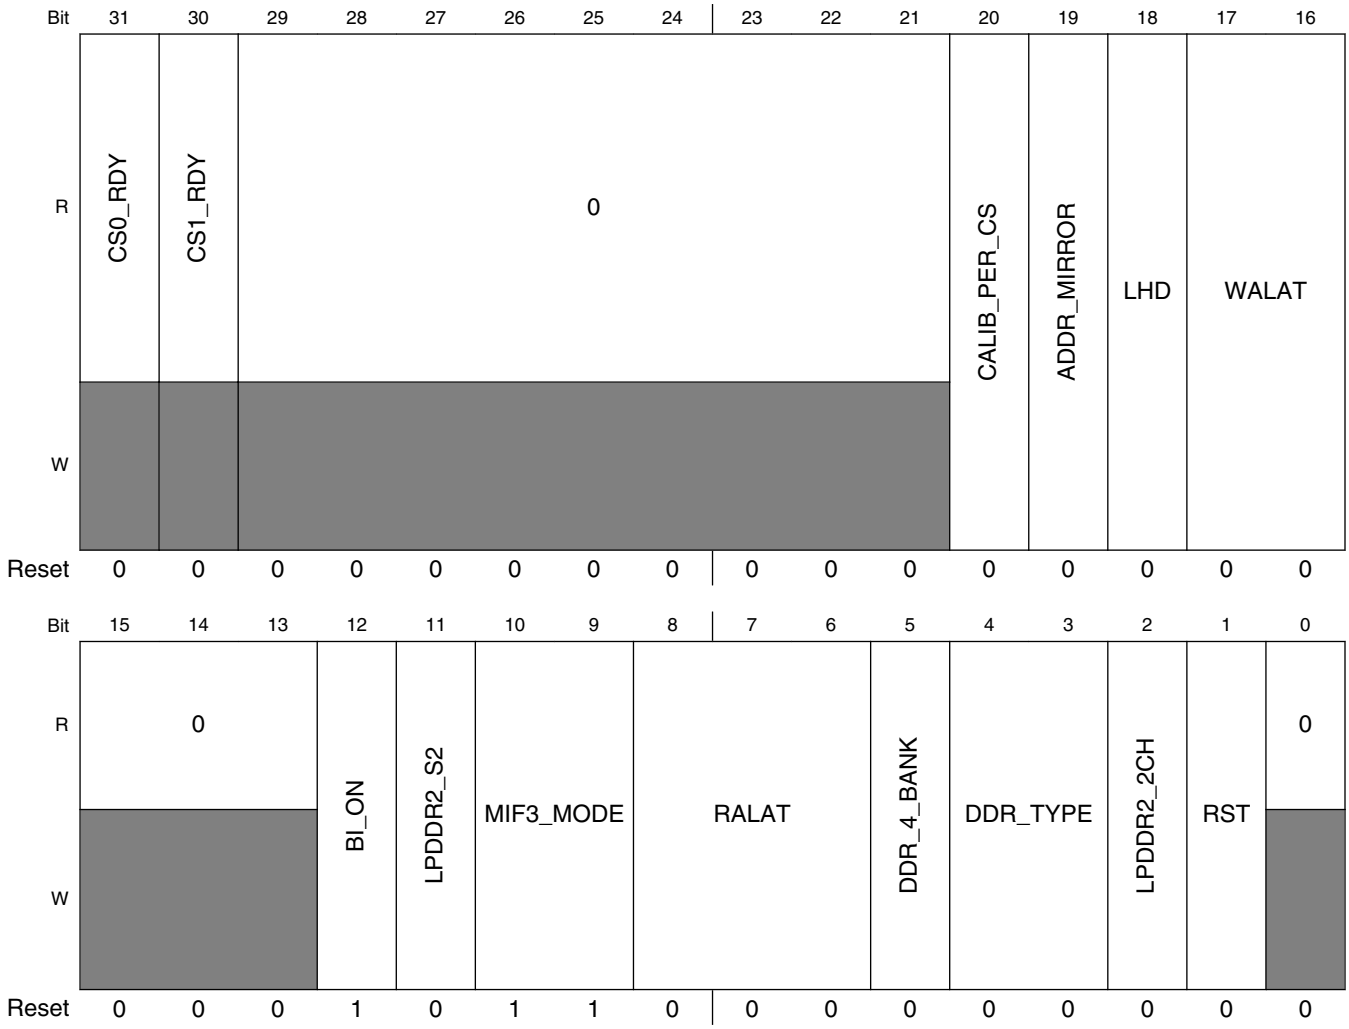
44.12.7 MMDC Core Miscellaneous Register (MMDCx_MDMISC)

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 18h offset



MMDCx_MDMISC field descriptions

Field	Description
31 CS0_RDY	External status device on CS0. This is a read-only status bit, that indicates whether the external memory is in wake-up period. 0 Device in wake-up period. 1 Device is ready for initialization.
30 CS1_RDY	External status device on CS1. This is a read-only status bit, that indicates whether the external memory is in wake-up period. 0 Device in wake-up period. 1 Device is ready for initialization.
29–21 Reserved	This read-only field is reserved and always has the value 0.
20 CALIB_PER_CS	Number of chip-select for calibration process. This bit determines the chip-select index that the associated calibration is targeted to. Relevant for read, write, write leveling and read DQS gating calibrations 0 Calibration is targeted to CS0 1 Calibration is targeted to CS1

Table continues on the next page...

MMDCx_MDMISC field descriptions (continued)

Field	Description
19 ADDR_MIRROR	Address mirroring. **NOTE:** This feature is not supported for LPDDR2/LPDDR3 memories. But only for DDR2/DDR3 memories. For further information see Address mirroring . 0 Address mirroring disabled. 1 Address mirroring enabled.
18 LHD	Latency hiding disable. This is a debug feature. When set to "1" the MMDC will handle one read/write access at a time. Meaning that the MMDC pipe-line will be limited to 1 open access (next AXI address phase will be acknowledged if the current AXI data phase had finished) 0 Latency hiding on. 1 Latency hiding disable.
17–16 WALAT	Write Additional latency. In case the write-leveling calibration process indicates a delay of greater than one-eighth a clock cycle (between CK and any of the DQS strobe lines), then this field must be configured accordingly. This field will add delay on the strobe I/O control, which will compensate on the additional write leveling delay on DQS and prevent the DQS from being cropped. **NOTE:** The purpose of WALAT is to add time delay at the end of a burst write operation to ensure that the JEDEC time specification for Write Post Amble Delay (tWPST) is met (DQS strobe is held low at the end of a write burst for > 30% a clock cycle before it is released). If the value of any of the WL_DL_ABS_OFFSETn register fields are greater than ‘1F’, WALAT should be set to ‘1’ (cycle additional delay). WALAT should be further increased for any full cycle delays added by the WL_CYC_DELn register fields. 0x0 No additional latency required. 0x1 1 cycle additional delay 0x2 2 cycles additional delay 0x3 3 cycles additional delay
15–13 Reserved	This read-only field is reserved and always has the value 0.
12 BI_ON	Bank Interleaving On. This bit controls the organization of the bank, row and column address bits. For further information see Address decoding . 0 Banks are not interleaved, and address will be decoded as bank-row-column 1 Banks are interleaved, and address will be decoded as row-bank-column
11 LPDDR2_S2	LPDDR2 S2 device type indication. In case LPDDR2 device is used (DDR_TYPE = 0x1), this bit will indicate whether S2 or S4 device is used. This bit should be cleared in DDR3 mode 0x0 LPDDR2-S4 device is used. 0x1 LPDDR2-S2 device is used.
10–9 MIF3_MODE	Command prediction working mode. This field determines the level of command prediction that will be used by the MMDC 00 Disable prediction.

Table continues on the next page...

MMDCx_MDMISC field descriptions (continued)

Field	Description
	01 Enable prediction based on : Valid access on first pipe line stage. 10 Enable prediction based on: Valid access on first pipe line stage, Valid access on axi bus. 11 Enable prediction based on: Valid access on first pipe line stage, Valid access on axi bus, Next miss access from access queue.
8–6 RALAT	Read Additional Latency. This field determines the additional read latency which is added to CAS latency and internal delays for which the MMDC will retrieve the read data from the internal FIFO. This field is used to compensate on board/chip delays. **NOTE:** In LPDDR2 mode 2 extra cycles will be added internally in order to compensate tDQSCK delay. 0x0 no additional latency. 0x1 1 cycle additional latency. 0x2 2 cycles additional latency. 0x3 3 cycles additional latency. 0x4 4 cycles additional latency. 0x5 5 cycles additional latency. 0x6 6 cycles additional latency. 0x7 7 cycles additional latency.
5 DDR_4_BANK	Number of banks per DDR device. When this bit is set to "1" then the MMDC will work with DDR device of 4 banks. 0 8 banks device is being used. (Default) 1 4 banks device is being used
4–3 DDR_TYPE	DDR TYPE. This field determines the type of the external DDR device. 0x0 DDR3 device is used. 0x1 LPDDR2 device is used. 0x2 Reserved 0x3 Reserved
2 LPDDR2_2CH	LPDDR2 2-channels mode. When this bit is set to "1" then dual channel mode is activated. This field should be cleared for DDR3 mode. 0 1-channel mode (DDR3) 1 2-channels mode (LPDDR2)
1 RST	Software Reset. When this bit is asserted then the internal FSMs and registers of the MMDC will be initialized. **NOTE:** This bit once asserted gets deasserted automatically. 0 Do nothing. 1 Assert reset to the MMDC.
0 Reserved	This read-only field is reserved and always has the value 0.

44.12.8 MMDC Core Special Command Register (MMDCx_MDSCR)

This register is used to issue special commands manually toward the external DDR device (such as load mode register, manual self refresh, manual precharge and so on). Every write to this register will be interpreted as a command, and a read from this register will show the last command that was executed.

Every write to this register will result in one special command, and the IP bus will assert ips_xfr_wait as long as the special command is being carried out.

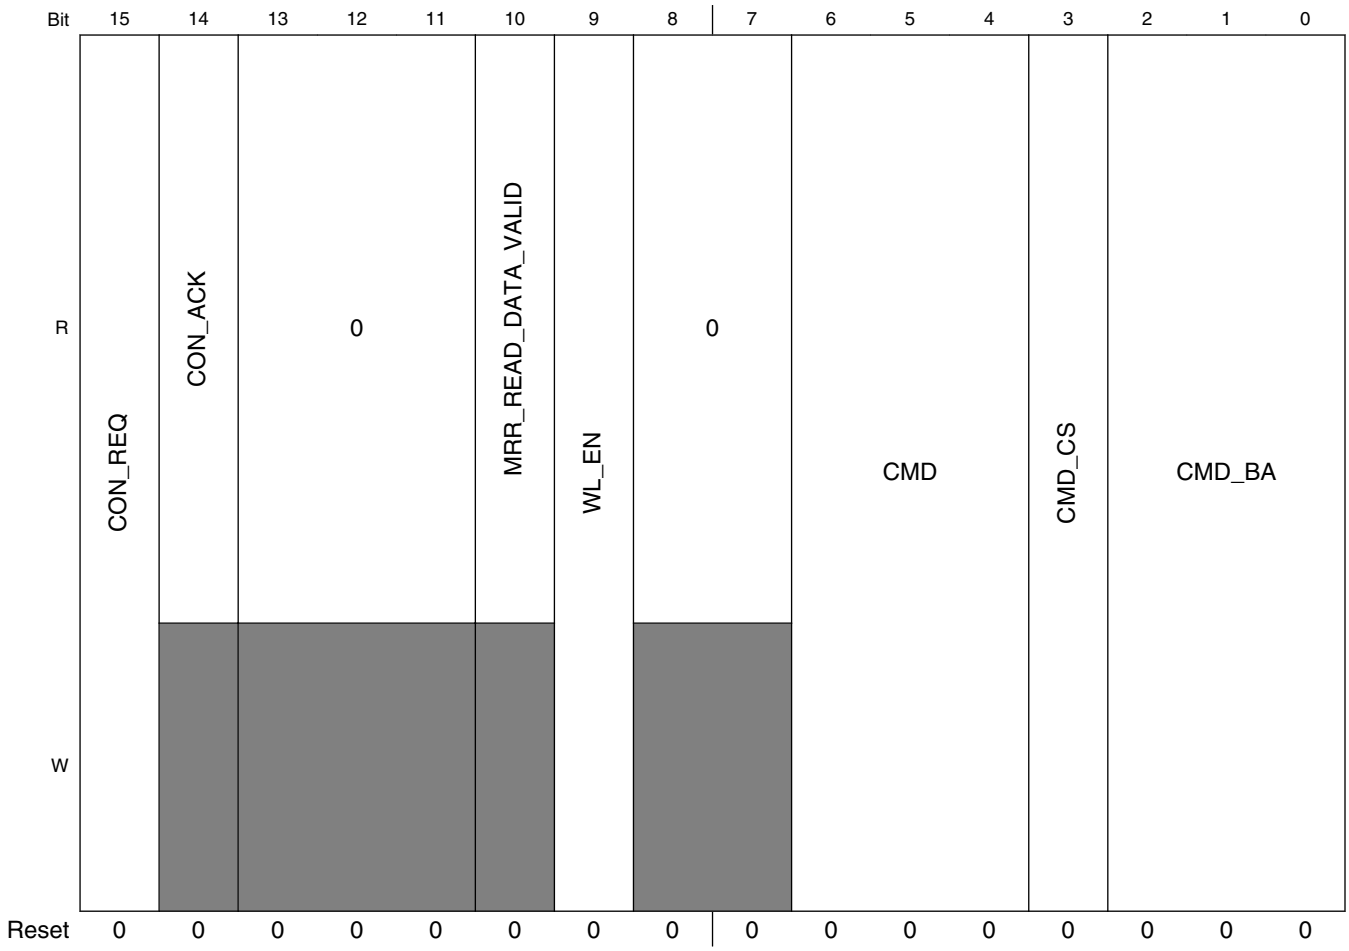
Supported Mode Of Operations:

For Channel 0: All

For Channel 1: LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 1Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	CMD_ADDR_MSB_MR_OP								CMD_ADDR_LSB_MR_ADDR							
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0



MMDCx_MDSCR field descriptions

Field	Description
31–24 CMD_ADDR_MSB_MR_OP	Command/Address MSB. This field indicates the MSB of the command/Address. In LPDDR2/LPDDR3 this field indicates the MRW operand
23–16 CMD_ADDR_LSB_MR_ADDR	Command/Address LSB. This field indicates the LSB of the command/Address In LPDDR2/LPDDR3 this field indicates the MRR/MRW address
15 CON_REQ	Configuration request. When this bit is set then the MMDC will clean the pending AXI accesses and will prevent from further AXI accesses to be acknowledged. This field guarantee safe configuration (or change configuration) of the MMDC while no access is in process and prevents an unexpected behaviour. After setting this bit, it is needed to poll on CON_ACK until it is set to "1". When CON_ACK is asserted then configuration is permitted. After configuration is completed then this bit must be deasserted in order to process further AXI accesses. **NOTE:** This bit is asserted at the end of the reset sequence, meaning that the MMDC is waiting to configure and initialize the external memory before accepting any AXI accesses. Configuration request/acknowledge mechanism should be used for the following procedures: changing of timing parameters , during calibration process or driving commands via MDSCR[CMD]

Table continues on the next page...

MMDCx_MDSCR field descriptions (continued)

Field	Description
	0 No request to configure MMDC. 1 A request to configure MMDC is valid
14 CON_ACK	Configuration acknowledge. Whenever this bit is set, it is permitted to configure MMDC IP registers. 0 Configuration of MMDC registers is forbidden. 1 Configuration of MMDC registers is permitted.
13–11 Reserved	This read-only field is reserved and always has the value 0.
10 MRR_READ_ DATA_VALID	MRR read data valid. This field indicates that read data is valid at MDMRR register **NOTE:** This field is relevant only for LPDDR2/LPDDR3 mode 0 Cleared upon the assertion of MRR command 1 Set after MRR data is valid and stored at MDMRR register.
9 WL_EN	DQS pads direction. This bit controls the DQS pads direction during write-leveling calibration process. Before starting the write-leveling calibration process this bit should be set to "1". It should be set to "0" when sending write leveling exit command. For further information see Write leveling Calibration . 0 Exit write leveling mode or stay in normal mode. 1 Write leveling entry command was sent.
8–7 Reserved	This read-only field is reserved and always has the value 0.
6–4 CMD	Command. This field contains the command to be executed. This field will be automatically cleared after the command will be send to the DDR memory. **NOTE:** Only the 0x5 Precharge all command should be used, memory operation is unpredictable when using the 0x1 command 0x0 Normal operation 0x1 Precharge all, command is sent independently of bank status (set correct CMD_CS). Will be issued even if banks are closed. Primarily used for initialization sequence purposes. Not to be used during run-time operation. 0x2 Auto-Refresh Command (set correct CMD_CS). 0x3 Load Mode Register Command DDR2/DDR3, set correct CMD_CS, CMD_BA, CMD_ADDR_LSB, CMD_ADDR_MSB), MRW Command (LPDDR2/LPDDR3, set correct CMD_CS, MR_OP, MR_ADDR) 0x4 ZQ calibration (DDR2/DDR3, set correct CMD_CS, {CMD_ADDR_MSB,CMD_ADDR_LSB} = 0x400 or 0x0) 0x5 Precharge all, only if banks open (set correct CMD_CS). 0x6 MRR command (LPDDR2/LPDDR3, set correct CMD_CS, MR_ADDR) 0x7 Reserved
3 CMD_CS	Chip Select. This field determines which chip select the command is targeted to 0 to Chip-select 0 1 to Chip-select 1
CMD_BA	Bank Address. This field determines the address of the bank within the selected chip-select to where the command is targeted.

Table continues on the next page...

MMDCx_MDSCR field descriptions (continued)

Field	Description
	0x0 bank address 0 0x1 bank address 1 0x2 bank address 2 0x7 bank address 7

44.12.9 MMDC Core Refresh Control Register (MMDCx_MDREF)

This register determines the refresh scheme that will be executed toward the DDR device. It specifies how often a refresh cycle occurs and how many refresh commands will be executed every refresh cycle.

For further information see Refresh Scheme .

The following tables show examples of possible refresh schemes.

Table 44-22. Refresh rate example for REF_SEL = 0

REFR[2:0]	Number of refresh commands every 64KHz	Average periodic refresh rate (tREFI)	System Refresh period
0x0	1	15.6 µs	tRFC
0x1	2	7.8 µs	2*tRFC
0x3	4	3.9µs	4*tRFC
0x7	8	1.95 µs	8*tRFC

Table 44-23. Refresh rate example for REF_SEL = 1

REFR[2:0]	Number of refresh commands every 32KHz	Average periodic refresh rate (tREFI)	System Refresh period
0x1	2	15.6 µs	2*tRFC
0x3	4	7.8 µs	4*tRFC
0x7	8	3.9µs	8*tRFC

Table 44-24. Refresh rate example for REF_SEL = 2@ 400MHz

REFR[2:0]	Number of refresh commands every refresh cycle	REF_CNT	Average periodic refresh rate (tREFI)	System Refresh period
0x0	1	0x618	3.9 µs	tRFC
0x1	2	0xC30	3.9 µs	2*tRFC

Table continues on the next page...

Table 44-24. Refresh rate example for REF_SEL = 2@ 400MHz (continued)

REFR[2:0]	Number of refresh commands every refresh cycle	REF_CNT	Average periodic refresh rate (tREFI)	System Refresh period
0x2	3	0x1248	3.9µs	3*tRFC
0x3	4	0x1860	3.9 µs	4*tRFC

Other refresh configurations are also allowed; the configuration values in the tables above are only examples for obtaining the desired average periodic refresh rate.

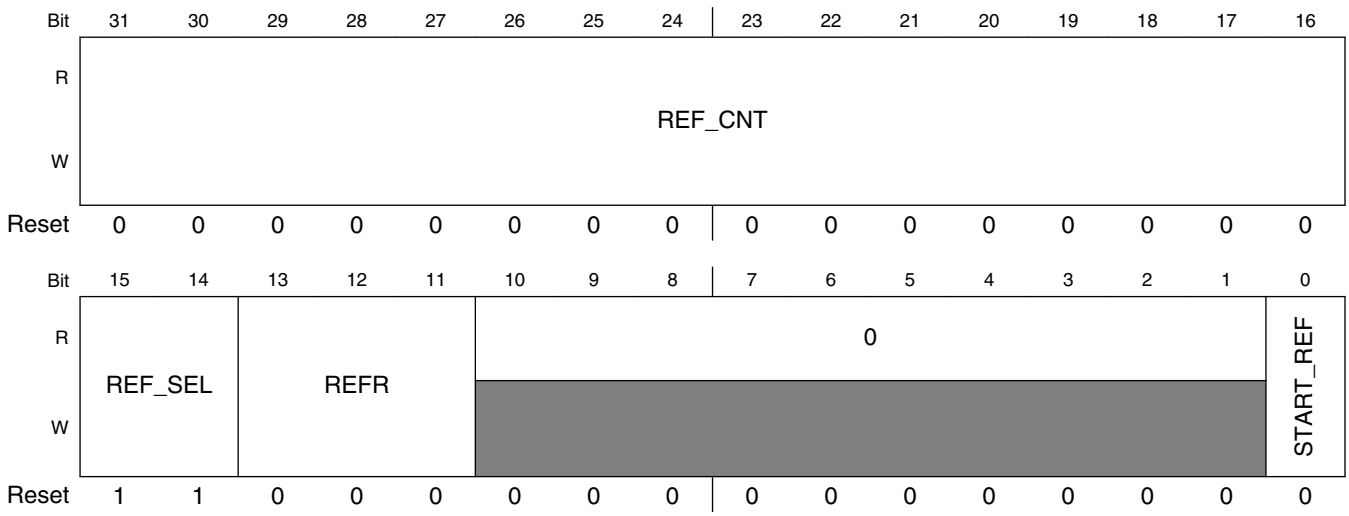
If the required average periodic refresh rate (tREFI) is kept, all of the rows will be refreshed in every refresh window. Because the memory device issues additional refresh commands for every refresh it receives, the tREFI remains the same across the device, regardless of its number of rows. This is particularly relevant in the tRFC parameter, which becomes bigger as the density increases.

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 20h offset



MMDCx_MDREF field descriptions

Field	Description
31–16 REF_CNT	Refresh Counter at DDR clock period If REF_SEL equals '2' a refresh cycle will begin every amount of DDR cycles configured in this field. 0x0 Reserved. 0x1 1 cycle.

Table continues on the next page...

MMDCx_MDREF field descriptions (continued)

Field	Description
	0xFFFE 65534 cycles. 0xFFFF 65535 cycles.
15–14 REF_SEL	Refresh Selector. This bit selects the source of the clock that will trigger each refresh cycle: 0 Periodic refresh cycles will be triggered in frequency of 64KHz. 1 Periodic refresh cycles will be triggered in frequency of 32KHz. 2 Periodic refresh cycles will be triggered every amount of cycles that are configured in REF_CNT field. 3 No refresh cycles will be triggered.
13–11 REFR	Refresh Rate. This field determines how many refresh commands will be issued every refresh cycle. After every refresh command the MMDC won't drive any command to the DDR device until satisfying tRFC period 0x0 1 refresh 0x1 2 refreshes 0x2 3 refreshes 0x3 4 refreshes 0x4 5 refreshes 0x5 6 refreshes 0x6 7 refreshes 0x7 8 refreshes
10–1 Reserved	This read-only field is reserved and always has the value 0.
0 START_REF	Manual start of refresh cycle. When this field is set to '1' the MMDC will start a refresh cycle immediately according to number of refresh commands that are configured in 'REFR' field. This bit returns to zero automatically. 0 Do nothing. 1 Start a refresh cycle.

44.12.10 MMDC Core Read/Write Command Delay Register (MMDCx_MDRWD)

This register determines the delay between back to back read and write accesses. The register reset values are set to the minimum required value.

NOTE

As the default values are set to achieve optimal results, changing them is discouraged.

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 2Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0			tDAI

MMDCx_MDRWD field descriptions

Field	Description
31–29 Reserved	This read-only field is reserved and always has the value 0.
28–16 tDAI	Device auto initialization period.(maximum) **NOTE:** This field is relevant only to LPDDR2 mode 0x0 1 cycle 0xF9F 4000 cycles (Default, JEDEC value for LPDDR2, gives 10us at 400MHz clock). 0x1FFF 8192 cycles
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 RTW_SAME	Read to write delay for the same chip-select. This field controls the delay between read to write commands toward the same chip select. The total delay is calculated according to: BL/2 + RTW_SAME + (tCL-tCWL) + RALAT 0x0 0 cycle 0x1 1 cycle 0x2 2 cycles (Default) 0x3 3 cycles 0x4 4 cycles 0x5 5 cycles 0x6 6 cycles 0x7 7 cycles
11–9 WTR_DIFF	Write to read delay for different chip-select. This field controls the delay between write to read commands toward different chip select. The total delay is calculated according to: BL/2 + WTR_DIFF + (tCL-tCWL) + RALAT 0x0 0 cycle 0x1 1 cycle 0x2 2 cycles 0x3 3 cycles (Default) 0x4 4 cycles 0x5 5 cycles 0x6 6 cycles 0x7 7 cycles

Table continues on the next page...

MMDCx_MDRWD field descriptions (continued)

Field	Description
8–6 WTW_DIFF	Write to write delay for different chip-select. This field controls the delay between write to write commands toward different chip select. The total delay is calculated according to: BL/2 + WTW_DIFF 0x0 0 cycle 0x1 1 cycle 0x2 2 cycles 0x3 3 cycles (Default) 0x4 4 cycles 0x5 5 cycles 0x6 6 cycles 0x7 7 cycles
5–3 RTW_DIFF	Read to write delay for different chip-select. This field controls the delay between read to write commands toward different chip select. The total delay is calculated according to: BL/2 + RTW_DIFF + (tCL - tCWL) + RALAT 0x0 0 cycle 0x1 1 cycle 0x2 2 cycles (Default) 0x3 3 cycles 0x4 4 cycles 0x5 5 cycles 0x6 6 cycles 0x7 7 cycles
RTR_DIFF	Read to read delay for different chip-select. This field controls the delay between read to read commands toward different chip select. The total delay is calculated according to: BL/2 + RTR_DIFF 0x0 0 cycle 0x1 1 cycle 0x2 2 cycles (Default) 0x3 3 cycles 0x4 4 cycles 0x5 5 cycles 0x6 6 cycles 0x7 7 cycles

44.12.11 MMDC Core Out of Reset Delays Register (MMDCx_MDOR)

This register defines delays that must be kept when MMDC exits reset.

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 30h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0								tXPR								0		SDE_to_RST						0		RST_to_CKE					
W																																
Reset	0	0	0	0	0	0	0	0	1	0	0	1	1	1	1	1	0	0	0	0	1	1	1	0	0	0	0	0	1	1	1	0

MMDCx_MDOR field descriptions

Field	Description
31–24 Reserved	This read-only field is reserved and always has the value 0.
23–16 tXPR	LPDDR2: Not relevant to this mode and should remain in default reset value. DDR3: As defined in timing parameter table. 0x0 Reserved 0x1 2 cycles 0x2 3 cycles 0xFE 255 cycles 0xFF 256 cycles
15–14 Reserved	This read-only field is reserved and always has the value 0.
13–8 SDE_to_RST	DDR3 mode: Time from SDE enable until DDR reset# is high. LPDDR2 mode: This field is not relevant and should remain in its default reset value. **NOTE:** Each cycle in this field is 15.258 us. 0x0 Reserved 0x1 Reserved 0x2 Reserved 0x3 1 cycles 0x4 2 cycles 0x10 14 cycles (JEDEC value for DDR3) - total of 200 us 0x3E 60 cycles 0x3F 61 cycles
7–6 Reserved	This read-only field is reserved and always has the value 0.
RST_to_CKE	DDR3: Time from SDE enable to CKE rise. In case that DDR reset# is low, will wait until it's high and then wait this period until rising CKE. (JEDEC value is 500 us) LPDDR2: Idle time after first CKE assertion (JEDEC value is 200 us). **NOTE:** Each cycle in this field is 15.258 us. 0x0 Reserved 0x1 Reserved 0x2 Reserved 0x3 1 cycles 0x10 14 cycles (JEDEC value for LPDDR2) - total of 200 us 0x23 33 cycles (JEDEC value for DDR3) - total of 500 us 0x3E 60 cycles 0x3F 61 cycles

44.12.12 MMDC Core MRR Data Register (MMDCx_MDMRR)

This register contains data that was collected after issuing MRR command. The data in this register is valid only when MDSCR[MRR_READ_DATA_VALID] is set to "1".

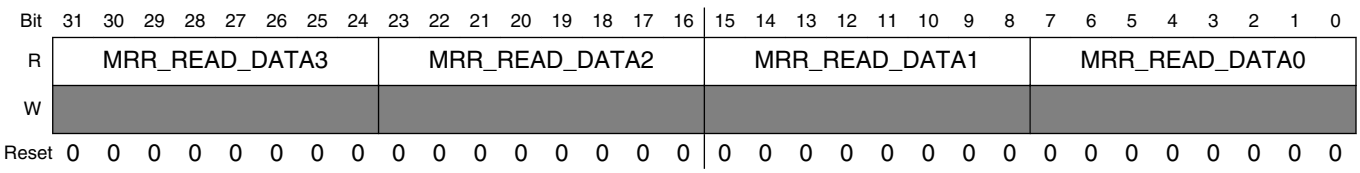
This register is relevant only in LPDDR2 mode. For further information see LPDDR2 Refresh Rate Update and Timing Derating.

Supported Mode Of Operations:

For Channel 0: LP2_2ch_x16, LP2_2ch_x32

For Channel 1: LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 34h offset



MMDCx_MDMRR field descriptions

Field	Description
31–24 MRR_READ_DATA3	MRR DATA that arrived on DQ[31:24]
23–16 MRR_READ_DATA2	MRR DATA that arrived on DQ[23:16]
15–8 MRR_READ_DATA1	MRR DATA that arrived on DQ[15:8]
MRR_READ_DATA0	MRR DATA that arrived on DQ[7:0]

44.12.13 MMDC Core Timing Configuration Register 3 (MMDCx_MDCFG3LP)

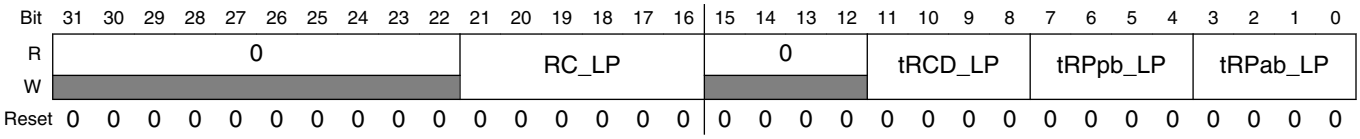
This register is relevant only for LPDDR2 mode.

Supported Mode Of Operations:

For Channel 0: LP2_2ch_x16, LP2_2ch_x32

For Channel 1: LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 38h offset



MMDCx_MDCFG3LP field descriptions

Field	Description
31–22 Reserved	This read-only field is reserved and always has the value 0.
21–16 RC_LP	Active to Active or Refresh command period (same bank). This field is valid only for LPDDR2 memories 0x0 1 clock 0x1 2 clocks 0x2 3 clocks 0x3E 63 clocks 0x3F Reserved
15–12 Reserved	This read-only field is reserved and always has the value 0.
11–8 tRCD_LP	Active command to internal read or write delay time (same bank). This field is valid only for LPDDR2 memories 0x0 1 clock 0x1 2 clocks 0x2 3 clocks 0xE 15 clocks 0xF Reserved
7–4 tRPpb_LP	Precharge (per bank) command period (same bank). This field is valid only for LPDDR2 memories 0x0 1 clock 0x1 2 clocks 0x2 3 clocks 0xE 15 clocks 0xF Reserved
tRPab_LP	Precharge (all banks) command period. This field is valid only for LPDDR2 memories 0x0 1 clock 0x1 2 clocks 0x2 3 clocks 0xE 15 clocks 0xF Reserved

44.12.14 MMDC Core MR4 Derating Register (MMDCx_MDMR4)

This register is relevant only for LPDDR2 mode. It is used to dynamically change certain values depending on MR4 read result, which is based on memory temperature sensor result.

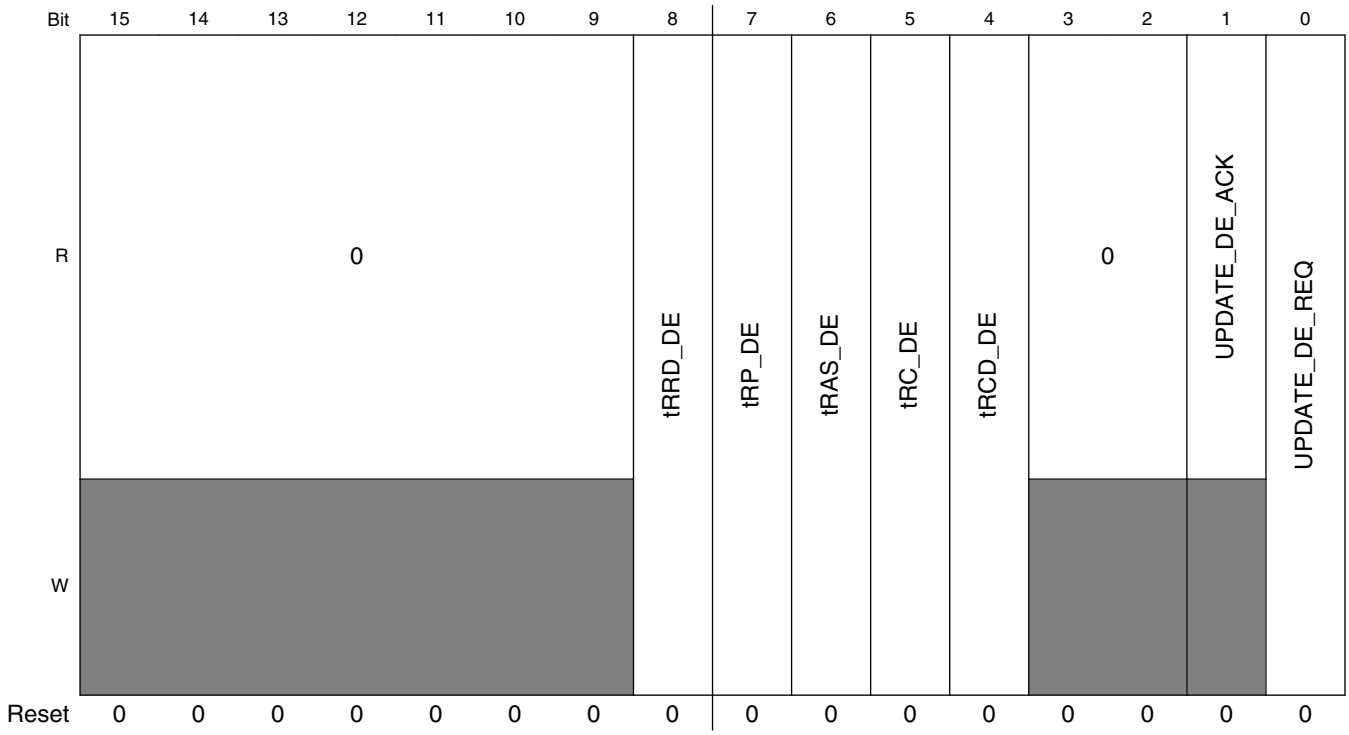
Supported Mode of Operations:

For Channel 0: LP2_2ch_x16, LP2_2ch_x32

For Channel 1: LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 3Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0



MMDCx_MDMR4 field descriptions

Field	Description
31–9 Reserved	This read-only field is reserved and always has the value 0.
8 tRRD_DE	tRRD derating value. 0 Original tRRD is used. 1 tRRD is derated in 1 cycle.
7 tRP_DE	tRP derating value. 0 Original tRP is used. 1 tRP is derated in 1 cycle.
6 tRAS_DE	tRAS derating value. 0 Original tRAS is used. 1 tRAS is derated in 1 cycle.
5 tRC_DE	tRC derating value. 0 Original tRC is used. 1 tRC is derated in 1 cycle.
4 tRCD_DE	tRCD derating value. 0 Original tRCD is used. 1 tRCD is derated in 1 cycle.
3–2 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

MMDCx_MDMR4 field descriptions (continued)

Field	Description
1 UPDATE_DE_ACK	Update Derated Values Acknowledge. This read only bit will be cleared upon UPDATE_DE_REQ assertion and will be set after the new values are taken.
0 UPDATE_DE_REQ	Update Derated Values Request. This read modify write field is automatically cleared after the request is issued. 0 Do nothing. 1 Request to update the following values: tRRD, tRCD, tRP, tRC, tRAS and refresh related fields(MDREF register): REF_CNT, REF_SEL, REFR

44.12.15 MMDC Core Address Space Partition Register (MMDCx_MDASP)

This register defines the partitioning between chip select 0 and chip select 1. For further information see Chip select settings .

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 40h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

MMDCx_MDASP field descriptions

Field	Description
31–7 Reserved	This read-only field is reserved and always has the value 0.
CS0_END	Defines the absolute last address associated with CS0 with increments of 256Mb. CS0_END=AXI_ADDRESS[31:25] bits. In DDR3 and 1-channel LPDDR2 mode: MMDCx_MDASP[CS0_END] should be set to DDR_CS_SIZE/32MB + 0x7 (DDR base address begins at 0x10000000) In 2-channel LPDDR2 mode: MMDC0_MDASP[CS0_END] should be set to DDR_CS_SIZE/32M + 0x3f (channel 0 base address begins at 0x80000000) MMDC1_MDASP[CS0_END] should be set to DDR_CS_SIZE/32M + 0x7 (channel 1 base address begins at 0x10000000)

Table continues on the next page...

