

Features

- Integrated Single-Chip 10/100/1000 Mbps Ethernet Switch
- 24 10/100 Mbps Autosensing, Fast Ethernet Ports with RMII or Serial Interface (7WS). Each port can independently use one of the two interfaces
- 2 Gigabit Ports with GMII, PCS, 10/100 and stacking (2 G per port) interface options per port
- Stacking port supports hot swap in managed configuration
- Supports 8/16-bit CPU interface in managed mode
- Serial interface in unmanaged mode
- Supports two Frame Buffer Memory domains with SRAM at 100 MHz
- Supports memory size 2 MB, or 4 MB
 - For 24 + 2, two SRAM domains (2 MB or 4 MB) are required.
 - For 24 + 2 stacking (2 G per stacking port), two ZBT domains (2 MB or 4 MB) are required
- Applies centralized shared memory architecture
- Up to 64 K MAC addresses
- Maximum throughput is 6.4 Gbps non-blocking
- High performance packet forwarding (19.047 M packets per second) at full wire speed

Ordering Information

MVTX2604AG 553 Pin HSBGA

-40°C to 85°C

- Provides port based and ID tagged VLAN support (IEEE 802.1Q), up to 255 VLANs
- Supports IP Multicast with IGMP snooping
- Supports spanning tree with CPU, on per port or per VLAN basis
- Packet Filtering and Port Security
 - Static address filtering for source and/or destination MAC
 - Static MAC address not subject to aging
- Secure mode freezes MAC address learning
Each port may independently use this mode
- Full Duplex Ethernet IEEE 802.3x Flow Control
- Backpressure flow control for Half Duplex ports
- Supports Ethernet multicasting and broadcasting and flooding control
- Supports per-system option to enable flow control for best effort frames even on QoS-enabled ports

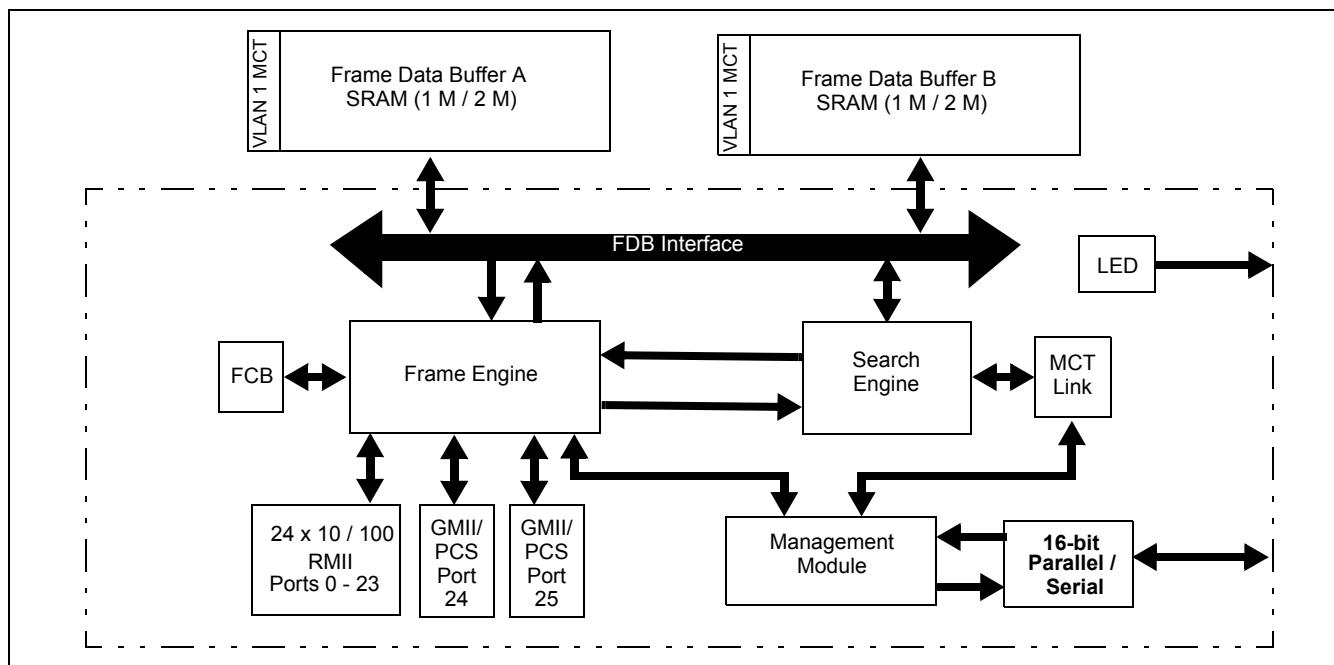

Figure 1 - MVTX2604 System Block Diagram

- Traffic Classification
 - 4 transmission priorities for Fast Ethernet ports with 2 dropping levels
 - Classification based on:
 - Port based priority
 - VLAN Priority field in VLAN tagged frame
 - DS/TOS field in IP packet
 - UDP/TCP logical ports: 8 hard-wired and 8 programmable ports, including one programmable range
- The precedence of the above classifications is programmable
- QoS Support
 - Supports IEEE 802.1p/Q Quality of Service with 4 transmission priority queues with delay bounded, strict priority, and WFQ service disciplines
 - Provides 2 levels of dropping precedence with WRED mechanism
 - User controls the WRED thresholds
 - Buffer management: per class and per port buffer reservations
 - Port-based priority: VLAN priority in a tagged frame can be overwritten by the priority of Port VLAN ID
- 3 port trunking groups, one for the 2 Gigabit ports, and two groups for 10/100 ports, with up to 4 10/100 ports per group
- Load sharing among trunked ports can be based on source MAC and/or destination MAC. The Gigabit trunking group has one more option, based on source port
- Port Mirroring to any two ports of 0-23 in managed mode or to a dedicated mirroring port or port 23 in unmanaged mode
- Full set of LED signals provided by a serial interface, or 6 LED signals dedicated to Gigabit port status only (without serial interface)
- Built-in MIB statistics counters
- Recognizes Simple Bandwidth Management (SBM) and Resource Reservation Protocol (RSVP) packets and forwards to CPU
- Hardware auto-negotiation through serial management interface (MDIO) for Ethernet ports
- Built-in reset logic triggered by system malfunction
- Built-in self test for internal and external SRAM
- I²C EEPROM for configuration
- 553 BGA package

Description

The MVTX2604 is a high density, low cost, high performance, non-blocking Ethernet switch chip. A single chip provides 24 ports at 10/100 Mbps, 2 ports at 1000 Mbps and a CPU interface for managed and unmanaged switch applications. The Gigabit ports can also support 10/100 M and 2 G stacking modes.

The chip supports up to 64 K MAC addresses and up to 255 port-based Virtual LANs (VLANs). The centralized shared memory architecture permits a very high performance packet forwarding rate at up to 9.524 M packets per second at full wire speed. The chip is optimized to provide low-cost, high-performance workgroup switching.

Two Frame Buffer Memory domains utilize cost-effective, high-performance synchronous SRAM with aggregate bandwidth of 12.8 Gbps to support full wire speed on all ports simultaneously. In the 24+2 stacking (2 G per stacking port) configuration, 2 ZBT domains are needed.

With delay bounded, strict priority, and/or WFQ transmission scheduling, and WRED dropping schemes, the MVTX2604 provides powerful QoS functions for various multimedia and mission-critical applications. The chip provides 4 transmission priorities (8 priorities per Gigabit port) and 2 levels of dropping precedence. Each packet is assigned a transmission priority and dropping precedence based on the VLAN priority field in a VLAN tagged frame, or the DS/TOS field, or the UDP/TCP logical port fields in IP packets. The MVTX2604 recognizes a total of 16 UDP/TCP logical ports, 8 hard-wired and 8 programmable (including one programmable range).

The MVTX2604 supports 3 groups of port trunking/load sharing. One group is dedicated to the two Gigabit ports, and the other two groups to 10/100 ports, where each 10/100 group can contain up to 4 ports. Port trunking/load sharing can be used to group ports between interlinked switches to increase the effective network bandwidth.

In half-duplex mode all ports support backpressure flow control to minimize the risk of losing data during long activity bursts. In full-duplex mode, IEEE 802.3x flow control is provided. The MVTX2604 also supports a per-system option to enable flow control for best effort frames, even on QoS-enabled ports.

The Physical Coding Sublayer (PCS) is integrated on-chip to provide a direct 10-bit interface for connection to SERDES chips. The PCS can be bypassed to provide a GMII interface.

Statistical information for SNMP and the Remote Monitoring Management Information Base (RMON MIB) are collected independently for all ports. Access to these statistical counters/registers is provided via the CPU interface. SNMP Management frames can be received and transmitted via the CPU interface creating a complete network management solution.

The MVTX2604 is fabricated using 0.25 micron technology. Inputs, however, are 3.3 V tolerant, and the outputs are capable of directly interfacing to LVTTL levels. The MVTX2604 is packaged in a 553-pin Ball Grid Array package.

1.0 Block Functionality

1.1 Frame Data Buffer (FDB) Interfaces

The FDB interface supports pipelined synchronous burst SRAM (SBRAM) memory at 100 MHz. To ensure a non-blocking switch two memory domains are required. Each domain has a 64 bit wide memory bus. At 100 MHz, the aggregate memory bandwidth is 12.8 Gbps which is enough to support 24 10/100 Mbps and 2 Gigabit ports at full wire speed switching. For 24 + 2 stacking application, pipelined ZBT-SRAM memory running at 125 MHz is required.

The Switching Database is also located in the external SRAM; it is used for storing MAC addresses and their physical port number. It is duplicated and stored in both memory domains. Therefore, when the system updates the contents of the switching database it has to write the entry to both domains at the same time.

1.2 GMII/PCS MAC Module (GMAC)

The GMII/PCS Media Access Control (MAC) module provides the necessary buffers and control interface between the Frame Engine (FE) and the external physical device (PHY).

The MVTX2604 GMAC implements both GMII and MII interface, which offers a simple migration from 10/100 to 1 G. The GMAC of the MVTX2604 meets the IEEE 802.3Z specification. It is able to operate in 10 M/100 M either Half or Full Duplex mode with a back pressure/flow control mechanism or in 1G Full duplex mode with flow control mechanism. Furthermore, it will automatically retransmit upon collision for up to 16 total transmissions. PHY addresses for GMAC are 01h and 02h.

For fiber optics media, the MVTX2604 implements the Physical Code Sublayer (PCS) interface. The PCS includes an 8B10B encoder and decoder, auto-negotiation and Ten Bit Interface (TBI)

1.3 Physical Coding Sublayer (PCS) Interface

For the MVTX2604, the 1000BASE-X PCS Interface is designed internally and may be utilized in the absence of a GMII. The PCS incorporates all the functions required by the GMII to include encoding (decoding) 8B GMII data to (from) 8B/10B TBI format for PHY communication and generating Collision Detect (COL) signals for half-duplex mode. It also manages the Auto negotiation process by informing the management entity that the PHY is ready for communications. The on-chip TBI may be disabled if TBI exists within the Gigabit PHY. The TBI interface provides a uniform interface for all 1000 Mbps PHY implementations.

The PCS comprises the PCS Transmit, Synchronization, PCS Receive and Auto negotiation processes for 1000BASE-X.

The PCS Transmit process sends the TBI signals TXD [9:0] to the physical medium and generates the GMII Collision Detect (COL) signal based on whether a reception is occurring simultaneously with transmission. Additionally, the Transmit process generates an internal “transmitting” flag and monitors Auto negotiation to determine whether to transmit data or to reconfigure the link.

The PCS Synchronization process determines whether or not the receive channel is operational.

The PCS Receive process generates RXD [7:0] on the GMII from the TBI data [9:0], and the internal “receiving” flag for use by the Transmit processes.

The PCS Auto negotiation process allows the MVTX2604 to exchange configuration information between two devices that share a link segment and to automatically configure the link for the appropriate speed of operation for both devices.

1.4 10/100 MAC Module (RMAC)

The 10/100 Media Access Control module provides the necessary buffers and control interface between the Frame Engine (FE) and the external physical device (PHY). The MVTX2604 has two interfaces, RMII or Serial (only for 10 M). The 10/100 MAC of the MVTX2604 device meets the IEEE 802.3 specification. It is able to operate in either Half or Full Duplex mode with a back pressure/flow control mechanism. In addition, it will automatically retransmit upon collision for up to 16 total transmissions. The PHY addresses for 24 10/100 MAC are from 08h to 1Fh.

1.5 CPU Interface Module

One extra port is dedicated to the CPU via the CPU interface module. The CPU interface utilizes a 16/8-bit bus in managed mode (Bootstrap pin TSTOUT6 makes the selection). It also supports a serial and an I²C interface, which provides an easy way to configure the system if unmanaged.

1.6 Management Module

The CPU can send a control frame to access or configure the internal network management database. The Management Module decodes the control frame and executes the functions requested by the CPU.

1.7 Frame Engine

The main function of the frame engine is to forward a frame to its proper destination port or ports. When a frame arrives, the frame engine parses the frame header (64 bytes) and formulates a switching request which is sent to the search engine to resolve the destination port. The arriving frame is moved to the FDB. After receiving a switch response from the search engine, the frame engine performs transmission scheduling based on the frame's priority. The frame engine forwards the frame to the MAC module when the frame is ready to be sent.

1.8 Search Engine

The Search Engine resolves the frame's destination port or ports according to the destination MAC address (L2) or IP multicast address (IP multicast packet) by searching the database. It also performs MAC learning, priority assignment and trunking functions.

1.9 LED Interface

The LED interface provides a serial interface for carrying 24 + 2 port status signals. It can also provide direct status pins (6) for the two Gigabit ports.

1.10 Internal Memory

Several internal tables are required and are described as follows:

- Frame Control Block (FCB) - Each FCB entry contains the control information of the associated frame stored in the FDB, e.g., frame size, read/write pointer, transmission priority, etc.
- Network Management (NM) Database - The NM database contains the information in the statistics counters and MIB.
- MAC address Control Table (MCT) Link Table - The MCT Link Table stores the linked list of MCT entries that have collisions in the external MAC Table.

Note that the external MAC table is located in the external SRAM Memory.

2.0 System Configuration (Stand-alone and Stacking)

2.1 Management and Configuration

Two modes are supported in the MVTX2604: managed and unmanaged. In managed mode, the MVTX2604 uses an 8 or 16 bit CPU interface very similar to the Industry Standard Architecture (ISA) specification. In unmanaged mode, the MVTX2604 has no CPU but can be configured by EEPROM using an I²C interface at bootup, or via a synchronous serial interface otherwise.

2.2 Managed Mode

In managed mode, the MVTX2604 uses an 8 or 16 bit CPU interface very similar to the ISA bus. The MVTX2604 CPU interface provides for easy and effective management of the switching system. Figure 2 provides an overview of the CPU interface.

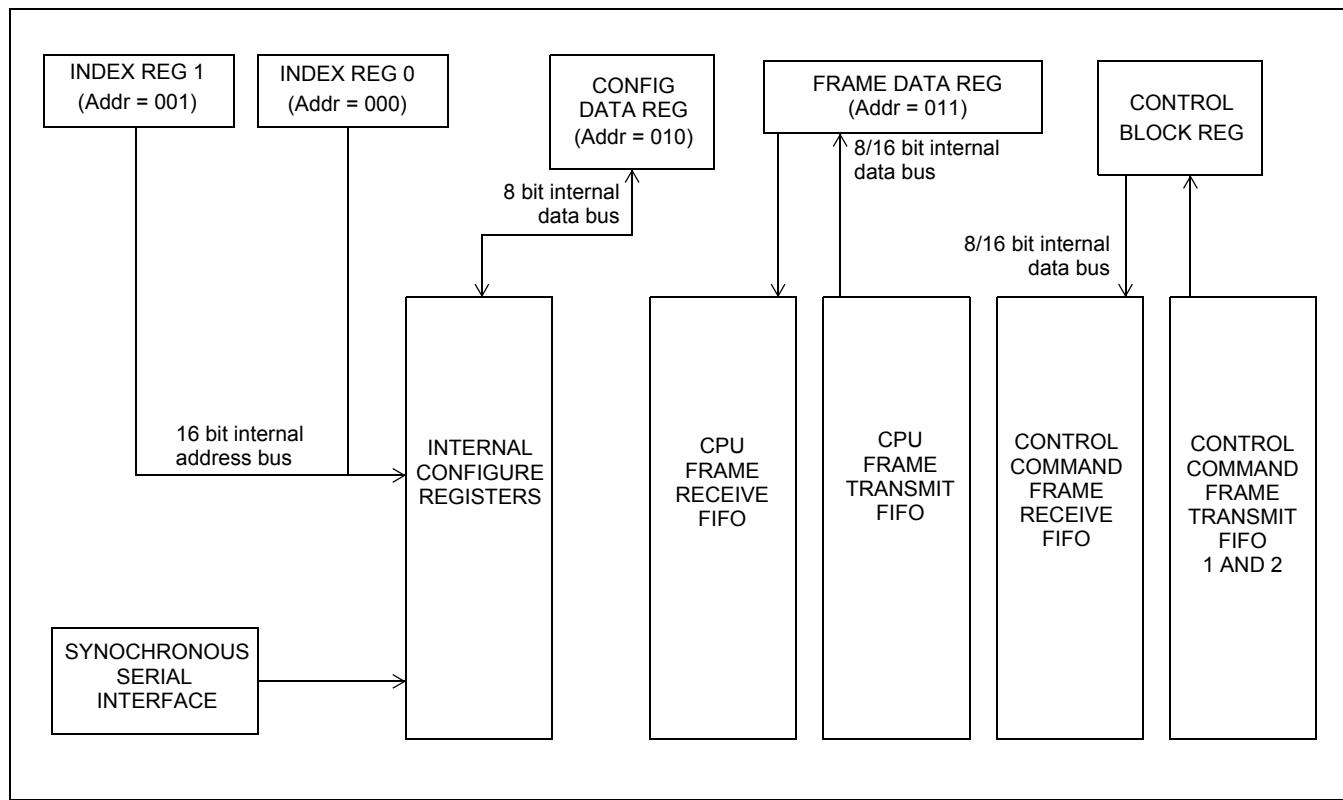

Figure 2 - Overview of the MVTX2604 CPU Interface

2.3 Register Configuration, Frame Transmission, and Frame Reception

2.3.1 Register Configuration

The MVTX2604 has many programmable parameters, covering such functions as QoS weights, VLAN control and port mirroring setup. In managed mode, the CPU interface provides an easy way of configuring these parameters. The parameters are contained in 8-bit configuration registers. The MVTX2604 allows indirect access to these registers, as follows:

- If operating in 8 bits-interface mode, two “index” registers (addresses 000 and 001) need to be written to indicate the desired 8-bit register address. In 16-bit mode, only one register (address 000) needs to be written for the desired 16-bit register address.

- To indirectly configure the register addressed by the two index registers, a “configure data” register (address 010) must be written with the desired 8-bit data.
- Similarly, to read the value in the register addressed by the two index registers, the “configure data” register can now simply be read.

In summary, access to the many internal registers is carried out simply by directly accessing only three registers – two registers to indicate the address of the desired parameter, and one register to read or write a value. Of course, because there is only one bus master, there can never be any conflict between reading and writing the configuration registers.

2.3.2 Rx/Tx of Standard Ethernet Frames

The CPU interface is also responsible for receiving and transmitting standard Ethernet frames to and from the CPU.

To transmit a frame from the CPU:

- The CPU writes a “data frame” register (address 011) with the data it wants to transmit (minimum 64 bytes). After writing all the data, it then writes the frame size, destination port number and frame status.
- The MVTX2604 forwards the Ethernet frame to the desired destination port, no longer distinguishing the fact that the frame originated from the CPU.

To receive a frame into the CPU:

- The CPU receives an interrupt when an Ethernet frame is available to be received.
- Frame information arrives first in the data frame register. This includes source port number, frame size and VLAN tag.
- The actual data follows the frame information. The CPU uses the frame size information to read the frame out.

In summary, receiving and transmitting frames to and from the CPU is a simple process that uses one direct access register only.

2.3.3 Control Frames

In addition to standard Ethernet frames described in the preceding section, the CPU is also called upon to handle special “Control frames,” generated by the MVTX2604 and sent to the CPU. These proprietary frames are related to such tasks as statistics collection, MAC address learning and aging etc. All Control frames are up to 40 bytes long. Transmitting and receiving these frames is similar to transmitting and receiving Ethernet frames, except that the register accessed is the “Control frame data” register (address 111).

Specifically, there are eight types of control frames generated by the CPU and sent to the MVTX2604:

- Memory read request
- Memory write request
- Learn MAC address
- Delete MAC address
- Search MAC address
- Learn IP Multicast address
- Delete IP Multicast address
- Search IP Multicast address

Note: Memory read and write requests by the CPU may include VLAN table, spanning tree, statistic counters and similar updates.

In addition, there are nine types of Control frames generated by the MVTX2604 and sent to the CPU:

- Interrupt CPU when statistics counter rolls over

- Response to memory read request from CPU
- Learn MAC address
- Delete MAC address
- Delete IP Multicast address
- New VLAN port
- Age out VLAN port
- Response to search MAC address request from CPU
- Response to search IP Multicast address request from CPU

The format of the Control Frame is described in the processor interface application note.

2.4 Unmanaged Mode

In unmanaged mode, the MVTX2604 can be configured by EEPROM (24C02 or compatible) via an I²C interface at boot time, or via a synchronous serial interface during operation.

2.5 I²C Interface

The I²C interface uses two bus lines, a serial data line (SDA) and a serial clock line (SCL). The SCL line carries the control signals that facilitate the transfer of information from EEPROM to the switch. Data transfer is 8-bit serial and bidirectional at 50 Kbps. Data transfer is performed between master and slave IC using a request / acknowledgment style of protocol. The master IC generates the timing signals and terminates data transfer. Figure 3 depicts the data transfer format.

START	SLAVE ADDRESS	R/W	ACK	DATA 1 (8 bits)	ACK	DATA 2	ACK	DATA M	ACK	STOP
-------	---------------	-----	-----	-----------------	-----	--------	-----	--------	-----	------

Figure 3 - Data Transfer Format for I²C Interface

2.5.1 Start Condition

Generated by the master (in our case, the MVTX2604). The bus is considered to be busy after the Start condition is generated. The Start condition occurs if while the SCL line is High, there is a High-to-Low transition of the SDA line.

Other than in the Start condition (and Stop condition), the data on the SDA line must be stable during the High period of SCL. The High or Low state of SDA can only change when SCL is Low. In addition, when the I²C bus is free, both lines are High.

2.5.2 Address

The first byte after the Start condition determines which slave the master will select. The slave in our case is the EEPROM. The first seven bits of the first data byte make up the slave address.

2.5.3 Data Direction

The eighth bit in the first byte after the Start condition determines the direction (R/W) of the message. A master transmitter sets this bit to W; a master receiver sets this bit to R.

2.5.4 Acknowledgment

Like all clock pulses, the acknowledgment-related clock pulse is generated by the master. However, the transmitter releases the SDA line (High) during the acknowledgment clock pulse. Furthermore, the receiver must pull down the SDA line during the acknowledge pulse so that it remains stable Low during the High period of this clock pulse. An acknowledgment pulse follows every byte transfer.

If a slave receiver does not acknowledge after any byte, then the master generates a Stop condition and aborts the transfer.

If a master receiver does not acknowledge after any byte, then the slave transmitter must release the SDA line to let the master generate the Stop condition.

2.5.5 Data

After the first byte containing the address, all bytes that follow are data bytes. Each byte must be followed by an acknowledge bit. Data is transferred MSB first.

2.5.6 Stop Condition

Generated by the master. The bus is considered to be free after the Stop condition is generated. The Stop condition occurs if while the SCL line is High, there is a Low-to-High transition of the SDA line.

The I²C interface serves the function of configuring the MVTX2604 at boot time. The master is the MVTX2604 and the slave is the EEPROM memory.