MMDCx_MDASP field descriptions (continued)

Field	Description
	In 2-channel LPDDR2 with 4k-interleave mode: MMDC0_MDASP[CS0_END] should be set to DDR_CS_SIZE/32M + 0x43 MMDC1_MDASP[CS0_END] should be set to DDR_CS_SIZE/32M + 0x3

44.12.16 MMDC Core AXI Reordering Control Register (MMDCx_MAARCR)

This register determines the values of the weights used for the re-ordering arbitration engine. For further information see Performance.

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 400h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	ARCR_SEC_ERR_LOCK	ARCR_SEC_ERR_EN	Reserved	ARCR_EXC_ERR_EN	Reserved	ARCR_ARB_REO_DIS	ARCR_REO_DIS	ARCR_RCH_EN	Reserved	ARCR_PAG_HIT			Reserved	ARCR_ACC_HIT

Reset	0	0	0	0	0	0	0	1	1	1	1	1	0	0	0	0

MMDCx_MAARCR field descriptions

Field	Description
31 ARCR_SEC_ERR_LOCK	Once set, this bit locks ARCR_SEC_ERR_EN and prevents from its updating. This bit can be only cleared by reset Default value is 0x0 - encoding 0 (unlocked) 0 ARCR_SEC_ERR_EN is unlocked, so can be updated any moment 1 ARCR_SEC_ERR_EN is locked, so it can't be updated
30 ARCR_SEC_ERR_EN	This bit defines whether security read/write access violation result in SLV Error response or in OKAY response Default value is 0x1 - encoding 1(response is SLV Error, rresp/bresp=2'b10) 0 security violation results in OKAY response (rresp/bresp=2'b00) 1 security violation results in SLAVE Error response (rresp/bresp=2'b10)
29 -	This field is reserved. Reserved
28 ARCR_EXC_ERR_EN	This bit defines whether exclusive read/write access violation of AXI 6.2.4 rule result in SLV Error response or in OKAY response Default value is 0x1 - encoding 1(response is SLV Error) 0 violation of AXI exclusive rules (6.2.4) result in OKAY response (rresp/bresp=2'b00) 1 violation of AXI exclusive rules (6.2.4) result in SLAVE Error response (rresp/bresp=2'b10)
27 -	This field is reserved. Reserved
26 ARCR_ARB_REO_DIS	0 MMDC arbitration and reordering controls enabled 1 MMDC arbitration and reordering controls disabled
25 ARCR_REO_DIS	0 MMDC reordering controls only enabled 1 MMDC reordering controls only disabled
24 ARCR_RCH_EN	This bit defines whether Real time channel is activated and bypassed all other pending accesses, So accesses with QoS=='F' will be granted the highest priority in the optimization/reordering mechanism Default value is 0x1 - encoding 1 (Enabled) 0 normal prioritization, no bypassing 1 accesses with QoS=='F' bypass the arbitration
23 -	This field is reserved. Reserved
22–20 ARCR_PAG_HIT	ARCR Page Hit Rate. This value will be added by the optimization/reordering mechanism to any pending access that is targeted to an open DDR row. Default value of ARCR_PAG_HIT is 0x00100 - encoding 4.
19 -	This field is reserved. Reserved
18–16 ARCR_ACC_HIT	ARCR Access Hit Rate. This value will be added by the optimization/reordering mechanism to any pending access that has the same access type (read/write) as the previous access. Default value of is ARCR_ACC_HIT 0x0010 - encoding 2.
15–12 -	This field is reserved. Reserved

Table continues on the next page...

MMDCx_MAARCR field descriptions (continued)

Field	Description
11–8 ARCR_DYN_JMP	ARCR Dynamic Jump. Each time an access is not chosen by the optimization/reordering mechanism then its dynamic score will be incremented by ARCR_DYN_JMP value. **NOTE:** Setting ARCR_DYN_JMP may cause starvation of low priority accesses **NOTE:** ARCR_DYN_JMP must be smaller than ARCR_DYN_MAX Default ARCR_DYN_JMP value is 0x0001 - encoding 1
7–4 ARCR_DYN_MAX	ARCR Dynamic Maximum. ARCR_DYN_MAX is the maximum dynamic score value that each access inside the optimization/reordering mechanism can get. 0000 0 0001 1 1111 15 (default)
ARCR_GUARD	ARCR Guard. After an access reached the maximum dynamic score value, it will wait additional ARCR_GUARD arbitration cycles and then will gain the highest priority in the optimization/reordering mechanism. 0000 15 (default) 0001 16 1111 30

44.12.17 MMDC Core Power Saving Control and Status Register (MMDCx_MAPSR)

The MAPSR determines the power saving features of MMDC. For further information see Power Saving and Clock Frequency Change modes .

Supported Mode Of Operations:

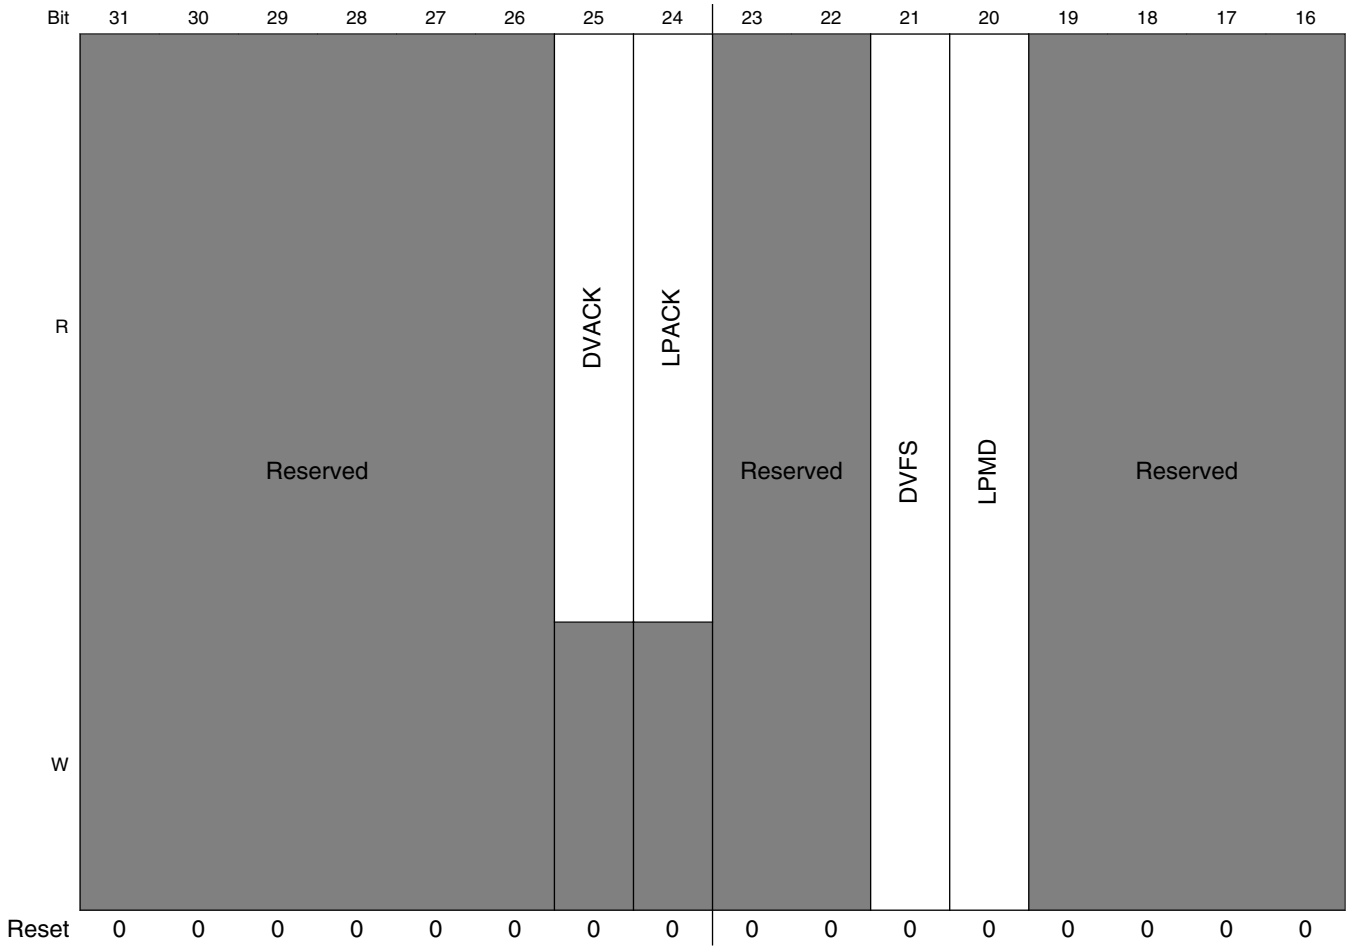
For Channel 0: All

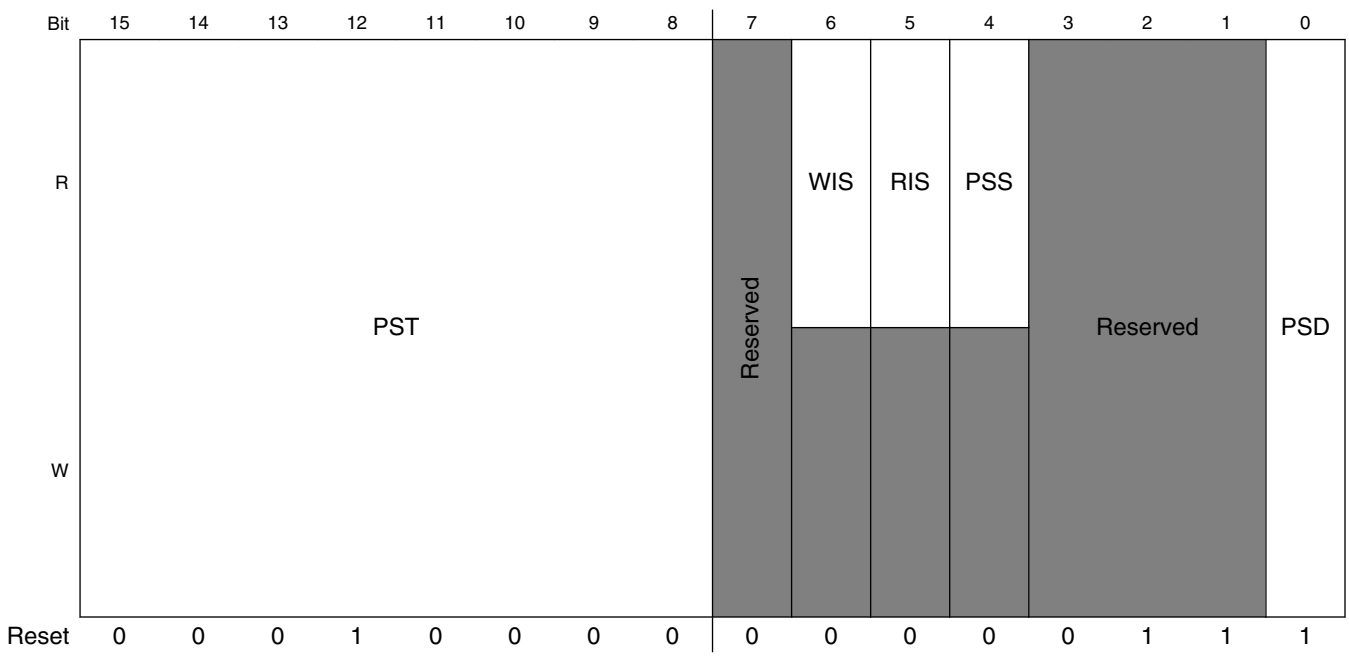
For Channel 1: LP2_2ch_x16, LP2_2ch_x32

NOTE

See chip-specific information for implementation on your device.

Address: Base address + 404h offset





MMDCx_MAPSR field descriptions

Field	Description
31–26 -	This field is reserved. Reserved
25 DVACK	DVFS/Self-Refresh acknowledge. This read only bit indicates whether a DVFS/self-refresh acknowledge was asserted and that the MMDC is in self-refresh mode.
24 LPACK	General low-power acknowledge. This read only bit indicates whether a low-power acknowledge was asserted and that MMDC is in self-refresh mode
23–22 -	This field is reserved. Reserved
21 DVFS	DVFS/Self-Refresh request. Software request for DVFS/self-refresh. Assertion of this bit will initiate a self-refresh entry sequence. 0 no DVFS/Self-Refresh entry request 1 DVFS/Self-Refresh entry request
20 LPMD	General LPMD request. Software request for LPMD. Assertion of this bit will yield in self-refresh entry sequence 0 no lpmd request 1 lpmd request
19–16 -	This field is reserved. Reserved
15–8 PST	Automatic Power saving timer. Valid only when PSD is set to "0". When the MMDC is idle for amount of cycles specified in that field then the DDR device will be entered automatically into self-refresh mode. The real value which is used is register-value multiplied by 64. 00000000 Reserved - this value is forbidden. 00000001 timer is configured to 64 clock cycles. 00000010 timer is configured to 128 clock cycles. 00010000 (Default)- 1024 clock cycles. 11111111 timer clock is configured to 16320 clock cycles.
7 -	This field is reserved. Reserved.
6 WIS	Write Idle Status. This read only bit indicates whether write request buffer is idle (empty) or not. 0 not idle 1 idle
5 RIS	Read Idle Status. This read only bit indicates whether read request buffer is idle (empty) or not. 0 not idle 1 idle
4 PSS	Power Saving Status. This read only bit indicates whether the MMDC is in automatic power saving mode. 0 not in power saving mode 1 power saving mode
3–1 -	This field is reserved. Reserved.

Table continues on the next page...

MMDCx_MAPSR field descriptions (continued)

Field	Description
0 PSD	Automatic Power Saving Disable. When the value of PSD is "0" (i.e. automatic power saving is enabled) then the PST is activated and MMDC will enter automatically to self-refresh while the number of idle cycle reached. **NOTE:** This bit must be disabled (i.e. set to "1") during calibration process 0 power saving enabled 1 power saving disabled (default)

44.12.18 MMDC Core Exclusive ID Monitor Register0 (MMDCx_MAEXIDR0)

This register defines the ID to be monitored for exclusive accesses of monitor0 and monitor1. For further information see Exclusive accesses handling .

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 408h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	EXC_ID_MONITOR1																EXC_ID_MONITOR0															
Reset	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MMDCx_MAEXIDR0 field descriptions

Field	Description
31–16 EXC_ID_ MONITOR1	This field defines ID for Exclusive monitor#1. Default value is 0x0020
EXC_ID_ MONITOR0	This field defines ID for Exclusive monitor#0. Default value is 0x0000

44.12.19 MMDC Core Exclusive ID Monitor Register1 (MMDCx_MAEXIDR1)

This register defines the ID to be monitored for exclusive accesses of monitor2 and monitor3. For further information see Exclusive accesses handling .

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 40Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Reset	0	0	0	0	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0

MMDCx_MAEXIDR1 field descriptions

Field	Description
31–16 EXC_ID_ MONITOR3	This field defines ID for Exclusive monitor#3. Default value is 0x0060
EXC_ID_ MONITOR2	This field defines ID for Exclusive monitor#2. Default value is 0x0040

44.12.20 MMDC Core Debug and Profiling Control Register 0 (MMDCx_MADPCR0)

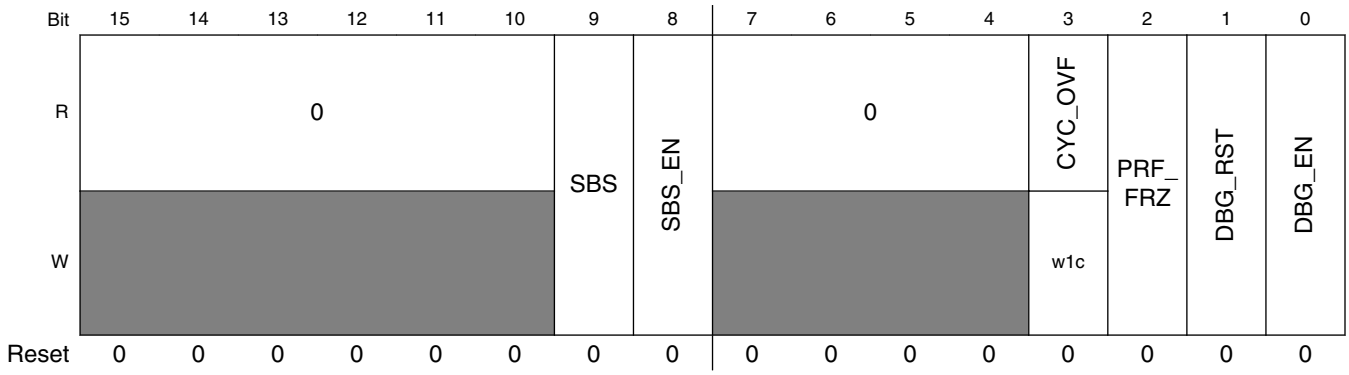
Supported Mode Of Operations:

For Channel 0: All

For Channel 1: LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 410h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0



MMDCx_MADPCR0 field descriptions

Field	Description
31–10 Reserved	This read-only field is reserved and always has the value 0.
9 SBS	Step By Step trigger. If SBS_EN is set to "1" then dispatching AXI pending access toward the DDR will done only if this bit is set to "1", otherwise no access will be dispatched toward the DDR. This bit is cleared when the pending access has been issued toward the DDR device. 1 Launch AXI pending access toward the DDR 0 No access will be launched toward the DDR
8 SBS_EN	Step By Step debug Enable. Enable step by step mode. Every time this mechanism is enabled then setting SBS to "1" will dispatch one pending AXI access to the DDR and in parallel its attributes will be observed in the status registers (MASBS0 and MASBS1). For further information see Step By Step (SBS) software monitor . 0 disable 1 enable
7–4 Reserved	This read-only field is reserved and always has the value 0.
3 CYC_OVF	Total Profiling Cycles Count Overflow. When profiling mechanism is enabled (DBG_EN is set to "1") then this bit is asserted when overflow of CYC_COUNT occurred. Cleared by writing 1 to it. 0 no overflow 1 overflow
2 PRF_FRZ	Profiling freeze. When this bit is asserted then the profiling mechanism will be froze and the associated status registers (MADPSR0-MADPSR5) will hold the current profiling values. 0 profiling counters are not frozen 1 profiling counters are frozen
1 DBG_RST	Debug and Profiling Reset. Reset all debug and profiling counters and components. 0 no reset 1 reset
0 DBG_EN	Debug and Profiling Enable. Enable debug and profiling mechanism. When this bit is asserted then the MMDC will perform a profiling based on the ID that is configured to MADPCR1. Upon assertion of PRF_FRZ the profiling will be froze and the profiling results will be sampled to the status registers (MADPSR0-MADPSR5). For further information see MMDC Profiling. 0 disable (default) 1 enable

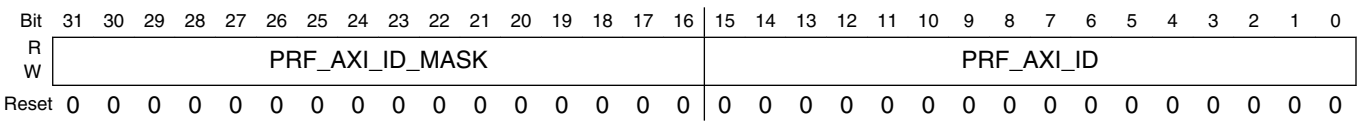
44.12.21 MMDC Core Debug and Profiling Control Register 1 (MMDCx_MADPCR1)

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 414h offset



MMDCx_MADPCR1 field descriptions

Field	Description
31–16 PRF_AXI_ID_ MASK	Profiling AXI ID Mask. AXI ID bits which masked by this value are chosen for profiling. 1 AXI ID specific bit is chosen for profiling 0 AXI ID specific bit is ignored (don't care)
PRF_AXI_ID	Profiling AXI ID. AXI IDs that match a bit-wise AND logic operation between PRF_AXI_ID and PRF_AXI_ID_MASK are chosen for profiling. Default value is 0x0, to choose any ID-s for profiling

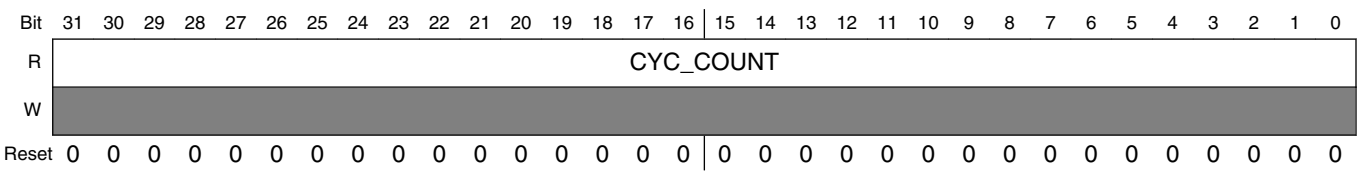
44.12.22 MMDC Core Debug and Profiling Status Register 0 (MMDCx_MADPSR0)

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 418h offset



MMDCx_MADPSR0 field descriptions

Field	Description
CYC_COUNT	Total Profiling cycle Count. This field reflects the total cycle count in case the profiling mechanism is enabled from assertion of DBG_EN and until PRF_FRZ is asserted

44.12.23 MMDC Core Debug and Profiling Status Register 1 (MMDCx_MADPSR1)

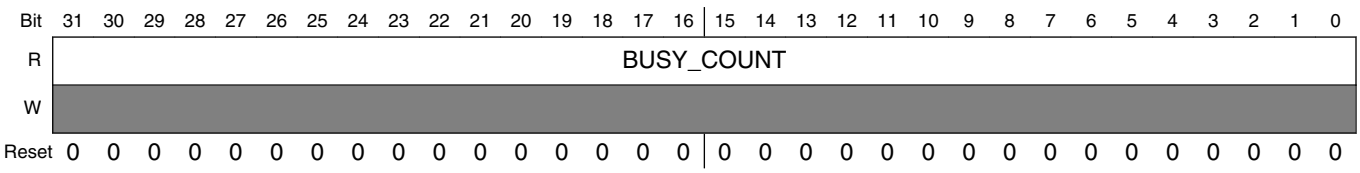
The register reflects the total cycles during which the MMDC state machines were busy (both writes and reads). This information can be used for DDR Utilization calculation.

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 41Ch offset



MMDCx_MADPSR1 field descriptions

Field	Description
BUSY_COUNT	Profiling Busy Cycles Count. This field reflects the total number of cycles where the MMDC read and write state machines were busy during the profiling period. Can be used for DDR utilization calculations. Busy cycles are any MMDC clock cycles where the internal state machine is not idle. If any read or write requests are pending in the FIFOs, the MMDC is not idle.

44.12.24 MMDC Core Debug and Profiling Status Register 2 (MMDCx_MADPSR2)

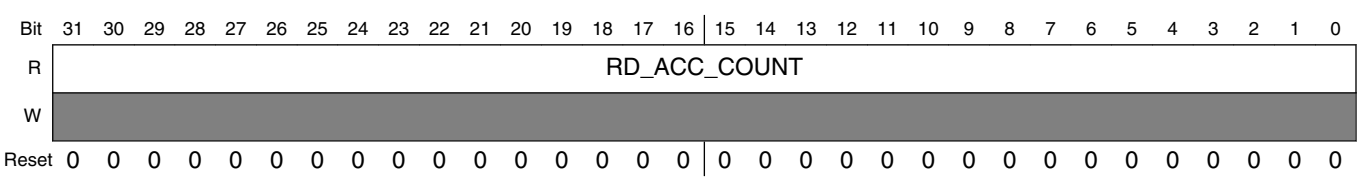
This register reflects the total number of read accesses (per AXI ID) toward MMDC.

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 420h offset



MMDCx_MADPSR2 field descriptions

Field	Description
RD_ACC_ COUNT	Profiling Read Access Count. This register reflects the total number of read accesses (per AXI ID) toward MMDC.

44.12.25 MMDC Core Debug and Profiling Status Register 3 (MMDCx_MADPSR3)

This register reflects the total number of write accesses (per AXI ID) toward MMDC.

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 424h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

MMDCx_MADPSR3 field descriptions

Field	Description
WR_ACC_ COUNT	Profiling Write Access Count. This register reflects the total number of write accesses (per AXI ID) toward MMDC.

44.12.26 MMDC Core Debug and Profiling Status Register 4 (MMDCx_MADPSR4)

This register reflects the total number of bytes that were transferred during read access (per AXI ID) toward MMDC.

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 428h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MMDCx_MADPSR4 field descriptions

Field	Description
RD_BYTES_ COUNT	Profiling Read Bytes Count. This register reflects the total number of bytes that were transferred during read access (per AXI ID) toward MMDC.

44.12.27 MMDC Core Debug and Profiling Status Register 5 (MMDCx_MADPSR5)

This register reflects the total number of bytes that were transferred during write access (per AXI ID) toward MMDC.

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 42Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MMDCx_MADPSR5 field descriptions

Field	Description
WR_BYTES_ COUNT	Profiling Write Bytes Count. This register reflects the total number of bytes that were transferred during write access (per AXI ID) toward MMDC.

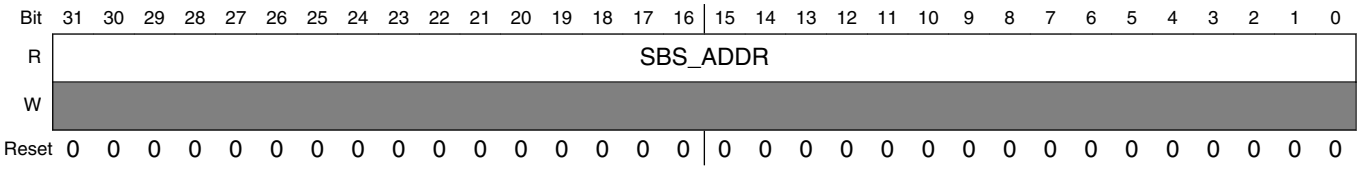
44.12.28 MMDC Core Step By Step Address Register (MMDCx_MASBS0)

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 430h offset



MMDCx_MASBS0 field descriptions

Field	Description
SBS_ADDR	Step By Step Address. These bits reflect the address of the pending request in case of step by step mode.

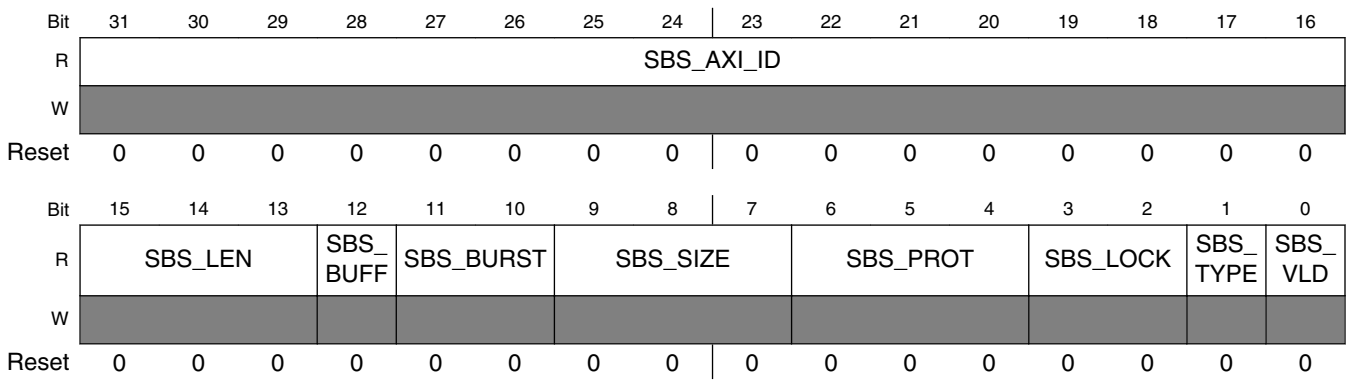
44.12.29 MMDC Core Step By Step Address Attributes Register (MMDCx_MASBS1)

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 434h offset



MMDCx_MASBS1 field descriptions

Field	Description
31–16 SBS_AXI_ID	Step By Step AXI ID. These bits reflect the AXI ID of the pending request in case of step by step mode.
15–13 SBS_LEN	Step By Step Length. These bits reflect the AXI LENGTH of the pending request in case of step by step mode. 000 burst of length 1 001 burst of length 2 111 burst of length 8
12 SBS_BUFF	Step By Step Buffered. This bit reflect the AXI CACHE[0] of the pending request in case of step by step mode. Relevant only for write requests

Table continues on the next page...

MMDCx_MASBS1 field descriptions (continued)

Field	Description
11–10 SBS_BURST	Step By Step Burst. These bits reflect the AXI BURST of the pending request in case of step by step mode. 00 FIXED 01 INCR burst 10 WRAP burst 11 reserved
9–7 SBS_SIZE	Step By Step Size. These bits reflect the AXI SIZE of the pending request in case of step by step mode. 000 8 bits 001 16 bits 010 32 bits 011 64 bits 100 128bits 101-111 Reserved
6–4 SBS_PROT	Step By Step Protection. These bits reflect the AXI PROT of the pending request in case of step by step mode.
3–2 SBS_LOCK	Step By Step Lock. These bits reflect the AXI LOCK of the pending request in case of step by step mode.
1 SBS_TYPE	Step By Step Request Type. These bits reflect the type (read/write) of the pending request in case of step by step mode. 0 write 1 read
0 SBS_VLD	Step By Step Valid. This bit reflects whether there is a pending request in case of step by step mode. 0 not valid 1 valid

44.12.30 MMDC Core General Purpose Register (MMDCx_MAGENP)

This register is a general 32 bit read/write register.

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 440h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	GP31_GP0																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MMDCx_MAGENP field descriptions

Field	Description
GP31_GP0	General purpose read/write bits.

44.12.31 MMDC PHY ZQ HW control register (MMDCx_MPZQHWCTRL)

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: LPDDR2 - When using LPDDR2, ZQ calibration must be applied to all channels in use.

Address: Base address + 800h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	ZQ_EARLY_COMPARATOR_EN_TIMER					0	TZQ_CS			TZQ_OPER			TZQ_INIT			ZQ_HW_FOR
W																
Reset	1	0	1	0	0	0	0	1	0	0	1	1	1	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	ZQ_HW_PD_RES					ZQ_HW_PU_RES					ZQ_HW_PER				ZQ_MODE	
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MMDCx_MPZQHWCTRL field descriptions

Field	Description
31–27 ZQ_EARLY_COMPARATOR_EN_TIMER	ZQ early comparator enable timer. This timer defines the interval between the warming up of the comparator of the i.MX ZQ calibration pad and the beginning of the ZQ calibration process with the pad 0x0 - 0x6 Reserved 0x7 8 cycles 0x14 21 cycles (Default) 0x1E 31 cycles 0x1F 32 cycles
26 Reserved	This read-only field is reserved and always has the value 0.
25–23 TZQ_CS	Device ZQ short time. This field holds the number of cycles that are required by the external DDR device to perform ZQ short calibration. Upon driving the command to the DDR device then no further accesses will be issued to the DDR device till satisfying that time. **NOTE:** In LPDDR2 the ZQ short time is taken from MPZQLP2CTL[ZQ_LP2_HW_ZQCS] **NOTE:** This field should not be update during ZQ calibration. 000 Reserved

Table continues on the next page...

MMDCx_MPZQHWCTRL field descriptions (continued)

Field	Description
	001 Reserved 010 128 cycles (Default) 011 256 cycles 100 512 cycles 101 1024 cycles 110- 111 Reserved
22–20 TZQ_OPER	Device ZQ long/oper time. This field holds the number of cycles that are required by the external DDR device to perform ZQ long calibration except the first ZQ long command that is issued after reset. Upon driving the command to the DDR device then no further accesses will be issued to the DDR device till satisfying that time. **NOTE:** In LPDDR2 the ZQ oper time is taken from MPZQLP2CTL[ZQ_LP2_HW_ZQCL] **NOTE:** This field should not be update during ZQ calibration. 000 Reserved 001 Reserved 010 128 cycles 011 256 cycles - Default (JEDEC value for DDR3) 100 512 cycles 101 1024 cycles 110- 111 Reserved
19–17 TZQ_INIT	Device ZQ long/init time. This field holds the number of cycles that are required by the external DDR device to perform ZQ long calibration right after reset. Upon driving the command to the DDR device then no further accesses will be issued to the DDR device till satisfying that time. **NOTE:** In LPDDR2 the ZQ init time is taken from MPZQLP2CTL[ZQ_LP2_HW_ZQINIT] **NOTE:** This field should not be update during ZQ calibration. 000 Reserved 001 Reserved 010 128 cycles 011 256 cycles 100 512 cycles - Default (JEDEC value for DDR3) 101 1024 cycles 110- 111 Reserved
16 ZQ_HW_FOR	Force ZQ automatic calibration process with the i.MX ZQ calibration pad. When this bit is asserted then the MMDC will issue one ZQ automatic calibration process with the i.MX ZQ calibration pad. It is the user responsibility to make sure that all the accesses to DDR will be finished before asserting this bit using CON_REQ/CON_ACK mechanism. HW will negate this bit upon completion of the ZQ calibration process. Upon negation of this bit the ZQ HW calibration pull-up and pull-down results (ZQ_HW_PU_RES and ZQ_HW_PD_RES respectively) are valid **NOTE:** In order to enable this bit ZQ_MODE must be set to either "1" or "3"
15–11 ZQ_HW_PD_ RES	ZQ HW calibration pull-down result. This field holds the pull-down resistor value calculated at the end of the ZQ automatic calibration process with the i.MX ZQ calibration pad. **NOTE:** An offset can be applied to this result, see MMDC_MPPDCMPR2[ZQ_PD_OFFSET]. 00000 Max. resistance. 11111 Min. resistance.

Table continues on the next page...

MMDCx_MPZQHWCTRL field descriptions (continued)

Field	Description
10–6 ZQ_HW_PU_RES	ZQ automatic calibration pull-up result. This field holds the pull-up resistor value calculated at the end of the ZQ automatic calibration process with the i.MX ZQ calibration pad. **NOTE:** An offset can be applied to this result, see MMDC_MPPDCMPR2[ZQ_PU_OFFSET] 00000 Min. resistance. 11111 Max. resistance.
5–2 ZQ_HW_PER	ZQ periodic calibration time. This field determines how often the periodic ZQ calibration is performed. This field is applied for both ZQ short calibration and ZQ automatic calibration process with i.MX ZQ calibration pad. Whenever this timer is expired then according to ZQ_MODE the ZQ automatic calibration process with the i.MX ZQ calibration pad will be issued and/or short/long command will be issued to the external DDR device. This field is ignored if ZQ_MODE equals "00" 0000 ZQ calibration is performed every 1 ms. 0001 ZQ calibration is performed every 2 ms. 0010 ZQ calibration is performed every 4 ms. 1010 ZQ calibration is performed every 1 sec. 1110 ZQ calibration is performed every 16 sec. 1111 ZQ calibration is performed every 32 sec.
ZQ_MODE	ZQ calibration mode: 0x0 No ZQ calibration is issued. (Default) 0x1 ZQ calibration is issued to i.MX ZQ calibration pad together with ZQ long command to the external DDR device only when exiting self refresh. 0x2 ZQ calibration command long/short is issued only to the external DDR device periodically and when exiting self refresh 0x3 ZQ calibration is issued to i.MX ZQ calibration pad together with ZQ calibration command long/short to the external DDR device periodically and when exiting self refresh

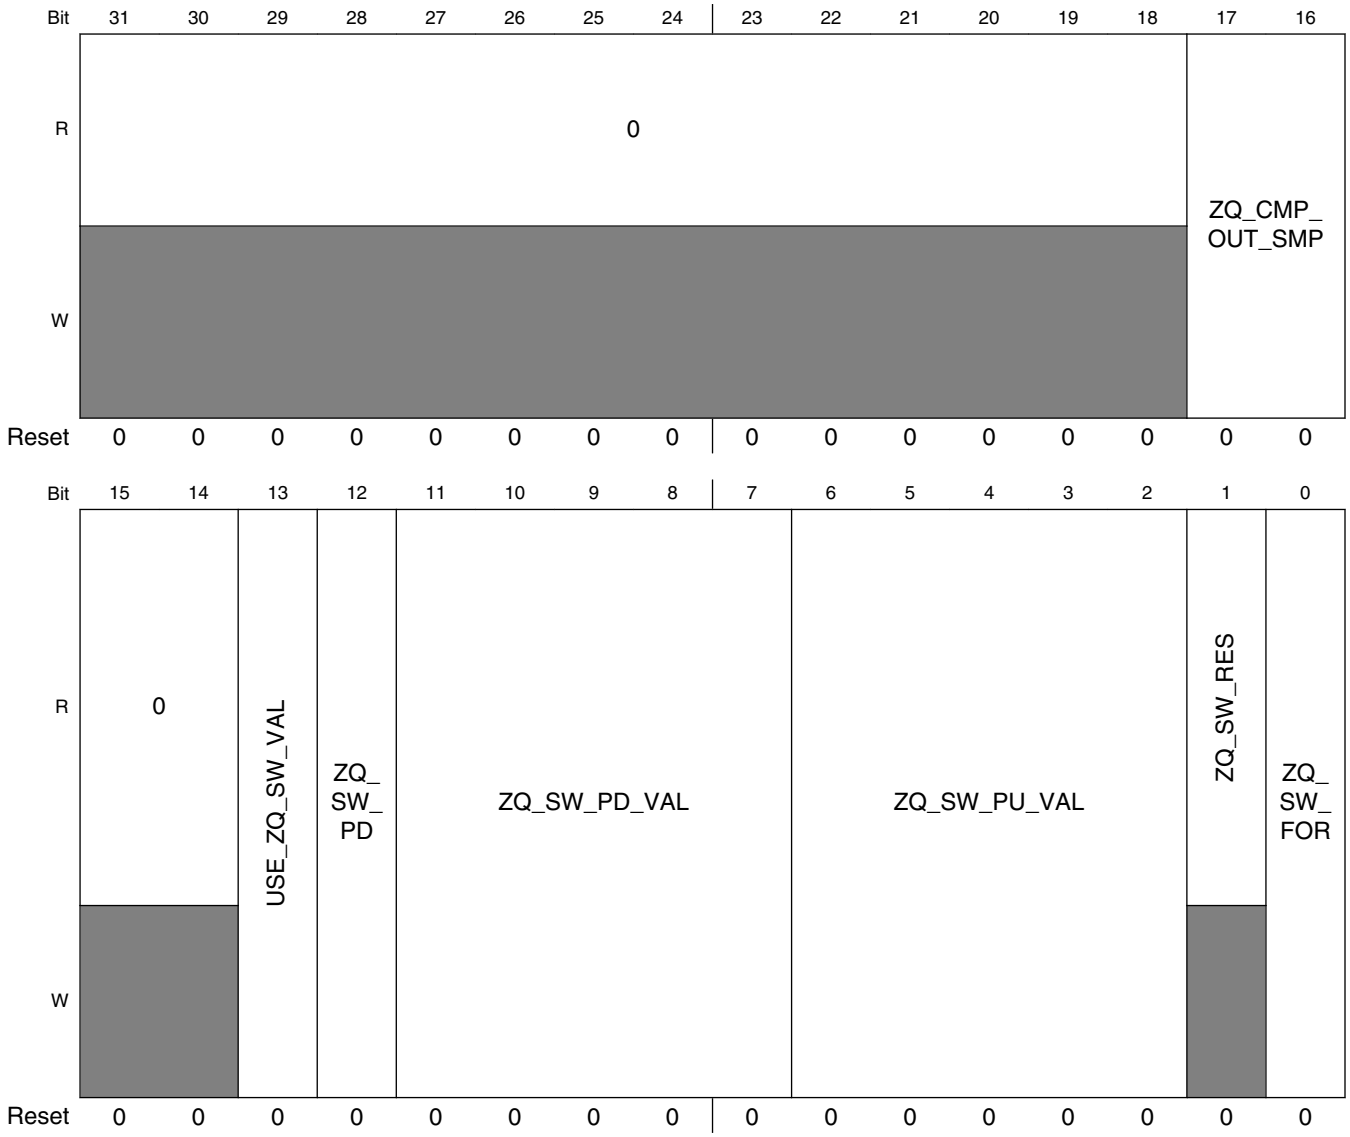
44.12.32 MMDC PHY ZQ SW control register (MMDCx_MPZQSWCTRL)

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: When using LPDDR2, ZQ calibration must be applied to all channels in use.