2.6 Synchronous Serial Interface

The synchronous serial interface serves the function of configuring the MVTX2604, not at boot time, but via a PC. The PC serves as master and the MVTX2604 serves as slave. The protocol for the synchronous serial interface is nearly identical to the I²C protocol. The main difference is that there is no acknowledgment bit after each byte of data transferred.

The unmanaged MVTX2604 uses a synchronous serial interface to program the internal registers. To reduce the number of signals required, the register address, command and data are shifted in serially through the D0 pin. STROBE- pin is used as the shift clock. AUTOFD- pin is used as data return path.

Each command consists of four parts.

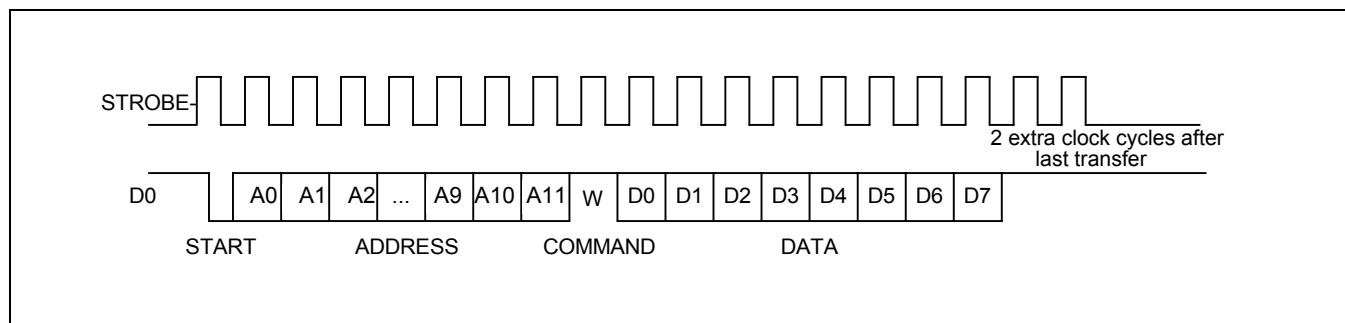

- START pulse
- Register Address
- Read or Write command
- Data to be written or read back

Any command can be aborted in the middle by sending a ABORT pulse to the MVTX2600AG.

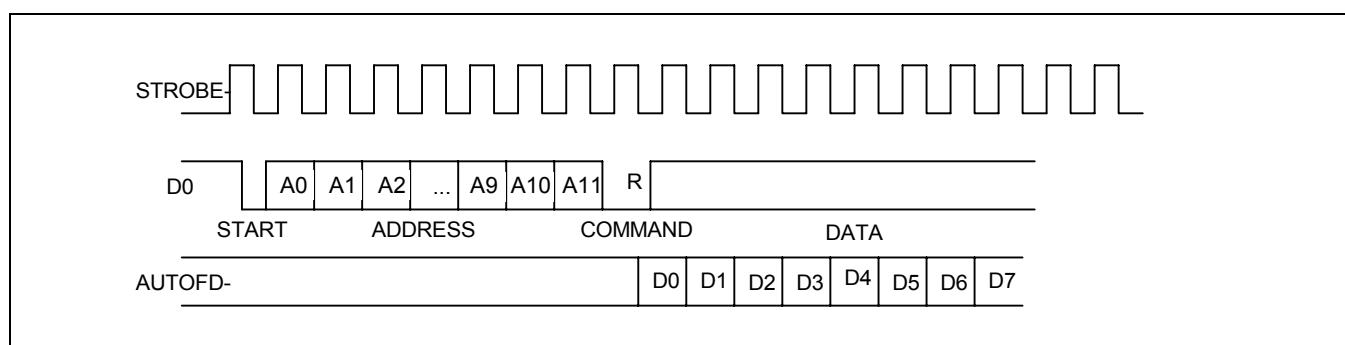

A START command is detected when D0 is sampled high when STROBE- rise and D0 is sampled low when STROBE- fall.

An ABORT command is detected when D0 is sampled low when STROBE- rise and D0 is sampled high when STROBE- fall.

2.6.1 Write Command

2.6.2 Read Command

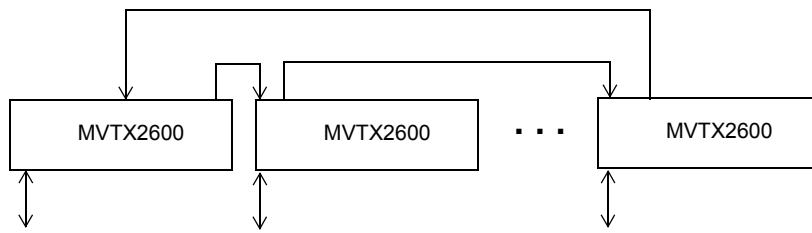

All registers in MVTX2600AG can be modified through this synchronous serial interface.

2.7 Stacking

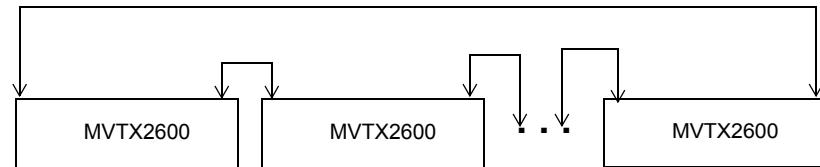

The MVTX2604 supports expanded port count by providing stacking capabilities. The Gigabit port is used as the link between boxes, and each Gigabit port can be accelerated to 2 Gbps if desired (in conjunction with ZBT memory domains at 125 MHz). If both Gigabit ports are used for this purpose, this provides a total of 4 Gbps of bandwidth between devices.

In addition to a standard back-to-back configuration of devices, the MVTX2604 also provides more powerful stacking alternatives:

- Unidirectional ring configuration. Up to 32 devices. Devices are connected by one Gigabit link, which can be accelerated to 2 Gbps, if desired. Flow control cannot be enabled in this configuration, because of the inherent inefficiency in sending flow control messages upstream in a unidirectional ring.
- Bidirectional ring configuration. Up to 32 devices. Devices are connected by two Gigabit links, forming two rings, one clockwise and one counter clockwise. The total outgoing bandwidth can be as much as 4 Gbps. Flow control may be enabled in this configuration. The outgoing direction of a packet (clockwise or counter clockwise) is selected using a hash key for load distribution. The hash key can be a function of source MAC address, destination MAC address, both MAC addresses, or source port. This configuration provides fault-tolerance when one of the stacking links fail.

- Cascade Stacking configuration. Up to 32 devices. Devices are connected to form a list configuration. Devices are connected by two Gigabit links, except the two devices at both ends, where one Gigabit port is used as an uplink port. Flow control may be enabled in this configuration.

3.0 MVTX2604 Data Forwarding Protocol

3.1 Unicast Data Frame Forwarding

When a frame arrives, it is assigned a handle in memory by the Frame Control Buffer Manager (FCB Manager). An FCB handle will always be available because of advance buffer reservations.

The memory (SRAM) interface consists of two 64-bit buses, connected to two SRAM banks, A and B. The Receive DMA (RxDMA) is responsible for multiplexing the data and the address. On a port's "turn," the RxDMA will move 8 bytes (or up to the end-of-frame) from the port's associated Rx FIFO into memory (Frame Data Buffer, or FDB).

Once an entire frame has been moved to the FDB, and a good end-of-frame (EOF) has been received, the Rx interface makes a switch request. The RxDMA arbitrates among multiple switch requests.

The switch request consists of the first 64 bytes of a frame, containing among other things, the source and destination MAC addresses of the frame. The search engine places a switch response in the switch response queue of the frame engine when done. Among other information, the search engine will have resolved the destination port of the frame and will have determined that the frame is unicast.

After processing the switch response, the Transmission Queue Manager (TxQ manager) of the frame engine is responsible for notifying the destination port that it has a frame to forward to it. But first, the TxQ manager has to decide whether or not to drop the frame, based on global FDB reservations and usage, as well as TxQ occupancy at the destination. If the frame is not dropped, then the TxQ manager links the frame's FCB to the correct per-port-per-class TxQ. Unicast TxQ's are linked lists of transmission jobs, represented by their associated frames' FCB's. There is one linked list for each transmission class for each port. There are 4 transmission classes for each of the 24 10/100 ports and 8 classes for each of the two Gigabit ports – a total of 112 unicast queues.

The TxQ manager is responsible for scheduling transmission among the queues representing different classes for a port. When the port control module determines that there is room in the MAC Transmission FIFO (Tx FIFO) for another frame, it requests the handle of a new frame from the TxQ manager. The TxQ manager chooses among the head-of-line (HOL) frames from the per-class queues for that port using a Zarlink Semiconductor scheduling algorithm.

The Transmission DMA (TxDMA) is responsible for multiplexing the data and the address. On a port's turn, the TxDMA will move 8 bytes (or up to the EOF) from memory into the port's associated Tx FIFO. After reading the EOF, the port control requests a FCB release for that frame. The TxDMA arbitrates among multiple buffer release requests.

The frame is transmitted from the Tx FIFO to the line.

3.2 Multicast Data Frame Forwarding

After receiving the switch response, the TxQ manager has to make the dropping decision. A global decision to drop can be made, based on global FDB utilization and reservations. If so, then the FCB is released and the frame is dropped. In addition, a selective decision to drop can be made, based on the TxQ occupancy at some subset of the multicast packet's destinations. If so, then the frame is dropped at some destinations but not others and the FCB is not released.

If the frame is not dropped at a particular destination port, then the TxQ manager formats an entry in the multicast queue for that port and class. Multicast queues are physical queues (unlike the linked lists for unicast frames). There are 2 multicast queues for each of the 24 10/100 ports. The queue with higher priority has room for 32 entries and the queue with lower priority has room for 64 entries. There are 4 multicast queues for each of the two Gigabit ports. The size of the queues are: 32 entries (higher priority queue), 32 entries, 32 entries and 64 entries (lower priority queue). There is one multicast queue for every two priority classes. For the 10/100 ports to map the 8 transmit priorities into 2 multicast queues, the 2 LSB are discarded. For the gigabit ports to map the 8 transmit priorities into 4 multicast queues, the LSB are discarded.

During scheduling, the TxQ manager treats the unicast queue and the multicast queue of the same class as one logical queue. The older head of line of the two queues is forwarded first.

The port control requests a FCB release only after the EOF for the multicast frame has been read by all ports to which the frame is destined.

3.3 Frame Forwarding To and From CPU

Frame forwarding from the CPU port to a regular transmission port is nearly the same as forwarding between transmission ports. The only difference is that the physical destination port must be indicated in addition to the destination MAC address.

Frame forwarding to the CPU port is nearly the same as forwarding to a regular transmission port. The only difference is in frame scheduling. Instead of using the patent-pending Zarlink Semiconductor scheduling algorithms, scheduling for the CPU port is simply based on strict priority. That is, a frame in a high priority queue will always be transmitted before a frame in a lower priority queue. There are four output queues to the CPU and one receive queue.

4.0 Memory Interface

4.1 Overview

The MVTX2604 provides two 64-bit wide SRAM banks, SRAM Bank A and SRAM Bank B with a 64-bit bus connected to each. Each DMA can read and write from both bank A and bank B. The following figure provides an overview of the MVTX2604 SRAM banks.

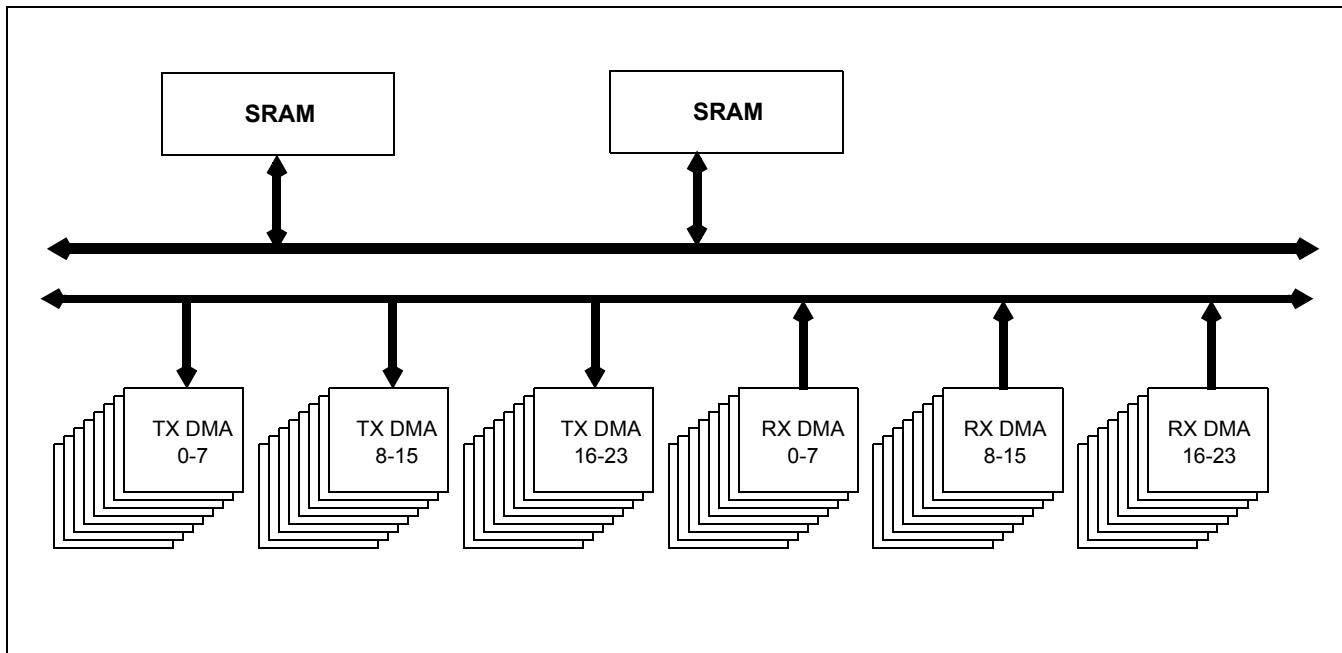

Figure 4 - MVTX2604 SRAM Interface Block Diagram (DMAs for 10/1000 Ports Only)

4.2 ZBT Support

The MVTX2604 supports Zero Bus Turnaround (ZBT). ZBT is a synchronous SRAM architecture that is optimized for networking and telecommunications applications. It can significantly increase the switch's internal bandwidth when compared to standard Pipeline SyncBurst SRAM.

The ZBT architecture is optimized for switching and other applications with highly random READs and WRITEs. ZBT SRAMs eliminate all idle cycles when turning the data bus around from a WRITE operation to a READ operation (or vice versa). This feature results in dramatic performance improvements in systems that have such traffic patterns (that is, frequent and random read and write access to the SRAM).

Please refer to the ZBT Application Note for further details.

4.3 Detailed Memory Information

Because the bus for each bank is 64 bits wide, frames are broken into 8-byte granules, written to and read from memory. The first 8-byte granule gets written to Bank A, the second 8-byte granule gets written to Bank B and so on in alternating fashion. When reading frames from memory, the same procedure is followed, first from A, then from B and so on.

The reading and writing from alternating memory banks can be performed with minimal waste of memory bandwidth. What's the worst case? For any speed port, in the worst case, a 1-byte-long EOF granule gets written to Bank A. This means that a 7-byte segment of Bank A bandwidth is idle, and furthermore, the next 8-byte segment of Bank B bandwidth is idle, because the first 8 bytes of the next frame will be written to Bank A, not B. This scenario results in a maximum 15 bytes of waste per frame, which is always acceptable because the interframe gap is 20 bytes.

The CPU management port gets treated like any other port, reading and writing to alternating memory banks starting with Bank A. The VLAN Index Mapping Table and Mac Address Table are duplicated in Bank A and B. When the CPU writes an entry to the VLAN Index Mapping Table it has to write the same data in bank A and bank B. Search engine data is written to both banks in parallel. In this way, a search engine read operation can be performed by either bank at any time without a problem.

4.4 Memory Requirements

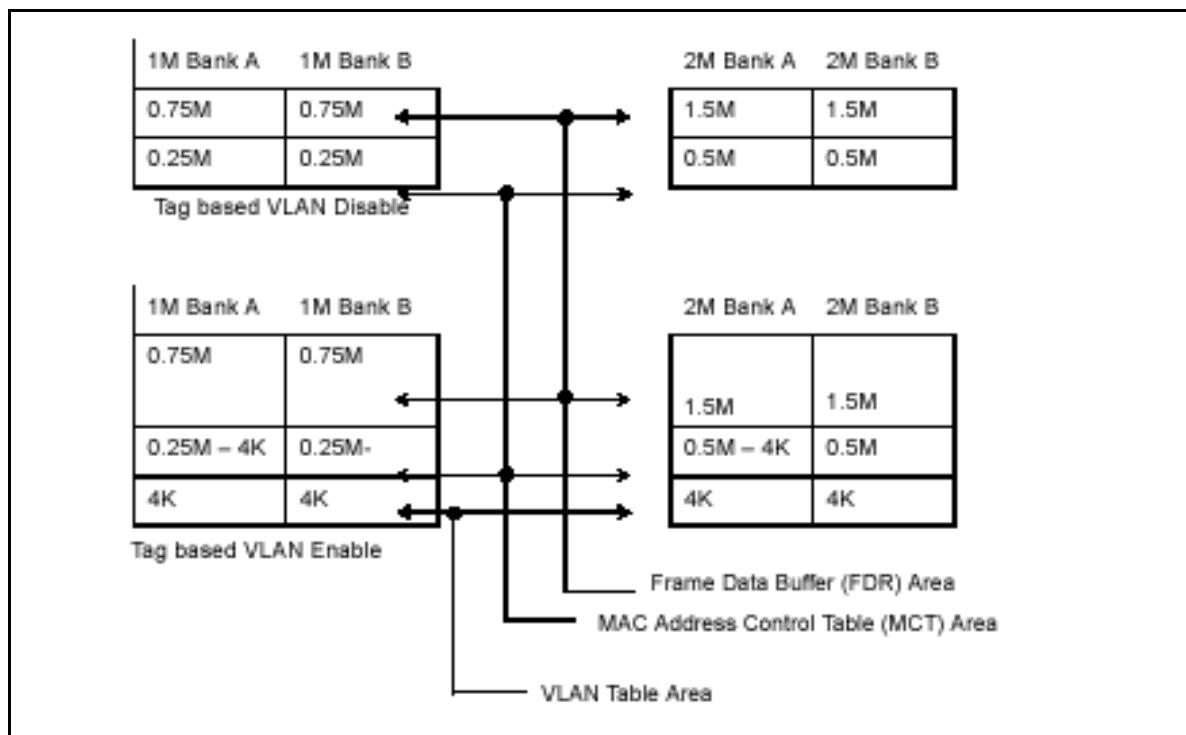

To speed up searching and decrease memory latency, the external MAC address database is duplicated in both memory banks. To support 64 K MAC address, 4 MB memory is required. When VLAN support is enabled, 512 entries of the MAC address table are used for storing the VLAN ID at VLAN Index Mapping Table.

Up to 2 K Ethernet frame buffers are supported and they will use 3 MB of memory. Each frame uses 1536 bytes. The maximum system memory requirement is 4 MB. If less memory is desired, the configuration can scale down.

Memory Configuration

Bank A	Bank B	Tag based VLAN	Frame Buffer	Max MAC Address
1 M	1 M	Disable	1 K	32 K
1 M	1 M	Enable	1 K	31.5 K
2 M	2 M	Disable	2 K	64 K
2 M	2 M	Enable	2 K	63.5 K

Memory Map

5.0 Search Engine

5.1 Search Engine Overview

The MVTX2604 search engine is optimized for high throughput searching, with enhanced features to support:

- Up to 64 K MAC addresses
- Up to 255 VLAN and IP Multicast groups
- 3 groups of port trunking (1 for the two Gigabit ports and 2 others)
- Traffic classification into 4 (or 8 for Gigabit) transmission priorities and 2 drop precedence levels
- Packet filtering
- Security

- Flooding, Broadcast, Multicast Storm Control
- MAC address learning and aging

5.2 Basic Flow

Shortly after a frame enters the MVTX2604 and is written to the Frame Data Buffer (FDB), the frame engine generates a Switch Request, which is sent to the search engine. The switch request consists of the first 64 bytes of the frame, which contain all the necessary information for the search engine to perform its task. When the search engine is done, it writes to the Switch Response Queue and the frame engine uses the information provided in that queue for scheduling and forwarding.

In performing its task, the search engine extracts and compresses the useful information from the 64-byte switch request. Among the information extracted are the source and destination MAC addresses, the transmission and discard priorities, whether the frame is unicast or multicast and VLAN ID. Requests are sent to the external SRAM to locate the associated entries in the external hash table.

When all the information has been collected from external SRAM, the search engine has to compare the MAC address on the current entry with the MAC address for which it is searching. If it is not a match, the process is repeated on the internal MCT Table. All MCT entries other than the first of each linked list are maintained internal to the chip. If the desired MAC address is still not found, then the result is either learning (source MAC address unknown) or flooding (destination MAC address unknown).

In addition, VLAN information is used to select the correct set of destination ports for the frame (for multicast), or to verify that the frame's destination port is associated with the VLAN (for unicast).

If the destination MAC address belongs to a port trunk, then the trunk number is retrieved instead of the port number. But on which port of the trunk will the frame be transmitted? This is easily computed using a hash of the source and destination MAC addresses.

When all the information is compiled, the switch response is generated, as stated earlier. The search engine also interacts with the CPU with regard to learning and aging.

5.3 Search, Learning, and Aging

5.3.1 MAC Search

The search block performs source MAC address and destination MAC address (or destination IP address for IP multicast) searching. As we indicated earlier, if a match is not found, then the next entry in the linked list must be examined and so on until a match is found or the end of the list is reached.

In tag based VLAN mode, if the frame is unicast, and the destination port is not a member of the correct VLAN, then the frame is dropped; otherwise, the frame is forwarded. If the frame is multicast, this same table is used to indicate

all the ports to which the frame will be forwarded. Moreover, if port trunking is enabled, this block selects the destination port (among those in the trunk group).

In port based VLAN mode, a bitmap is used to determine whether the frame should be forwarded to the outgoing port. The main difference in this mode is that the bitmap is not dynamic. Ports cannot enter and exit groups because of real-time learning made by a CPU.

The MAC search block is also responsible for updating the source MAC address timestamp and the VLAN port association timestamp, used for aging.

5.3.2 Learning

The learning module learns new MAC addresses and performs port change operations on the MCT database. The goal of learning is to update this database as the networking environment changes over time.

When CPU reporting is enabled, learning and port change will be performed when the CPU request queue has room, and a memory slot is available, and a “Learn MAC Address” message is sent to the CPU. When fast learning mode is enabled, learning and port change will be performed when memory slot is available and a latter “Learn MAC Address” message is sent to the CPU when CPU queue has room.

When CPU reporting is disabled, learning and port change will be performed based on memory slot availability only.

In tag based VLAN mode, if the source port is not a member of a classified VLAN a “New VLAN Port” message is sent to the CPU. The CPU can decide whether or not the source port can be added to the VLAN.

5.3.3 Aging

Aging time is controlled by register 400h and 401h.

The aging module scans and ages MCT entries based on a programmable “age out” time interval. As we indicated earlier, the search module updates the source MAC address and VLAN port association timestamps for each frame it processes. When an entry is ready to be aged, the entry is removed from the table and a “Delete MAC Address” message is sent to inform the CPU.

Supported MAC entry types are: dynamic, static, source filter, destination filter, IP multicast, source and destination filter and secure MAC address. Only dynamic entries can be aged; all others are static. The MAC entry type is stored in the “status” field of the MCT data structure.