Address: Base address + 804h offset



MMDCx_MPZQSWCTRL field descriptions

Field	Description
31–18 Reserved	This read-only field is reserved and always has the value 0.
17–16 ZQ_CMP_OUT_SMP	Defines the amount of cycles between driving the ZQ signals to the ZQ pad and till sampling the comparator enable output while performing ZQ calibration process with the i.MX ZQ calibration pad 00 7 cycles 01 15 cycles 10 23 cycles 11 31 cycles
15–14 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

MMDCx_MPZQSWCTRL field descriptions (continued)

Field	Description
13 USE_ZQ_SW_VAL	Use SW ZQ configured value for I/O pads resistor controls. This bit selects whether ZQ SW value or ZQ HW value will be driven to the I/O pads resistor controls. By default this bit is cleared and MMDC drives the HW ZQ status bits on the resistor controls of the I/O pads. **NOTE:** This bit should not be updated during ZQ calibration. 0 Fields ZQ_HW_PD_VAL & ZQ_HW_PU_VAL will be driven to I/O pads resistor controls. 1 Fields ZQ_SW_PD_VAL & ZQ_SW_PU_VAL will be driven to I/O pads resistor controls.
12 ZQ_SW_PD	ZQ software PU/PD calibration. This bit determines the calibration stage (PU or PD). 0 PU resistor calibration 1 PD resistor calibration
11–7 ZQ_SW_PD_VAL	ZQ software pull-down resistance. This field determines the value of the PD resistor during SW ZQ calibration. 00000 Max. resistance. 11111 Min. resistance.
6–2 ZQ_SW_PU_VAL	ZQ software pull-up resistance. This field determines the value of the PU resistor during SW ZQ calibration. 00000 Min. resistance. 11111 Max. resistance.
1 ZQ_SW_RES	ZQ software calibration result. This bit reflects the ZQ calibration voltage comparator value. 0 Current ZQ calibration voltage is less than VDD/2. 1 Current ZQ calibration voltage is more than VDD/2
0 ZQ_SW_FOR	ZQ SW calibration enable. This bit when asserted enables ZQ SW calibration. HW negates this bit upon completion of the ZQ SW calibration. Upon negation of this bit the ZQ SW calibration result (i.e. ZQ_SW_RES) is valid

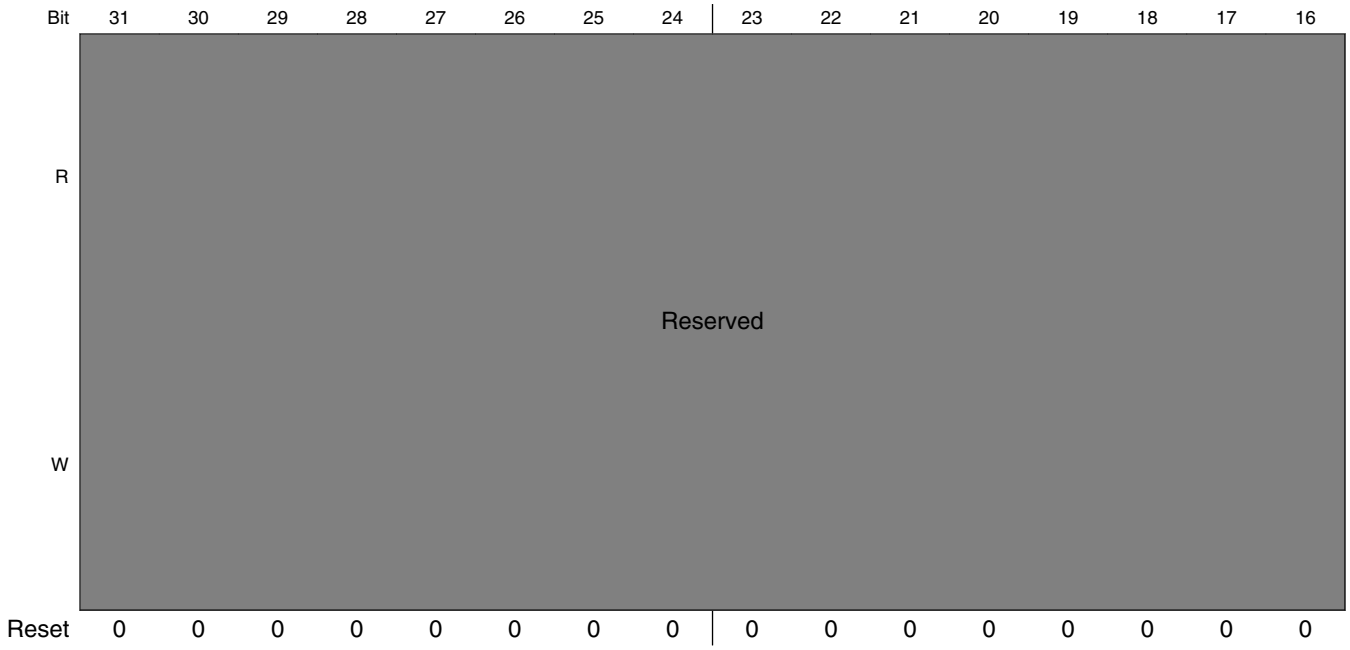
44.12.33 MMDC PHY Write Leveling Configuration and Error Status Register (MMDCx_MPWLGCR)

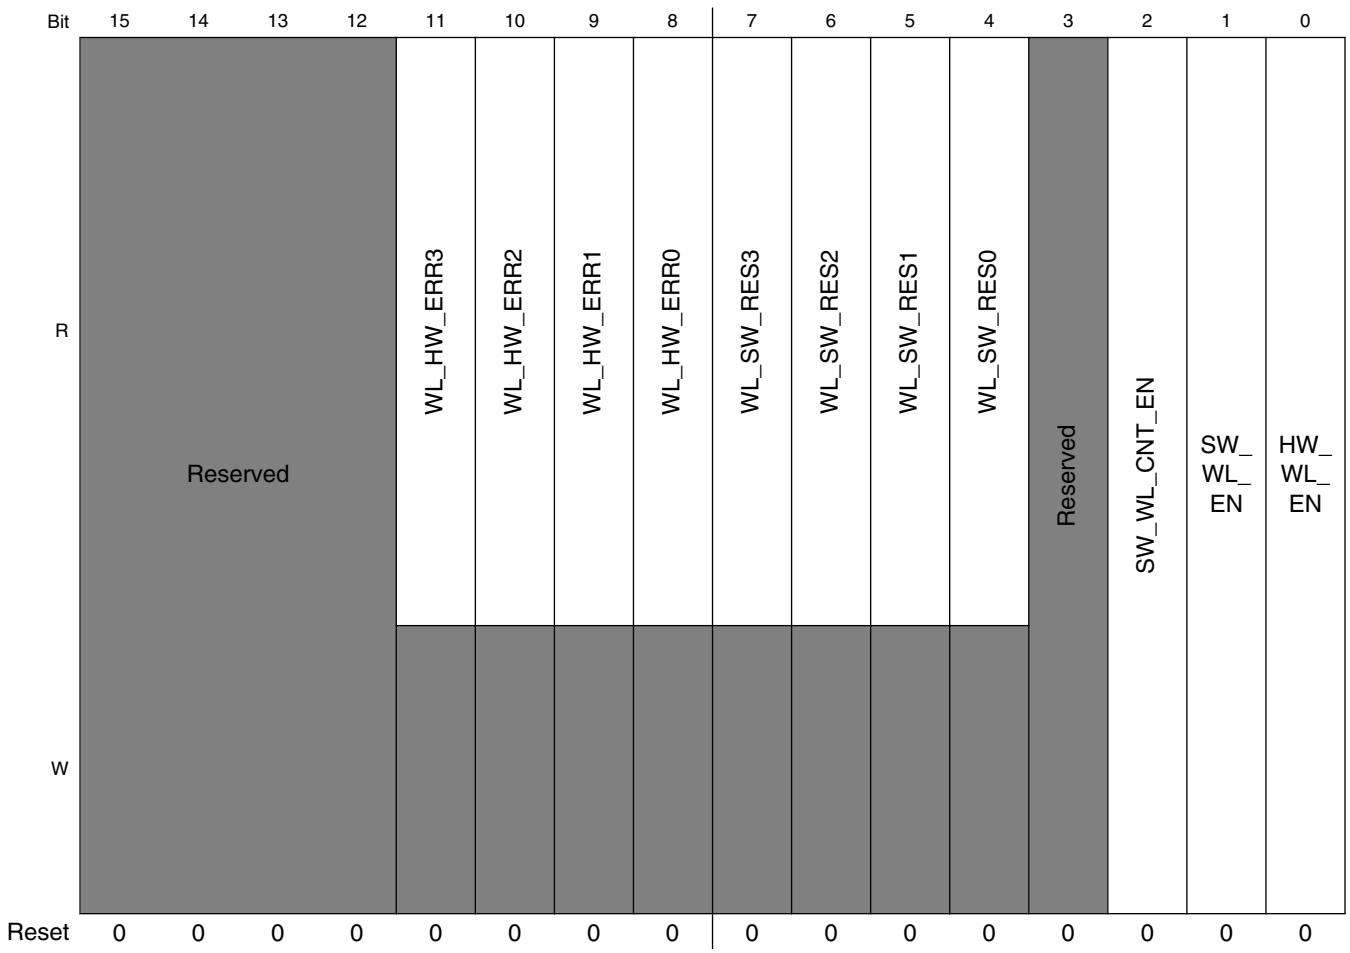
Supported Mode Of Operations:

For Channel 0: All

For Channel 1: DDR3_x64, LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 808h offset





MMDCx_MPWLGCR field descriptions

Field	Description
31–12 -	This field is reserved. Reserved
11 WL_HW_ERR3	Byte3 write-leveling HW calibration error. This bit is asserted when an error was found on byte3 during write-leveling HW calibration. This bit is valid only upon completion of the write-leveling HW calibration (i.e. HW_WL_EN bit is de-asserted) 0 No error was found on byte3 during write-leveling HW calibration. 1 An error was found on byte3 during write-leveling HW calibration.
10 WL_HW_ERR2	Byte2 write-leveling HW calibration error. This bit is asserted when an error was found on byte2 during write-leveling HW calibration. This bit is valid only upon completion of the write-leveling HW calibration (i.e. HW_WL_EN bit is de-asserted) 0 No error was found on byte2 during write-leveling HW calibration. 1 An error was found on byte2 during write-leveling HW calibration.
9 WL_HW_ERR1	Byte1 write-leveling HW calibration error. This bit is asserted when an error was found on byte1 during write-leveling HW calibration. This bit is valid only upon completion of the write-leveling HW calibration (i.e. HW_WL_EN bit is de-asserted) 0 No error was found on byte1 during write-leveling HW calibration. 1 An error was found on byte1 during write-leveling HW calibration.
8 WL_HW_ERR0	Byte0 write-leveling HW calibration error. This bit is asserted when an error was found on byte0 during write-leveling HW calibration. This bit is valid only upon completion of the write-leveling HW calibration (i.e. HW_WL_EN bit is de-asserted) 0 No error was found on byte0 during write-leveling HW calibration. 1 An error was found on byte0 during write-leveling HW calibration.
7 WL_SW_RES3	Byte3 write-leveling software result. This bit reflects the value that is driven by the DDR device on DQ24 during SW write-leveling. 0 DQS3 sampled low CK during SW write-leveling. 1 DQS3 sampled high CK during SW write-leveling.
6 WL_SW_RES2	Byte2 write-leveling software result. This bit reflects the value that is driven by the DDR device on DQ16 during SW write-leveling. 0 DQS2 sampled low CK during SW write-leveling. 1 DQS2 sampled high CK during SW write-leveling.
5 WL_SW_RES1	Byte1 write-leveling software result. This bit reflects the value that is driven by the DDR device on DQ8 during SW write-leveling. 0 DQS1 sampled low CK during SW write-leveling. 1 DQS1 sampled high CK during SW write-leveling.
4 WL_SW_RES0	Byte0 write-leveling software result. This bit reflects the value that is driven by the DDR device on DQ0 during SW write-leveling.

Table continues on the next page...

MMDCx_MPWLGCR field descriptions (continued)

Field	Description
	0 DQS0 sampled low CK during SW write-leveling. 1 DQS0 sampled high CK during SW write-leveling.
3 -	This field is reserved. Reserved
2 SW_WL_CNT_EN	SW write-leveling count down enable. This bit when asserted set a certain delay of (25+15) cycles from the setting of SW_WL_EN and before driving the DQS to the DDR device. This bit should be asserted before the first SW write-leveling request and after issuing the write leveling MRS command 0 MMDC doesn't count 25+15 cycles before issuing write-leveling DQS. 1 MMDC counts 25+15 cycles before issuing write-leveling DQS.
1 SW_WL_EN	Write-Leveling SW enable. If this bit is asserted then the MMDC will perform one write-leveling iteration with the DDR device (assuming that Write-Leveling procedure is already enabled in the DDR device through MRS command). HW negate this bit upon completion of the SW write-leveling. Negation of this bit also points that the write-leveling SW calibration result is valid **NOTE:** If this bit and the SW_WL_CNT_EN are enabled the MMDC counts 25 + 15 cycles before issuing the SW write-leveling DQS.
0 HW_WL_EN	Write-Leveling HW (automatic) enable. If this bit is asserted then the MMDC will perform the whole Write-Leveling sequence with the DDR device (assuming that Write-Leveling procedure is already enabled in the DDR device through MRS command). HW negates this bit upon completion of the HW write-leveling. Negation of this bit also points that the write-leveling HW calibration results are valid **NOTE:** Before issuing the first DQS the MMDC counts 25 + 15 cycles automatically as required by the standard.

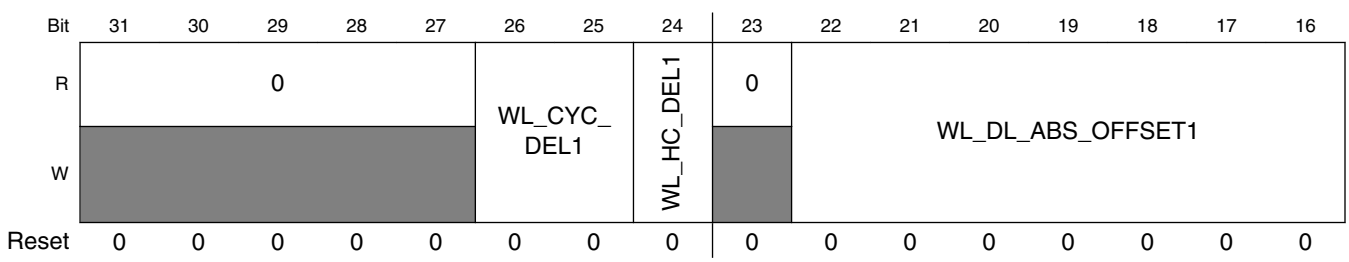
44.12.34 MMDC PHY Write Leveling Delay Control Register 0 (MMDCx_MPWLDECTRL0)

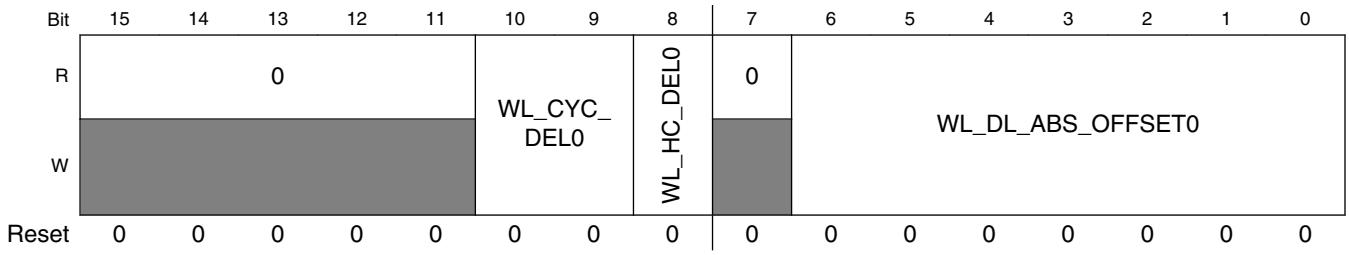
Supported Mode OF Operations:

For Channel 0: All

For Channel 1: DDR3_x64, LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 80Ch offset





MMDCx_MPWLDECTRL0 field descriptions

Field	Description
31–27 Reserved	This read-only field is reserved and always has the value 0.
26–25 WL_CYC_DEL1	Write leveling cycle delay for Byte 1. This field indicates whether a delay of 1 or 2 cycles between CK and write DQS is added to the delay that is indicated in the associated WR_DL_ABS_OFFSET and WL_HC_DEL. So the total delay is the sum of (WL_DL_ABS_OFFSET/256*cycle) + (WL_HC_DEL*half cycle) + (WL_CYC_DEL*cycle). When both SW write-leveling is enabled (i.e. SW_WL_EN = 1) or HW write-leveling is enabled (i.e. HW_WL_EN = 1) then this value will be taken as is and will be added to the associated delay that is configured in WL_DL_OFFSET and WL_HC_DEL. **NOTE:** In HW write-leveling this field is not used for indication, as in WL_DL_OFFSET and WL_HC_DEL, but for configuration. 0 No delay is added. 1 1 cycle delay is added. 2 2 cycles delay is added. 3 Reserved.
24 WL_HC_DEL1	Write leveling half cycle delay for Byte 1. This field indicates whether a delay of half cycle between CK and write DQS is added to the delay that is indicated in the associated WR_DL_ABS_OFFSET and WL_CYC_DEL. So the total delay is the sum of (WL_DL_ABS_OFFSET/256*cycle) + (WL_HC_DEL*half cycle) + (WL_CYC_DEL*cycle). When SW write-leveling is enabled (i.e. SW_WL_EN = 1) then this value will be taken as is and will be added to the associated delay that is configured in WL_DL_OFFSET and WL_CYC_DEL. When HW write-leveling is enabled (i.e. HW_WL_EN = 1) then this value will indicate (status) whether a delay of half cycle was added or not to the associated WL_DL_OFFSET and WL_CYC_DEL. 0 No delay is added. 1 Half cycle delay is added.
23 Reserved	This read-only field is reserved and always has the value 0.
22–16 WL_DL_ABS_ OFFSET1	Absolute write-leveling delay offset for Byte 1. This field indicates the absolute delay between CK and write DQS of Byte1 with fractions of a clock period and up to half cycle. This value is process and frequency independent. The value of the delay can be calculated using the following equation (WR_DL_ABS_OFFSET1 / 256) * clock period When SW write-leveling is enabled (i.e. SW_WL_EN = 1) then this value will be taken as is to the associated delay-line. When HW write-leveling is enabled (i.e. HW_WL_EN = 1) then this value will indicate (status) the value that is taken to the associated delay-line at the end of the write-leveling calibration. **NOTE:** The delay-line has a resolution that may vary between device to device, therefore is some cases an increment of the delay by 1 step may be smaller than the delay-line resolution.

Table continues on the next page...

MMDCx_MPWLDECTRL0 field descriptions (continued)

Field	Description
15–11 Reserved	This read-only field is reserved and always has the value 0.
10–9 WL_CYC_DEL0	Write leveling cycle delay for Byte 0. This field indicates whether a delay of 1 or 2 cycles between CK and write DQS is added to the delay that is indicated in the associated WR_DL_ABS_OFFSET and WL_HC_DEL. So the total delay is the sum of (WL_DL_ABS_OFFSET/256*cycle) + (WL_HC_DEL*half cycle) + (WL_CYC_DEL*cycle). When both SW write-leveling is enabled (i.e. SW_WL_EN = 1) or HW write-leveling is enabled (i.e. HW_WL_EN = 1) then this value will be taken as is and will be added to the associated delay that is configured in WL_DL_OFFSET and WL_HC_DEL. Note that in HW write-leveling this field is not used for indication, as in WL_DL_OFFSET and WL_HC_DEL, but for configuration. 0 No delay is added. 1 1 cycle delay is added. 2 2 cycles delay is added. 3 Reserved.
8 WL_HC_DEL0	Write leveling half cycle delay for Byte 0. This field indicates whether a delay of half cycle between CK and write DQS is added to the delay that is indicated in the associated WR_DL_ABS_OFFSET and WL_CYC_DEL. So the total delay is the sum of (WL_DL_ABS_OFFSET/256*cycle) + (WL_HC_DEL*half cycle) + (WL_CYC_DEL*cycle). When SW write-leveling is enabled (i.e. SW_WL_EN = 1) then this value will be taken as is and will be added to the associated delay that is configured in WL_DL_OFFSET and WL_CYC_DEL. When HW write-leveling is enabled (i.e. HW_WL_EN = 1) then this value will indicate (status) whether a delay of half cycle was added or not to the associated WL_DL_OFFSET and WL_CYC_DEL. 0 No delay is added. 1 Half cycle delay is added.
7 Reserved	This read-only field is reserved and always has the value 0.
WL_DL_ABS_ OFFSET0	Absolute write-leveling delay offset for Byte 0. This field indicates the absolute delay between CK and write DQS of Byte0 with fractions of a clock period and up to half cycle. This value is process and frequency independent. The value of the delay can be calculated using the following equation (WR_DL_ABS_OFFSET1 / 256) * clock period When SW write-leveling is enabled (i.e. SW_WL_EN = 1) then this value will be taken as is to the associated delay-line. When HW write-leveling is enabled (i.e. HW_WL_EN = 1) then this value will indicate (status) the value that is taken to the associated delay-line at the end of the write-leveling calibration. **NOTE:** The delay-line has a resolution that may vary between device to device, therefore is some cases an increment of the delay by 1 step may be smaller than the delay-line resolution.

44.12.35 MMDC PHY Write Leveling Delay Control Register 1 (MMDCx_MPWLDECTRL1)

44.12.36 MMDC PHY Write Leveling delay-line Status Register (MMDCx_MPWLDLST)

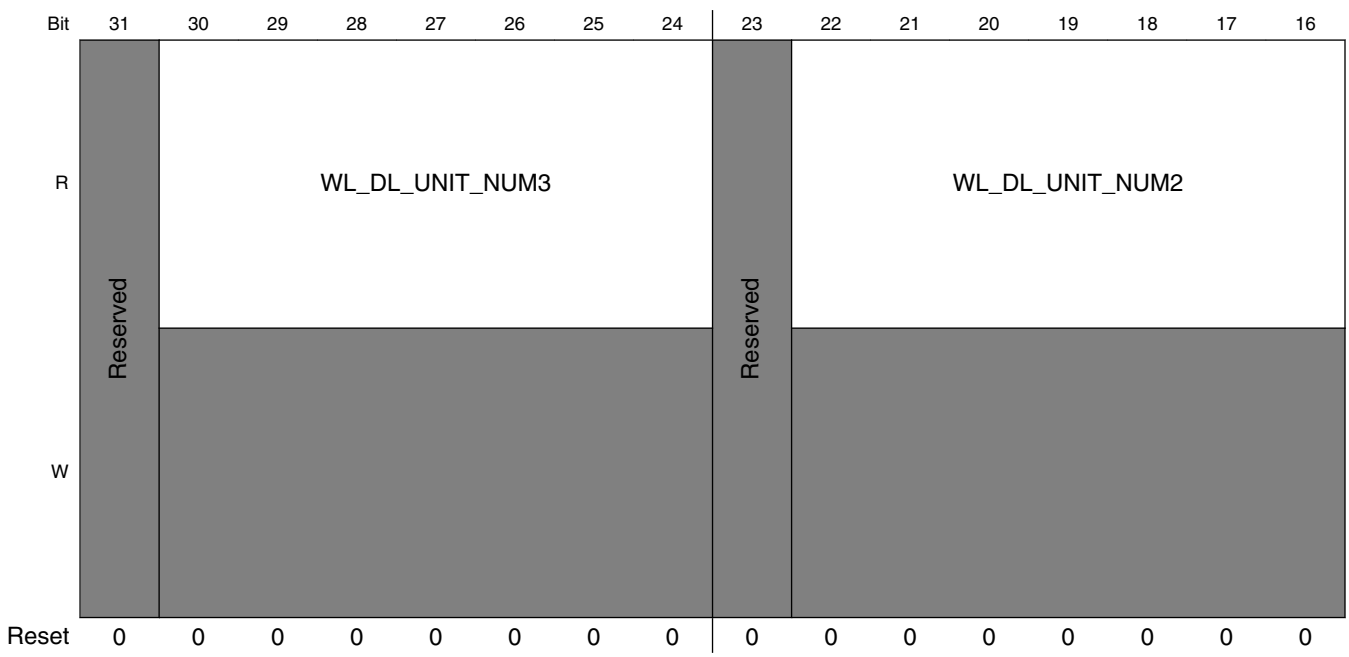
This register holds the status of the four write leveling delay-lines.

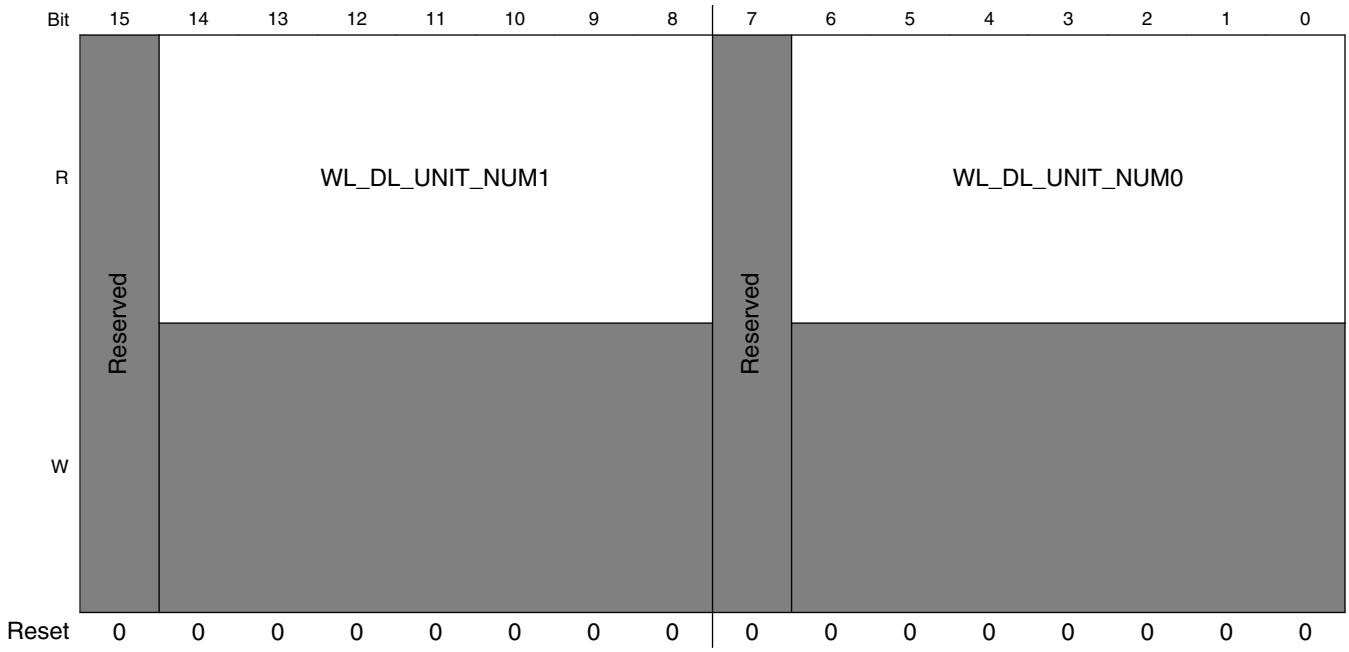
Supported Mode Of Operations:

For Channel 0: All

For Channel 1: DDR3_x64, LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 814h offset





MMDCx_MPWLDLST field descriptions

Field	Description
31 -	This field is reserved. Reserved
30–24 WL_DL_UNIT_NUM3	This field reflects the number of delay units that are actually used by write leveling delay-line 3.
23 -	This field is reserved. Reserved
22–16 WL_DL_UNIT_NUM2	This field reflects the number of delay units that are actually used by write leveling delay-line 2.
15 -	This field is reserved. Reserved
14–8 WL_DL_UNIT_NUM1	This field reflects the number of delay units that are actually used by write leveling delay-line 1.
7 -	This field is reserved. Reserved
WL_DL_UNIT_NUM0	This field reflects the number of delay units that are actually used by write leveling delay-line 0.

44.12.37 MMDC PHY ODT control register (MMDCx_MPODTCTRL)

NOTE

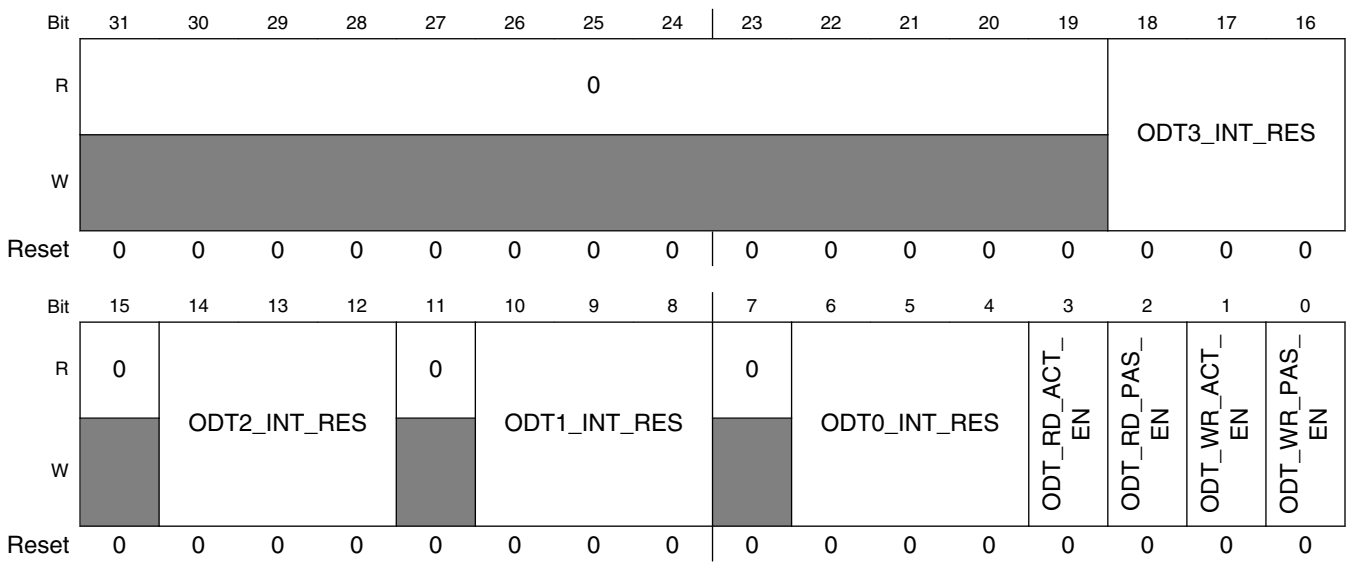
In LPDDR2 mode this register should be cleared, so no termination will be activated

Supported Mode Of Operations:

For Channel 0: DDR3_x16, DDR3_x32, DDR3_x64

For Channel 1: DDR3_x64

Address: Base address + 818h offset



MMDCx_MPODTCTRL field descriptions

Field	Description
31–19 Reserved	This read-only field is reserved and always has the value 0.
18–16 ODT3_INT_RES	On chip ODT byte3 resistor - This field determines the Rtt_Nom of the on chip ODT byte3 resistor during read accesses. 000 Rtt_Nom Disabled. 001 Rtt_Nom 120 Ohm 010 Rtt_Nom 60 Ohm 011 Rtt_Nom 40 Ohm 100 Rtt_Nom 30 Ohm 101 Rtt_Nom 24 Ohm 110 Rtt_Nom 20 Ohm 111 Rtt_Nom 17 Ohm

MMDCx_MPRDDQBY1DL field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–28 rd_dq15_del	Read dqs1 to dq15 delay fine-tuning. This field holds the number of delay units that are added to dq15 relative to dqs1. 000 No change in dq15 delay 001 Add dq15 delay of 1 delay unit 010 Add dq15 delay of 2 delay units. 011 Add dq15 delay of 3 delay units. 100 Add dq15 delay of 4 delay units. 101 Add dq15 delay of 5 delay units. 110 Add dq15 delay of 6 delay units. 111 Add dq15 delay of 7 delay units.
27 Reserved	This read-only field is reserved and always has the value 0.
26–24 rd_dq14_del	Read dqs1 to dq14 delay fine-tuning. This field holds the number of delay units that are added to dq14 relative to dqs1. 000 No change in dq14 delay 001 Add dq14 delay of 1 delay unit 010 Add dq14 delay of 2 delay units. 011 Add dq14 delay of 3 delay units. 100 Add dq14 delay of 4 delay units.

Table continues on the next page...

MMDCx_MPRDDQBY1DL field descriptions (continued)

Field	Description
	101 Add dq14 delay of 5 delay units. 110 Add dq14 delay of 6 delay units. 111 Add dq14 delay of 7 delay units.
23 Reserved	This read-only field is reserved and always has the value 0.
22–20 rd_dq13_del	Read dqs1 to dq13 delay fine-tuning. This field holds the number of delay units that are added to dq13 relative to dqs1. 000 No change in dq13 delay 001 Add dq13 delay of 1 delay unit 010 Add dq13 delay of 2 delay units. 011 Add dq13 delay of 3 delay units. 100 Add dq13 delay of 4 delay units. 101 Add dq13 delay of 5 delay units. 110 Add dq13 delay of 6 delay units. 111 Add dq13 delay of 7 delay units.
19 Reserved	This read-only field is reserved and always has the value 0.
18–16 rd_dq12_del	Read dqs1 to dq12 delay fine-tuning. This field holds the number of delay units that are added to dq12 relative to dqs1. 000 No change in dq12 delay 001 Add dq12 delay of 1 delay unit 010 Add dq12 delay of 2 delay units. 011 Add dq12 delay of 3 delay units. 100 Add dq12 delay of 4 delay units. 101 Add dq12 delay of 5 delay units. 110 Add dq12 delay of 6 delay units. 111 Add dq12 delay of 7 delay units.
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 rd_dq11_del	Read dqs1 to dq11 delay fine-tuning. This field holds the number of delay units that are added to dq11 relative to dqs1. 000 No change in dq11 delay 001 Add dq11 delay of 1 delay unit 010 Add dq11 delay of 2 delay units. 011 Add dq11 delay of 3 delay units. 100 Add dq11 delay of 4 delay units. 101 Add dq11 delay of 5 delay units. 110 Add dq11 delay of 6 delay units. 111 Add dq11 delay of 7 delay units.
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 rd_dq10_del	Read dqs1 to dq10 delay fine-tuning. This field holds the number of delay units that are added to dq10 relative to dqs1. 000 No change in dq10 delay

Table continues on the next page...

MMDCx_MPRDDQBY1DL field descriptions (continued)

Field	Description
	001 Add dq10 delay of 1 delay unit 010 Add dq10 delay of 2 delay units. 011 Add dq10 delay of 3 delay units. 100 Add dq10 delay of 4 delay units. 101 Add dq10 delay of 5 delay unit 110 Add dq10 delay of 6 delay units. 111 Add dq10 delay of 7 delay units.
7 Reserved	This read-only field is reserved and always has the value 0.
6–4 rd_dq9_del	Read dqs1 to dq9 delay fine-tuning. This field holds the number of delay units that are added to dq9 relative to dqs1. 000 No change in dq9 delay 001 Add dq9 delay of 1 delay unit 010 Add dq9 delay of 2 delay units. 011 Add dq9 delay of 3 delay units. 100 Add dq9 delay of 4 delay units. 101 Add dq9 delay of 5 delay units. 110 Add dq9 delay of 6 delay units. 111 Add dq9 delay of 7 delay units.
3 Reserved	This read-only field is reserved and always has the value 0.
rd_dq8_del	Read dqs1 to dq8 delay fine-tuning. This field holds the number of delay units that are added to dq8 relative to dqs1. 000 No change in dq8 delay 001 Add dq8 delay of 1 delay unit 010 Add dq8 delay of 2 delay units. 011 Add dq8 delay of 3 delay units. 100 Add dq8 delay of 4 delay units. 101 Add dq8 delay of 5 delay units. 110 Add dq8 delay of 6 delay units. 111 Add dq8 delay of 7 delay units.

44.12.40 MMDC PHY Read DQ Byte2 Delay Register (MMDCx_MPRDDQBY2DL)

This register is used to add fine-tuning adjustment to every bit in the read DQ byte2 relative to the read DQS

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: DDR3_x64, LP2_2ch_x32

Address: Base address + 824h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

MMDCx_MPRDDQBY2DL field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–28 rd_dq23_del	Read dqs2 to dq23 delay fine-tuning. This field holds the number of delay units that are added to dq23 relative to dqs2. 000 No change in dq23 delay 001 Add dq23 delay of 1 delay unit 010 Add dq23 delay of 2 delay units. 011 Add dq23 delay of 3 delay units. 100 Add dq23 delay of 4 delay units. 101 Add dq23 delay of 5 delay units. 110 Add dq23 delay of 6 delay units. 111 Add dq23 delay of 7 delay units.
27 Reserved	This read-only field is reserved and always has the value 0.
26–24 rd_dq22_del	Read dqs2 to dq22 delay fine-tuning. This field holds the number of delay units that are added to dq22 relative to dqs2. 000 No change in dq22 delay 001 Add dq22 delay of 1 delay unit 010 Add dq22 delay of 2 delay units. 011 Add dq22 delay of 3 delay units. 100 Add dq22 delay of 4 delay units. 101 Add dq22 delay of 5 delay units. 110 Add dq22 delay of 6 delay units. 111 Add dq22 delay of 7 delay units.
23 Reserved	This read-only field is reserved and always has the value 0.
22–20 rd_dq21_del	Read dqs2 to dq21 delay fine-tuning. This field holds the number of delay units that are added to dq21 relative to dqs2. 000 No change in dq21 delay 001 Add dq21 delay of 1 delay unit 010 Add dq21 delay of 2 delay units. 011 Add dq21 delay of 3 delay units. 100 Add dq21 delay of 4 delay units. 101 Add dq21 delay of 5 delay units.

Table continues on the next page...

MMDCx_MPRDDQBY2DL field descriptions (continued)

Field	Description
	110 Add dq21 delay of 6 delay units. 111 Add dq21 delay of 7 delay units.
19 Reserved	This read-only field is reserved and always has the value 0.
18–16 rd_dq20_del	Read dqs2 to dq20 delay fine-tuning. This field holds the number of delay units that are added to dq20 relative to dqs2. 000 No change in dq20 delay 001 Add dq20 delay of 1 delay unit 010 Add dq20 delay of 2 delay units. 011 Add dq20 delay of 3 delay units. 100 Add dq20 delay of 4 delay units. 101 Add dq20 delay of 5 delay units. 110 Add dq20 delay of 6 delay units. 111 Add dq20 delay of 7 delay units.
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 rd_dq19_del	Read dqs2 to dq19 delay fine-tuning. This field holds the number of delay units that are added to dq19 relative to dqs2. 000 No change in dq19 delay 001 Add dq19 delay of 1 delay unit 010 Add dq19 delay of 2 delay units. 011 Add dq19 delay of 3 delay units. 100 Add dq19 delay of 4 delay units. 101 Add dq19 delay of 5 delay units. 110 Add dq19 delay of 6 delay units. 111 Add dq19 delay of 7 delay units.
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 rd_dq18_del	Read dqs2 to dq18 delay fine-tuning. This field holds the number of delay units that are added to dq18 relative to dqs2. 000 No change in dq18 delay 001 Add dq18 delay of 1 delay unit 010 Add dq18 delay of 2 delay units. 011 Add dq18 delay of 3 delay units. 100 Add dq18 delay of 4 delay units. 101 Add dq18 delay of 5 delay units. 110 Add dq18 delay of 6 delay units. 111 Add dq18 delay of 7 delay units.
7 Reserved	This read-only field is reserved and always has the value 0.
6–4 rd_dq17_del	Read dqs2 to dq17 delay fine-tuning. This field holds the number of delay units that are added to dq17 relative to dqs2. 000 No change in dq17 delay 001 Add dq17 delay of 1 delay unit

Table continues on the next page...

MMDCx_MPRDDQBY2DL field descriptions (continued)

Field	Description
	010 Add dq17 delay of 2 delay units. 011 Add dq17 delay of 3 delay units. 100 Add dq17 delay of 4 delay units. 101 Add dq17 delay of 5 delay units. 110 Add dq17 delay of 6 delay units. 111 Add dq17 delay of 7 delay units.
3 Reserved	This read-only field is reserved and always has the value 0.
rd_dq16_del	Read dqs2 to dq16 delay fine-tuning. This field holds the number of delay units that are added to dq16 relative to dqs2. 000 No change in dq16 delay 001 Add dq16 delay of 1 delay unit 010 Add dq16 delay of 2 delay units. 011 Add dq16 delay of 3 delay units. 100 Add dq16 delay of 4 delay units. 101 Add dq16 delay of 5 delay units. 110 Add dq16 delay of 6 delay units. 111 Add dq16 delay of 7 delay units.

44.12.41 MMDC PHY Read DQ Byte3 Delay Register (MMDCx_MPRDDQBY3DL)

This register is used to add fine-tuning adjustment to every bit in the read DQ byte3 relative to the read DQS.

The bit assignments and the bit field descriptions for the register are shown below.

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: DDR3_x64, LP2_2ch_x32

Address: Base address + 828h offset

MMDCx_MPRDDQBY3DL field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–28 rd_dq31_del	Read dqs3 to dq31 delay fine-tuning. This field holds the number of delay units that are added to dq31 relative to dqs3. 000 No change in dq31 delay 001 Add dq31 delay of 1 delay unit 010 Add dq31 delay of 2 delay units. 011 Add dq31 delay of 3 delay units. 100 Add dq31 delay of 4 delay units. 101 Add dq31 delay of 5 delay units. 110 Add dq31 delay of 6 delay units. 111 Add dq31 delay of 7 delay units.
27 Reserved	This read-only field is reserved and always has the value 0.
26–24 rd_dq30_del	Read dqs3 to dq30 delay fine-tuning. This field holds the number of delay units that are added to dq30 relative to dqs3. 000 No change in dq30 delay 001 Add dq30 delay of 1 delay unit 010 Add dq30 delay of 2 delay units. 011 Add dq30 delay of 3 delay units. 100 Add dq30 delay of 4 delay units. 101 Add dq30 delay of 5 delay units. 110 Add dq30 delay of 6 delay units. 111 Add dq30 delay of 7 delay units.
23 Reserved	This read-only field is reserved and always has the value 0.
22–20 rd_dq29_del	Read dqs3 to dq29 delay fine-tuning. This field holds the number of delay units that are added to dq29 relative to dqs3. 000 No change in dq29 delay 001 Add dq29 delay of 1 delay unit 010 Add dq29 delay of 2 delay units. 011 Add dq29 delay of 3 delay units. 100 Add dq29 delay of 4 delay units. 101 Add dq29 delay of 5 delay units. 110 Add dq29 delay of 6 delay units. 111 Add dq29 delay of 7 delay units.
19 Reserved	This read-only field is reserved and always has the value 0.
18–16 rd_dq28_del	Read dqs3 to dq28 delay fine-tuning. This field holds the number of delay units that are added to dq28 relative to dqs3. 000 No change in dq28 delay 001 Add dq28 delay of 1 delay unit 010 Add dq28 delay of 2 delay units. 011 Add dq28 delay of 3 delay units.

Table continues on the next page...

MMDCx_MPRDDQBY3DL field descriptions (continued)

Field	Description
	100 Add dq28 delay of 4 delay units. 101 Add dq28 delay of 5 delay units. 110 Add dq28 delay of 6 delay units. 111 Add dq28 delay of 7 delay units.
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 rd_dq27_del	Read dqs3 to dq27 delay fine-tuning. This field holds the number of delay units that are added to dq27 relative to dqs3. 000 No change in dq27 delay 001 Add dq27 delay of 1 delay unit 010 Add dq27 delay of 2 delay units. 011 Add dq27 delay of 3 delay units. 100 Add dq27 delay of 4 delay units. 101 Add dq27 delay of 5 delay units. 110 Add dq27 delay of 6 delay units. 111 Add dq27 delay of 7 delay units.
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 rd_dq26_del	Read dqs3 to dq26 delay fine-tuning. This field holds the number of delay units that are added to dq26 relative to dqs3. 000 No change in dq26 delay 001 Add dq26 delay of 1 delay unit 010 Add dq26 delay of 2 delay units. 011 Add dq26 delay of 3 delay units. 100 Add dq26 delay of 4 delay units. 101 Add dq26 delay of 5 delay units. 110 Add dq26 delay of 6 delay units. 111 Add dq26 delay of 7 delay units.
7 Reserved	This read-only field is reserved and always has the value 0.
6–4 rd_dq25_del	Read dqs3 to dq25 delay fine-tuning. This field holds the number of delay units that are added to dq25 relative to dqs3. 000 No change in dq25 delay 001 Add dq25 delay of 1 delay unit 010 Add dq25 delay of 2 delay units. 011 Add dq25 delay of 3 delay units. 100 Add dq25 delay of 4 delay units. 101 Add dq25 delay of 5 delay units. 110 Add dq25 delay of 6 delay units. 111 Add dq25 delay of 7 delay units.
3 Reserved	This read-only field is reserved and always has the value 0.
rd_dq24_del	Read dqs3 to dq24 delay fine-tuning. This field holds the number of delay units that are added to dq24 relative to dqs3.

Table continues on the next page...

MMDCx_MPRDDQBY3DL field descriptions (continued)

Field	Description
	000 No change in dq24 delay 001 Add dq24 delay of 1 delay unit 010 Add dq24 delay of 2 delay units. 011 Add dq24 delay of 3 delay units. 100 Add dq24 delay of 4 delay units. 101 Add dq24 delay of 5 delay units. 110 Add dq24 delay of 6 delay units. 111 Add dq24 delay of 7 delay units.

44.12.42 MMDC PHY Write DQ Byte0 Delay Register (MMDCx_MPWRDQBY0DL)

This register is used to add fine-tuning adjustment to every bit in the write DQ byte0 relative to the write DQS

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: DDR3_x64, LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 82Ch offset

MMDCx_MPWRDQBY1DL field descriptions

Field	Description
31–30 wr_dm1_del	Write dm1 delay fine-tuning. This field holds the number of delay units that are added to dm1 relative to dqs1. 00 No change in dm1 delay 01 Add dm1 delay of 1 delay unit. 10 Add dm1 delay of 2 delay units. 11 Add dm1 delay of 3 delay units.
29–28 wr_dq15_del	Write dq15 delay fine-tuning. This field holds the number of delay units that are added to dq15 relative to dqs1. 00 No change in dq15 delay 01 Add dq15 delay of 1 delay unit. 10 Add dq15 delay of 2 delay units. 11 Add dq15 delay of 3 delay units.
27–26 Reserved	This read-only field is reserved and always has the value 0.
25–24 wr_dq14_del	Write dq14 delay fine-tuning. This field holds the number of delay units that are added to dq14 relative to dqs1. 00 No change in dq14 delay 01 Add dq14 delay of 1 delay unit. 10 Add dq14 delay of 2 delay units. 11 Add dq14 delay of 3 delay units.
23–22 Reserved	This read-only field is reserved and always has the value 0.
21–20 wr_dq13_del	Write dq13 delay fine-tuning. This field holds the number of delay units that are added to dq13 relative to dqs1. 00 No change in dq13 delay 01 Add dq13 delay of 1 delay unit. 10 Add dq13 delay of 2 delay units. 11 Add dq13 delay of 3 delay units.
19–18 Reserved	This read-only field is reserved and always has the value 0.
17–16 wr_dq12_del	Write dq12 delay fine-tuning. This field holds the number of delay units that are added to dq12 relative to dqs1. 00 No change in dq12 delay 01 Add dq12 delay of 1 delay unit. 10 Add dq12 delay of 2 delay units. 11 Add dq12 delay of 3 delay units.
15–14 Reserved	This read-only field is reserved and always has the value 0.
13–12 wr_dq11_del	Write dq11 delay fine-tuning. This field holds the number of delay units that are added to dq11 relative to dqs1. 00 No change in dq11 delay 01 Add dq11 delay of 1 delay unit.

Table continues on the next page...

MMDCx_MPWRDQBY1DL field descriptions (continued)

Field	Description
	10 Add dq11 delay of 2 delay units. 11 Add dq11 delay of 3 delay units.
11–10 Reserved	This read-only field is reserved and always has the value 0.
9–8 wr_dq10_del	Write dq10 delay fine-tuning. This field holds the number of delay units that are added to dq10 relative to dqs1. 00 No change in dq10 delay 01 Add dq10 delay of 1 delay unit. 10 Add dq10 delay of 2 delay units. 11 Add dq10 delay of 3 delay units.
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–4 wr_dq9_del	Write dq9 delay fine-tuning. This field holds the number of delay units that are added to dq9 relative to dqs1. 00 No change in dq9 delay 01 Add dq9 delay of 1 delay unit. 10 Add dq9 delay of 2 delay units. 11 Add dq9 delay of 3 delay units.
3–2 Reserved	This read-only field is reserved and always has the value 0.
wr_dq8_del	Write dq8 delay fine-tuning. This field holds the number of delay units that are added to dq8 relative to dqs1. 00 No change in dq8 delay 01 Add dq8 delay of 1 delay unit. 10 Add dq8 delay of 2 delay units. 11 Add dq8 delay of 3 delay units.

44.12.44 MMDC PHY Write DQ Byte2 Delay Register (MMDCx_MPWRDQBY2DL)

This register is used to add fine-tuning adjustment to every bit in the write DQ byte2 relative to the write DQS

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: DDR3_x64, LP2_2ch_x32

Address: Base address + 834h offset

Field	Description
19–18 Reserved	This read-only field is reserved and always has the value 0.
17–16 wr_dq28_del	Write dq28 delay fine tuning. This field holds the number of delay units that are added to dq28 relative to dqs3. 00 No change in dq28 delay 01 Add dq28 delay of 1 delay unit. 10 Add dq28 delay of 2 delay units. 11 Add dq28 delay of 3 delay units.
15–14 Reserved	This read-only field is reserved and always has the value 0.
13–12 wr_dq27_del	Write dq27 delay fine tuning. This field holds the number of delay units that are added to dq27 relative to dqs3. 00 No change in dq27 delay 01 Add dq27 delay of 1 delay unit. 10 Add dq27 delay of 2 delay units. 11 Add dq27 delay of 3 delay units.
11–10 Reserved	This read-only field is reserved and always has the value 0.
9–8 wr_dq26_del	Write dq26 delay fine tuning. This field holds the number of delay units that are added to dq26 relative to dqs3. 00 No change in dq26 delay 01 Add dq26 delay of 1 delay unit. 10 Add dq26 delay of 2 delay units. 11 Add dq26 delay of 3 delay units.
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–4 wr_dq25_del	Write dq25 delay fine tuning. This field holds the number of delay units that are added to dq25 relative to dqs3. 00 No change in dq25 delay 01 Add dq25 delay of 1 delay unit. 10 Add dq25 delay of 2 delay units. 11 Add dq25 delay of 3 delay units.
3–2 Reserved	This read-only field is reserved and always has the value 0.
wr_dq24_del	Write dq24 delay fine tuning. This field holds the number of delay units that are added to dq24 relative to dqs3. 00 No change in dq24 delay 01 Add dq24 delay of 1 delay unit. 10 Add dq24 delay of 2 delay units. 11 Add dq24 delay of 3 delay units.

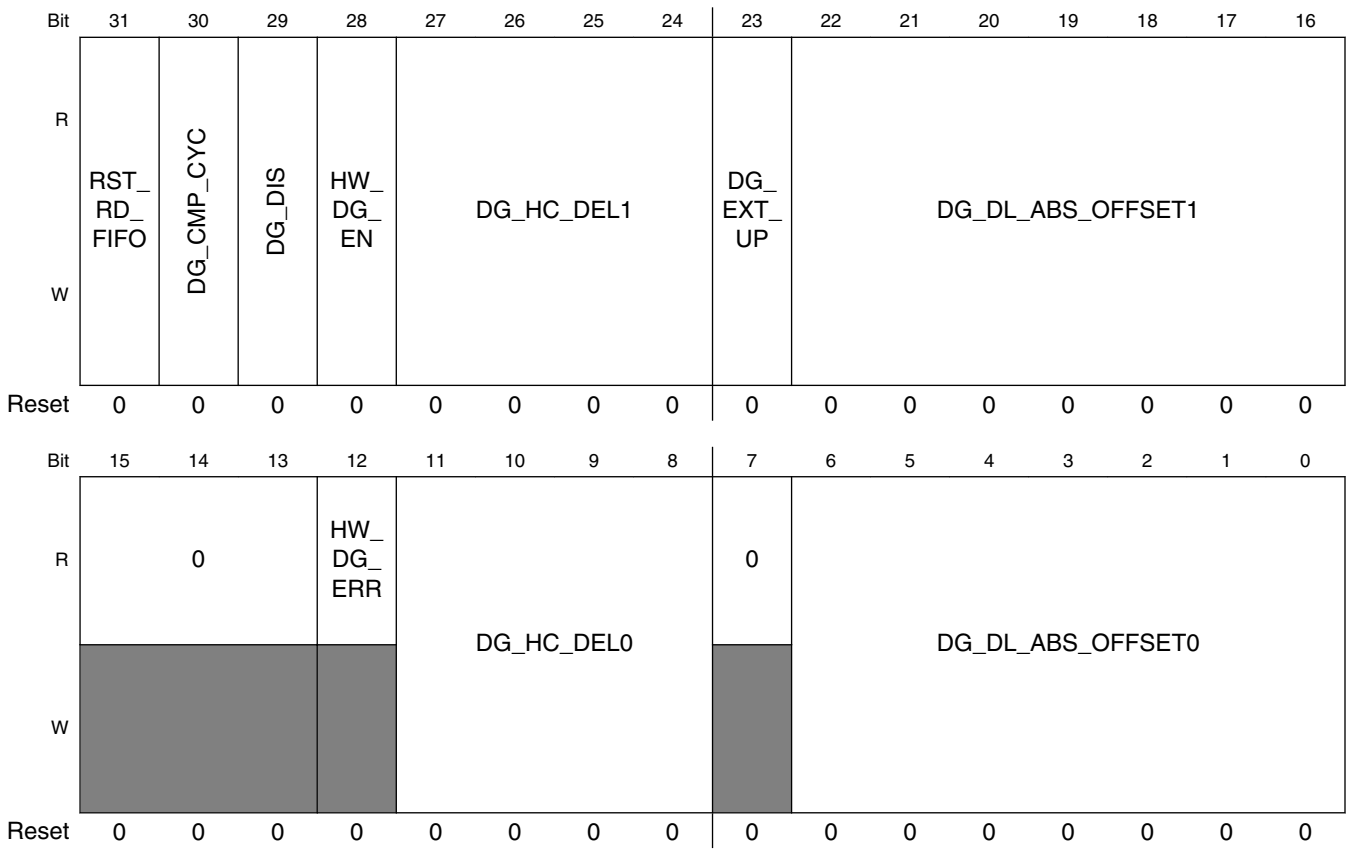
44.12.46 MMDC PHY Read DQS Gating Control Register 0 (MMDCx_MPDGCTRL0)

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: DDR3_x64, LP2_2ch_x32

Address: Base address + 83Ch offset



MMDCx_MPDGCTRL0 field descriptions

Field	Description
31 RST_RD_FIFO	Reset Read Data FIFO and associated pointers. If this bit is asserted then the MMDC resets the read data FIFO and the associated pointers. This bit is self cleared after the FIFO reset is done.
30 DG_CMP_CYC	Read DQS gating sample cycle. If this bit is asserted then the MMDC waits 32 cycles before comparing the read data, Otherwise it waits 16 DDR cycles. 0 MMDC waits 16 DDR cycles 1 MMDC waits 32 DDR cycles
29 DG_DIS	Read DQS gating disable. If this bit is asserted then the MMDC disables the read DQS gating mechanism.

Table continues on the next page...

MMDCx_MPDGCTRL0 field descriptions (continued)

Field	Description
	If this bits is asserted (read DQS gating is disabled) then pull-up and pull-down resistors suppose to be used on DQS and DQS# respectively 0 Read DQS gating mechanism is enabled 1 Read DQS gating mechanism is disabled
28 HW_DG_EN	Enable automatic read DQS gating calibration. If this bit is asserted then the MMDC performs automatic read DQS gating calibration. HW negates this bit upon completion of the automatic read DQS gating. **NOTE:** Before issuing the first read command the MMDC counts 12 cycles. In LPDDR2 mode automatic (HW) read DQS gating should be disabled and Pull-up/pull-down resistors on DQS/DQS# should be enabled while ODT resistors must be disconnected. 0 Disable automatic read DQS gating calibration 1 Start automatic read DQS gating calibration
27–24 DG_HC_DEL1	Read DQS gating half cycles delay for Byte1. (channel 0 register) and Byte5 in 64-bit mode (channel 1 register) This field indicates the delay in half cycles between read DQS gate and the middle of the read DQS preamble of Byte1. This delay is added to the delay that is generated by the read DQS1 gating delay-line, So the total read DQS gating delay is (DG_HC_DEL#)*0.5*cycle + (DG_DL_ABS_OFFSET#)*1/256*cycle Upon completion of the automatic read DQS gating calibration this field gets the value of the 4 MSB of ((HW_DG_LOW1 + HW_DG_UP1) /2). 0000 0 cycles delay. 0001 Half cycle delay. 0010 1 cycle delay 1101 6.5 cycles delay 1110 Reserved 1111 Reserved
23 DG_EXT_UP	DG extend upper boundary. By default the upper boundary of DQS gating HW calibration is set according to first failing comparison after at least one passing comparison. If this bit is asserted then the upper boundary is set according to the last passing comparison.
22–16 DG_DL_ABS_ OFFSET1	Absolute read DQS gating delay offset for Byte1. This field indicates the absolute delay between read DQS gate and the middle of the read DQS preamble of Byte1 with fractions of a clock period and up to half cycle. The fraction is process and frequency independent. The delay of the delay-line would be (DG_DL_ABS_OFFSET1 / 256)* MMDC_CH0 AXI clock (fast clock). This field can also bit written by HW. Upon completion of the automatic read DQS gating calibration this field gets the value of the 7 LSB of ((HW_DG_LOW1 + HW_DG_UP1) /2). **NOTE:** Not all changes will have effect on the actual delay. If the requested change is smaller than the delay-line resolution, then no change will occur.
15–13 Reserved	This read-only field is reserved and always has the value 0.
12 HW_DG_ERR	HW DQS gating error. This bit valid is asserted when an error was found during the read DQS gating HW calibration process. Error can occur when no valid value was found during HW calibration. This bit is valid only after HW_DG_EN is de-asserted. 0 No error was found during the DQS gating HW calibration process. 1 An error was found during the DQS gating HW calibration process.

Table continues on the next page...

MMDCx_MPDGCTRL0 field descriptions (continued)

Field	Description
11–8 DG_HC_DEL0	Read DQS gating half cycles delay for Byte0 (Channel 0 register) and Byte4 in 64-bit mode (Channel 1 register) . This field indicates the delay in half cycles between read DQS gate and the middle of the read DQS preamble of Byte0/4. This delay is added to the delay that is generated by the read DQS1 gating delay-line, So the total read DQS gating delay is (DG_HC_DEL#)*0.5*cycle + (DG_DL_ABS_OFFSET#)*1/256*cycle Upon completion of the automatic read DQS gating calibration this field gets the value of the 4 MSB of ((HW_DG_LOW1 + HW_DG_UP1) /2). 0000 0 cycles delay. 0001 Half cycle delay. 0010 1 cycle delay 1101 6.5 cycles delay 1110 Reserved 1111 Reserved
7 Reserved	This read-only field is reserved and always has the value 0.
DG_DL_ABS_OFFSET0	Absolute read DQS gating delay offset for Byte0. This field indicates the absolute delay between read DQS gate and the middle of the read DQS preamble of Byte0 with fractions of a clock period and up to half cycle. The fraction is process and frequency independent. The delay of the delay-line would be (DG_DL_ABS_OFFSET0 / 256)* MMDC_CH0 AXI clock (fast clock). This field can also bit written by HW. Upon completion of the automatic read DQS gating calibration this field gets the value of the 7 LSB of ((HW_DG_LOW0 + HW_DG_UP0) /2). **NOTE:** Not all changes will have effect on the actual delay. If the requested change is smaller than the delay-line resolution, then no change will occur.

44.12.47 MMDC PHY Read DQS Gating Control Register 1 (MMDCx_MPDGCTRL1)

Supported Mode Of Operations:

For Channel 0: DDR3_x16, DDR3_x32, DDR3_x64

For Channel 1: DDR3_x64

Address: Base address + 840h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

MMDCx_MPDGCTRL1 field descriptions

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27–24 DG_HC_DEL3	Read DQS gating half cycles delay for Byte3 (Channel 0 register) and Byte7 for 64-bit data (Channel 1 register) . This field indicates the delay in half cycles between read DQS gate and the middle of the read DQS preamble of Byte3/7. This delay is added to the delay that is generated by the read DQS1 gating delay-line, So the total read DQS gating delay is (DG_HC_DEL#)*0.5*cycle + (DG_DL_ABS_OFFSET#)*1/256*cycle Upon completion of the automatic read DQS gating calibration this field gets the value of the 4 MSB of ((HW_DG_LOW3 + HW_DG_UP3) /2). 0000 0 cycles delay. 0001 Half cycle delay. 0010 1 cycle delay 1101 6.5 cycles delay 1110 Reserved 1111 Reserved
23 Reserved	This read-only field is reserved and always has the value 0.
22–16 DG_DL_ABS_OFFSET3	Absolute read DQS gating delay offset for Byte3. This field indicates the absolute delay between read DQS gate and the middle of the read DQS preamble of Byte3 with fractions of a clock period and up to half cycle. The fraction is process and frequency independent. The delay of the delay-line would be (DG_DL_ABS_OFFSET3 / 256)* MMDC_CH0 AXI clock (fast clock). This field can also bit written by HW. Upon completion of the automatic read DQS gating calibration this field gets the value of the 7 LSB of ((HW_DG_LOW3 + HW_DG_UP3) /2). **NOTE:** Not all changes will have effect on the actual delay. If the requested change is smaller than the delay-line resolution, then no change will occur.
15–12 Reserved	This read-only field is reserved and always has the value 0.
11–8 DG_HC_DEL2	Read DQS gating half cycles delay for Byte2 (Channel 0 register) and Byte6 for 64-bit mode(channel 1 register) . This field indicates the delay in half cycles between read DQS gate and the middle of the read DQS preamble of Byte2/5. This delay is added to the delay that is generated by the read DQS1 gating delay-line, So the total read DQS gating delay is (DG_HC_DEL#)*0.5*cycle + (DG_DL_ABS_OFFSET#)*1/256*cycle Upon completion of the automatic read DQS gating calibration this field gets the value of the 4 MSB of ((HW_DG_LOW2 + HW_DG_UP2) /2). 0000 0 cycles delay. 0001 Half cycle delay. 0010 1 cycle delay 1101 6.5 cycles delay 1110 Reserved 1111 Reserved
7 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

MMDCx_MPDGCTRL1 field descriptions (continued)

Field	Description
DG_DL_ABS_ OFFSET2	Absolute read DQS gating delay offset for Byte2. This field indicates the absolute delay between read DQS gate and the middle of the read DQS preamble of Byte2 with fractions of a clock period and up to half cycle. The fraction is process and frequency independent. The delay of the delay-line would be (DG_DL_ABS_OFFSET2 / 256)* MMDC_CH0 AXI clock (fast clock). This field can also bit written by HW. Upon completion of the automatic read DQS gating calibration this field gets the value of the 7 LSB of ((HW_DG_LOW2 + HW_DG_UP2) /2). **NOTE:** Not all changes will have effect on the actual delay. If the requested change is smaller than the delay-line resolution, then no change will occur.

44.12.48 MMDC PHY Read DQS Gating delay-line Status Register (MMDCx_MPDGDLST0)

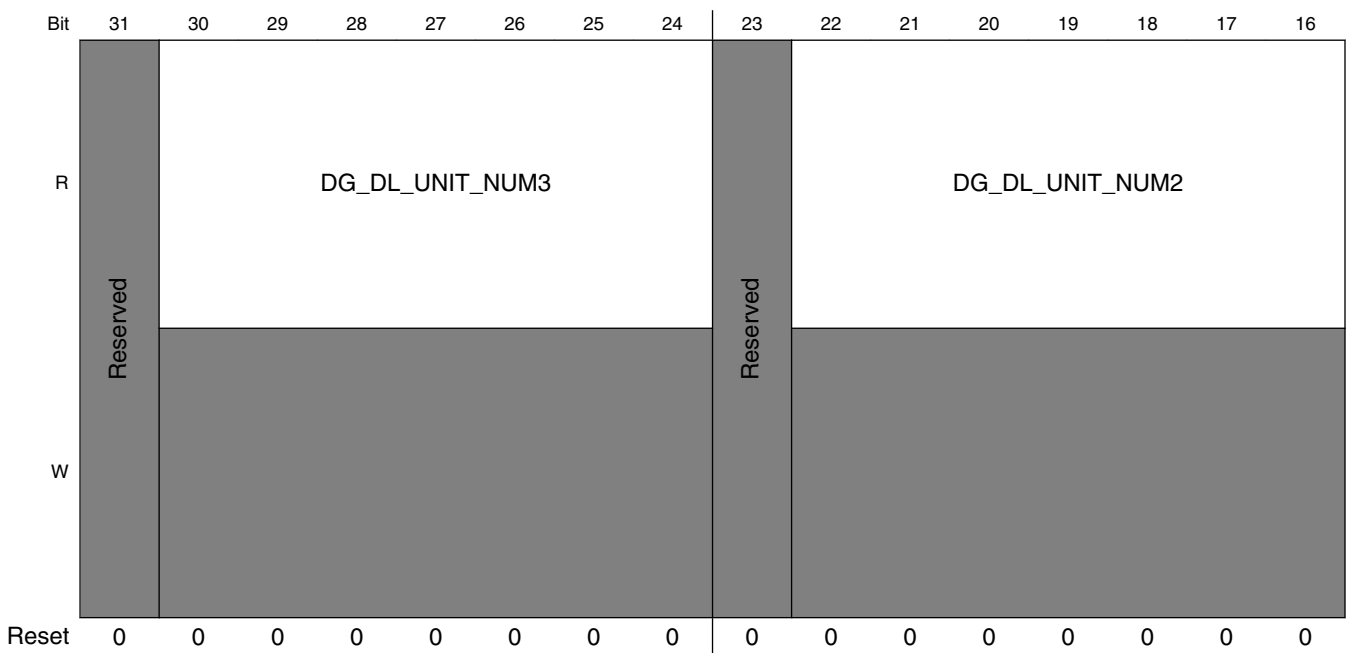
This register holds the status of the 4 dqs gating delay-lines.

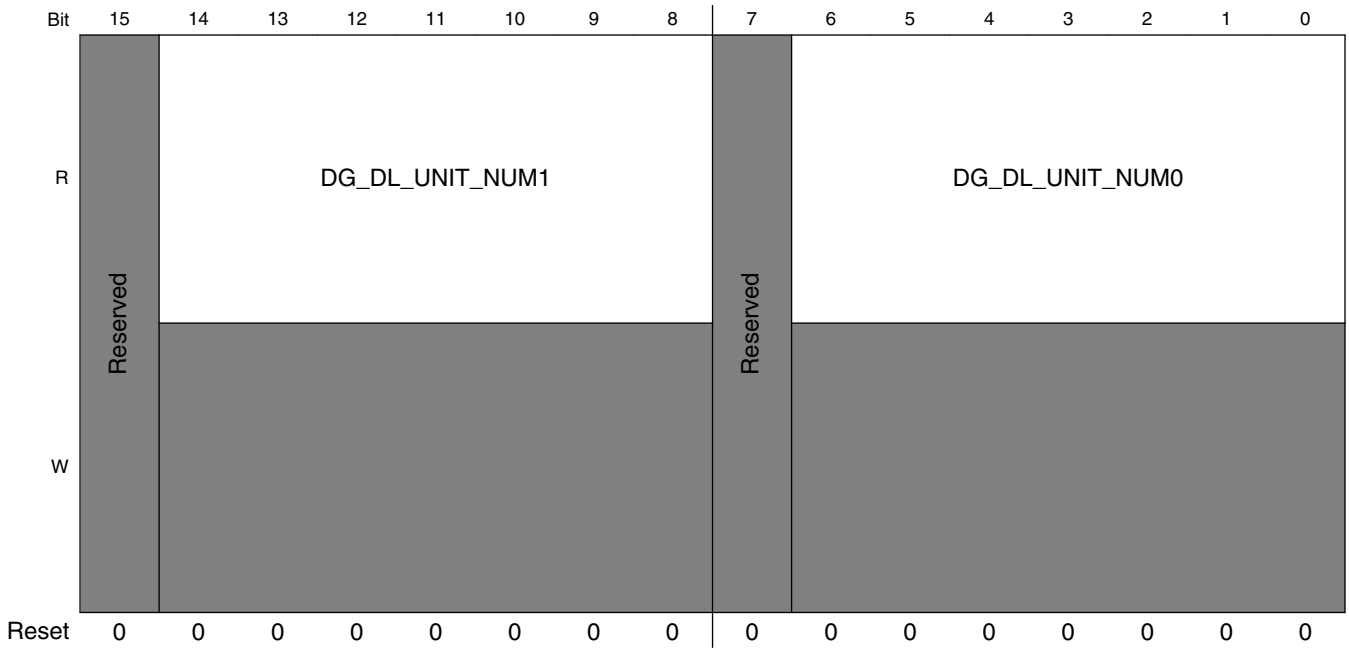
Supported Mode Of Operations:

For Channel 0: DDR3_x16, DDR3_x32, DDR3_x64

For Channel 1: DDR3_x64

Address: Base address + 844h offset





MMDCx_MPDGDLST0 field descriptions

Field	Description
31 -	This field is reserved. Reserved
30–24 DG_DL_UNIT_NUM3	This field reflects the number of delay units that are actually used by read DQS gating delay-line 3.
23 -	This field is reserved. Reserved
22–16 DG_DL_UNIT_NUM2	This field reflects the number of delay units that are actually used by read DQS gating delay-line 2.
15 -	This field is reserved. Reserved
14–8 DG_DL_UNIT_NUM1	This field reflects the number of delay units that are actually used by read DQS gating delay-line 1.
7 -	This field is reserved. Reserved
DG_DL_UNIT_NUM0	This field reflects the number of delay units that are actually used by read DQS gating delay-line 0.

44.12.49 MMDC PHY Read delay-lines Configuration Register (MMDCx_MPRDDLCTL)

This register controls read delay-lines functionality; it determines DQS delay relative to the associated DQ read access. The delay-line compensates for process variations and produces a constant delay regardless of the process, temperature and voltage.

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: DDR3_x64, LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 848h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0	RD_DL_ABS_OFFSET3							0	RD_DL_ABS_OFFSET2

MMDCx_MPRDDLCTL field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–24 RD_DL_ABS_ OFFSET3	Absolute read delay offset for Byte3. This field indicates the absolute delay between read DQS strobe and the read data of Byte3 with fractions of a clock period and up to half cycle. The fraction is process and frequency independent. The delay of the delay-line would be (RD_DL_ABS_OFFSET3 / 256) * MMDC_CH0 AXI clock (fast clock). So for the default value of 64 we get a quarter cycle delay. This field can also bit written by HW. Upon completion of the read delay-line HW calibration this field gets the value of (HW_RD_DL_LOW3 + HW_RD_DL_UP3) /2 **NOTE:** Not all changes will have effect on the actual delay. If the requested change is smaller than the delay-line resolution, then no change will occur.
23 Reserved	This read-only field is reserved and always has the value 0.
22–16 RD_DL_ABS_ OFFSET2	Absolute read delay offset for Byte2. This field indicates the absolute delay between read DQS strobe and the read data of Byte2 with fractions of a clock period and up to half cycle. The fraction is process and frequency independent. The delay of the delay-line would be (RD_DL_ABS_OFFSET2 / 256) * MMDC_CH0 AXI clock (fast clock). So for the default value of 64 we get a quarter cycle delay. This field can also bit written by HW. Upon completion of the read delay-line HW calibration this field gets the value of (HW_RD_DL_LOW2 + HW_RD_DL_UP2) /2 **NOTE:** Not all changes will have effect on the actual delay. If the requested change is smaller than the delay-line resolution, then no change will occur.

Table continues on the next page...