5.3.4 VLAN Table

The table below provides a mapping from VLAN ID to VLAN index. It is maintained by system software and is checked by the hardware search engine for every incoming frame. This table has 4 K entries and is stored in external SRAM. It is organized as 512×8 entries (total of 4 K VLAN indexes) as shown. Each VLAN index is 8 bits.

VIX7	VIX6	VIX5	VIX4	VIX3	VIX2	VIX1	VIX0
...
...
VIX4095	VIX4094	VIX4093	VIX4092	VIX4091	VIX4090	VIX4089	VIX4088

Table 1 - VLAN Index Mapping Table

Each VIX represents the mapping result from the associated VLAN ID (VLANID = 0x004 is mapped to VIX4). Unused VLAN ID's have their corresponding VIX programmed to hexadecimal 00. Used VLAN ID's have their corresponding VIX programmed to hexadecimal 01 through FF. In other words, 255 VLAN's are supported. The VIX value is a pointer to the entries in the VLAN Index port association table (internal memory).

The VLAN Index port association table is used by both software and hardware. It contains 256 entries. Each entry has 27 fields, such that each field represents the port status of that particular VLAN.

	Port	Not Used	G1		G0		CPU		P23		P22		P3		P2		P1		P0	
	Bit	63 to 54	53 52		51 50		49 48		47 46		45 44			7 6		5 4		3 2		1 0	
E N T R I E S	0																				
	1																				
	:																				
	:																				
	255																				

Table 2 - LAN Index Port Association Table

Each entry has 64 bits. Each port has a VLAN status field with the following two bits values:

- 00: Port not a member of VLAN
- 01: Port is a member of VLAN, and is subject to aging (Do not use. Used by the aging module)
- 10: Port is a member of VLAN, and is subject to aging
- 11: Port is a member of VLAN, and is not subject to aging

Note: The VLAN aging time is controlled by register 402h.

5.4 MAC Address Filtering

The MVTX2604's implementation of intelligent traffic switching provides filters for source and destination MAC addresses. This feature filters unnecessary traffic, thereby providing intelligent control over traffic flows and broadcast traffic.

MAC address filtering allows the MVTX2604 to block an incoming packet to an interface when it sees a specified MAC address in either the source address or destination address of the incoming packet. For example, if your network is congested because of high utilization from a MAC address you can filter all traffic transmitted from that address and restore network flow while you troubleshoot the problem.

5.5 Quality of Service

Quality of Service (QoS) refers to the ability of a network to provide better service to selected network traffic over various technologies. Primary goals of QoS include dedicated bandwidth, controlled jitter and latency (required by some real-time and interactive traffic) and improved loss characteristics.

Traditional Ethernet networks have had no prioritization of traffic. Without a protocol to prioritize or differentiate traffic, a service level known as "best effort" attempts to get all the packets to their intended destinations with minimum delay; however, there are no guarantees. In a congested network or when a low-performance switch/router is overloaded, "best effort" becomes unsuitable for delay-sensitive traffic and mission-critical data transmission.

The advent of QoS for packet-based systems accommodates the integration of delay-sensitive video and multimedia traffic onto any existing Ethernet network. It also alleviates the congestion issues that have previously plagued such “best effort” networking systems. QoS provides Ethernet networks with the breakthrough technology to prioritize traffic and ensure that a certain transmission will have a guaranteed minimum amount of bandwidth.

Extensive core QoS mechanisms are built into the MVTX2604 architecture to ensure policy enforcement and buffering of the ingress port, as well as weighted fair-queue(WFQ) scheduling at the egress port.

In the MVTX2604, QoS-based policies sort traffic into a small number of classes and mark the packets accordingly. The QoS identifier provides specific treatment to traffic in different classes, so that different quality of service is provided to each class. Frame and packet scheduling and discarding policies are determined by the class to which the frames and packets belong. For example, the overall service given to frames and packets in the premium class will be better than that given to the standard class; the premium class is expected to experience lower loss rate or delay.

The MVTX2604 supports the following QoS techniques:

- In a port-based setup, any station connected to the same physical port of the switch will have the same transmit priority.
- In a tag-based setup, a 3-bit field in the VLAN tag provides the priority of the packet. This priority can be mapped to different queues in the switch to provide QoS.
- In a TOS/DS-based set up, TOS stands for “Type of Service” that may include “minimize delay,” “maximize throughput,” or “maximize reliability.” Network nodes may select routing paths or forwarding behaviours that are suitably engineered to satisfy the service request.
- In a logical port-based set up, a logical port provides the application information of the packet. Certain applications are more sensitive to delays than others; using logical ports to classify packets can help speed up delay sensitive applications, such as VoIP.

5.6 Priority Classification Rule

Figure 5 shows the MVTX2604 priority classification rule.

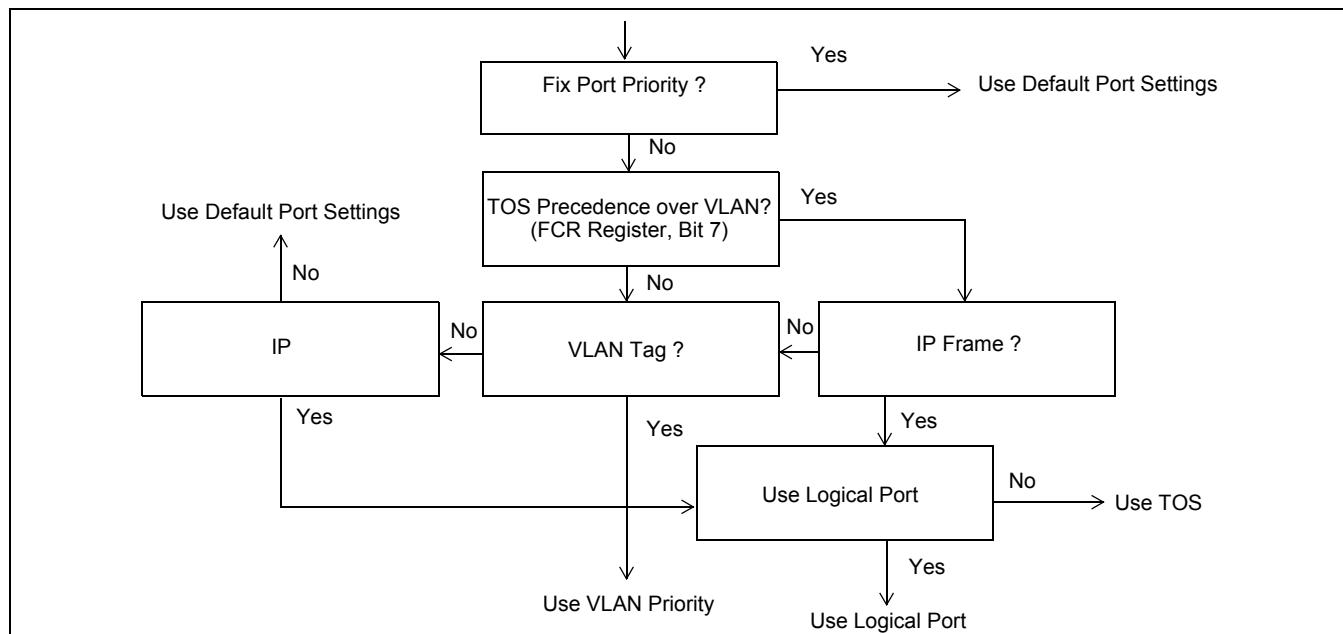

Figure 5 - Priority Classification Rule

5.7 Port and Tag Based VLAN

The MVTX2604 supports two models for determining and controlling how a packet gets assigned to a VLAN: port priority and tag -based VLAN.

5.7.1 Port-Based VLAN

An administrator can use the PVMAP Registers to configure the MVTX2604 for port-based VLAN (see “Registration Definition” on page 42). For example, ports 1-3 might be assigned to the Marketing VLAN, ports 4-6 to the Engineering VLAN and ports 7-9 to the Administrative VLAN. The MVTX2604 determines the VLAN membership of each packet by noting the port on which it arrives. From there, the MVTX2604 determines which outgoing port(s) is/are eligible to transmit each packet or whether the packet should be discarded.

	Destination Port Numbers Bit Map				
Port Registers	26	...	2	1	0
Register for Port #0 PVMAP00_0[7:0] to PVMAP00_3[2:0]	0		1	1	0
Register for Port #1 PVMAP01_0[7:0] to PVMAP01_3[2:0]	0		1	0	1
Register for Port #2 PVMAP02_0[7:0] to PVMAP02_3[2:0]	0		0	0	0
...					
Register for Port #26 PVMAP26_0[7:0] to PVMAP26_3[2:0]	0		0	0	0

Table 3 - PVMAP Register

For example, in the above table, a “1” denotes that an outgoing port is eligible to receive a packet from an incoming port. A 0 (zero) denotes that an outgoing port is not eligible to receive a packet from an incoming port.

In this example:

Data packets received at port #0 are eligible to be sent to outgoing ports 1 and 2.

Data packets received at port #1 are eligible to be sent to outgoing ports 0 and 2.

Data packets received at port #2 are **NOT** eligible to be sent to ports 0 and 1.

5.7.2 Tag-Based VLAN

The MVTX2604 supports the IEEE 802.1q specification for “tagging” frames. The specification defines a way to coordinate VLANs across multiple switches. In the specification, an additional 4-octet header (or “tag”) is inserted in a frame after the source MAC address and before the frame type. 12 bits of the tag are used to define the VLAN ID. Packets are then switched through the network with each MVTX2604 simply swapping the incoming tag for an appropriate forwarding tag rather than processing each packet’s contents to determine the path. This approach minimizes the processing needed once the packet enters the tag-switched network. In addition, coordinating VLAN IDs across multiple switches enables VLANs to extend to multiple switches.

Up to 255 VLANs are supported in the MVTX2604. The 4 K VLANs specified in the IEEE 802.1q are mapped to 255 VLAN indexes. The mapping is made by the VLAN index mapping table. Based on the VLAN index (VIXn), the source and destination port membership is checked against the content in the VLAN Index Port association table. If the destination port is a member of the VLAN, the packet is forwarded; otherwise it is discarded. If the source port is not a member, a “New VLAN Port” message is sent to the CPU. A filter can be applied to discard the packet if the source port is not a member of the VLAN.

5.8 Memory Configurations

The MVTX2604 supports the following memory configurations. Pipeline SBRAM modes support 1 M and 2 M per bank configurations, while ZBT mode supports 4 M configurations, 2 M per domain (bank). For detail connection information, please reference the memory application note.

Configuration	1 M per bank (Bootstrap pin TSTOUT7 = open)	2 M per bank (Bootstrap pin TSTOUT7 = pull down)	Connections
Single Layer (Bootstrap pin TSTOUT13 = open)	Two 128 K x 32 SRAM/bank or One 128 K x 64 SRAM/bank	Two 256 K x 32 SRAM/bank	Connect 0E# and WE#
Double Layer (Bootstrap pin TSTOUT13 = pull down)	NA	Four 128 K x 32 SRAM/bank or Two 128 K x 64 SRAM/bank	Connect 0E0# and WE0# Connect 0E1# and WE1#

Table 4 - Supported Memory Configurations (SBRAM Mode)

Configuration	2 M per bank	Connections
Single Layer (Bootstrap pin TSTOUT13 = open)	Two 256 K x 32 ZBT SRAM/bank or One 256 K x 64 ZBT SRAM/bank	Connect ADS# to Layer 0 chipselect pin
Double Layer (Bootstrap pin TSTOUT13 = pull down)	Four 128 K x 32 ZBT SRAM/bank or Two 128 K x 64 ZBT SRAM/bank	Connect ADS# to Layer 0 chipselect pin and 0E# to Layer 1 chipselect pin

Table 5 - Supported Memory Configurations (ZBT Mode)

6.0 Frame Engine

6.1 Data Forwarding Summary

When a frame enters the device at the RxMAC, the RxDMA will move the data from the MAC RxFIFO to the FDB. Data is moved in 8-byte granules in conjunction with the scheme for the SRAM interface.

A switch request is sent to the Search Engine. The Search Engine processes the switch request.

A switch response is sent back to the Frame Engine and indicates whether the frame is unicast or multicast and its destination port or ports. A VLAN table lookup is performed as well.