MMDCx_MPRDDLCTL field descriptions (continued)

Field	Description
15 Reserved	This read-only field is reserved and always has the value 0.
14–8 RD_DL_ABS_ OFFSET1	Absolute read delay offset for Byte1. This field indicates the absolute delay between read DQS strobe and the read data of Byte1 with fractions of a clock period and up to half cycle. The fraction is process and frequency independent. The delay of the delay-line would be (RD_DL_ABS_OFFSET1 / 256) * MMDC_CH0 AXI clock (fast clock). So for the default value of 64 we get a quarter cycle delay. This field can also bit written by HW. Upon completion of the read delay-line HW calibration this field gets the value of (HW_RD_DL_LOW1 + HW_RD_DL_UP1) /2 **NOTE:** Not all changes will have effect on the actual delay. If the requested change is smaller than the delay-line resolution, then no change will occur.
7 Reserved	This read-only field is reserved and always has the value 0.
RD_DL_ABS_ OFFSET0	Absolute read delay offset for Byte0. This field indicates the absolute delay between read DQS strobe and the read data of Byte0 with fractions of a clock period and up to half cycle. The fraction is process and frequency independent. The delay of the delay-line would be (RD_DL_ABS_OFFSET0 / 256) * MMDC_CH0 AXI clock (fast clock). So for the default value of 64 we get a quarter cycle delay. This field can also bit written by HW. Upon completion of the read delay-line HW calibration this field gets the value of (HW_RD_DL_LOW0 + HW_RD_DL_UP0) /2 **NOTE:** Not all changes will have effect on the actual delay. If the requested change is smaller than the delay-line resolution, then no change will occur.

44.12.50 MMDC PHY Read delay-lines Status Register (MMDCx_MPRDDLST)

This register holds the status of the 4 read delay-lines.

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: DDR3_x64, LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 84Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

MMDCx_MPRDDLST field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–24 RD_DL_UNIT_NUM3	This field reflects the number of delay units that are actually used by read delay-line 3.
23 Reserved	This read-only field is reserved and always has the value 0.
22–16 RD_DL_UNIT_NUM2	This field reflects the number of delay units that are actually used by read delay-line 2.
15 Reserved	This read-only field is reserved and always has the value 0.
14–8 RD_DL_UNIT_NUM1	This field reflects the number of delay units that are actually used by read delay-line 1.
7 Reserved	This read-only field is reserved and always has the value 0.
RD_DL_UNIT_NUM0	This field reflects the number of delay units that are actually used by read delay-line 0.

44.12.51 MMDC PHY Write delay-lines Configuration Register (MMDCx_MPWRDLCTL)

This register controls write delay-lines functionality, it determines DQ/DM delay relative to the associated DQS in write access. The delay-line compensates for process variations, and produces a constant delay regardless of the process, temperature and voltage.

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: DDR3_x64, LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 850h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0	WR_DL_ABS_OFFSET3							0	WR_DL_ABS_OFFSET2						
W																
Reset	0	1	0	0	0	0	0	0	0	1	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0	WR_DL_ABS_OFFSET1							0	WR_DL_ABS_OFFSET0						
W																
Reset	0	1	0	0	0	0	0	0	0	1	0	0	0	0	0	0

MMDCx_MPWRDLCTL field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–24 WR_DL_ABS_ OFFSET3	Absolute write delay offset for Byte3. This field indicates the absolute delay between write DQS strobe and the write data of Byte3 with fractions of a clock period and up to half cycle. The fraction is process and frequency independent. The delay of the delay-line would be (WR_DL_ABS_OFFSET3 / 256) * MMDC_CH0 AXI clock (fast clock). So for the default value of 64 we get a quarter cycle delay. This field can also bit written by HW. Upon completion of the write delay-line HW calibration this field gets the value of (HW_WR_DL_LOW3 + HW_WR_DL_UP3) /2 **NOTE:** Not all changes will have effect on the actual delay. If the requested change is smaller than the delay-line resolution, then no change will occur.
23 Reserved	This read-only field is reserved and always has the value 0.
22–16 WR_DL_ABS_ OFFSET2	Absolute write delay offset for Byte2. This field indicates the absolute delay between write DQS strobe and the write data of Byte2 with fractions of a clock period and up to half cycle. The fraction is process and frequency independent. The delay of the delay-line would be (WR_DL_ABS_OFFSET2/ 256) * MMDC_CH0 AXI clock (fast clock). So for the default value of 64 we get a quarter cycle delay. This field can also bit written by HW. Upon completion of the write delay-line HW calibration this field gets the value of (HW_WR_DL_LOW2 + HW_WR_DL_UP2) /2 **NOTE:** Not all changes will have effect on the actual delay. If the requested change is smaller than the delay-line resolution, then no change will occur.
15 Reserved	This read-only field is reserved and always has the value 0.
14–8 WR_DL_ABS_ OFFSET1	Absolute write delay offset for Byte1. This field indicates the absolute delay between write DQS strobe and the write data of Byte1 with fractions of a clock period and up to half cycle. The fraction is process and frequency independent. The delay of the delay-line would be (WR_DL_ABS_OFFSET1 / 256) * MMDC_CH0 AXI clock (fast clock). So for the default value of 64 we get a quarter cycle delay. This field can also bit written by HW. Upon completion of the write delay-line HW calibration this field gets the value of (HW_WR_DL_LOW1 + HW_WR_DL_UP1) /2 **NOTE:** Not all changes of this value will affect the actual delay. If the requested change is smaller than the delay-line resolution, then no change will occur.
7 Reserved	This read-only field is reserved and always has the value 0.
WR_DL_ABS_ OFFSET0	Absolute write delay offset for Byte0. This field indicates the absolute delay between write DQS strobe and the write data of Byte3 with fractions of a clock period and up to half cycle. The fraction is process and frequency independent. The delay of the delay-line would be (WR_DL_ABS_OFFSET0 / 256) * MMDC_CH0 AXI clock (fast clock). So for the default value of 64 we get a quarter cycle delay. This field can also bit written by HW. Upon completion of the write delay-line HW calibration this field gets the value of (HW_WR_DL_LOW0 + HW_WR_DL_UP0) /2 **NOTE:** Not all changes of this value will affect the actual delay. If the requested change is smaller than the delay-line resolution, then no change will occur.

44.12.52 MMDC PHY Write delay-lines Status Register (MMDCx_MPWRDLST)

This register holds the status of the 4 write delay-line.

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: DDR3_x64, LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 854h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0	WR_DL_UNIT_NUM3							0	WR_DL_UNIT_NUM2						
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0	WR_DL_UNIT_NUM1							0	WR_DL_UNIT_NUM0

MMDCx_MPWRDLST field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–24 WR_DL_UNIT_NUM3	This field reflects the number of delay units that are actually used by write delay-line 3.
23 Reserved	This read-only field is reserved and always has the value 0.
22–16 WR_DL_UNIT_NUM2	This field reflects the number of delay units that are actually used by write delay-line 2.
15 Reserved	This read-only field is reserved and always has the value 0.
14–8 WR_DL_UNIT_NUM1	This field reflects the number of delay units that are actually used by write delay-line 1.
7 Reserved	This read-only field is reserved and always has the value 0.
WR_DL_UNIT_NUM0	This field reflects the number of delay units that are actually used by write delay-line 0.

44.12.53 MMDC PHY CK Control Register (MMDCx_MPSDCTRL)

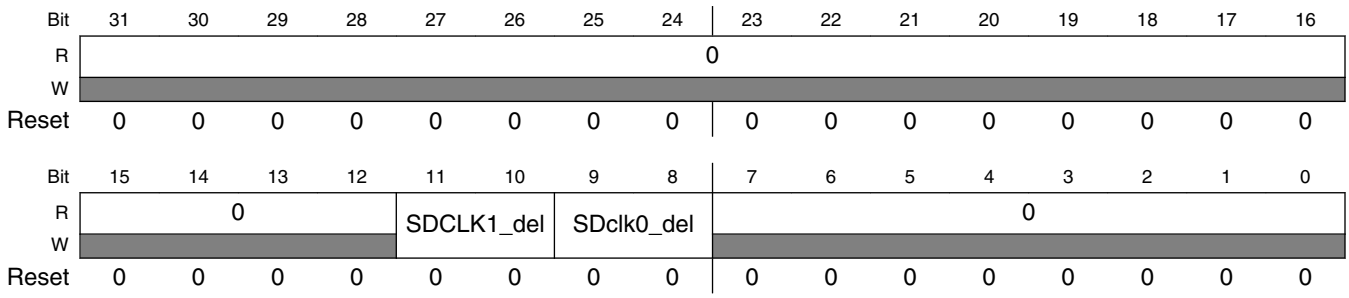
This register controls the fine tuning of the primary clock (CK0).

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 858h offset



MMDCx_MPSDCTRL field descriptions

Field	Description
31–12 Reserved	This read-only field is reserved and always has the value 0.
11–10 SDCLK1_del	DDR clock1 delay fine tuning. This field holds the number of delay units that are added to DDR clock1 (CK1). 00 No change in DDR clock delay 01 Add DDR clock delay of 1 delay unit. 10 Add DDR clock delay of 2 delay units. 11 Add DDR clock delay of 3 delay units.
9–8 SDclk0_del	DDR clock0 delay fine tuning. This field holds the number of delay units that are added to DDR clock (CK0). **NOTE:** In case of LPDDR2 2-ch mode this registers controls the fine tuning of the clock that is driven to channel0 In case of DDR3 the fine tuning of the secondary clock is controlled by 0x021B_4858[SDCLK] 00 No change in DDR clock0 delay 01 Add DDR clock0 delay of 1 delay unit. 10 Add DDR clock0 delay of 2 delay units. 11 Add DDR clock0 delay of 3 delay units.
Reserved	This read-only field is reserved and always has the value 0.

44.12.54 MMDC ZQ LPDDR2 HW Control Register (MMDCx_MPZQLP2CTL)

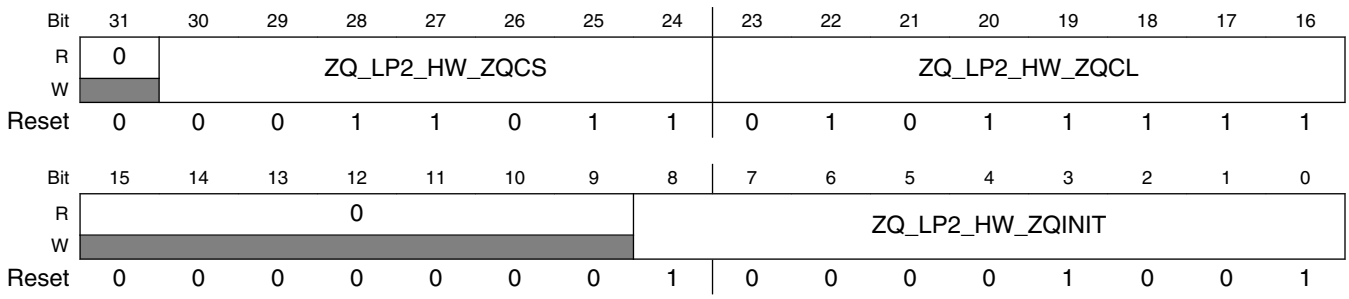
This register controls the idle time that takes the LPDDR2 device to perform ZQ calibration.

Supported Mode Of Operations:

For Channel 0: LP2_2ch_x16, LP2_2ch_x32

For Channel 1: LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 85Ch offset



MMDCx_MPZQLP2CTL field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–24 ZQ_LP2_HW_ZQCS	This register defines the period in cycles that it takes the memory device to perform a short ZQ calibration. This is the period of time that the MMDC has to wait after sending a short ZQ calibration and before sending other commands. This delay will also be used if ZQ reset is sent. 0x0-0x1A Reserved 0x1B 112 cycles (default) 0x1C 116 cycles 0x7E 508 cycles 0x7F 512 cycles
23–16 ZQ_LP2_HW_ZQCL	This register defines the period in cycles that it takes the memory device to perform a long ZQ calibration. This is the period of time that the MMDC has to wait after sending a long ZQ calibration and before sending other commands. 0x0-0x36 Reserved 0x37 112 cycles 0x38 114 cycles 0x5F 192 cycles (Default, JEDEC value, tZQCL, for LPDDR2, 360ns @ clock frequency 533MHz) 0xFE 510 cycles 0xFF 512 cycles

Table continues on the next page...

MMDCx_MPZQLP2CTL field descriptions (continued)

Field	Description
15–9 Reserved	This read-only field is reserved and always has the value 0.
ZQ_LP2_HW_ ZQINIT	This register defines the period in cycles that it takes the memory device to perform a Init ZQ calibration. This is the period of time that the MMDC has to wait after sending a init ZQ calibration and before sending other commands. 0x0-0x36 Reserved 0x37 112 cycles 0x38 114 cycles 0x109 532 cycles (Default, JEDEC value, tZQINIT, for LPDDR2, 1us @ clock frequency 533MHz) 0x1FE 1022 cycles 0x1FF 1024 cycles

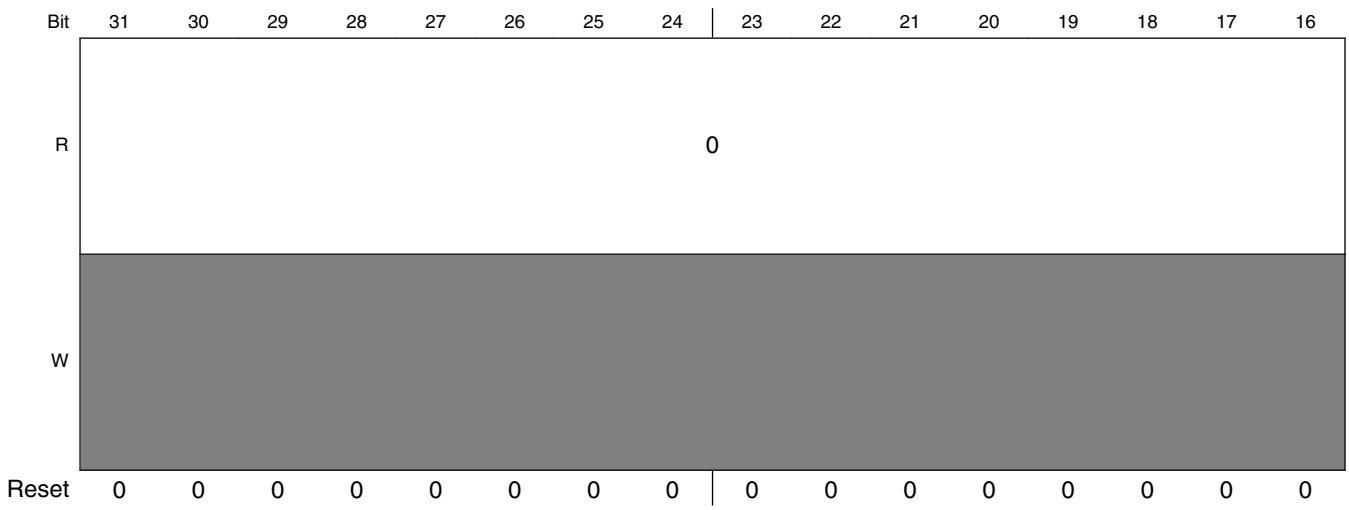
44.12.55 MMDC PHY Read Delay HW Calibration Control Register (MMDCx_MPRDDLHWCTL)

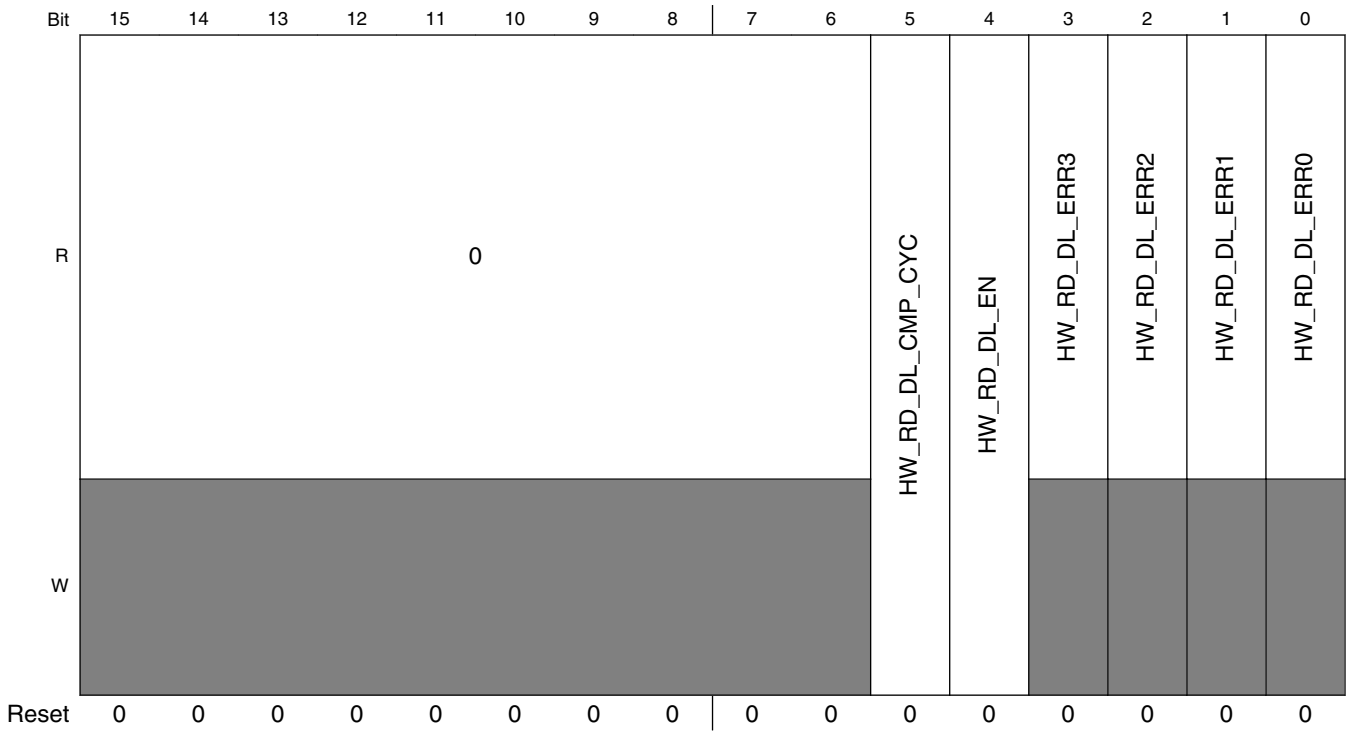
Supported Mode Of Operations:

For Channel 0: All

For Channel 1: DDR3_x64, LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 860h offset





MMDCx_MPRDDLHWCTL field descriptions

Field	Description
31–6 Reserved	This read-only field is reserved and always has the value 0.
5 HW_RD_DL_ CMP_CYC	Automatic (HW) read sample cycle. If this bit is asserted then the MMDC will compare the read data 32 cycles after the MMDC sent the read command enable pulse else it compares the data after 16 cycles.
4 HW_RD_DL_EN	Enable automatic (HW) read calibration. If this bit is asserted then the MMDC will perform an automatic read calibration. HW should negate this bit upon completion of the calibration. Negation of this bit also points that the read calibration results are valid **NOTE:** Before issuing the first read command MMDC counts 12 cycles.
3 HW_RD_DL_ ERR3	Automatic (HW) read calibration error of Byte3. If this bit is asserted then it indicates that an error was found during the HW calibration process of read delay-line 3. In case this bit is zero at the end of the calibration process then the boundary results can be found at MPRDDLHWST1 register. This bit is valid only after HW_RD_DL_EN is de-asserted. 0 No error was found in read delay-line 3 during the automatic (HW) read calibration process of read delay-line 3. 1 An error was found in read delay-line 3 during the automatic (HW) read calibration process of read delay-line 3.
2 HW_RD_DL_ ERR2	Automatic (HW) read calibration error of Byte2. If this bit is asserted then it indicates that an error was found during the HW calibration process of read delay-line 2. In case this bit is zero at the end of the calibration process then the boundary results can be found at MPRDDLHWST1 register. This bit is valid only after HW_RD_DL_EN is de-asserted.

Table continues on the next page...

MMDCx_MPRDDLHWCTL field descriptions (continued)

Field	Description
	0 No error was found in read delay-line 2 during the automatic (HW) read calibration process of read delay-line 2. 1 An error was found in read delay-line 2 during the automatic (HW) read calibration process of read delay-line 2.
1 HW_RD_DL_ERR1	Automatic (HW) read calibration error of Byte1. If this bit is asserted then it indicates that an error was found during the HW calibration process of read delay-line 1. In case this bit is zero at the end of the calibration process then the boundary results can be found at MPRDDLHWST0 register. This bit is valid only after HW_RD_DL_EN is de-asserted. 0 No error was found in read delay-line 1 during the automatic (HW) read calibration process of read delay-line 1. 1 An error was found in read delay-line 1 during the automatic (HW) read calibration process of read delay-line 1.
0 HW_RD_DL_ERR0	Automatic (HW) read calibration error of Byte0. If this bit is asserted then it indicates that an error was found during the HW calibration process of read delay-line 0. In case this bit is zero at the end of the calibration process then the boundary results can be found at MPRDDLHWST0 register. This bit is valid only after HW_RD_DL_EN is de-asserted. 0 No error was found in read delay-line 0 during the automatic (HW) read calibration process of read delay-line 0. 1 An error was found in read delay-line 0 during the automatic (HW) read calibration process of read delay-line 0.

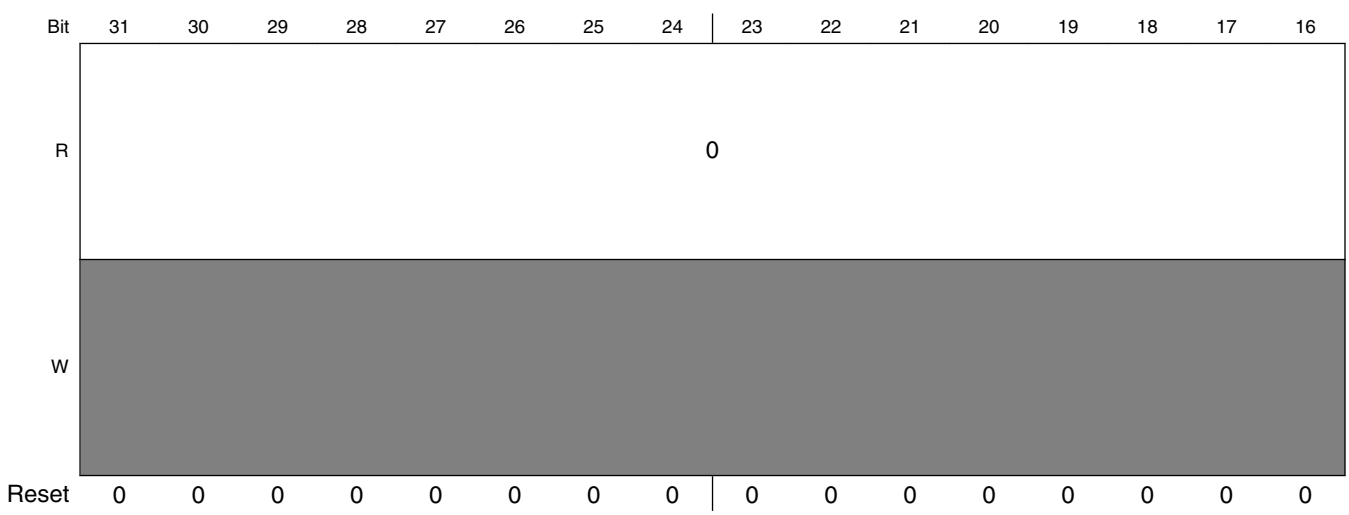
44.12.56 MMDC PHY Write Delay HW Calibration Control Register (MMDCx_MPWRDLHWCTL)

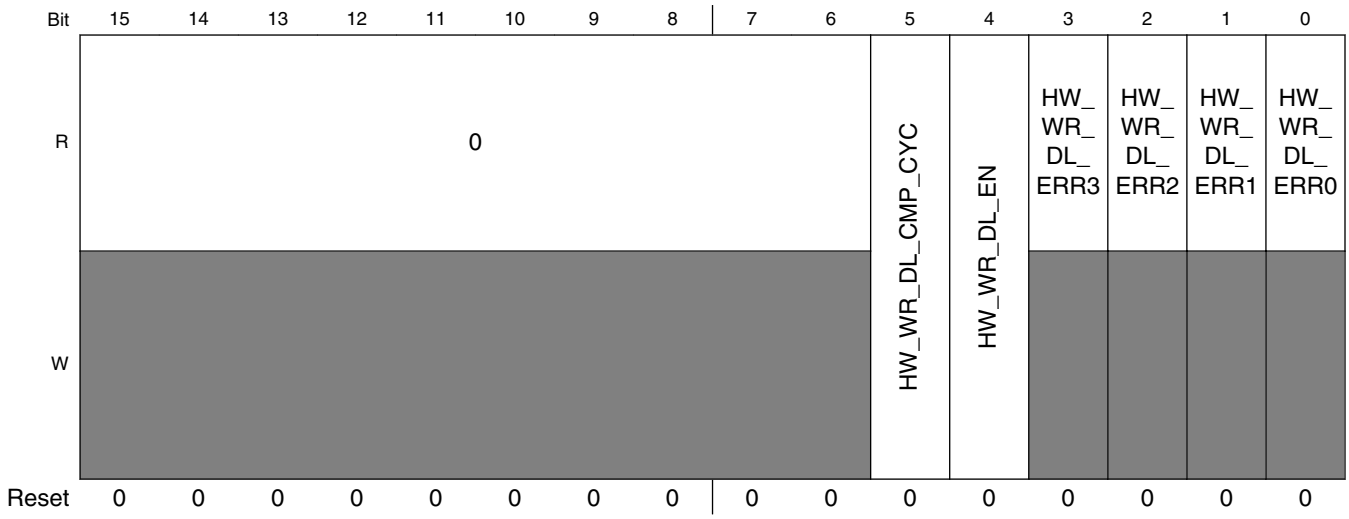
Supported Mode Of Operations:

For Channel 0: All

For Channel 1: DDR3_x64, LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 864h offset





MMDCx_MPWRDLHWCTL field descriptions

Field	Description
31–6 Reserved	This read-only field is reserved and always has the value 0.
5 HW_WR_DL_CMP_CYC	Write sample cycle. If this bit is asserted then the MMDC will compare the data 32 cycles after the MMDC sent the read command enable pulse else it compares the data after 16 cycles.
4 HW_WR_DL_EN	Enable automatic (HW) write calibration. If this bit is asserted then the MMDC will perform an automatic write calibration. HW should negate this bit upon completion of the calibration. Negation of this bit also indicates that the write calibration results are valid **NOTE:** Before issuing the first read command MMDC counts 12 cycles.
3 HW_WR_DL_ERR3	Automatic (HW) write calibration error of Byte3. If this bit is asserted then it indicates that an error was found during the HW calibration process of write delay-line 3. In case this bit is zero at the end of the calibration process then the boundary results can be found at MPWRDLHWST1 register. This bit is valid only after HW_WR_DL_EN is de-asserted. 0 No error was found during the automatic (HW) write calibration process of write delay-line 3. 1 An error was found during the automatic (HW) write calibration process of write delay-line 3.
2 HW_WR_DL_ERR2	Automatic (HW) write calibration error of Byte2. If this bit is asserted then it indicates that an error was found during the HW calibration process of write delay-line 2. T In case this bit is zero at the end of the calibration process then the boundary results can be found at MPWRDLHWST1 register. This bit is valid only after HW_WR_DL_EN is de-asserted. 0 No error was found during the automatic (HW) write calibration process of write delay-line 2. 1 An error was found during the automatic (HW) write calibration process of write delay-line 2.
1 HW_WR_DL_ERR1	Automatic (HW) write calibration error of Byte1. If this bit is asserted then it indicates that an error was found during the HW calibration process of write delay-line 1. In case this bit is zero at the end of the calibration process then the boundary results can be found at MPWRDLHWST0 register. This bit is valid only after HW_WR_DL_EN is de-asserted. 0 No error was found during the automatic (HW) write calibration process of write delay-line 1. 1 An error was found during the automatic (HW) write calibration process of write delay-line 1.
0 HW_WR_DL_ERR0	Automatic (HW) write calibration error of Byte0. If this bit is asserted then it indicates that an error was found during the HW calibration process of write delay-line 0. In case this bit is zero at the end of the

MMDCx_MPWLHWERR field descriptions

Field	Description
31–24 HW_WL3_DQ	HW write-leveling calibration result of Byte3. This field holds the results for all the 8 write-leveling steps of Byte3. i.e. bit 0 holds the result of the write-leveling calibration of 0 delay, bit 1holds the result of the write-leveling calibration of 1/8delay till bit 7 that holds the result of the write-leveling calibration of 7/8 delay
23–16 HW_WL2_DQ	HW write-leveling calibration result of Byte2. This field holds the results for all the 8 write-leveling steps of Byte2. i.e. bit 0 holds the result of the write-leveling calibration of 0 delay, bit 1holds the result of the write-leveling calibration of 1/8delay till bit 7 that holds the result of the write-leveling calibration of 7/8 delay
15–8 HW_WL1_DQ	HW write-leveling calibration result of Byte1. This field holds the results for all the 8 write-leveling steps of Byte1. i.e. bit 0 holds the result of the write-leveling calibration of 0 delay, bit 1holds the result of the write-leveling calibration of 1/8delay till bit 7 that holds the result of the write-leveling calibration of 7/8 delay
HW_WL0_DQ	HW write-leveling calibration result of Byte0. This field holds the results for all the 8 write-leveling steps of Byte0. i.e. bit 0 holds the result of the write-leveling calibration of 0 delay, bit 1holds the result of the write-leveling calibration of 1/8delay till bit 7 that holds the result of the write-leveling calibration of 7/8 delay

44.12.62 MMDC PHY Read DQS Gating HW Status Register 0 (MMDCx_MPDGHWST0)

Supported Mode Of Operations:

For Channel 0: DDR3_x16, DDR3_x32, DDR3_x64

For Channel 1: DDR3_x64

Address: Base address + 87Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

MMDCx_MPDGHWST3 field descriptions

Field	Description
31–27 -	This field is reserved. Reserved
26–16 HW_DG_UP3	HW DQS gating calibration result of the upper boundary of Byte3. This field holds the HW DQS gating calibration result of the upper boundary of Byte3.
15–11 -	This field is reserved. Reserved
HW_DG_LOW3	HW DQS gating calibration result of the lower boundary of Byte3. This field holds the HW DQS gating calibration result of the lower boundary of Byte3.

44.12.66 MMDC PHY Pre-defined Compare Register 1 (MMDCx_MPPDCMPR1)

This register holds the MMDC pre-defined compare value that will be used during automatic read, read DQS gating and write calibration process. The compare value can be the MPR value (as defined in the JEDEC) or can be programmed by the PDV1 and PDV2 fields. In case of DDR3 (BL=8) the MMDC will duplicate PDV1, PDV2 and drive that data on Beat4-7 of the same byte.

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 88Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	PDV2																PDV1															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MMDCx_MPPDCMPR1 field descriptions

Field	Description
31–16 PDV2	MMDC Pre defined compare value2. This field holds the 2 MSB of the data that will be driven to the DDR device during automatic read, read DQS gating and write calibrations in case MPR(DDR3)/ DQ calibration (LPDDR2/LPDDR3) mode are disabled (MPR_CMP is disabled). Upon read access during the calibration the MMDC will compare the read data with the data that is stored in this field. **NOTE:** Before issue the read access the MMDC will invert the value of this field and drive it to the associate entry in the read comparison FIFO. For further information see Section 19.14.3.1.2, "Calibration with pre-defined value , Section 19.14.4.1.2, "Calibration with pre-defined value and Section 19.14.5.1, "HW (automatic) Write Calibration
PDV1	MMDC Pre defined compare value2. This field holds the 2 LSB of the data that will be driven to the DDR device during automatic read, read DQS gating and write calibrations in case MPR(DDR3)/ DQ calibration (LPDDR2/LPDDR3) mode are disabled (MPR_CMP is disabled). Upon read access during the calibration the MMDC will compare the read data with the data that is stored in this field.

Table continues on the next page...

MMDCx_MPPDCMPR1 field descriptions (continued)

Field	Description
	NOTE: Before issuing the read access, the MMDC will invert the value of this field and drive it to the associated entry in the read comparison FIFO.

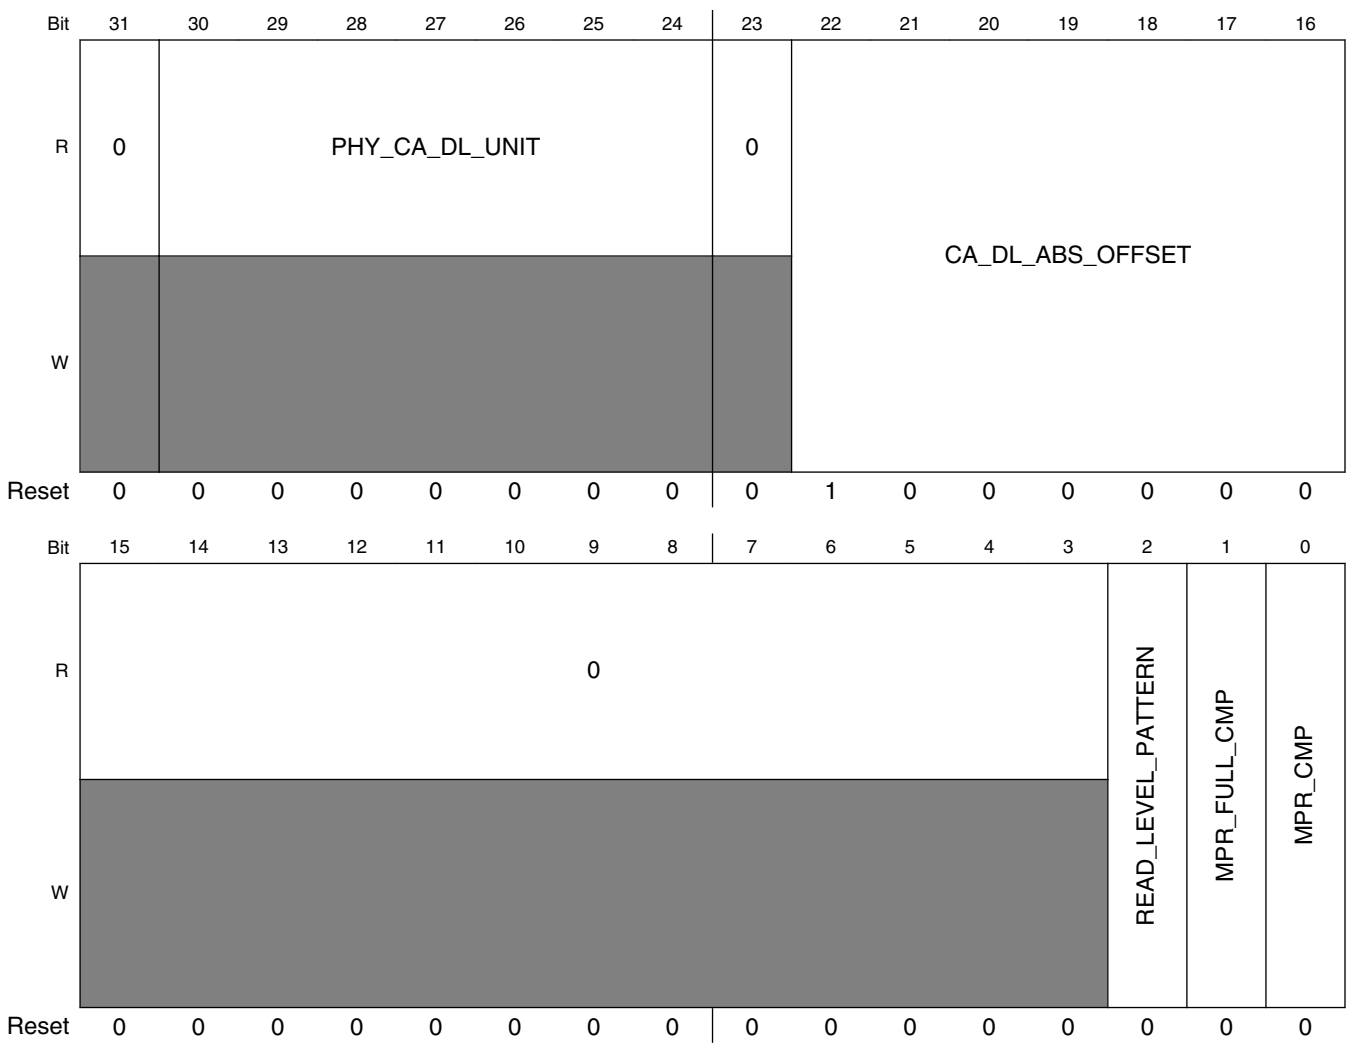
44.12.67 MMDC PHY Pre-defined Compare and CA delay-line Configuration Register (MMDCx_MPPDCMPR2)

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 890h offset



MMDCx_MPPDCMPR2 field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–24 PHY_CA_DL_UNIT	This field reflects the number of delay units that are actually used by CA(Command/Address of LPDDR2) delay-line
23 Reserved	This read-only field is reserved and always has the value 0.
22–16 CA_DL_ABS_OFFSET	Absolute CA (Command/Address of LPDDRR2) offset. This field indicates the absolute delay between CA (Command/Address) bus and the DDR clock (CK) with fractions of a clock period and up to half cycle. The fraction is process and frequency independent. The delay of the delay-line would be (CA_DL_ABS_OFFSET / 256) * MMDC_CH0 AXI clock (fast clock). So for the default value of 64 we get a quarter cycle delay.
15–3 Reserved	This read-only field is reserved and always has the value 0.
2 READ_LEVEL_PATTERN	MPR(DDR3)/ DQ calibration (LPDDR2/LPDDR3) read compare pattern. In case MPR(DDR3)/ DQ calibration (LPDDR2/LPDDR3) modes are used during the calibration process (MPR_CMP is asserted) then this field indicates the read pattern for the comparison. 0 Compare with read pattern 1010 1 Compare with read pattern 0011 (Used only in LPDDR2/LPDDR3 mode)
1 MPR_FULL_CMP	MPR(DDR3)/ DQ calibration (LPDDR2/LPDDR3) full compare enable. In case MPR(DDR3)/ DQ calibration (LPDDR2/LPDDR3) modes are used during the calibration process (MPR_CMP is asserted) then this field indicates whether the MMDC will compare all the bits of the data that is read from the DDR device to the MPR pre-defined pattern. When this bit is de-asserted only LSB of each byte is compared.
0 MPR_CMP	MPR(DDR3)/ DQ calibration (LPDDR2/LPDDR3) compare enable. This bit indicates whether the MMDC will compare the read data during automatic read and read DQS calibration processes to the pre-defined patterns that are driven by the DDR device (READ_LEVEL_PATTERN as defined by JEDEC) or general pre-defined value that are stored in PDV1 and PDV2. When this bit is disabled data is compared to the data of the pre defined compare value field For further information see Read DQS Gating Calibration and Read Calibration .