A Transmission Scheduling Request is sent in the form of a signal notifying the TxQ manager. Upon receiving a Transmission Scheduling Request, the device will format an entry in the appropriate Transmission Scheduling Queue (TxSch Q) or Queues. There are 4 TxSch Q for each 10/100 port (and 8 per Gigabit port), one for each priority. Creation of a queue entry either involves linking a new job to the appropriate linked list if unicast or adding an entry to a physical queue if multicast.

When the port is ready to accept the next frame, the TxQ manager will get the head-of-line (HOL) entry of one of the TxSch Qs, according to the transmission scheduling algorithm (to ensure per-class quality of service). The unicast linked list and the multicast queue for the same port-class pair are treated as one logical queue. The older HOL between the two queues goes first. For 10/100 ports multicast queue 0 is associated with unicast queue 0 and multicast queue 1 is associated with unicast queue 2. For Gigabit ports multicast queue 0 is associated with unicast queue 0, multicast queue 1 with unicast queue 2, multicast queue 2 with unicast queue 4 and multicast queue 3 with unicast queue 6.

The TxDMA will pull frame data from the memory and forward it granule-by-granule to the MAC TxFIFO of the destination port.

6.2 Frame Engine Details

This section briefly describes the functions of each of the modules of the MVTX2604 frame engine.

6.2.1 FCB Manager

The FCB manager allocates FCB handles to incoming frames and releases FCB handles upon frame departure. The FCB manager is also responsible for enforcing buffer reservations and limits. The default values can be determined by referring to Chapter 7. In addition, the FCB manager is responsible for buffer aging and for linking unicast forwarding jobs to their correct TxSch Q. The buffer aging can be enabled or disabled by the bootstrap pin and the aging time is defined in register FCBAT.

6.2.2 Rx Interface

The Rx interface is mainly responsible for communicating with the RxMAC. It keeps track of the start and end of frame and frame status (good or bad). Upon receiving an end of frame that is good, the Rx interface makes a switch request.

6.2.3 RxDMA

The RxDMA arbitrates among switch requests from each Rx interface. It also buffers the first 64 bytes of each frame for use by the search engine when the switch request has been made.

6.2.4 TxQ Manager

First, the TxQ manager checks the per-class queue status and global reserved resource situation and using this information makes the frame dropping decision after receiving a switch response. If the decision is not to drop, the TxQ manager requests that the FCB manager link the unicast frame's FCB to the correct per-port-per-class TxQ. If multicast, the TxQ manager writes to the multicast queue for that port and class. The TxQ manager can also trigger source port flow control for the incoming frame's source if that port is flow control enabled. Second, the TxQ manager handles transmission scheduling; it schedules transmission among the queues representing different classes for a port. Once a frame has been scheduled, the TxQ manager reads the FCB information and writes to the correct port control module.

6.3 Port Control

The port control module calculates the SRAM read address for the frame currently being transmitted. It also writes start of frame information and an end of frame flag to the MAC TxFIFO. When transmission is done, the port control module requests that the buffer be released.

6.4 TxDMA

The TxDMA multiplexes data and address from port control and arbitrates among buffer release requests from the port control modules.

7.0 Quality of Service and Flow Control

7.1 Model

Quality of service is an all-encompassing term for which different people have different interpretations. In general, the approach to quality of service described here assumes that we do not know the offered traffic pattern. We also assume that the incoming traffic is not policed or shaped. Furthermore, we assume that the network manager knows his applications, such as voice, file transfer, or web browsing and their relative importance. The manager can then subdivide the applications into classes and set up a service contract with each. The contract may consist

of bandwidth or latency assurances per class. Sometimes it may even reflect an estimate of the traffic mix offered to the switch. As an added bonus, although we do not assume anything about the arrival pattern, if the incoming traffic is policed or shaped we may be able to provide additional assurances about our switch's performance.

Table 7 shows examples of QoS applications with three transmission priorities, but best effort (P0) traffic may form a fourth class with no bandwidth or latency assurances. Gigabit ports actually have eight total transmission priorities.

Goals	Total Assured Bandwidth (user defined)	Low Drop Probability (low-drop)	High Drop Probability (high-drop)
Highest transmission priority, P3	50 Mbps	Apps: phone calls, circuit emulation. Latency: < 1 ms. Drop: No drop if P3 not oversubscribed.	Apps: training video. Latency: < 1 ms. Drop: No drop if P3 not oversubscribed; first P3 to drop otherwise.
Middle transmission priority, P2	37.5 Mbps	Apps: interactive apps, Web business. Latency: < 4-5 ms. Drop: No drop if P2 not oversubscribed.	Apps: non-critical interactive apps. Latency: < 4-5 ms. Drop: No drop if P2 not oversubscribed; first P2 to drop otherwise.
Low transmission priority, P1	12.5 Mbps	Apps: emails, file backups. Latency: < 16 ms desired, but not critical. Drop: No drop if P1 not oversubscribed.	Apps: casual web browsing. Latency: < 16 ms desired, but not critical. Drop: No drop if P1 not oversubscribed; first to drop otherwise.
Total	100 Mbps		

Table 7 - Two-dimensional World Traffic

A class is capable of offering traffic that exceeds the contracted bandwidth. A well-behaved class offers traffic at a rate no greater than the agreed-upon rate. By contrast, a misbehaving class offers traffic that exceeds the agreed-upon rate. A misbehaving class is formed from an aggregation of misbehaving microflows. To achieve high link utilization, a misbehaving class is allowed to use any idle bandwidth. However, such leniency must not degrade the quality of service (QoS) received by well-behaved classes.

As Table 7 illustrates, the six traffic types may each have their own distinct properties and applications. As shown, classes may receive bandwidth assurances or latency bounds. In the table, P3, the highest transmission class, requires that all frames be transmitted within 1 ms, and receives 50% of the 100 Mbps of bandwidth at that port.

Best-effort (P0) traffic forms a fourth class that only receives bandwidth when none of the other classes have any traffic to offer. It is also possible to add a fourth class that has strict priority over the other three; if this class has even one frame to transmit, then it goes first. In the MVTX2604, each 10/100 Mbps port will support four total classes and each 1000 Mbps port will support eight classes. We will discuss the various modes of scheduling these classes in the next section.

In addition, each transmission class has two subclasses, high-drop and low-drop. Well-behaved users should rarely lose packets. But poorly behaved users – users who send frames at too high a rate – will encounter frame loss and the first to be discarded will be high-drop. Of course, if this is insufficient to resolve the congestion, eventually some low-drop frames are dropped and then all frames in the worst case.

Table 7 shows that different types of applications may be placed in different boxes in the traffic table. For example, casual web browsing fits into the category of high-loss, high-latency-tolerant traffic, whereas VoIP fits into the category of low-loss, low-latency traffic.

7.2 Four QoS Configurations

There are four basic pieces to QoS scheduling in the MVTX2604: strict priority (SP), delay bound, weighted fair queuing (WFQ), and best effort (BE). Using these four pieces, there are four different modes of operation as shown in the tables below. For 10/100 Mbps ports, the following registers select these modes:

QOSC24 [7:6]_CREDIT_C00

QOSC28 [7:6]_CREDIT_C10

QOSC32 [7:6]_CREDIT_C20

QOSC36 [7:6]_CREDIT_C30

	P3	P2	P1	P0
Op1 (default)	Delay Bound			BE
Op2	SP	Delay Bound		BE
Op3	SP	WFQ		
Op4	WFQ			

Table 8 - Four QoS Configurations for a 10/100 Mbps Port

QOSC40 [7:6] and QOSC48 [7:6] select these modes for the first and second gigabit ports, respectively.

	P7	P6	P5	P4	P3	P2	P1	P0
Op1 (default)	Delay Bound						BE	
Op2	SP	Delay Bound			BE			
Op3	SP	WFQ						
Op4	WFQ							

Table 9 - Four QoS Configurations for a Gigabit Port

The default configuration for a 10/100 Mbps port is three delay-bounded queues and one best-effort queue. The delay bounds per class are 0.8 ms for P3, 3.2 ms for P2, and 12.8 ms for P1. For a 1 Gbps port, we have a default of six delay-bounded queues and two best-effort queues. The delay bounds for a 1 Gbps port are 0.16 ms for P7 and P6, 0.32 ms for P5, 0.64 ms for P4, 1.28 ms for P3, and 2.56 ms for P2. Best effort traffic is only served when there is no delay-bounded traffic to be served. For a 1 Gbps port, where there are two best-effort queues, P1 has strict priority over P0.

We have a second configuration for a 10/100 Mbps port in which there is one strict priority queue, two delay bounded queues and one best effort queue. The delay bounds per class are 3.2 ms for P2 and 12.8 ms for P1. If the user is to choose this configuration, it is important that P3 (SP) traffic be either policed or implicitly bounded (e.g., if the incoming P3 traffic is very light and predictably patterned). Strict priority traffic, if not admission-controlled at a prior stage to the MVTX2604 can have an adverse effect on all other classes' performance. For a 1 Gbps port, P7 and P6 are both SP classes and P7 has strict priority over P6. In this case, the delay bounds per class are 0.32 ms for P5, 0.64 ms for P4, 1.28 ms for P3, and 2.56 ms for P2.

The third configuration for a 10/100 Mbps port contains one strict priority queue and three queues receiving a bandwidth partition via WFQ. As in the second configuration, strict priority traffic needs to be carefully controlled. In the fourth configuration, all queues are served using a WFQ service discipline.

7.3 Delay Bound

In the absence of a sophisticated QoS server and signaling protocol, the MVTX2604 may not know the mix of incoming traffic ahead of time. To cope with this uncertainty, our delay assurance algorithm dynamically adjusts its scheduling and dropping criteria, guided by the queue occupancies and the due dates of their head-of-line (HOL) frames. As a result, we assure latency bounds for all admitted frames with high confidence, even in the presence of system-wide congestion. Our algorithm identifies misbehaving classes and intelligently discards frames at no detriment to well-behaved classes. Our algorithm also differentiates between high-drop and low-drop traffic with a weighted random early drop (WRED) approach. Random early dropping prevents congestion by randomly dropping a percentage of high-drop frames even before the chip's buffers are completely full, while still largely sparing low-drop frames. This allows high-drop frames to be discarded early, as a sacrifice for future low-drop frames. Finally, the delay bound algorithm also achieves bandwidth partitioning among classes.

7.4 Strict Priority and Best Effort

When strict priority is part of the scheduling algorithm, if a queue has even one frame to transmit, it goes first. Two of our four QoS configurations include strict priority queues. The goal is for strict priority classes to be used for IETF expedited forwarding (EF), where performance guarantees are required. As we have indicated, it is important that strict priority traffic be either policed or implicitly bounded, so as to keep from harming other traffic classes.

When best effort is part of the scheduling algorithm, a queue only receives bandwidth when none of the other classes have any traffic to offer. Two of our four QoS configurations include best effort queues. The goal is for best effort classes to be used for non-essential traffic, because we provide no assurances about best effort performance. However, in a typical network setting, much best effort traffic will indeed be transmitted and with an adequate degree of expediency.

Because we do not provide any delay assurances for best effort traffic, we do not enforce latency by dropping best effort traffic. Furthermore, because we assume that strict priority traffic is carefully controlled before entering the MVTX2604, we do not enforce a fair bandwidth partition by dropping strict priority traffic. To summarize, dropping to enforce bandwidth or delay does not apply to strict priority or best effort queues. We only drop frames from best effort and strict priority queues when global buffer resources become scarce.

7.5 Weighted Fair Queuing

In some environments – for example, in an environment in which delay assurances are not required, but precise bandwidth partitioning on small time scales is essential, WFQ may be preferable to a delay-bounded scheduling discipline. The MVTX2604 provides the user with a WFQ option with the understanding that delay assurances can not be provided if the incoming traffic pattern is uncontrolled. The user sets four WFQ “weights” (eight for Gigabit ports) such that all weights are whole numbers and sum to 64. This provides per-class bandwidth partitioning with error within 2%.