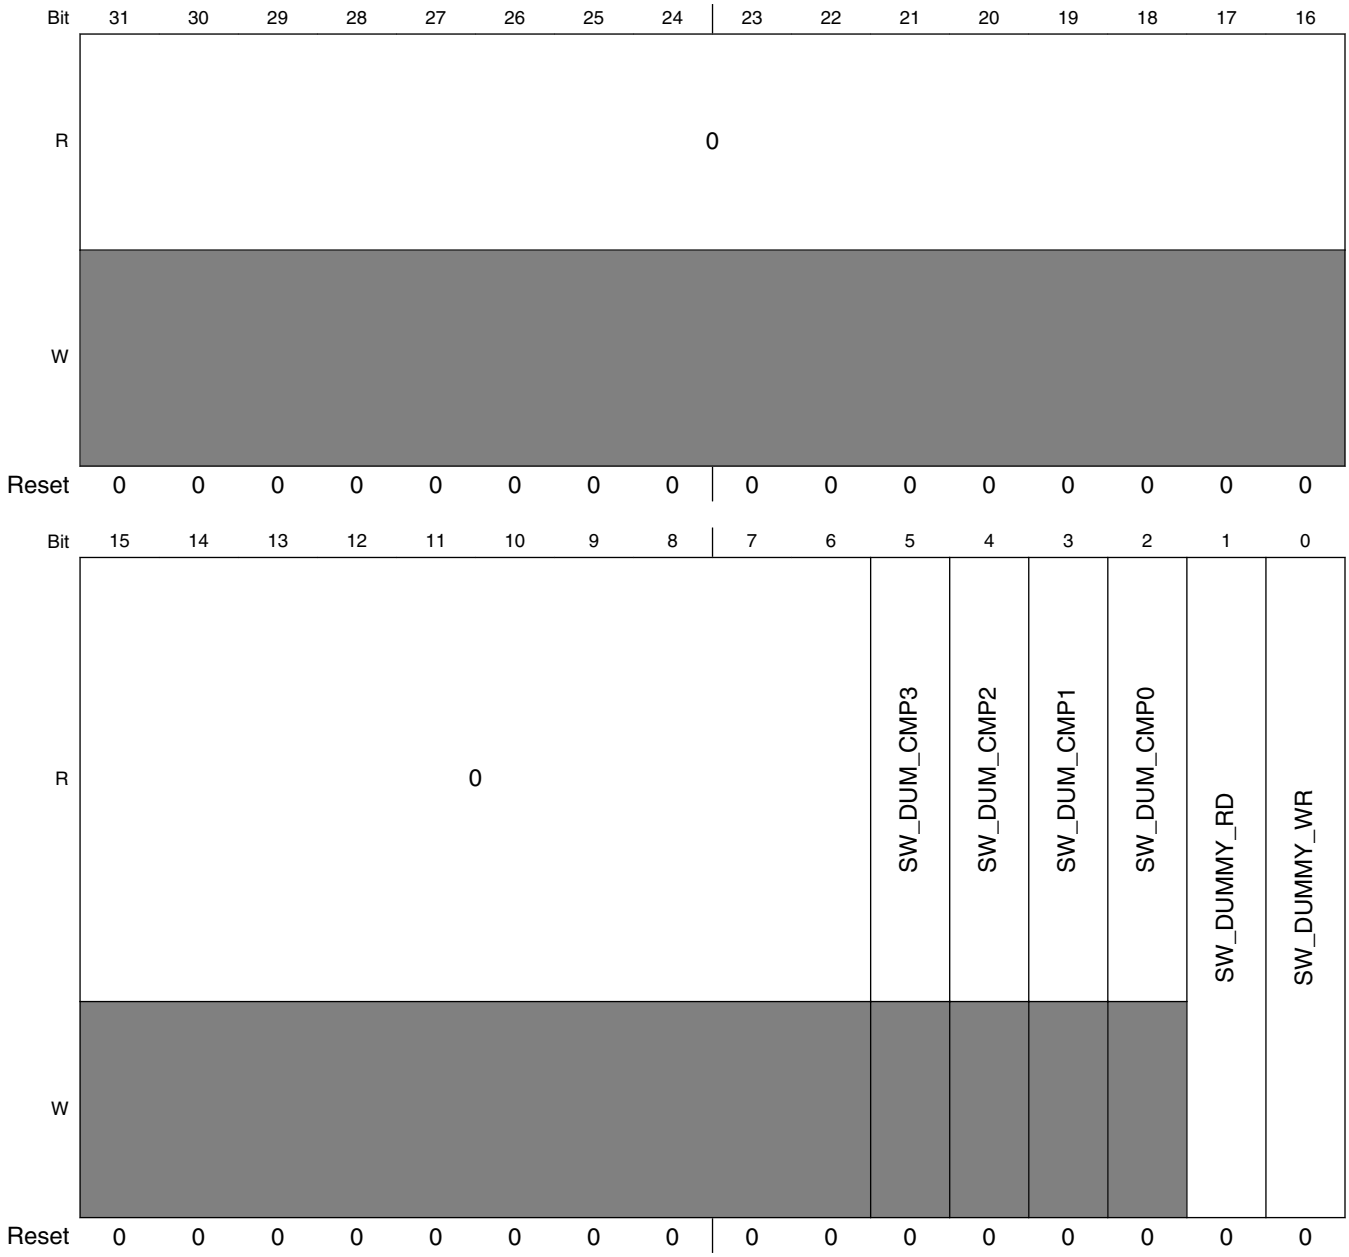
44.12.68 MMDC PHY SW Dummy Access Register (MMDCx_MPSWDAR0)

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: DDR3_x64, LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 894h offset



MMDCx_MPSWDAR0 field descriptions

Field	Description
31–6 Reserved	This read-only field is reserved and always has the value 0.
5 SW_DUM_CMP3	SW dummy read byte3 compare results. This bit indicates the result of the read data comparison of Byte3 at the completion of SW_DUMMY_RD. This bit is valid only when SW_DUMMY_RD is de-asserted. 0 Dummy read fail 1 Dummy read pass
4 SW_DUM_CMP2	SW dummy read byte2 compare results. This bit indicates the result of the read data comparison of Byte2 at the completion of SW_DUMMY_RD. This bit is valid only when SW_DUMMY_RD is de-asserted.

Table continues on the next page...

MMDCx_MPSWDAR0 field descriptions (continued)

Field	Description
	0 Dummy read fail 1 Dummy read pass
3 SW_DUM_CMP1	SW dummy read byte1 compare results. This bit indicates the result of the read data comparison of Byte1 at the completion of SW_DUMMY_RD. This bit is valid only when SW_DUMMY_RD is de-asserted. 0 Dummy read fail 1 Dummy read pass
2 SW_DUM_CMP0	SW dummy read byte0 compare results. This bit indicates the result of the read data comparison of Byte0 at the completion of SW_DUMMY_RD. This bit is valid only when SW_DUMMY_RD is de-asserted. 0 Dummy read fail 1 Dummy read pass
1 SW_DUMMY_ RD	SW dummy read. When this bit is asserted the MMDC will generate internally read access without intervention of the system toward bank 0, row 0, column 0. If MPR_CMP = 1then the read data will be compared to MPPDCMPR2[READ_LEVEL_PATTERN] . If MPR_CMP =0 then the read data will be compared to MPPDCMPR1[PDV1], MPPDCMPR1[PDV2]. Upon completion of the access this bit is de-asserted automatically and the read data and comparison results are valid at MPSWDAR0[SW_DUM_CMP#] and MPSWDRDR0-MPSWDRDR7 respectively.
0 SW_DUMMY_ WR	SW dummy write. When this bit is asserted the MMDC will generate internally write access without intervention of the system toward bank 0, row 0, column 0, while the data is driven from MPPDCMPR1[PDV1] and MPPDCMPR1[PDV2]. The bit is de-asserted automatically upon completion of the access.

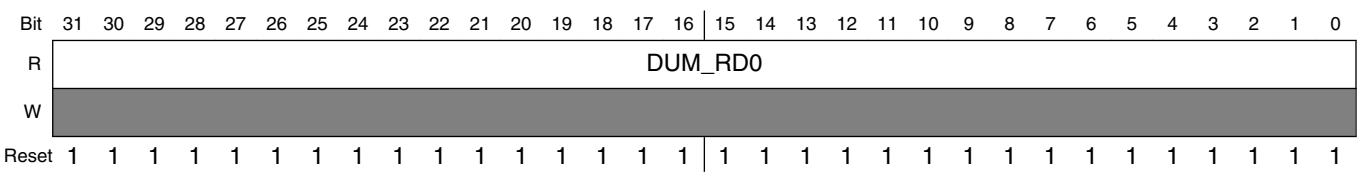
44.12.69 MMDC PHY SW Dummy Read Data Register 0 (MMDCx_MPSWDRDR0)

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: DDR3_x64, LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 898h offset



MMDCx_MPSWDRDR0 field descriptions

Field	Description
DUM_RD0	Dummy read data0. This field holds the first data that is read from the DDR during SW dummy read access (i.e. when SW_DUMMY_RD = 1). This field is valid only when SW_DUMMY_RD is de-asserted

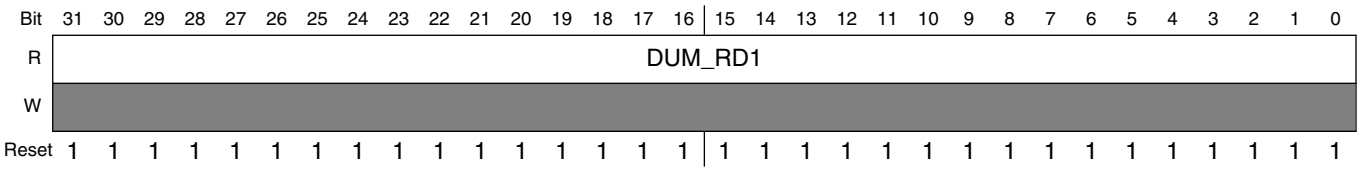
44.12.70 MMDC PHY SW Dummy Read Data Register 1 (MMDCx_MPSWDRDR1)

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: DDR3_x64, LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 89Ch offset



MMDCx_MPSWDRDR1 field descriptions

Field	Description
DUM_RD1	Dummy read data1. This field holds the second data that is read from the DDR during SW dummy read access (i.e. when SW_DUMMY_RD = 1). This field is valid only when SW_DUMMY_RD is de-asserted

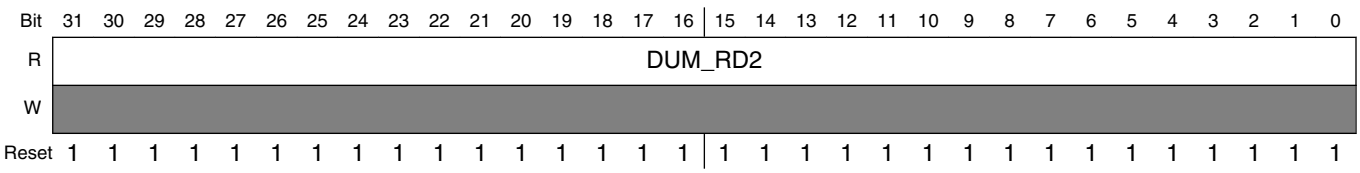
44.12.71 MMDC PHY SW Dummy Read Data Register 2 (MMDCx_MPSWDRDR2)

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: DDR3_x64, LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 8A0h offset



MMDCx_MPSWDRDR2 field descriptions

Field	Description
DUM_RD2	Dummy read data2. This field holds the third data that is read from the DDR during SW dummy read access (i.e. when SW_DUMMY_RD = 1). This field is valid only when SW_DUMMY_RD is de-asserted.

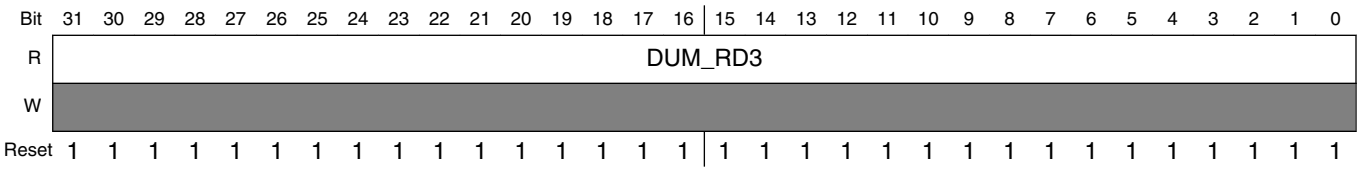
44.12.72 MMDC PHY SW Dummy Read Data Register 3 (MMDCx_MPSWDRDR3)

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: DDR3_x64, LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 8A4h offset



MMDCx_MPSWDRDR3 field descriptions

Field	Description
DUM_RD3	Dummy read data3. This field holds the forth data that is read from the DDR during SW dummy read access (i.e. when SW_DUMMY_RD = 1). This field is valid only when SW_DUMMY_RD is de-asserted.

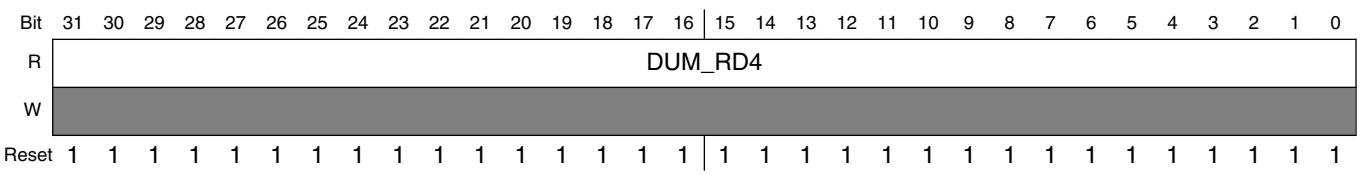
44.12.73 MMDC PHY SW Dummy Read Data Register 4 (MMDCx_MPSWDRDR4)

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: DDR3_x64, LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 8A8h offset



MMDCx_MPSWDRDR4 field descriptions

Field	Description
DUM_RD4	Dummy read data4. This field holds the fifth data (only in case of burst length 8 (BL =1)) that is read from the DDR during SW dummy read access (i.e. when SW_DUMMY_RD = 1). This field is valid only when SW_DUMMY_RD is de-asserted.

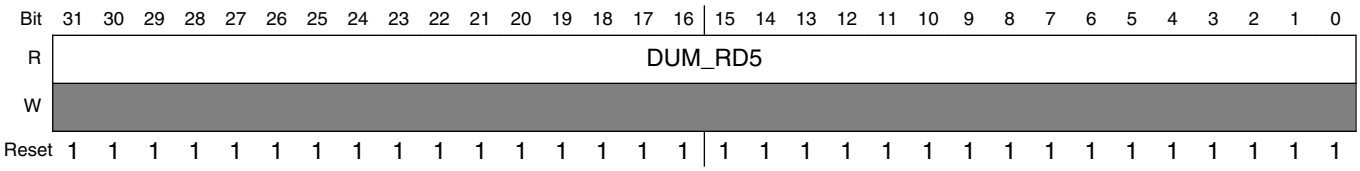
44.12.74 MMDC PHY SW Dummy Read Data Register 5 (MMDCx_MPSWDRDR5)

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: DDR3_x64, LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 8ACh offset



MMDCx_MPSWDRDR5 field descriptions

Field	Description
DUM_RD5	Dummy read data5. This field holds the sixth data (only in case of burst length 8 (BL =1)) that is read from the DDR during SW dummy read access (i.e. when SW_DUMMY_RD = 1). This field is valid only when SW_DUMMY_RD is de-asserted.

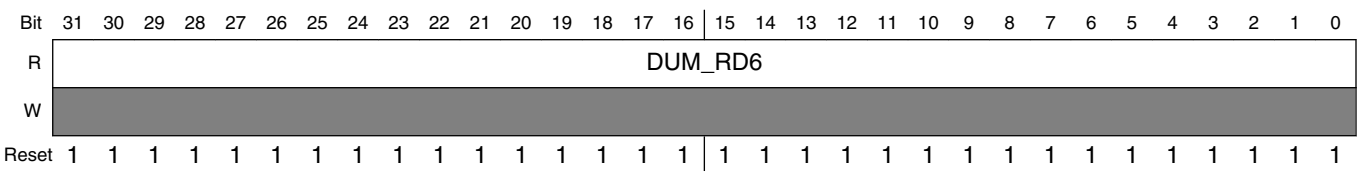
44.12.75 MMDC PHY SW Dummy Read Data Register 6 (MMDCx_MPSWDRDR6)

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: DDR3_x64, LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 8B0h offset



MMDCx_MPSWDRDR6 field descriptions

Field	Description
DUM_RD6	Dummy read data6. This field holds the seventh data (only in case of burst length 8 (BL =1)) that is read from the DDR during SW dummy read access (i.e. when SW_DUMMY_RD = 1). This field is valid only when SW_DUMMY_RD is de-asserted.

44.12.76 MMDC PHY SW Dummy Read Data Register 7 (MMDCx_MPSWDRDR7)

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: DDR3_x64, LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 8B4h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

MMDCx_MPSWDRDR7 field descriptions

Field	Description
DUM_RD7	Dummy read data7. This field holds the eight data (only in case of burst length 8 (BL =1)) that is read from the DDR during SW dummy read access (i.e. when SW_DUMMY_RD = 1). This field is valid only when SW_DUMMY_RD is de-asserted.

44.12.77 MMDC PHY Measure Unit Register (MMDCx_MPMUR0)

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 8B8h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0						MU_UNIT_DEL_NUM									
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0				FRC_MSR	MU_BYP_EN	MU_BYP_VAL									
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MMDCx_MPMUR0 field descriptions

Field	Description
31–26 Reserved	This read-only field is reserved and always has the value 0.
25–16 MU_UNIT_DEL_NUM	Number of delay units measured per cycle. This field is used in debug mode and holds the number of delay units that were measured by the measure unit per DDR clock cycle. The delay-lines that are used in every calibration process use that number for generating the desired delay.
15–12 Reserved	This read-only field is reserved and always has the value 0.
11 FRC_MSR	Force measurement on delay-lines. When this bit is asserted then a measurement process will be performed, where at the completion of the process the delay-lines will issue the desired delay. Upon completion of the measurement process the measure unit and the delay-lines will return to functional mode. This bit is self cleared. **NOTE:** This bit should be used only during manual (SW) calibration and not while the DDR is functional (being accessed). After initial calibration is done the hardware performs periodic measurements to track any operating conditions changes. Hence, force measurements (FRC_MSR) should not be used. See Calibration Process for more information. **NOTE:** User should make sure that there is no active accesses to/from DDR before asserting this bit. 0 No measurement is performed 1 Perform measurement process
10 MU_BYP_EN	Measure unit bypass enable. This field is used in debug mode and when it is asserted then the delay-lines will use the number of delay units that are indicated at MU_BYP_VAL, otherwise the delay-lines will use the number of delay units that was measured by the measurement unit and are indicated at MU_UNIT_DEL_NUM 0 The delay-lines use delay units as indicated at MU_UNIT_DEL_NUM. 1 The delay-lines use delay units as indicated at MU_BYPASS_VAL.
MU_BYP_VAL	Number of delay units for measurement bypass. This field is used in debug mode and holds the number of delay units that will be used by the delay-lines when MU_BYP_EN is asserted.

44.12.78 MMDC Write CA delay-line controller (MMDCx_MPWRCADL)

This register is used to add fine-tuning adjustment to the CA (command/Address of LPDDR2 bus) relative to the DDR clock.

Supported Mode Of Operations:

For Channel 0: LP2_2ch_x16, LP2_2ch_x32

For Channel 1: LP2_2ch_x16, LP2_2ch_x32

Address: Base address + 8BCh offset

MMDCx_MPWRCADL field descriptions

Field	Description
31–20 Reserved	This read-only field is reserved and always has the value 0.
19–18 WR_CA9_DEL	CA (Command/Address LPDDR2 bus) bit 9 delay fine tuning. This field holds the number of delay units that are added to CA (Command/Address bus) bit 9 relative to the clock. 00 No change in CA9 delay 01 Add CA9 delay of 1 delay unit 10 Add CA9 delay of 2 delay units. 11 Add CA9 delay of 3 delay units.
17–16 WR_CA8_DEL	CA (Command/Address LPDDR2 bus) bit 8 delay fine tuning. This field holds the number of delay units that are added to CA (Command/Address bus) bit 8 relative to the clock. 00 No change in CA8 delay 01 Add CA8 delay of 1 delay unit 10 Add CA8 delay of 2 delay units. 11 Add CA8 delay of 3 delay units.
15–14 WR_CA7_DEL	CA (Command/Address LPDDR2 bus) bit 7 delay fine tuning. This field holds the number of delay units that are added to CA (Command/Address bus) bit 7 relative to the clock. 00 No change in CA7 delay 01 Add CA7 delay of 1 delay unit 10 Add CA7 delay of 2 delay units. 11 Add CA7 delay of 3 delay units.
13–12 WR_CA6_DEL	CA (Command/Address LPDDR2 bus) bit 6 delay fine tuning. This field holds the number of delay units that are added to CA (Command/Address bus) bit 6 relative to the clock. 00 No change in CA6 delay 01 Add CA6 delay of 1 delay unit 10 Add CA6 delay of 2 delay units. 11 Add CA6 delay of 3 delay units.
11–10 WR_CA5_DEL	CA (Command/Address LPDDR2 bus) bit 5 delay fine tuning. This field holds the number of delay units that are added to CA (Command/Address bus) bit 5 relative to the clock. 00 No change in CA5 delay 01 Add CA5 delay of 1 delay unit 10 Add CA5 delay of 2 delay units. 11 Add CA5 delay of 3 delay units.
9–8 WR_CA4_DEL	CA (Command/Address LPDDR2 bus) bit 4 delay fine tuning. This field holds the number of delay units that are added to CA (Command/Address bus) bit 4 relative to the clock. 00 No change in CA4 delay 01 Add CA4 delay of 1 delay unit 10 Add CA4 delay of 2 delay units. 11 Add CA4 delay of 3 delay units.

Table continues on the next page...

MMDCx_MPWRCADL field descriptions (continued)

Field	Description
7–6 WR_CA3_DEL	CA (Command/Address LPDDR2 bus) bit 3 delay fine tuning. This field holds the number of delay units that are added to CA (Command/Address bus) bit 3 relative to the clock. 00 No change in CA3 delay 01 Add CA3 delay of 1 delay unit 10 Add CA3 delay of 2 delay units. 11 Add CA3 delay of 3 delay units.
5–4 WR_CA2_DEL	CA (Command/Address LPDDR2 bus) bit 2 delay fine tuning. This field holds the number of delay units that are added to CA (Command/Address bus) bit 2 relative to the clock. 00 No change in CA2 delay 01 Add CA2 delay of 1 delay unit 10 Add CA2 delay of 2 delay units. 11 Add CA2 delay of 3 delay units.
3–2 WR_CA1_DEL	CA (Command/Address LPDDR2 bus) bit 1 delay fine tuning. This field holds the number of delay units that are added to CA (Command/Address bus) bit 1 relative to the clock. 00 No change in CA1 delay 01 Add CA1 delay of 1 delay unit 10 Add CA1 delay of 2 delay units. 11 Add CA1 delay of 3 delay units.
WR_CA0_DEL	CA(Command/Address LPDDR2 bus) bit 0 delay fine tuning. This field holds the number of delay units that are added to CA (Command/Address bus) bit 0 relative to the clock. 00 No change in CA0 delay 01 Add CA0 delay of 1 delay unit 10 Add CA0 delay of 2 delay units. 11 Add CA0 delay of 3 delay units.

44.12.79 MMDC Duty Cycle Control Register (MMDCx_MPDCCR)

This register is used to control the duty cycle of the DQS and the primary clock (CK0). Programming of this register is permitted by entering the DDR device into self-refresh mode through LPMD/DVFS mechanism.

MMDC1_MPDCCR only affects SDCLK0.

MMDC2_MPDCCR only affects SDCLK1.

Supported Mode Of Operations:

For Channel 0: All

For Channel 1: DDR3_x64, LP2_2ch_x16, LP2_2ch_x32

NOTE

If the duty cycle is modified after DDR initialization, the DDR will have to be placed in self-refresh mode.

NOTE

The duty cycle may be changed during initial DDR initialization without having to be placed in self-refresh mode.

Address: Base address + 8C0h offset

Chapter 45
Network Interconnect Bus System (NIC-301)

45.1 Overview

This section provides an overview of the NIC-301 (Network Inter-Connect) AXI arbiter IP.

The NIC-301 (by ARM Ltd.) is a configurable AXI arbiter between several masters and slaves. The NIC-301 IP is designed so that many configuration options are selected at the hardware design stage, determined by SoC characteristics and needs, while several other configuration options are software-controlled.

This chapter covers in brief the NIC-301 functionality, while providing configuration details on the NIC-301 instances used in the chip. For complete details on the NIC-301 design, see the ARM specification, *AMBA® Network Interconnect (NIC-301) Technical Reference Manual, version r2p3*.

NOTE

The NIC-301 default settings are configured by NXP's board support package (BSP), and in most cases should not be modified by the customer. The default settings have gone through exhaustive testing during the validation of the part, and have proven to work well for the part's intended target applications. Changes to the default settings may result in a degradation in system performance.

45.1.1 Block diagram

The NIC-301 AXIAMBA arbiter (or "CoreLink Network Interconnect") by ARM, provides configurable AXIAMBA-based interconnect logic, for connecting a number of masters (initiators) to several slaves (targets), via a configurable bus switches and bridging components .

The bus system is composed of five instances: PER1, PER2, FAST1, FAST2, and FAST3.

Each instance can include one or more bus switches, with additional logic.

This chapter provides details of the various instances and the selected configuration parameters.

The top level diagram of the bus system is shown in the following figure.

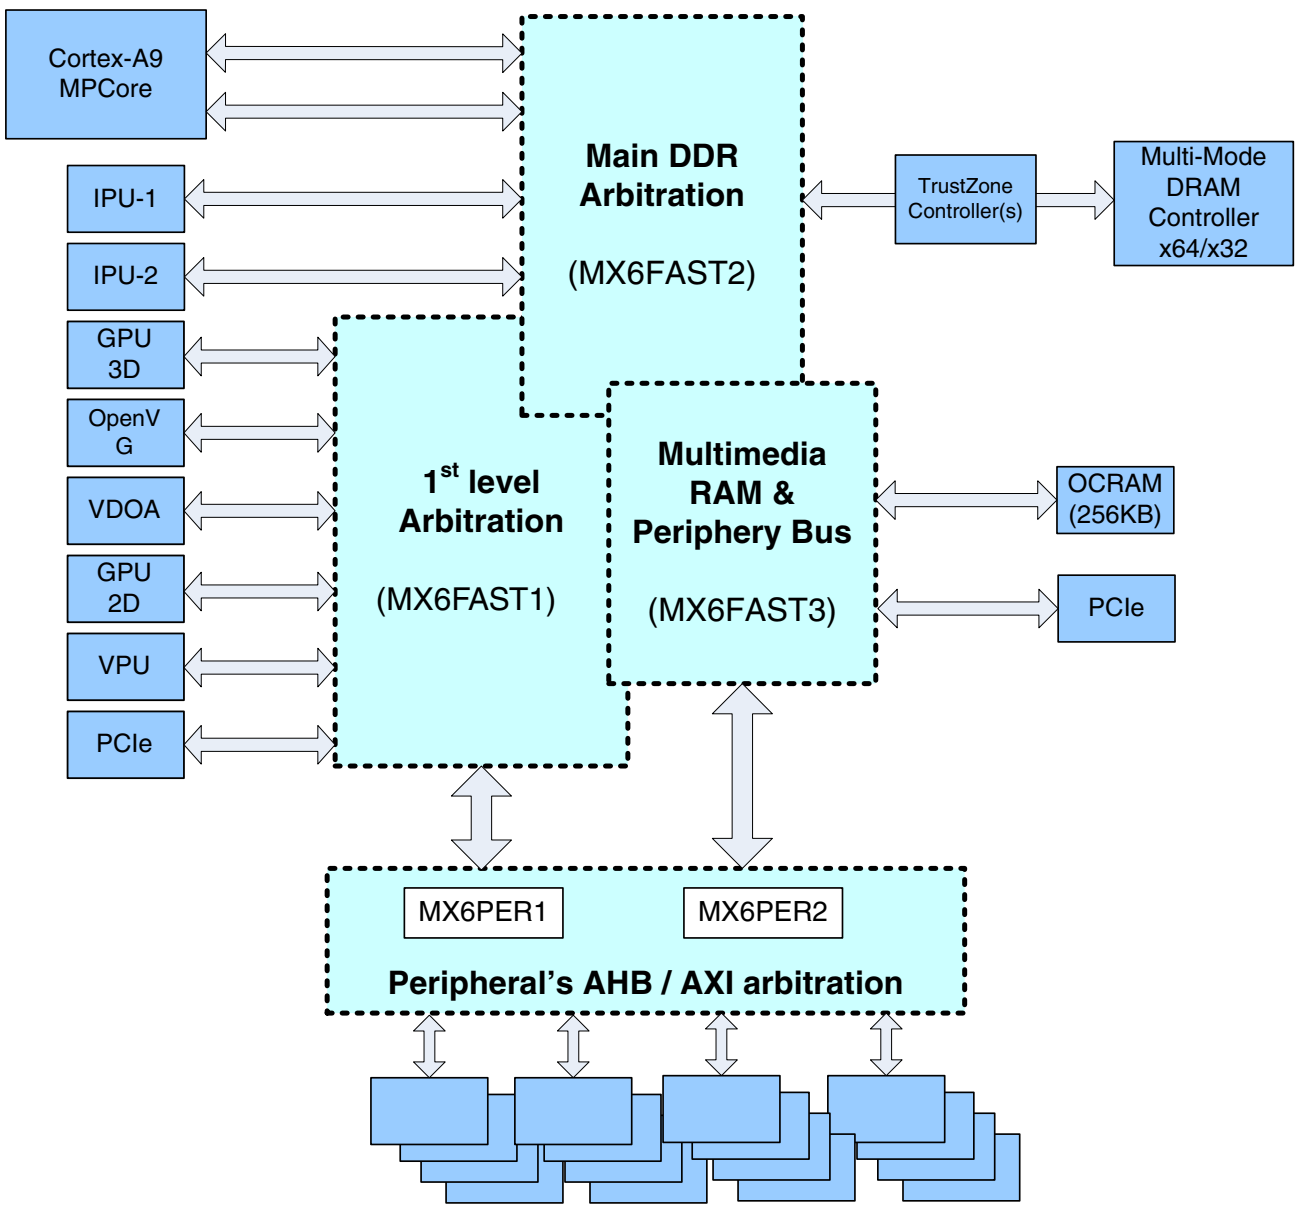

Figure 45-1. NIC-301 Bus System

45.1.2 NIC-301 Main Features

Key features of the NIC-301 module include the following:

- Address space memory mapping, including 'remap' functions.
- Programmer's view, for software-configured parameters, via "GPV" ports.
- Support for cross-clock domain synchronization.

45.1.3 Modes and Operations

The NIC-301 supports a normal functional mode only.

45.2 External Signals

There are no external I/O interfaces for NIC-301.

45.3 Memory Map and Register Definition

This section includes the block memory map and detailed register descriptions.

Access to NIC-301 registers is provided through the global programmer's view (GPV) ports. Each GPV port provides access to the configuration registers of certain IP as listed in Table 45-5 . The GPV base addresses are listed in the table below:

Table 45-1. GPV ports memory allocations

GPV	Associated NIC-301	System Bus	Chip Address	
			Start	End
GPV_0	FAST2	Main DDR Arbitration	00B0_0000	00BF_FFFF
GPV_1	FAST1	First Level Arbitration	00C0_0000	00CF_FFFF
GPV_2	PER1	Peripheral's AHB/AXI Arbitration	0020_0000	002F_FFFF
GPV_3	PER2	Reserved (Internal Use Only)	0030_0000	003F_FFFF
GPV_4	FAST3	Multimedia RAM and Peripheral Bus	0080_0000	008F_FFFF

45.3.1 Memory Map

The NIC-301 memory map, is dependent on the selected configuration option at time of creation.

A "template" map is provided in Table 45-2 below. For specific features, see the configuration tables in NIC-specific parameters to check whether specific options are selected.

45.3.2 Configuration programmers model

The GPV's contain configuration registers, partitioned into a number of individual 4KB blocks.

The general structure of the registers is provided by the following tables:

- Address map of the programmers model, Table 45-2
- AMIB Registers, and
- ASIB Registers, and

Table 45-2. Address map of the programmers model

Address Offset from Base Address	Registers	Notes
0x000F_F000	Internal interface p registers	Maximum p = 61
	...	Note [1]
0x000C_4000	Internal interface 2 registers	
0x000C_3000	Internal interface 1 registers	
0x000C_2000	Internal interface 0 registers	
0x000C_1000	Slave interface m registers	Maximum m = 127
	...	Note [2]
0x0004_4000	Slave interface 2 registers	
0x0004_3000	Slave interface 1 registers	
0x0004_2000	Slave interface 0 registers	
0x0004_1000	Master interface n registers	Maximum n = 63
	...	Note [3]
0x0000_4000	Master interface 2 registers	
0x0000_3000	Master interface 1 registers	
0x0000_2000	Master interface 0 registers	
0x0000_1000	ID registers	
0x0000_0000	Address control registers	Configurable base address [4]

1. Index refers to BI registers index
2. Index refer to ASIB registers index
3. Index refer to AMIB registers index

4. Reserved for internal use

45.3.2.1 Address control and ID registers

Registers at offsets 0x0–0xFFC are reserved for internal use.

45.3.2.2 AMBA master interface block (AMIB) configuration registers

The table below lists only the registers that affect the user. All other addresses are treated as "reserved". Non-implemented or reserved addresses inside NIC domains are read as ZEROS and writes operations are ignored.

Table 45-3. AMIB Registers

Offset	Register	Access	Width	Reset Value
0x024	fn_mod2 Bypass merge. This register is only present if upsizing or downsizing. See upsizing/downsizing data width functions in AMBA Network Interconnect TRM.	RW	1	0
0x040	wr_tidemark	RW	4	Note [1]

1. Reset value varies, default value chosen at RTL creation time is designed to suit normal operation.

45.3.2.3 ASIB (AMBA slave interface block) configuration registers

The table below lists only the registers that affect the user. All other addresses are treated as "reserved". Non-implemented or reserved addresses inside NIC domains are read as ZEROS and writes operations are ignored.

Table 45-4. ASIB Registers

Offset	Register	Access	Width	Reset Value
0x040	wr_tidemark Valid only for AXI slaves with WFIFO >=4.	RW	1	Note [1]
0x100	read_qos	RW	4	Note [2]
0x104	write_qos	RW	4	Note [2]

1. Reset value varies, default value chosen at RTL creation time is designed to suit typical operation cases.
2. QoS default is set at RTL creation time, and is listed in specific NIC-301 configuration tables in NIC-specific parameters, as parameters "QoS qv_value" in ASIB / AMIB parameter tables.

45.3.3 Register Descriptions

The NIC-301 registers are dependent upon the selected configuration, the type of ports, hardware-selected features and whether they have a GPV view. The addressing is associated to a specific port, by looking at the port's index number, under "apb_slave" column.

The memory map template is provided in the Configuration programmers model above.

45.3.3.1 QoS registers' address look-up example

The flow below describes the steps needed in determining the memory addresses for GPU3D QoS read/write registers:

- Look up the GPU3D port indexes ("apb_slave"[1] column in Table 45-5): index 66 and 71 for primary and secondary buses, respectively. Note that the GPU3D is listed under GPV_1 interface.
- Look up the GPV_1 base address: 0x00C0_0000, in Table 45-1 .
- The master/slave ports configuration base address, is always obtained by: "GPV base" + ("APB index" x 0x1000), regardless of whether it is a slave or a master port. This is somewhat contrary to the way indexes are presented in the "Address map of the NIC-301 programmers model" in the ARM documentation as shown in Table 45-2, where, instead, the indexes are provided in absolute values (of 0x1000 jumps), starting from the GPV base address.

  Hence, for the GPU3Dprimary port (index '66'), the "slave interface" programming base address is 0x00C4_2000 (= GPV_1 base + 66 x 0x1000).

  Similarly, for the GPU3D's secondary port (index 71), the "slave interface" programming base address is 0x00C4_7000 (= GPV_1 base + 71 x 0x1000).

- To access any of the slave/master interface registers (in this example - the QoS read/write ones), their offset(s) must be added, as shown in Table 45-4 :

  "0x100" for Read_QoS and "0x104" for Write_QoS, in our example.

Final addresses obtained for QoS registers for the GPU3D primary port (index 66), are as follows:

- Read QoS: "0x00C4_2100"
- Write QoS: "0x00C4_2104"

1. The "slave", "master" type is assumed from NIC-301 point of view.

Similarly, QoS registers addresses for the GPU3D secondary port (index 71), are as follows:

- Read QoS: "0x00C4_7100"
- Write QoS: "0x00C4_7104"

45.3.4 NIC-specific parameters

This section details the configuration parameters of the NIC-301.

General notes:

1. All accesses to GPV_4 port, must be of "Supervisor" type.
2. The associated master/slave port interface ID (for each "GPV_N") is specified by the "apb_slave" / "apb_master" [2] index. The slave/master interface, configuration register's start address is obtained by the following:

   Start address (for "apb" index= "n") = GPV_N base + (n x 0x1000).

3. The security features of NIC-301 are not used, since master-slaves permissions are controlled by the CSU security policy/scheme.

Table 45-5. QoS and tidemark parameters

Master	apb_slave	Tidemark	QOS qv_value	Comments
Configured via GPV_1 port				
GPU3D (Primary)	66	2	2	
GPU3D (Secondary)	71	2	2	
GPU2D (Primary)	67	2	2	
GPU2D (Secondary)	72	2	2	
VDOA	68	2	2	
OpenVG	69	2	2	
VPU Prim.	73	2	2	
PCIe	74	2	2	
Configured via GPV_0 port				
MPCore-0	66		2	
MPCore-1	67		2	
IPU1	68	4	0	QoS configurable via GPR bits in IOMUXC.
IPU2	69	4	0	QoS configurable via GPR bits in IOMUXC.
Configured via GPV_4 port				
VPU	68		2	

Table continues on the next page...

2. "APB" stands for "ARM Peripheral Bus".

Chapter 46
On-Chip OTP Controller (OCOTP_CTRL)

46.1 Overview

This section contains information describing the requirements for the on-chip eFuse OTP controller along with details about the block functionality and implementation.

In this document, the words "eFuse" and "OTP" are interchangeable. OCOTP refers to the hardware block itself.

46.1.1 Features

The OCOTP provides the following features:

- 32-bit word restricted program and read to 4 kbit of eFuse OTP (512 x 8).
- Loading and housing of fuse content into shadow registers.
- Memory-mapped (restricted) access to 4 kbit of shadow registers.
- Generation of HWV_FUSE (hardware visible fuse bus) and the HWV_REG bus which is made up of volatile PIO register based "fuses". The HWV_REG bits come from the SCS (Software Controllable Signals) register.
- Generation of STICKY_REG which is consist of sticky register bits.
- Provide program-protect and read-protect eFuse.
- Provide override and read protection of shadow register.
- CRC32 test for read-lock fuse content.

46.2 Clocks

The table found here describes the clock sources for OCOTP.

Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 46-1. OCOTP Clocks

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

46.3 Top-Level Symbol and Functional Overview

The figure found here shows the OCOTP system level diagram.

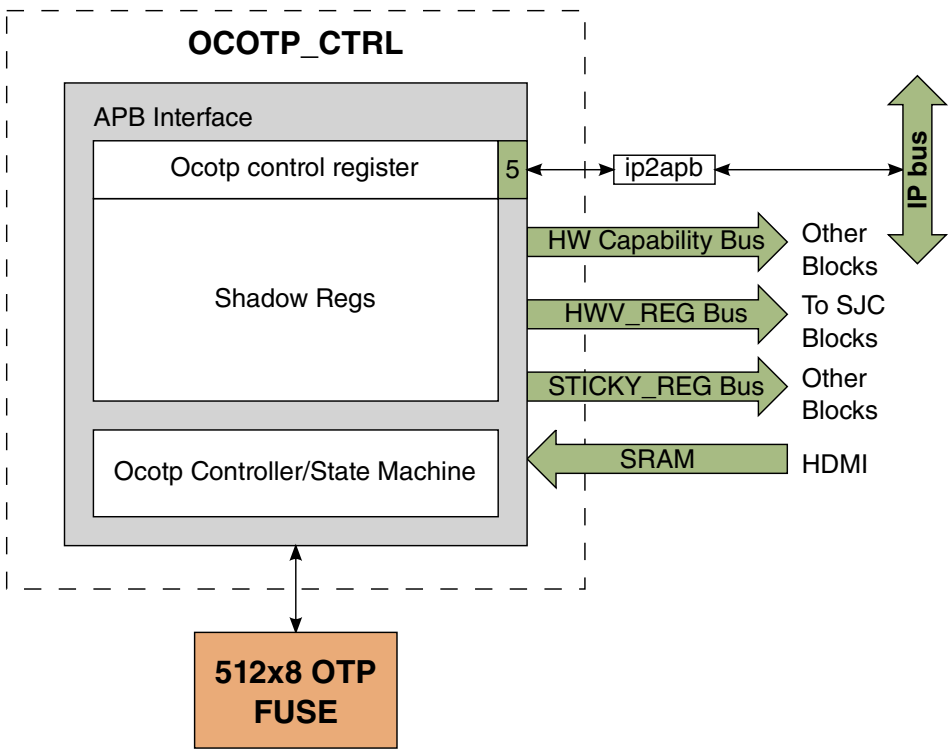

Figure 46-1. OCOTP System Level Diagram

46.3.1 Operation

The IP bus interface of the OCOTP provides two functions.

- Configure control registers for programming and reading fuse word.
- Override and read shadow registers.

For efuse, program can only be performed on bit and read is based on byte. OCOTP configuration for program and read are performed on 32-bit words for SW convenience. For writes, the 32-bit word reflects the "write-mask". Bit fields with 0 will not be programmed and bit fields with 1 will be programmed. OCOTP will program bit field with 1 in the fuse word one bit by one bit. For reads, OCOTP will read 4 times to get 4 bytes in the fuse word in order.

In this document, 4-kbit fuse are divided into 16 banks by function. Each bank has 8 fuse words. In physical, 4k bits fuse are in one 512x8 efusebox.

46.3.1.1 Shadow Register Reload

All fuse words in efusebox are shadowed. Therefore, fuse information is available through memory mapped shadow registers. If fuses are subsequently programmed, the shadow registers should be reloaded to keep them coherent with the fuse bank arrays.

The "reload shadows" feature allows the user to force a reload of the shadow registers (including HW_OCOTP_LOCK) without having to reset the device. To force a reload, complete the following steps:

1. Set the HW_OCOTP_TIMING[STROBE_READ] and HW_OCOTP_TIMING[RELAX] field value appropriately (as explained in a later section).
2. Check that HW_OCOTP_CTRL[BUSY] and HW_OCOTP_CTRL[ERROR] are clear. Overlapped accesses are not supported by the controller. Any pending write , read or reload must be completed before a new access can be requested.
3. Set the HW_OCOTP_CTRL[RELOAD_SHADOWS] bit. OCOTP will read all the fuse one by one and put it into corresponding shadow register.
4. Wait for HW_OCOTP_CTRL[BUSY] and HW_OCOTP_CTRL[RELOAD_SHADOWS] to be cleared by the controller.

The controller will automatically clear the HW_OCOTP_CTRL[RELOAD_SHADOWS] bit after the successful completion of the operation.

46.3.1.2 Fuse and Shadow Register Read

All shadow registers are always readable through the APB bus except some secret keys regions. When their corresponding fuse lock bits are set, the shadow registers also become read locked. After read locking, reading from these registers will return 0xBADABADA.

In addition HW_OCOTP_CTRL[ERROR] will be set. It must be cleared by software before any new write , read or reload access can be issued. Subsequent reads to unlocked shadow locations will still work successfully however.

To read fuse words directly from fusebox correctly complete the following steps:

1. Program HW_OCOTP_TIMING[STROBE_READ] and HW_OCOTP_TIMING[RELAX] fields with timing values to match the current frequency of the ipg_clk. OTP read will work at maximum bus frequencies as long as the HW_OCOTP_TIMING parameters are set correctly.
2. Check that HW_OCOTP_CTRL[BUSY] and HW_OCOTP_CTRL[ERROR] are clear. Overlapped accesses are not supported by the controller. Any pending write, read or reload must be completed before a read access can be requested.
3. Write the requested address to HW_OCOTP_CTRL[ADDR].
4. Set HW_OCOTP_READ_CTRL[READ_FUSE] to 1. OCOTP will auto read 4 bytes in requested word address in fusebox one by one. Then put read value into HW_OCOTP_READ_FUSE_DATA register.
5. Once complete, the controller will clear BUSY. A read request to a protected or locked region will result in no OTP access and no setting of HW_OCOTP_CTRL[BUSY]. In addition HW_OCOTP_CTRL[ERROR] will be set. It must be cleared by software before any new access can be issued.
6. Read HW_OCOTP_READ_FUSE_DATA register to get fuse word value.HW_OCOTP_READ_FUSE_DATA will be 0xBADABADA when HW_OCOTP_CTRL[ERROR] is set.

46.3.1.3 Fuse and Shadow Register Writes

Shadow register bits can be overridden by software until the corresponding fuse lock bit for the region is set. When the lock shadow bit is set, the shadow registers for that lock region become write locked. The LOCK shadow register also has no shadow or fuse lock bits but it is always read only.

In order to avoid "rogue" code performing erroneous writes to OTP, a special unlocking sequence is required for writes to the fuse banks. To program fuse bank correctly complete the following steps:

1. Program HW_OCOTP_TIMING[STROBE_PROG] and HW_OCOTP_TIMING[RELAX] fields with timing values to match the current frequency of the ipg_clk. OTP writes will work at maximum bus frequencies as long as the HW_OCOTP_TIMING parameters are set correctly.

2. Check that HW_OCOTP_CTRL[BUSY] and HW_OCOTP_CTRL[ERROR] are clear. Overlapped accesses are not supported by the controller. Any pending write or reload must be completed before a write access can be requested.
3. Write the requested address to HW_OCOTP_CTRL[ADDR] and program the unlock code into HW_OCOTP_CTRL[WR_UNLOCK]. This must be programmed for each write access. The lock code is documented in the register description. Both the unlock code and address can be written in the same operation.
4. Write the data to the HW_OCOTP_DATA register. This will automatically set HW_OCOTP_CTRL[BUSY] and clear HW_OCOTP_CTRL[WR_UNLOCK]. To protect programming same OTP bit twice, before program OCOTP will automatically read fuse value in OTP and use read value to mask program data. The controller will use masked program data to program a 32-bit word in the OTP per the address in HW_OCOTP_CTRL[ADDR]. Bit fields with 1's will result in that OTP bit being programmed. Bit fields with 0's will be ignored. At the same time that the write is accepted, the controller makes an internal copy of HW_OCOTP_CTRL[ADDR] which cannot be updated until the next write sequence is initiated. This copy guarantees that erroneous writes to HW_OCOTP_CTRL[ADDR] will not affect an active write operation. It should also be noted that during the programming HW_OCOTP_DATA will shift right (with zero fill). This shifting is required to program the OTP serially. During the write operation, HW_OCOTP_DATA cannot be modified.
5. Once complete, the controller will clear BUSY. A write request to a protected or locked region will result in no OTP access and no setting of HW_OCOTP_CTRL[BUSY]. In addition HW_OCOTP_CTRL[ERROR] will be set. It must be cleared by software before any new write access can be issued.

It should be noted that write latencies to OTP are numbers of 10 micro-seconds per word. Write latencies is based on amount of bit filed which is 1. For example : program half fuse bits in one word need 10 us x 16.

For further details of OTP read/write operations see [eFUSE].

HW_OCOTP_CTRL[ERROR] will be set under the following conditions:

- A write is performed to a shadow register during a shadow reload (essentially, while HW_OCOTP_CTRL[RELOAD_SHADOWS] is set. In addition, the contents of the shadow register shall not be updated.
- A write is performed to a shadow register which has been locked.
- A read is performed to from a shadow register which has been read locked.
- A program is performed to a fuse word which has been locked.
- A read is performed to from a fuse word which has been read locked.

46.3.1.4 Write Postamble

Due to internal electrical characteristics of the OTP during writes, all OTP operations following a write must be separated by 2 us after the clearing of HW_OCOTP_CTRL_BUSY following the write. This guarantees programming voltages on-chip to reach a steady state when exiting a write sequence. This includes reads, shadow reloads, or other writes.

A recommended software sequence to meet the postamble requirements is as follows:

- Issue the write and poll for BUSY (as per Fuse Shadow Memory Footprint).
- Once BUSY is clear, use HW_DIGCTL_MICROSECONDS to wait 2 us.
- Perform the next OTP operation.

46.3.2 Fuse Shadow Memory Footprint

The OTP memory footprint shows in the following figure. The registers are grouped by lock region. Their names correspond to the PIO register and fusemap names.

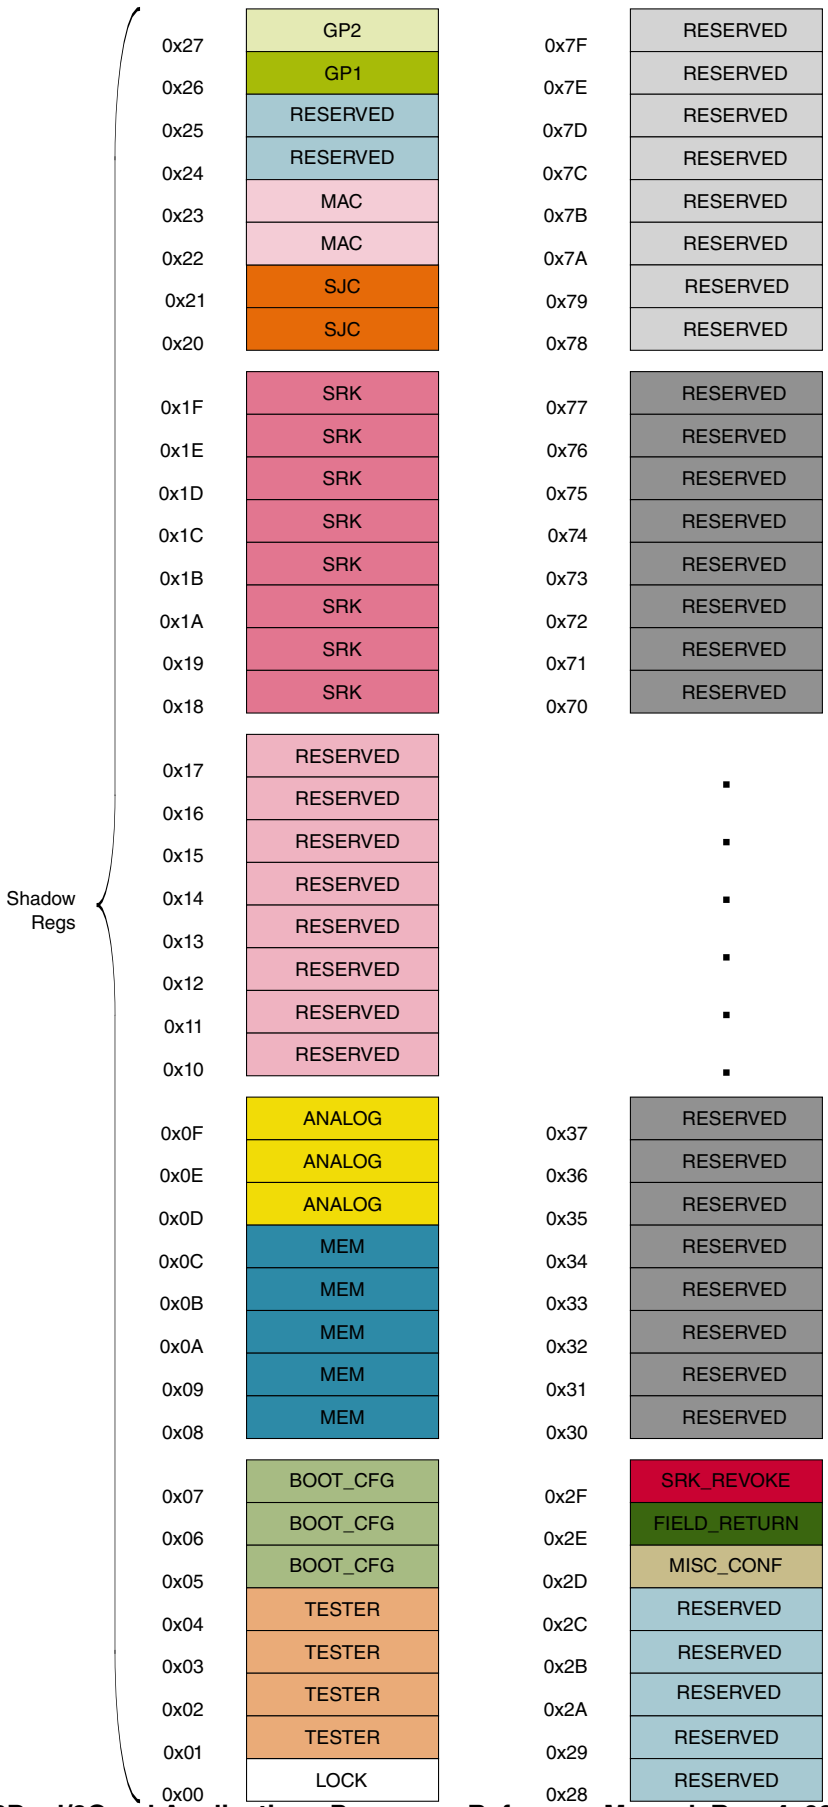

Figure 46-2. OTP Memory Footprint

46.3.3 OTP Read/Write Timing Parameters

There are three timing fields contained in the HW_OCOTP_TIMING register that specify counter limit values, which are used to time how long the state machine remains in the various states, as well as specify the STROBE signal timing.

TheyBoth two timing parameters are all specified in ipg_clk cycles. Since the ipg_clk frequency can be set to a range of values, these parameters must be adjusted with the clock to yield the appropriate delay.

The HW_OCOTP_TIMING[RELAX] field specifies how long to remain in states to meet setup and hold timing requirement in fuse spec. This parameter should be set by the following equation:

tRELAX = tHP_PG = (HW_OCOTP_TIMING[RELAX]+1)/ipg_frequency > 16.2ns

HW_OCOTP_TIMING[RELAX] field is used to create other setup and hold timing delays in addition to tHP_PG. For all timing to be met, this is the max delay that must be programmed.

Except for setup and hold timing delay, there are 2 timing parameters for STROBE signal pulse width in program and read.

The HW_OCOTP_TIMING[STROBE_PROG] field specifies the period of the STROBE signal for fuse writes and is given in units of ipg_clk cycles. This value should be specified so that the requirement for the time when the STROBE signal is asserted high is met: 9000ns < tPGM < 11000ns is met. Even though a range is given for tPGM, it is advised in **[eFUSE]** to program for a value of 10000ns. Therefore, this field should be set according to the following equation:

tPGM = ((HW_OCOTP_TIMING[STROBE_PROG]+1)-
2*(HW_OCOTP_TIMING[RELAX]+1))/ipg_frequency = 10000ns.

The HW_OCOTP_TIMING[STROBE_READ] field specifies the period of the STROBE signal for fuse reads and is given in units of ipg_clk cycles. This field should be set according to the following equation:

tRD = ((HW_OCOTP_TIMING[STROBE_READ]+1)-
2*(HW_OCOTP_TIMING[RELAX]+1))/ipg_frequency > 36ns.

The figure below illustrates the relationship between the STROBE signal in programming and reading mode, as well as the timing PIO register fields that affect it. The implementation uses one counter to generate the STROBE waveform within one period and a second counter counts the number of cycles to create for programming the designated word.

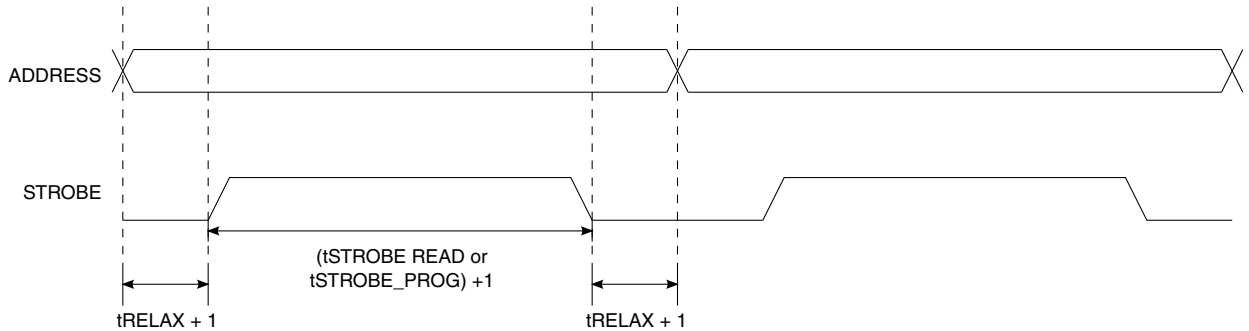

Figure 46-3. STROBE Signal Creation and Timing

46.3.4 Hardware Visible Fuses

The hwv_fuse bus emanates from the OCOTP block and goes to various other blocks inside the chip. This bus is made up of the shadow register bits for banks 0, 1, 2 and 4.

Only a subset of these fuse bits are currently used by the hardware. The fuse bits are initially copied from the eFuse banks after reset is deasserted. When all fuse bits are loaded into their shadow registers, the OCOTP asserts the fuse_latched output signal.

The hwv_reg bus also comes from the OCOTP. Its source is the HW_OCOTP_SCS register. This register has 1 defined bit, the HAB_JDE bit, that is connected to the SJC block. The SCS bits are intended to be used as volatile fuse bits under software control. Additional bits will be defined as needed in future implementations.

The system-wide reset sequence must be coordinated by the system reset controller, so that the hwv_fuse and hwv_reg buses are stable and reflect the values of the fuses before they are used by the rest of the system.

46.3.5 Behavior During Reset

The OCOTP is always active. The shadow registers automatically load the appropriate OTP contents after reset is deasserted. During this load-time HW_OCOTP_CTRL_BUSY is set. The load time is similar to that of a "reload shadow" operation.

46.3.6 Secure JTAG control

The JTAG control fuses are used to allow or disallow JTAG access to secured resources.

Three JTAG security levels are envisioned, as shown in the table below.

Table 46-2. JTAG Security Level Control Bits

Security Mode	JTAG_SMODE	Description
No Debug	2'b11	The highest security level.
Secure JTAG	2'b01	Limit the JTAG access by using key based authentication mechanism.
JTAG Enable	2'b00	Low Security, all JTAG features are enabled.

46.4 Fuse Map

See the Fusemap chapter of this reference manual for more information.

46.5 OCOTP Memory Map/Register Definition

NOTE

When write/read unimplemented register address in ocotp_ctrl, ocotp_ctrl will not send error and read data will be 0.

OCOTP Hardware Register Format Summary

OCOTP memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
21B_C000	OTP Controller Control Register (OCOTP_CTRL)	32	R/W	0000_0000h	46.5.1/4016
21B_C004	OTP Controller Control Register (OCOTP_CTRL_SET)	32	R/W	0000_0000h	46.5.1/4016
21B_C008	OTP Controller Control Register (OCOTP_CTRL_CLR)	32	R/W	0000_0000h	46.5.1/4016
21B_C00C	OTP Controller Control Register (OCOTP_CTRL_TOG)	32	R/W	0000_0000h	46.5.1/4016
21B_C010	OTP Controller Timing Register (OCOTP_TIMING)	32	R/W	0146_1299h	46.5.2/4018
21B_C020	OTP Controller Write Data Register (OCOTP_DATA)	32	R/W	0000_0000h	46.5.3/4019
21B_C030	OTP Controller Write Data Register (OCOTP_READ_CTRL)	32	R/W	0000_0000h	46.5.4/4019
21B_C040	OTP Controller Read Data Register (OCOTP_READ_FUSE_DATA)	32	R/W	0000_0000h	46.5.5/4020
21B_C050	Sticky bit Register (OCOTP_SW_STICKY)	32	R/W	0000_0000h	46.5.6/4021
21B_C060	Software Controllable Signals Register (OCOTP_SCS)	32	R/W	0000_0000h	46.5.7/4022
21B_C064	Software Controllable Signals Register (OCOTP_SCS_SET)	32	R/W	0000_0000h	46.5.7/4022

Table continues on the next page...

OCOTP memory map (continued)

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
21B_C068	Software Controllable Signals Register (OCOTP_SCS_CLR)	32	R/W	0000_0000h	46.5.7/4022
21B_C06C	Software Controllable Signals Register (OCOTP_SCS_TOG)	32	R/W	0000_0000h	46.5.7/4022
21B_C090	OTP Controller Version Register (OCOTP_VERSION)	32	R	0200_0000h	46.5.8/4023
21B_C400	Value of OTP Bank0 Word0 (Lock controls) (OCOTP_LOCK)	32	R	0000_0000h	46.5.9/4023
21B_C410	Value of OTP Bank0 Word1 (Configuration and Manufacturing Info.) (OCOTP_CFG0)	32	R/W	0000_0000h	46.5.10/ 4026
21B_C420	Value of OTP Bank0 Word2 (Configuration and Manufacturing Info.) (OCOTP_CFG1)	32	R/W	0000_0000h	46.5.11/ 4027
21B_C430	Value of OTP Bank0 Word3 (Configuration and Manufacturing Info.) (OCOTP_CFG2)	32	R/W	0000_0000h	46.5.12/ 4027
21B_C440	Value of OTP Bank0 Word4 (Configuration and Manufacturing Info.) (OCOTP_CFG3)	32	R/W	0000_0000h	46.5.13/ 4028
21B_C450	Value of OTP Bank0 Word5 (Configuration and Manufacturing Info.) (OCOTP_CFG4)	32	R/W	0000_0000h	46.5.14/ 4028
21B_C460	Value of OTP Bank0 Word6 (Configuration and Manufacturing Info.) (OCOTP_CFG5)	32	R/W	0000_0000h	46.5.15/ 4029
21B_C470	Value of OTP Bank0 Word7 (Configuration and Manufacturing Info.) (OCOTP_CFG6)	32	R/W	0000_0000h	46.5.16/ 4029
21B_C480	Value of OTP Bank1 Word0 (Memory Related Info.) (OCOTP_MEM0)	32	R/W	0000_0000h	46.5.17/ 4030
21B_C490	Value of OTP Bank1 Word1 (Memory Related Info.) (OCOTP_MEM1)	32	R/W	0000_0000h	46.5.18/ 4030
21B_C4A0	Value of OTP Bank1 Word2 (Memory Related Info.) (OCOTP_MEM2)	32	R/W	0000_0000h	46.5.19/ 4031
21B_C4B0	Value of OTP Bank1 Word3 (Memory Related Info.) (OCOTP_MEM3)	32	R/W	0000_0000h	46.5.20/ 4031
21B_C4C0	Value of OTP Bank1 Word4 (Memory Related Info.) (OCOTP_MEM4)	32	R/W	0000_0000h	46.5.21/ 4032
21B_C4D0	Value of OTP Bank1 Word5 (Memory Related Info.) (OCOTP_ANA0)	32	R/W	0000_0000h	46.5.22/ 4032
21B_C4E0	Value of OTP Bank1 Word6 (General Purpose Customer Defined Info.) (OCOTP_ANA1)	32	R/W	0000_0000h	46.5.23/ 4033
21B_C4F0	Value of OTP Bank1 Word7 (General Purpose Customer Defined Info.) (OCOTP_ANA2)	32	R/W	0000_0000h	46.5.24/ 4033
21B_C580	Shadow Register for OTP Bank3 Word0 (SRK Hash) (OCOTP_SRK0)	32	R/W	0000_0000h	46.5.25/ 4034
21B_C590	Shadow Register for OTP Bank3 Word1 (SRK Hash) (OCOTP_SRK1)	32	R/W	0000_0000h	46.5.26/ 4034
21B_C5A0	Shadow Register for OTP Bank3 Word2 (SRK Hash) (OCOTP_SRK2)	32	R/W	0000_0000h	46.5.27/ 4035
21B_C5B0	Shadow Register for OTP Bank3 Word3 (SRK Hash) (OCOTP_SRK3)	32	R/W	0000_0000h	46.5.28/ 4035

Table continues on the next page...

OCOTP memory map (continued)

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
21B_C5C0	Shadow Register for OTP Bank3 Word4 (SRK Hash) (OCOTP_SRK4)	32	R/W	0000_0000h	46.5.29/ 4036
21B_C5D0	Shadow Register for OTP Bank3 Word5 (SRK Hash) (OCOTP_SRK5)	32	R/W	0000_0000h	46.5.30/ 4036
21B_C5E0	Shadow Register for OTP Bank3 Word6 (SRK Hash) (OCOTP_SRK6)	32	R/W	0000_0000h	46.5.31/ 4037
21B_C5F0	Shadow Register for OTP Bank3 Word7 (SRK Hash) (OCOTP_SRK7)	32	R/W	0000_0000h	46.5.32/ 4037
21B_C600	Value of OTP Bank4 Word0 (Secure JTAG Response Field) (OCOTP_RESP0)	32	R/W	0000_0000h	46.5.33/ 4038
21B_C610	Value of OTP Bank4 Word1 (Secure JTAG Response Field) (OCOTP_HSJC_RESP1)	32	R/W	0000_0000h	46.5.34/ 4038
21B_C620	Value of OTP Bank4 Word2 (MAC Address) (OCOTP_MAC0)	32	R/W	0000_0000h	46.5.35/ 4039
21B_C630	Value of OTP Bank4 Word3 (MAC Address) (OCOTP_MAC1)	32	R/W	0000_0000h	46.5.36/ 4039
21B_C660	Value of OTP Bank4 Word6 (HW Capabilities) (OCOTP_GP1)	32	R/W	0000_0000h	46.5.37/ 4040
21B_C670	Value of OTP Bank4 Word7 (HW Capabilities) (OCOTP_GP2)	32	R/W	0000_0000h	46.5.38/ 4040
21B_C6D0	Value of OTP Bank5 Word5 (HW Capabilities) (OCOTP_MISC_CONF)	32	R/W	0000_0000h	46.5.39/ 4041
21B_C6E0	Value of OTP Bank5 Word6 (HW Capabilities) (OCOTP_FIELD_RETURN)	32	R/W	0000_0000h	46.5.40/ 4041
21B_C6F0	Value of OTP Bank5 Word7 (HW Capabilities) (OCOTP_SRK_REVOKE)	32	R/W	0000_0000h	46.5.41/ 4042

46.5.1 OTP Controller Control Register (OCOTP_CTRL*n*)

The OCOTP Control and Status Register specifies the copy state, as well as the control required for random access of the OTP memory

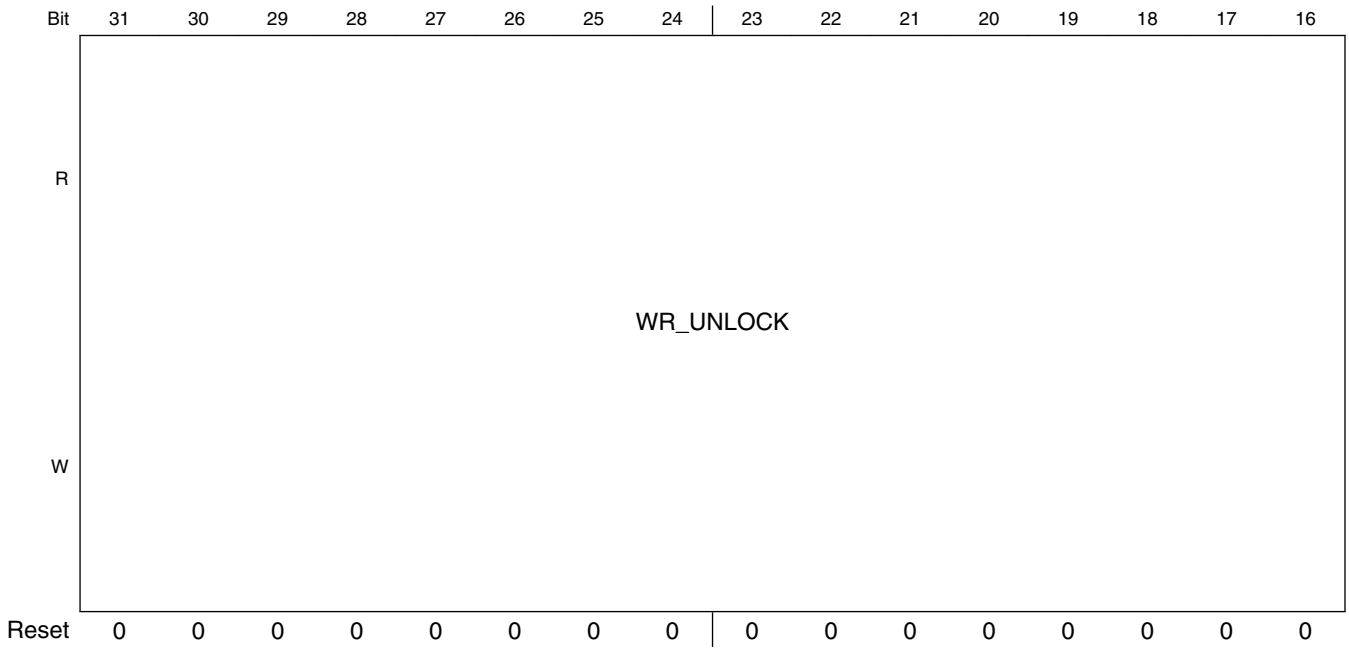
OCOTP_CTRL: 0x000

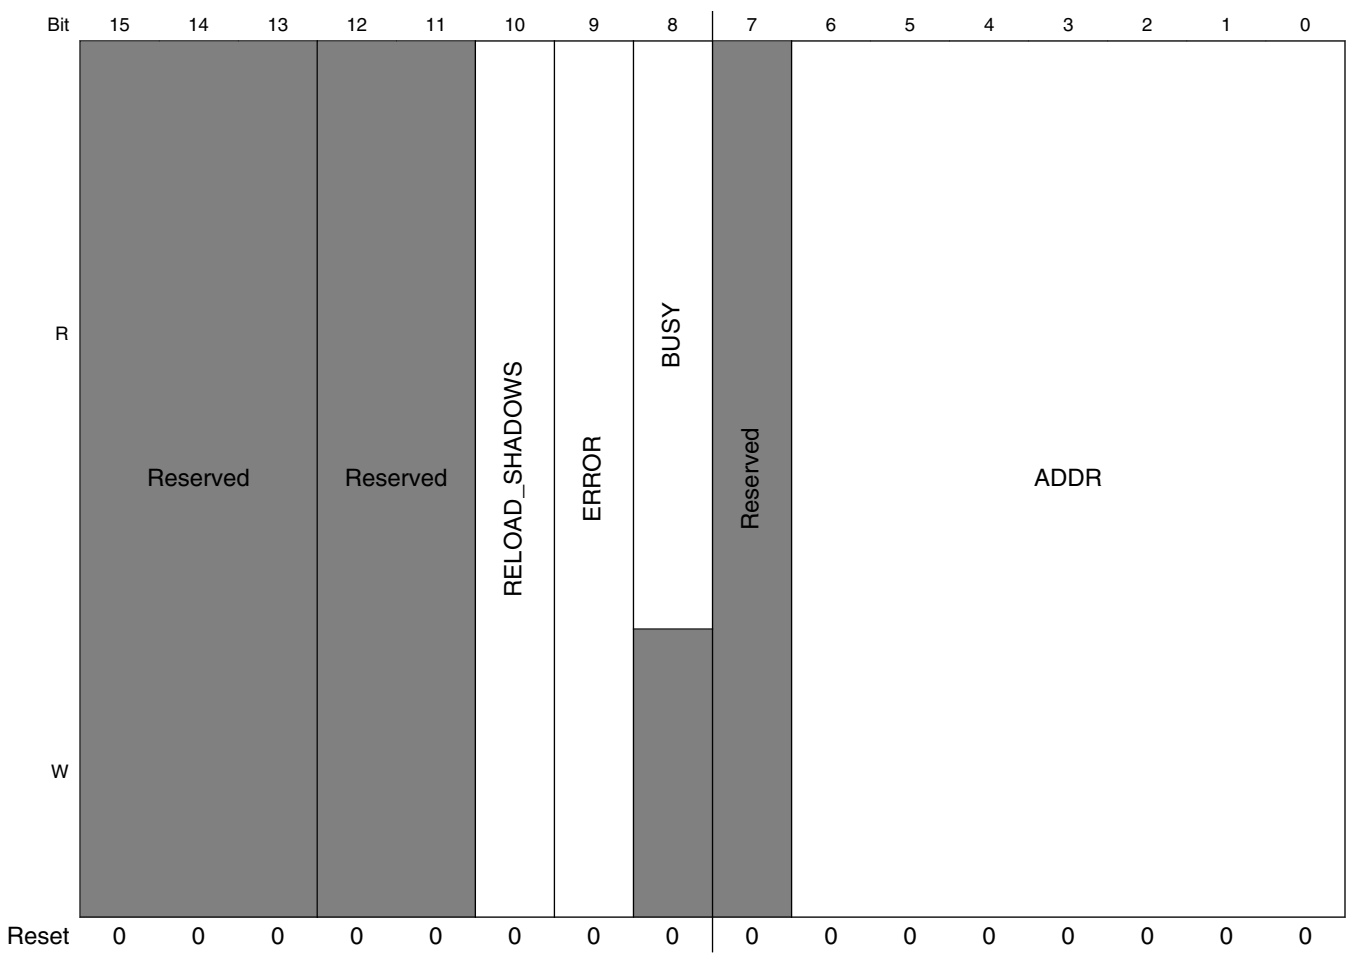
The OCOTP Control and Status Register provides the necessary software interface for performing read and write operations to the On-Chip OTP (One-Time Programmable ROM). The control fields such as WR_UNLOCK, ADDR and BUSY/ERROR may be used in conjuction with the HW_OCOTP_DATA register to perform write operations. Read operations to the On-Chip OTP are involving ADDR, BUSY/ERROR bit field and HW_OCOTP_READ_CTRL register. Read value is saved in HW_OCOTP_READ_FUSE_DATA register.

EXAMPLE

Empty Example.