In WFQ mode, though we do not assure frame latency, the MVTX2604 still retains a set of dropping rules that helps to prevent congestion and trigger higher level protocol end-to-end flow control.

As before, when strict priority is combined with WFQ, we do not have special dropping rules for the strict priority queues, because the input traffic pattern is assumed to be carefully controlled at a prior stage. However, we do indeed drop frames from SP queues for global buffer management purposes. In addition, queue P0 for a 10/100 port (and queues P0 and P1 for a Gigabit port) are treated as best effort from a dropping perspective, though they still are assured a percentage of bandwidth from a WFQ scheduling perspective. What this means is that these particular queues are only affected by dropping when the global buffer count becomes low.

7.6 Shaper

Although traffic shaping is not a primary function of the MVTX2604, the chip does implement a shaper for expedited forwarding (EF). Our goal in shaping is to control the peak and average rate of traffic exiting the MVTX2604. Shaping is limited to the two Gigabit ports only, and only to class P6 (the second highest priority). This means that class P6 will be the class used for EF traffic. If shaping is enabled for P6, then P6 traffic must be scheduled using strict priority. With reference to Table 7, only the middle two QoS configurations may be used.

Peak rate is set using a programmable whole number, no greater than 64. For example, if the setting is 32, then the peak rate for shaped traffic is $32/64 * 1000$ Mbps = 500 Mbps. Average rate is also a programmable whole number, no greater than 64 and no greater than the peak rate. For example, if the setting is 16, then the average rate for shaped traffic is $16/64 * 1000$ Mbps = 250 Mbps. As a consequence of the above settings in our example, shaped traffic will exit the MVTX2604 at a rate always less than 500 Mbps and averaging no greater than 250 Mbps. See Programming QoS Register application note for more information.

Also, when shaping is enabled, it is possible for a P6 queue to explode in length if fed by a greedy source. The reason is that a shaper is by definition not work-conserving; that is, it may hold back from sending a packet even if the line is idle. Though we do have global resource management, we do nothing to prevent this situation locally. We assume SP traffic is policed at a prior stage to the MVTX2604.

7.7 Rate Control

The MVTX2604 provides a rate control function on its 10/100 ports. This rate control function applies to the outgoing traffic aggregate on each 10/100 port. It provides a way of reducing the outgoing average rate below full wire speed. Note that the rate control function does not shape or manipulate any particular traffic class. Furthermore, though the average rate of the port can be controlled with this function, the peak rate will still be full line rate.

Two principal parameters are used to control the average rate for a 10/100 port. A port's rate is controlled by allowing, on average, M bytes to be transmitted every N microseconds. Both of these values are programmable. The user can program the number of bytes in 8-byte increments and the time may be set in units of 10 ms.

The value of M/N will, of course, equal the average data rate of the outgoing traffic aggregate on the given 10/100 port. Although there are many (M,N) pairs that will provide the same average data rate performance, the smaller the time interval N, the "smoother" the output pattern will appear.

In addition to controlling the average data rate on a 10/100 port, the rate control function also manages the maximum burst size at wire speed. The maximum burst size can be considered the memory of the rate control mechanism; if the line has been idle for a long time, to what extent can the port "make up for lost time" by transmitting a large burst? This value is also programmable, measured in 8-byte increments.

Example: Suppose that the user wants to restrict Fast Ethernet port P's average departure rate to 32 Mbps – 32% of line rate – when the average is taken over a period of 10 ms. In an interval of 10 ms, exactly 40000 bytes can be transmitted at an average rate of 32 Mbps.

So how do we set the parameters? The rate control parameters are contained in an internal RAM block accessible through the CPU port (See Programming QoS Registers application note and Processor interface application note). The data format is shown below.

63:40	39:32	31:16	15:0
0	Time interval	Maximum burst size	Number of bytes

As we indicated earlier, the number of bytes is measured in 8-byte increments, so the 16-bit field "Number of bytes" should be set to $40000/8$, or 5000. In addition, the time interval has to be indicated in units of 10 ms. Though we want the average data rate on port P to be 32 Mbps when measured over an interval of 10 ms, we can also adjust the maximum number of bytes that can be transmitted at full line rate in any single burst. Suppose we wish this limit

to be 12 kilobytes. The number of bytes is measured in 8-byte increments, so the 16-bit field “Maximum burst size” is set to $12000/8$, or 1500.

7.8 WRED Drop Threshold Management Support

To avoid congestion, the Weighted Random Early Detection (WRED) logic drops packets according to specified parameters. The following table summarizes the behavior of the WRED logic.

In KB (kilobytes)	P3	P2	P1	High Drop	Low Drop
Level 1 $N \geq 120$	P3 $\geq AKB$	P2 $\geq BKB$	P1 $\geq CKB$	X%	0%
Level 2 $N \geq 140$				Y%	Z%
Level 3 $N \geq 160$				100%	100%

Table 10 - WRED Drop Thresholds

P_x is the total byte count, in the priority queue x . The WRED logic has three drop levels, depending on the value of N , which is based on the number of bytes in the priority queues. If delay bound scheduling is used, N equals $P3*16+P2*4+P1$. If using WFQ scheduling, N equals $P3+P2+P1$. Each drop level from one to three has defined high-drop and low-drop percentages, which indicate the minimum and maximum percentages of the data that can be discarded. The X, Y Z percent can be programmed by the register RDRC0, RDRC1. In Level 3, all packets are dropped if the bytes in each priority queue exceed the threshold. Parameters A, B, C are the byte count thresholds for each priority queue. They can be programmed by the QOS control register (refer to the register group 5). See Programming QoS Registers application note for more information.

7.9 Buffer Management

Because the number of FDB slots is a scarce resource and because we want to ensure that one misbehaving source port or class cannot harm the performance of a well-behaved source port or class, we introduce the concept of buffer management into the MVTX2604. Our buffer management scheme is designed to divide the total buffer space into numerous reserved regions and one shared pool as shown in Figure 11 on page 41.

As shown in the figure, the FDB pool is divided into several parts. A reserved region for temporary frames stores frames prior to receiving a switch response. Such a temporary region is necessary, because when the frame first enters the MVTX2604, its destination port and class are as yet unknown, and so the decision to drop or not needs to be temporarily postponed. This ensures that every frame can be received first before subjecting them to the frame drop discipline after classifying.

Six reserved sections, one for each of the first six priority classes, ensure a programmable number of FDB slots per class. The lowest two classes do not receive any buffer reservation. Furthermore, even for 10/100 Mbps ports, a frame is stored in the region of the FDB corresponding to its class. As we have indicated, the eight classes use only four transmission scheduling queues for 10/100 Mbps ports, but as far as buffer usage is concerned there are still eight distinguishable classes.

Another segment of the FDB reserves space for each of the 27 ports — 26 ports for Ethernet and one CPU port (port number 24). Two parameters can be set, one for the source port reservation for 10/100 Mbps ports and CPU port, and one for the source port reservation for 1 Gbps ports. These 27 reserved regions make sure that no well-behaved source port can be blocked by another misbehaving source port.

In addition, there is a shared pool, which can store any type of frame. The frame engine allocates the frames first in the six priority sections. When the priority section is full or the packet has priority 1 or 0, the frame is allocated in the shared pool. Once the shared pool is full the frames are allocated in the section reserved for the source port.

The following registers define the size of each section of the Frame data Buffer:

PR100- Port Reservation for 10/100 Ports

PRG- Port Reservation for Giga Ports

SFCB- Share FCB Size

C2RS- Class 2 Reserve Size

C3RS- Class 3 Reserve Size

C4RS- Class 4 Reserve Size

C5RS- Class 5 Reserve Size

C6RS- Class 6 Reserve Size

C7RS- Class 7 Reserve Size

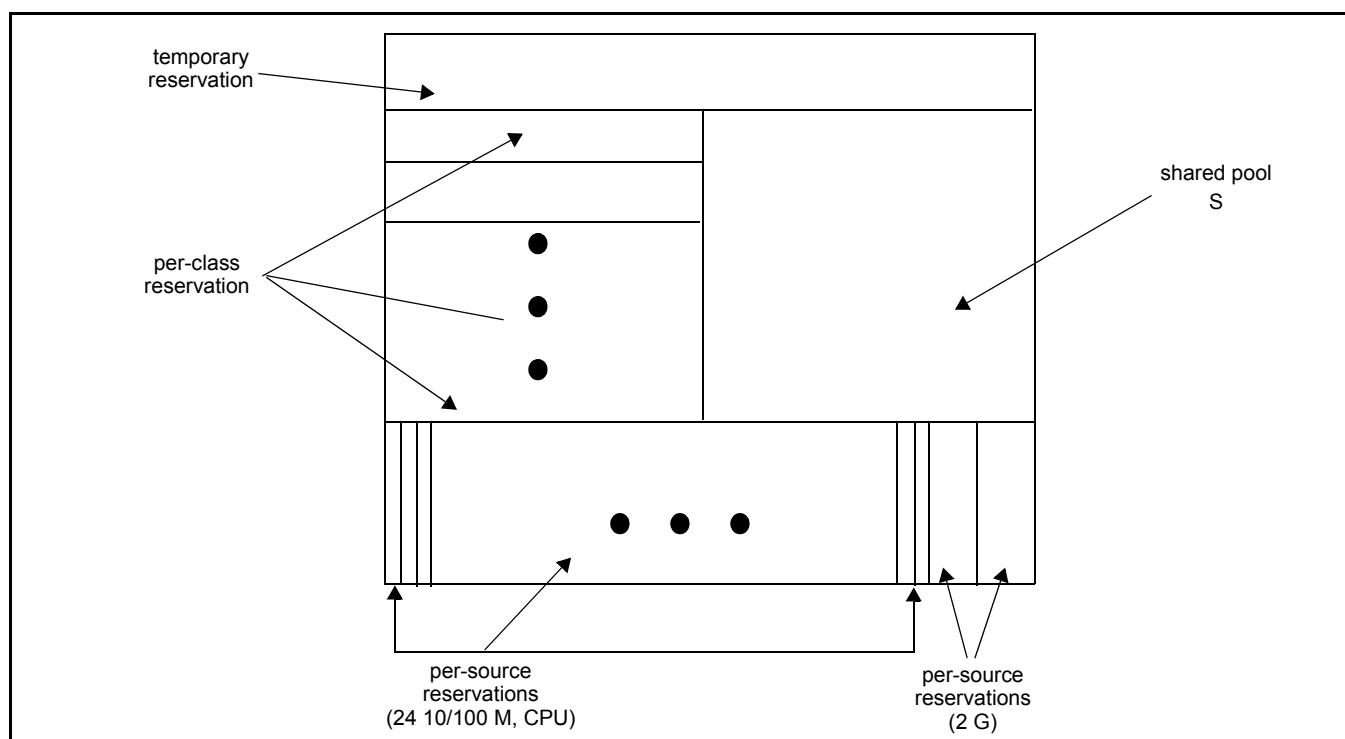

Figure 11 - Buffer Partition Scheme Used to Implement MVTX2604 AG Buffer Management

7.9.1 Dropping When Buffers Are Scarce

Summarizing the two examples of local dropping discussed earlier in this chapter:

If a queue is a delay-bounded queue we have a multi-level WRED drop scheme designed to control delay and partition bandwidth in case of congestion.

If a queue is a WFQ-scheduled queue we have a multi-level WRED drop scheme designed to prevent congestion.

In addition to these reasons for dropping, we also drop frames when global buffer space becomes scarce. The function of buffer management is to make sure that such dropping causes as little blocking as possible.

7.10 MVTX2604 Flow Control Basics

Because frame loss is unacceptable for some applications, the MVTX2604 provides a flow control option. When flow control is enabled, scarcity of buffer space in the switch may trigger a flow control signal; this signal tells a source port that is sending a packet to this switch, to temporarily hold off.

While flow control offers the clear benefit of no packet loss, it also introduces a problem for quality of service. When a source port receives an Ethernet flow control signal, all microflows originating at that port, well-behaved or not, are halted. A single packet destined for a congested output can block other packets destined for uncongested outputs. The resulting head-of-line blocking phenomenon means that quality of service cannot be assured with high confidence when flow control is enabled.