Address: 21B_C000h base + 0h offset + (4d × i), where i=0d to 3d





OCOTP_CTRL*n* field descriptions

Field	Description
31–16 WR_UNLOCK	Write 0x3E77 to enable OTP write accesses. NOTE: This register must be unlocked on a write-by-write basis (a write is initiated when HW_OCOTP_DATA is written), so the UNLOCK bitfield must contain the correct key value during all writes to HW_OCOTP_DATA, otherwise a write shall not be initiated. This field is automatically cleared after a successful write completion (clearing of BUSY). 0x3E77 **KEY** — Key needed to unlock HW_OCOTP_DATA register.
15–13 -	This field is reserved. Reserved
12–11 -	This field is reserved. Reserved
10 RELOAD_ SHADOWS	Set to force re-loading the shadow registers (HW/SW capability and LOCK). This operation will automatically set BUSY. Once the shadow registers have been re-loaded, BUSY and RELOAD_SHADOWS are automatically cleared by the controller.
9 ERROR	Set by the controller when an access to a locked region(OTP or shadow register) is requested. Must be cleared before any further access can be performed. This bit can only be set by the controller. This bit is also set if the Pin interface is active and software requests an access to the OTP. In this instance, the ERROR bit cannot be cleared until the Pin interface access has completed. Reset this bit by writing a one to the SCT clear address space and not by a general write.
8 BUSY	OTP controller status bit. When active, no new write access or read access to OTP(including RELOAD_SHADOWS) can be performed. Cleared by controller when access complete. After reset (or after setting RELOAD_SHADOWS), this bit is set by the controller until the HW/SW and LOCK registers are successfully copied, after which time it is automatically cleared by the controller.
7 -	This field is reserved. Reserved
ADDR	OTP write and read access address register. Specifies one of 128 word address locations (0x00 - 0x7f). If a valid access is accepted by the controller, the controller makes an internal copy of this value. This internal copy will not update until the access is complete.

46.5.2 OTP Controller Timing Register (OCOTP_TIMING)

The OCOTP Data Register is used for OTP Programming

This register specifies timing parameters for programming and reading the OCOTP fuse array.

EXAMPLE

```
Empty Example.
```

Address: 21B_C000h base + 10h offset = 21B_C010h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0				WAIT						STROBE_READ						RELAX				STROBE_PROG											
W																																
Reset	0	0	0	0	0	0	0	1	0	1	0	0	0	1	1	0	0	0	0	1	0	0	1	0	1	0	0	1	1	0	0	1

OCOTP_TIMING field descriptions

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27–22 WAIT	This count value specifies time interval between auto read and write access in one time program. It is given in number of ipg_clk periods.
21–16 STROBE_READ	This count value specifies the strobe period in one time read OTP. Trd = ((STROBE_READ+1)- 2*(RELAX +1)) /ipg_clk_freq. It is given in number of ipg_clk periods.
15–12 RELAX	This count value specifies the time to add to all default timing parameters other than the Tpgm and Trd. It is given in number of ipg_clk periods.
STROBE_PROG	This count value specifies the strobe period in one time write OTP. Tpgm = ((STROBE_PROG+1)- 2*(RELAX+1)) /ipg_clk_freq. It is given in number of ipg_clk periods.

46.5.3 OTP Controller Write Data Register (OCOTP_DATA)

The OCOTP Data Register is used for OTP Programming

This register is used in conjuction with HW_OCOTP_CTRL to perform one-time writes to the OTP. Please see the "Software Write Sequence" section for operating details.

EXAMPLE

```
Empty Example.
```

Address: 21B_C000h base + 20h offset = 21B_C020h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	DATA																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

OCOTP_DATA field descriptions

Field	Description
DATA	Used to initiate a write to OTP. Please see the "Software Write Sequence" section for operating details.

46.5.4 OTP Controller Write Data Register (OCOTP_READ_CTRL)

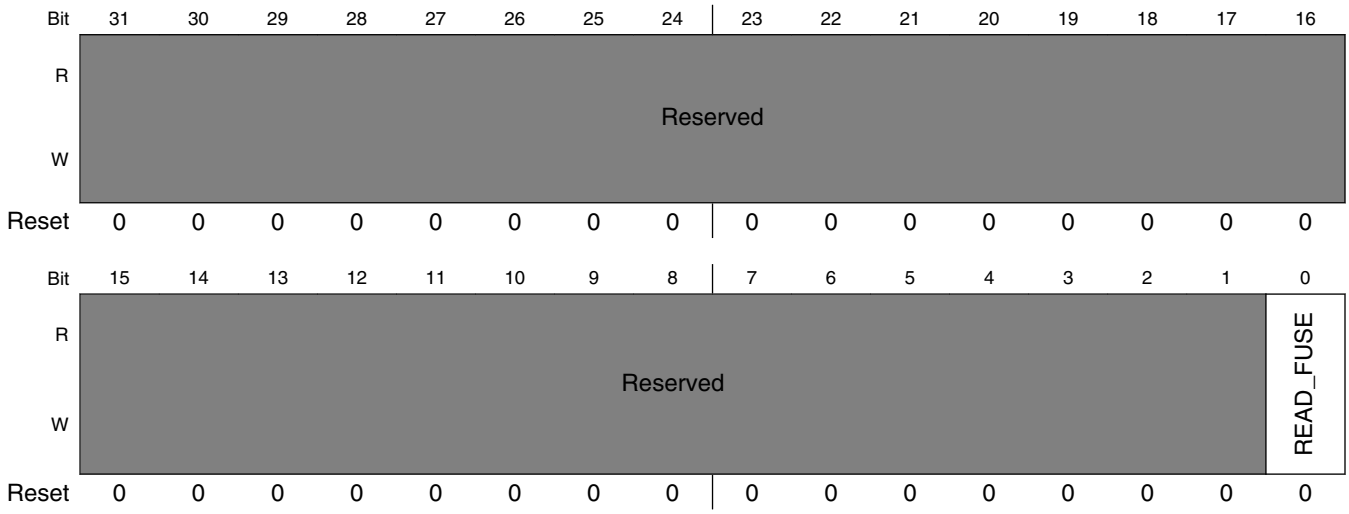
The OCOTP Register is used for OTP Read

This register is used in conjuction with HW_OCOTP_CTRL to perform one time read to the OTP. Please see the "Software read Sequence" section for operating details.

EXAMPLE

```
Empty Example.
```

Address: 21B_C000h base + 30h offset = 21B_C030h



OCOTP_READ_CTRL field descriptions

Field	Description
31–1 -	This field is reserved. Reserved
0 READ_FUSE	Used to initiate a read to OTP. Please see the "Software read Sequence" section for operating details.

46.5.5 OTP Controller Read Data Register (OCOTP_READ_FUSE_DATA)

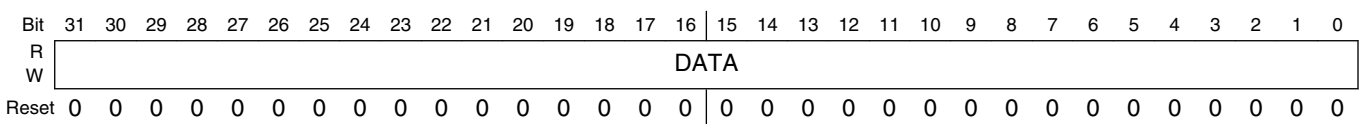
The OCOTP Data Register is used for OTP Read

The data read from OTP

EXAMPLE

```
Empty Example.
```

Address: 21B_C000h base + 40h offset = 21B_C040h



OCOTP_READ_FUSE_DATA field descriptions

Field	Description
DATA	The data read from OTP

46.5.6 Sticky bit Register (OCOTP_SW_STICKY)

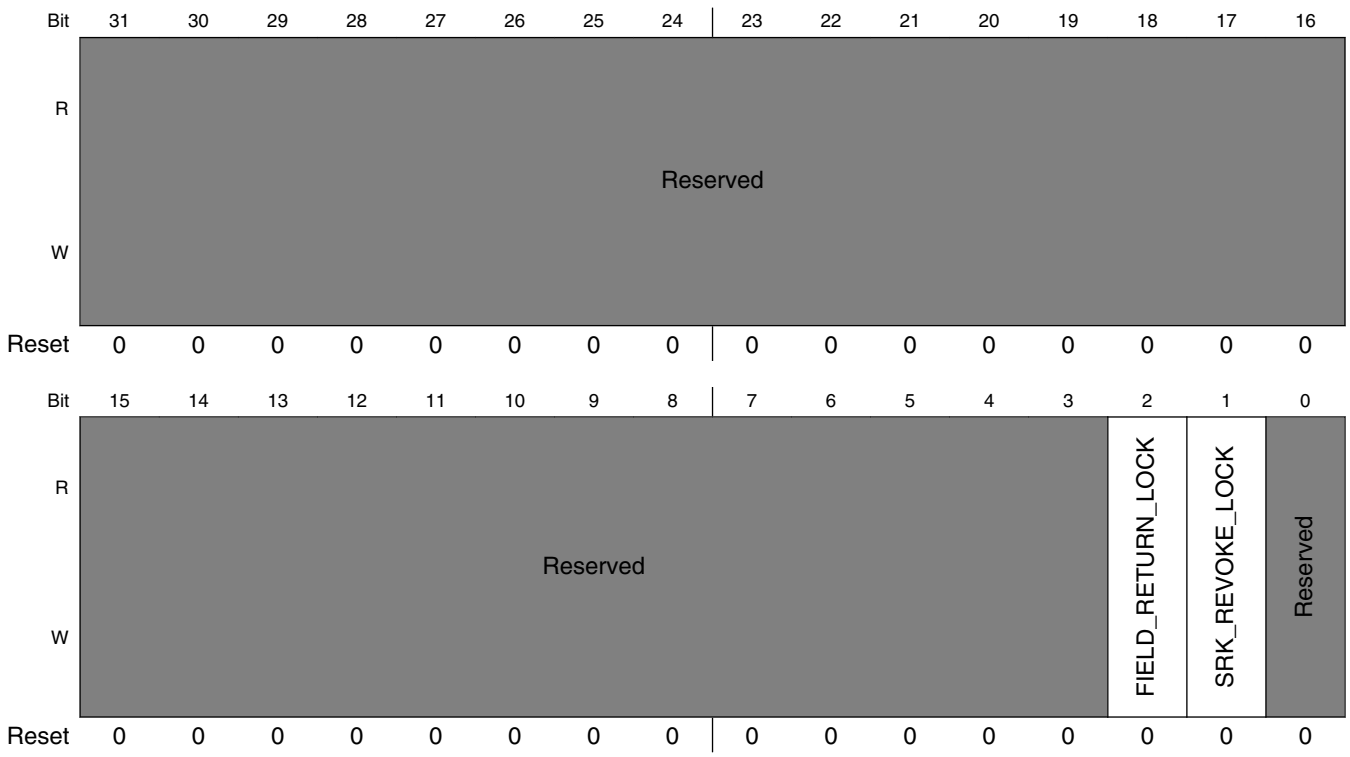
Some SW sticky bits .

Some sticky bits are used by SW to lock some fuse area , shadow registers and other features.

EXAMPLE

```
Empty Example.
```

Address: 21B_C000h base + 50h offset = 21B_C050h



OCOTP_SW_STICKY field descriptions

Field	Description
31–3 -	This field is reserved. Reserved
2 FIELD_ RETURN_LOCK	Shadow register write and OTP write lock for FIELD_RETURN region. When set, the writing of this region's shadow register and OTP fuse word are blocked.Once this bit is set, it is always high unless a POR is issued.
1 SRK_REVOKE_ LOCK	Shadow register write and OTP write lock for SRK_REVOKE, MC_ERA and AP_BI_VER regions. When set, the writing of these region's shadow register and OTP fuse word are blocked. Once this bit is set, it is always high unless a POR is issued.
0 -	This field is reserved. Reserved.

46.5.7 Software Controllable Signals Register (OCOTP_SCS*n*)

HW_OCOTP_SCS: 0x060

This register holds volatile configuration values that can be set and locked by trusted software. All values are returned to their defualt values after POR.

EXAMPLE

```
Empty Example.
```

Address: 21B_C000h base + 60h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	LOCK	SPARE														
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	SPARE															HAB_JDE
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

OCOTP_SCS*n* field descriptions

Field	Description
31 LOCK	When set, all of the bits in this register are locked and can not be changed through SW programming. This bit is only reset after a POR is issued.
30–1 SPARE	Unallocated read/write bits for implementation specific software use.
0 HAB_JDE	HAB JTAG Debug Enable. This bit is used by the HAB to enable JTAG debugging, assuming that a properly signed command to do so is found and validated by the HAB. The HAB must lock the register before passing control to the OS whether or not JTAG debugging has been enabled. Once JTAG is enabled by this bit, it can not be disabled unless the system is reset by POR. 0: JTAG debugging is not enabled by the HAB (it may still be enabled by other mechanisms). 1: JTAG debugging is enabled by the HAB (though this signal may be gated off). 1 JTAG debugging is enabled by the HAB (though this signal may be gated off)

46.5.8 OTP Controller Version Register (OCOTP_VERSION)

This register always returns a known read value for debug purposes it indicates the version of the block.

This register indicates the RTL version in use.

EXAMPLE

```
Empty Example.
```

Address: 21B_C000h base + 90h offset = 21B_C090h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	MAJOR								MINOR								STEP															
W																																
Reset	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

OCOTP_VERSION field descriptions

Field	Description
31–24 MAJOR	Fixed read-only value reflecting the MAJOR field of the RTL version.
23–16 MINOR	Fixed read-only value reflecting the MINOR field of the RTL version.
STEP	Fixed read-only value reflecting the stepping of the RTL version.

46.5.9 Value of OTP Bank0 Word0 (Lock controls) (OCOTP_LOCK)

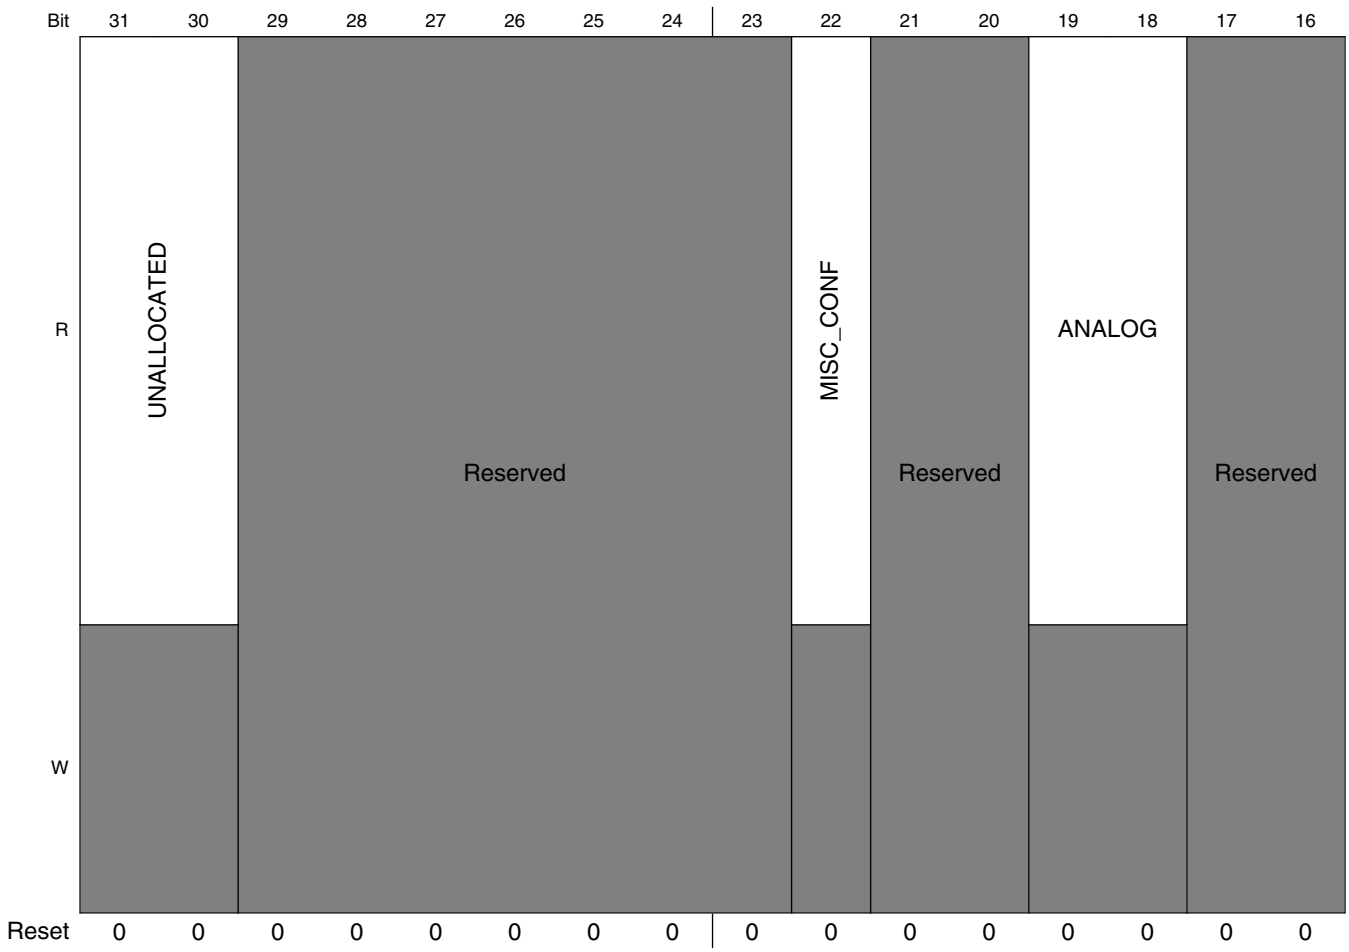
Copied from the OTP automatically after reset. Can be re-loaded by setting HW_OCOTP_CTRL[RELOAD_SHADOWS]

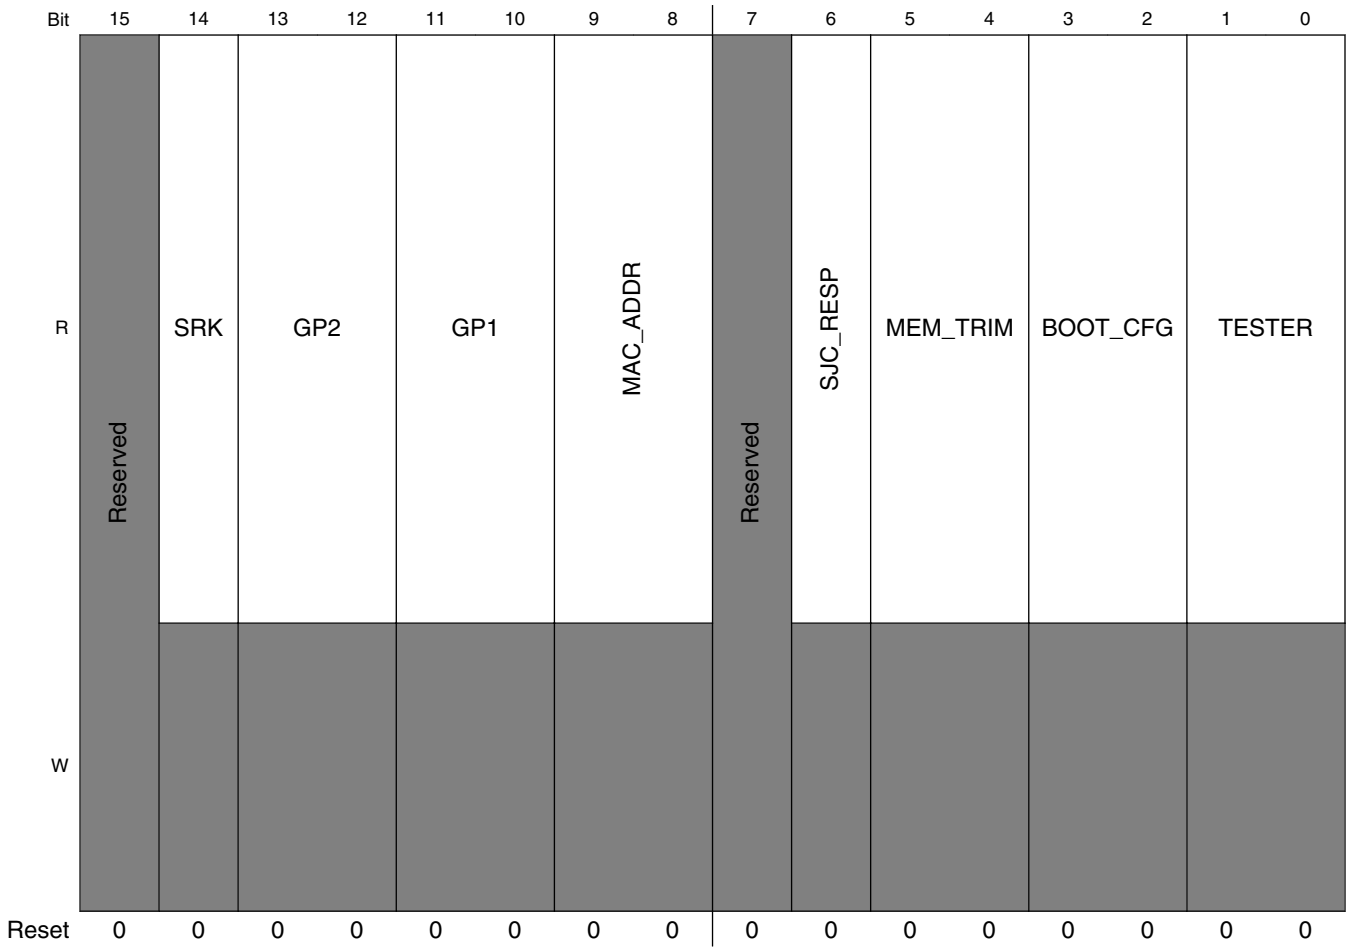
Shadowed memory mapped access to OTP Bank 0, word 0 (ADDR = 0x00).

EXAMPLE

```
Empty Example.
```

Address: 21B_C000h base + 400h offset = 21B_C400h





OCOTP_LOCK field descriptions

Field	Description
31–30 UNALLOCATED	Value of un-used portion of LOCK word
29–23 -	This field is reserved. Reserved
22 MISC_CONF	Status of shadow register and OTP write lock for misc_conf region. When set, the writing of this region's shadow register and OTP fuse word are blocked.
21–20 -	This field is reserved. Reserved
19–18 ANALOG	Status of shadow register and OTP write lock for analog region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
17–16 -	This field is reserved. Reserved
15 -	This field is reserved. Reserved
14 SRK	Status of shadow register and OTP write lock for srk region. When set, the writing of this region's shadow register and OTP fuse word are blocked.

Table continues on the next page...

OCOTP_LOCK field descriptions (continued)

Field	Description
13–12 GP2	Status of shadow register and OTP write lock for gp2 region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
11–10 GP1	Status of shadow register and OTP write lock for gp2 region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
9–8 MAC_ADDR	Status of shadow register and OTP write lock for mac_addr region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
7 -	This field is reserved. Reserved
6 SJC_RESP	Status of shadow register read and write, OTP read and write lock for sjc_resp region. When set, the writing of this region's shadow register and OTP fuse word are blocked. The read of this region's shadow register and OTP fuse word are also blocked.
5–4 MEM_TRIM	Status of shadow register and OTP write lock for mem_trim region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
3–2 BOOT_CFG	Status of shadow register and OTP write lock for boot_cfg region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
TESTER	Status of shadow register and OTP write lock for tester region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.

46.5.10 Value of OTP Bank0 Word1 (Configuration and Manufacturing Info.) (OCOTP_CFG0)

Copied from the OTP automatically after reset. Can be re-loaded by setting HW_OCOTP_CTRL[RELOAD_SHADOWS]

Shadowed memory mapped access to OTP Bank 0, word 1 (ADDR = 0x01).

EXAMPLE

```
Empty Example.
```

Address: 21B_C000h base + 410h offset = 21B_C410h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	BITS																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

OCOTP_CFG0 field descriptions

Field	Description
BITS	This register contains 32 bits of the Unique ID and SJC_CHALLENGE field. Reflects value of OTP Bank 0, word 1 (ADDR = 0x01). These bits become read-only after the HW_OCOTP_LOCK_TESTER[1] bit is set.

46.5.11 Value of OTP Bank0 Word2 (Configuration and Manufacturing Info.) (OCOTP_CFG1)

Copied from the OTP automatically after reset. Can be re-loaded by setting HW_OCOTP_CTRL[RELOAD_SHADOWS]

shadowed memory mapped access to OTP Bank 0, word 2 (ADDR = 0x02).

EXAMPLE

```
Empty Example.
```

Address: 21B_C000h base + 420h offset = 21B_C420h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	BITS																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

OCOTP_CFG1 field descriptions

Field	Description
BITS	This register contains 32 bits of the Unique ID and SJC_CHALLENGE field. Reflects value of OTP Bank 0, word 2 (ADDR = 0x02). These bits become read-only after the HW_OCOTP_LOCK_TESTER[1] bit is set.

46.5.12 Value of OTP Bank0 Word3 (Configuration and Manufacturing Info.) (OCOTP_CFG2)

Copied from the OTP automatically after reset. Can be re-loaded by setting HW_OCOTP_CTRL[RELOAD_SHADOWS]

Shadowed memory mapped access to OTP Bank 0, word 3 (ADDR = 0x03).

EXAMPLE

```
Empty Example.
```

Address: 21B_C000h base + 430h offset = 21B_C430h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	BITS																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

OCOTP_CFG2 field descriptions

Field	Description
BITS	Reflects value of OTP Bank 0, word 3 (ADDR = 0x03). These bits become read-only after the HW_OCOTP_LOCK_TESTER[1] bit is set.

46.5.13 Value of OTP Bank0 Word4 (Configuration and Manufacturing Info.) (OCOTP_CFG3)

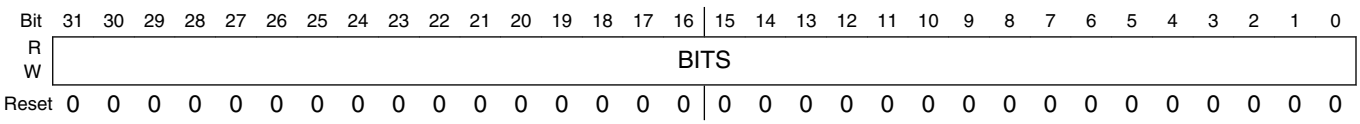
Copied from the OTP automatically after reset. Can be re-loaded by setting HW_OCOTP_CTRL[RELOAD_SHADOWS]

Non-shadowed memory mapped access to OTP Bank 0, word 4 (ADDR = 0x04).

EXAMPLE

```
Empty Example.
```

Address: 21B_C000h base + 440h offset = 21B_C440h



OCOTP_CFG3 field descriptions

Field	Description
BITS	Reflects value of OTP Bank 0, word 4 (ADDR = 0x04). These bits become read-only after the HW_OCOTP_LOCK_TESTER[1] bit is set.

46.5.14 Value of OTP Bank0 Word5 (Configuration and Manufacturing Info.) (OCOTP_CFG4)

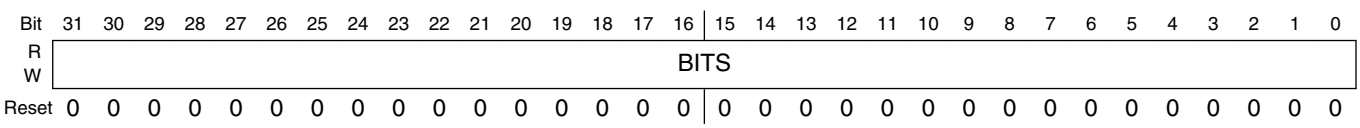
Copied from the OTP automatically after reset. Can be re-loaded by setting HW_OCOTP_CTRL[RELOAD_SHADOWS]

Shadowed memory mapped access to OTP Bank 0, word 5 (ADDR = 0x05).

EXAMPLE

```
Empty Example.
```

Address: 21B_C000h base + 450h offset = 21B_C450h



OCOTP_CFG4 field descriptions

Field	Description
BITS	Reflects value of OTP Bank 0, word 5 (ADDR = 0x05). These bits become read-only after the HW_OCOTP_LOCK_BOOT_CFG[1] bit is set.

46.5.15 Value of OTP Bank0 Word6 (Configuration and Manufacturing Info.) (OCOTP_CFG5)

Copied from the OTP automatically after reset. Can be re-loaded by setting HW_OCOTP_CTRL[RELOAD_SHADOWS]

Shadowed memory mapped access to OTP Bank 0, word 6 (ADDR = 0x06).

EXAMPLE

```
Empty Example.
```

Address: 21B_C000h base + 460h offset = 21B_C460h

46.5.38 Value of OTP Bank4 Word7 (HW Capabilities) (OCOTP_GP2)

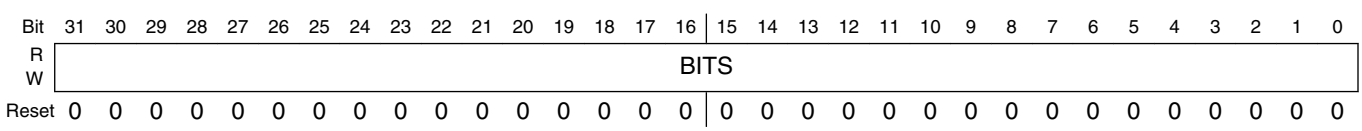
Copied from the OTP automatically after reset. Can be re-loaded by setting HW_OCOTP_CTRL[RELOAD_SHADOWS]

Shadowed memory mapped access to OTP Bank 4, word 7 (ADDR = 0x27).

EXAMPLE

```
Empty Example.
```

Address: 21B_C000h base + 670h offset = 21B_C670h



OCOTP_GP2 field descriptions

Field	Description
BITS	Reflects value of OTP Bank 4, word 7 (ADDR = 0x27).

46.5.39 Value of OTP Bank5 Word5 (HW Capabilities) (OCOTP_MISC_CONF)

Copied from the OTP automatically after reset. Can be re-loaded by setting HW_OCOTP_CTRL[RELOAD_SHADOWS]

Shadowed memory mapped access to OTP Bank 5, word 5 (ADDR = 0x2d).

EXAMPLE

```
Empty Example.
```

Address: 21B_C000h base + 6D0h offset = 21B_C6D0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

OCOTP_MISC_CONF field descriptions

Field	Description
BITS	Reflects value of OTP Bank 5, word 5 (ADDR = 0x2d).

46.5.40 Value of OTP Bank5 Word6 (HW Capabilities) (OCOTP_FIELD_RETURN)

Copied from the OTP automatically after reset. Can be re-loaded by setting HW_OCOTP_CTRL[RELOAD_SHADOWS]

Shadowed memory mapped access to OTP Bank 5, word 6 (ADDR = 0x2e).

EXAMPLE

```
Empty Example.
```

Address: 21B_C000h base + 6E0h offset = 21B_C6E0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

OCOTP_FIELD_RETURN field descriptions

Field	Description
BITS	Reflects value of OTP Bank 5, word 6 (ADDR = 0x2e).

46.5.41 Value of OTP Bank5 Word7 (HW Capabilities) (OCOTP_SRK_REVOKE)

Copied from the OTP automatically after reset. Can be re-loaded by setting HW_OCOTP_CTRL[RELOAD_SHADOWS]

Shadowed memory mapped access to OTP Bank 5, word 7 (ADDR = 0x2f).

EXAMPLE

```
Empty Example.
```

Address: 21B_C000h base + 6F0h offset = 21B_C6F0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

OCOTP_SRK_REVOKE field descriptions

Field	Description
BITS	Reflects value of OTP Bank 5, word 7 (ADDR = 0x2f).

Chapter 47
On-Chip RAM Memory Controller (OCRAM)

47.1 Overview

The on-chip RAM is implemented as a slave module on the 64-bit system AXI bus. Designed as a simple on-chip memory block, it has one bank of single port SRAM and supports one AXI port.

For the AXI port, the read and write transactions are handled by two independent blocks. As it is possible to have simultaneous read and write requests from the AXI bus, an arbiter with round-robin scheme is implemented to handle this. After arbitration, the granted read or write access command can then be issued to the memory cell through a read/write MUX.

Various options are provided for adding a pipeline or wait-states in a read/write access, in order to ensure flexible timing control at both high and low frequencies.

The internal block diagram is shown in the figure below.

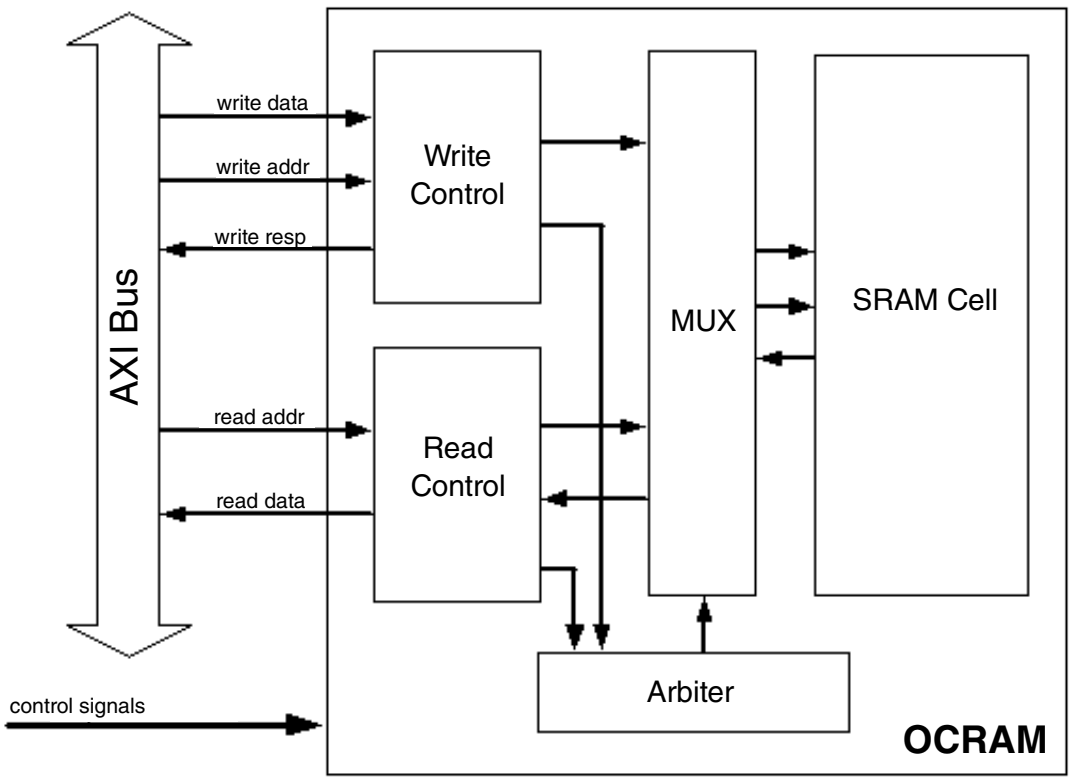

Figure 47-1. On-chip RAM Block Diagram

47.2 Basic Functions

47.2.1 Memory Map

The total on-chip RAM size for the chip is 256 Kbytes, organized as 16K x 64 bits, mapped from 0x00900000 to 0x0093FFFF .

Memory alias is also supported for on-chip RAM. Address from 0x00940000 to 0x009FFFFF are alias addresses for it, any read/write operation to this area will be mapped back to the 256 Kbytes area.

The 32-bit AXI address are arranged as shown in the table below.

Table 47-1. On-Chip RAM Address Bits

AHB ADDR Bits	Usage	Description
29:3	Address	Selects one of the 16 K words in the memory (64-bit a word).
2:0	Byte Address	Selects/masks out specific bytes within a word.

47.2.2 Read/Write Arbitration

The read/write arbitration uses the round-robin method.

The detailed rules used in arbitration are as follows:

- If there is no granted read or write in the last cycle, and there is only a read request or a write request, the request will be granted.
- If there is no granted read or write in the last cycle, and there are both read or write requests coming in at the same time, the read request will be granted first.
- If a granted read/write transaction has just finished, the write/read request will have the higher priority in the next cycle.
- If the first read/write access request in a transaction is granted, all the data transfer in this burst will be finished before the next arbitration begins, that is, the round-robin arbitration mechanism is based on AXI transaction, not data access.

47.3 Advanced Features

This section describes some advanced features designed to avoid timing issues when the on-chip RAM is working at high frequency.

All of the features can be disabled/enabled by programming the corresponding fields of the General Purpose Register (IOMUXC.GPR3) bits [24:21] in the IOMUX chapter.

47.3.1 Read Data Wait State

When the wait state is enabled, it will take 2 cycles for each read access (each beat of a read burst).

This can avoid the potential timing problem caused by the longer memory access time at higher frequency.

When this feature is disabled, it only takes 1 clock cycle to finish a read transaction. That is, read data is available in the next cycle of read request becomes valid on the bus.

The read data wait state is configurable via IOMUXC.GPR3[21].

47.3.2 Read Address Pipeline

When this feature is enabled, the read address from the AXI master is delayed 1 cycle before it can be accepted by the on-chip RAM.

This can avoid setup time issues for the read access on the memory cell at high frequency. Enabling this feature can cost, at most, 1 more clock cycle for each AXI read transaction, that is, at most 1 more clock cycle for each read burst with multiple beats of data.

When this feature is disabled, the read address from the AXI master can be accepted by the on-chip RAM without delay, and data can become ready for master at next clock cycle (if no other access and no read data wait).

The read address pipeline is configurable via IOMUXC.GPR3[22].

47.3.3 Write Data Pipeline

When this feature is enabled, the write data from the AXI master would be delayed 1 cycle before it can be accepted by the on-chip RAM.

This can avoid setup time issue for the write access on the memory cell at high frequency. Enabling this feature would cost at most 1 more clock cycle for each AXI write transaction, that is, at most 1 more clock cycle for each write burst with multiple beats of data.

When this feature is disabled, the write data from the AXI master can be accepted by the on-chip RAM without delay, and data can be written to memory at this cycle (if no other access and write address is also ready at this cycle).

The write data pipeline is configurable via IOMUXC.GPR3[23].

47.3.4 Write Address Pipeline