In the MVTX2604, each source port can independently have flow control enabled or disabled. For flow control enabled ports, by default all frames are treated as lowest priority during transmission scheduling. This is done so that those frames are not exposed to the WRED Dropping scheme. Frames from flow control enabled ports feed to only one queue at the destination, the queue of lowest priority. This means that if flow control is enabled for a given source port then we can guarantee that no packets originating from that port will be lost but at the possible expense of minimum bandwidth or maximum delay assurances. In addition, these “downgraded” frames may only use the shared pool or the per-source reserved pool in the FDB; frames from flow control enabled sources may not use reserved FDB slots for the highest six classes (P2-P7).

The MVTX2604 does provide a system-wide option of permitting normal QoS scheduling (and buffer use) for frames originating from flow control enabled ports. When this programmable option is active, it is possible that some packets may be dropped even though flow control is on. The reason is that intelligent packet dropping is a major component of the MVTX2604’s approach to ensuring bounded delay and minimum bandwidth for high priority flows.

7.10.1 Unicast Flow Control

For unicast frames, flow control is triggered by source port resource availability. Recall that the MVTX2604’s buffer management scheme allocates a reserved number of FDB slots for each source port. If a programmed number of a source port’s reserved FDB slots have been used then flow control Xoff is triggered.

Xon is triggered when a port is currently being flow controlled and all of that port’s reserved FDB slots have been released.

Note that the MVTX2604’s per-source-port FDB reservations assure that a source port that sends a single frame to a congested destination will not be flow controlled.

7.10.2 Multicast Flow Control

In unmanaged mode, flow control for multicast frames is triggered by a global buffer counter. When the system exceeds a programmable threshold of multicast packets Xoff is triggered. Xon is triggered when the system returns below this threshold.

In managed mode, per-VLAN flow control is used for multicast frames. In this case, flow control is triggered by congestion at the destination. How so? The MVTX2604 checks each destination to which a multicast packet is headed. For each destination port, the occupancy of the lowest-priority transmission multicast queue (measured in number of frames) is compared against a programmable congestion threshold. If congestion is detected at even one of the packet’s destinations then Xoff is triggered.

In addition, each source port has a 26-bit port map recording which port or ports of the multicast frame’s fanout were congested at the time Xoff was triggered. All ports are continuously monitored for congestion and a port is identified as uncongested when its queue occupancy falls below a fixed threshold. When all those ports that were originally marked as congested in the port map have become uncongested, then Xon is triggered and the 26-bit vector is reset to zero.

The MVTX2604 also provides the option of disabling VLAN multicast flow control.

Note: If per-Port flow control is on, QoS performance will be affected.

7.11 Mapping to IETF Diffserv Classes

The mapping between priority classes discussed in this chapter and elsewhere is shown below.

VTX	P7	P6	P5	P4	P3	P2	P1	P0
IETF	NM	EF	AF0	AF1	AF2	AF3	BE0	BE1

Table 11 - Mapping between MVTX2604 and IETF Diffserv Classes for Gigabit Ports

As the table illustrates, P7 is used solely for network management (NM) frames. P6 is used for expedited forwarding service (EF). Classes P2 through P5 correspond to an assured forwarding (AF) group of size 4. Finally, P0 and P1 are two best effort (BE) classes.

For 10/100 Mbps ports, the classes of Table 12 are merged in pairs—one class corresponding to NM+EF, two AF classes, and a single BE class.

VTX	P3	P2	P1	P0
IETF	NM+EF	AF0	AF1	BE0

Table 12 - Mapping between MVTX2604 and IETF Diffserv Classes for 10/100 Ports

Features of the MVTX2604 that correspond to the requirements of their associated IETF classes are summarized in the table below.

Network management (NM) and Expedited forwarding (EF)	Global buffer reservation for NM and EF Shaper for EF traffic on 1 Gbps ports Option of strict priority scheduling No dropping if admission controlled
Assured forwarding (AF)	Four AF classes for 1 Gbps ports Programmable bandwidth partition, with option of WFQ service Option of delay-bounded service keeps delay under fixed levels even if not admission-controlled Random early discard, with programmable levels Global buffer reservation for each AF class
Best effort (BE)	Two BE classes for 1 Gbps ports Service only when other queues are idle means that QoS not adversely affected Random early discard, with programmable levels Traffic from flow control enabled ports automatically classified as BE

Table 13 - MVTX2604 Features Enabling IETF Diffserv Standards

8.0 Port Trunking

8.1 Features and Restrictions

A port group (i.e., trunk) can include up to 4 physical ports but when using stack all of the ports in a group must be in the same MVTX2604.

The two Gigabit ports may also be trunked together. There are three trunk groups total including the option to trunk Gigabit ports.

Load distribution among the ports in a trunk for unicast is performed using hashing based on source MAC address and destination MAC address. Three other options include source MAC address only, destination MAC address only and source port (in bidirectional ring mode only). Load distribution for multicast is performed similarly.

If a VLAN includes any of the ports in a trunk group, all the ports in that trunk group should be in the same VLAN member map.

The MVTX2604 also provides a safe fail-over mode for port trunking automatically. If one of the ports in the trunking group goes down, the MVTX2604 will automatically redistribute the traffic over to the remaining ports in the trunk in unmanaged mode. In managed mode, the software can perform similar tasks.

8.2 Unicast Packet Forwarding

The search engine finds the destination MCT entry, and if the status field says that the destination port found belongs to a trunk, then the group number is retrieved instead of the port number. In addition, if the source address belongs to a trunk then the source port's trunk membership register is checked.

A hash key, based on some combination of the source and destination MAC addresses for the current packet selects the appropriate forwarding port as specified in the Trunk_Hash registers.

8.3 Multicast Packet Forwarding

For multicast packet forwarding, the device must determine the proper set of ports from which to transmit the packet based on the VLAN index and hash key.

Two functions are required in order to distribute multicast packets to the appropriate destination ports in a port trunking environment.

Determining one forwarding port per group. For multicast packets, all but one port per group, the forwarding port must be excluded.

Preventing the multicast packet from looping back to the source trunk.

The search engine needs to prevent a multicast packet from sending to a port that is in the same trunk group with the source port. This is because, when we select the primary forwarding port for each group we do not take the source port into account. To prevent this, we simply apply one additional filter so as to block that forwarding port for this multicast packet.

8.4 Unmanaged Trunking

In unmanaged mode, 3 trunk groups are supported. Groups 0 and 1 can trunk up to 4 10/100 ports. Group 2 can trunk 2 Gigabit ports. The supported combinations are shown in the following table.

Group 0	Port 0	Port 1	Port 2	Port 3
	✓	✓		
	✓	✓	✓	
	✓	✓	✓	✓

Select via trunk0_mode register

Group 1	Port 4	Port 5	Port 6	Port 7
	✓	✓		
	✓	✓	✓	✓

Select via trunk1_mode register

Group 2	Port 25(Giga 0)	Port 26 (Giga 1)
	✓	✓

In unmanaged mode, the trunks are individually enabled/disabled by controlling pin trunk0,1,2.

9.0 Port Mirroring

9.1 Port Mirroring Features

The received or transmitted data of any 10/100 port in the MVTX2604 chip can be “mirrored” to any other port. We support two such mirrored source-destination pairs. A mirror port can not also serve as a data port.

Please refer to the Port Mirroring Application note for further details.

9.2 Setting Registers for Port Mirroring

MIRROR1_SRC: Sets the source port for the first port mirroring pair. Bits [4:0] select the source port to be mirrored. An illegal port number is used to disable mirroring (which is the default setting). Bit [5] is used to select between ingress (Rx) or egress (Tx) data.

MIRROR1_DEST: Sets the destination port for the first port mirroring pair. Bits [4:0] select the destination port to be mirrored. The default is port 23.

MIRROR2_SRC: Sets the source port for the second port mirroring pair. Bits [4:0] select the source port to be mirrored. An illegal port number is used to disable mirroring (which is the default setting). Bit [5] is used to select between ingress (Rx) or egress (Tx) data.

MIRROR2_DEST: Sets the destination port for the second port mirroring pair. Bits [4:0] select the destination port to be mirrored. The default is port 0.

10.0 TBI Interface

10.1 TBI Connection

The TBI interface can be used for 1000 Mbps fiber operation. In this mode, the MVTX2604 is connected to the Serdes as shown in Figure 12. There are two TBI interfaces in the MVTX2604 devices. To enable to TBI function, the corresponding TXEN and TXER pins need to be boot strapped. See Ball – Signal Description for details.

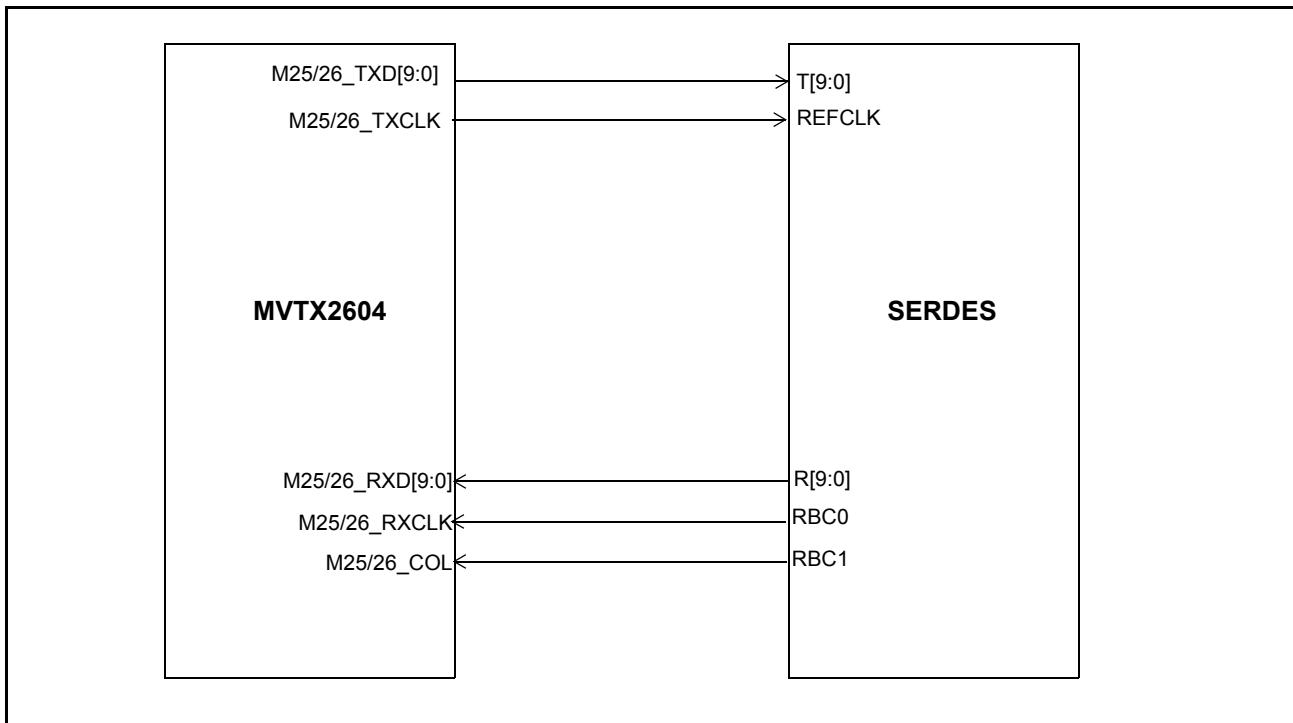

Figure 12 - TBI Connection

11.0 GPSI (7WS) Interface

11.1 GPSI connection

The 10/100 RMII ethernet port can function in GPSI (7WS) mode when the corresponding TXEN pin is strapped low with a 1K pull down resistor. In this mode, the TXD[0], TXD[1], RXD[0] and RXD[1] serve as TX data, TX clock, RX data and RX clock respectively. The link status and collision from the PHY are multiplexed and shifted into the switch device through external glue logic. The duplex of the port can be controlled by programming the ECR register.

The GPSI interface can be operated in port based VLAN mode only.

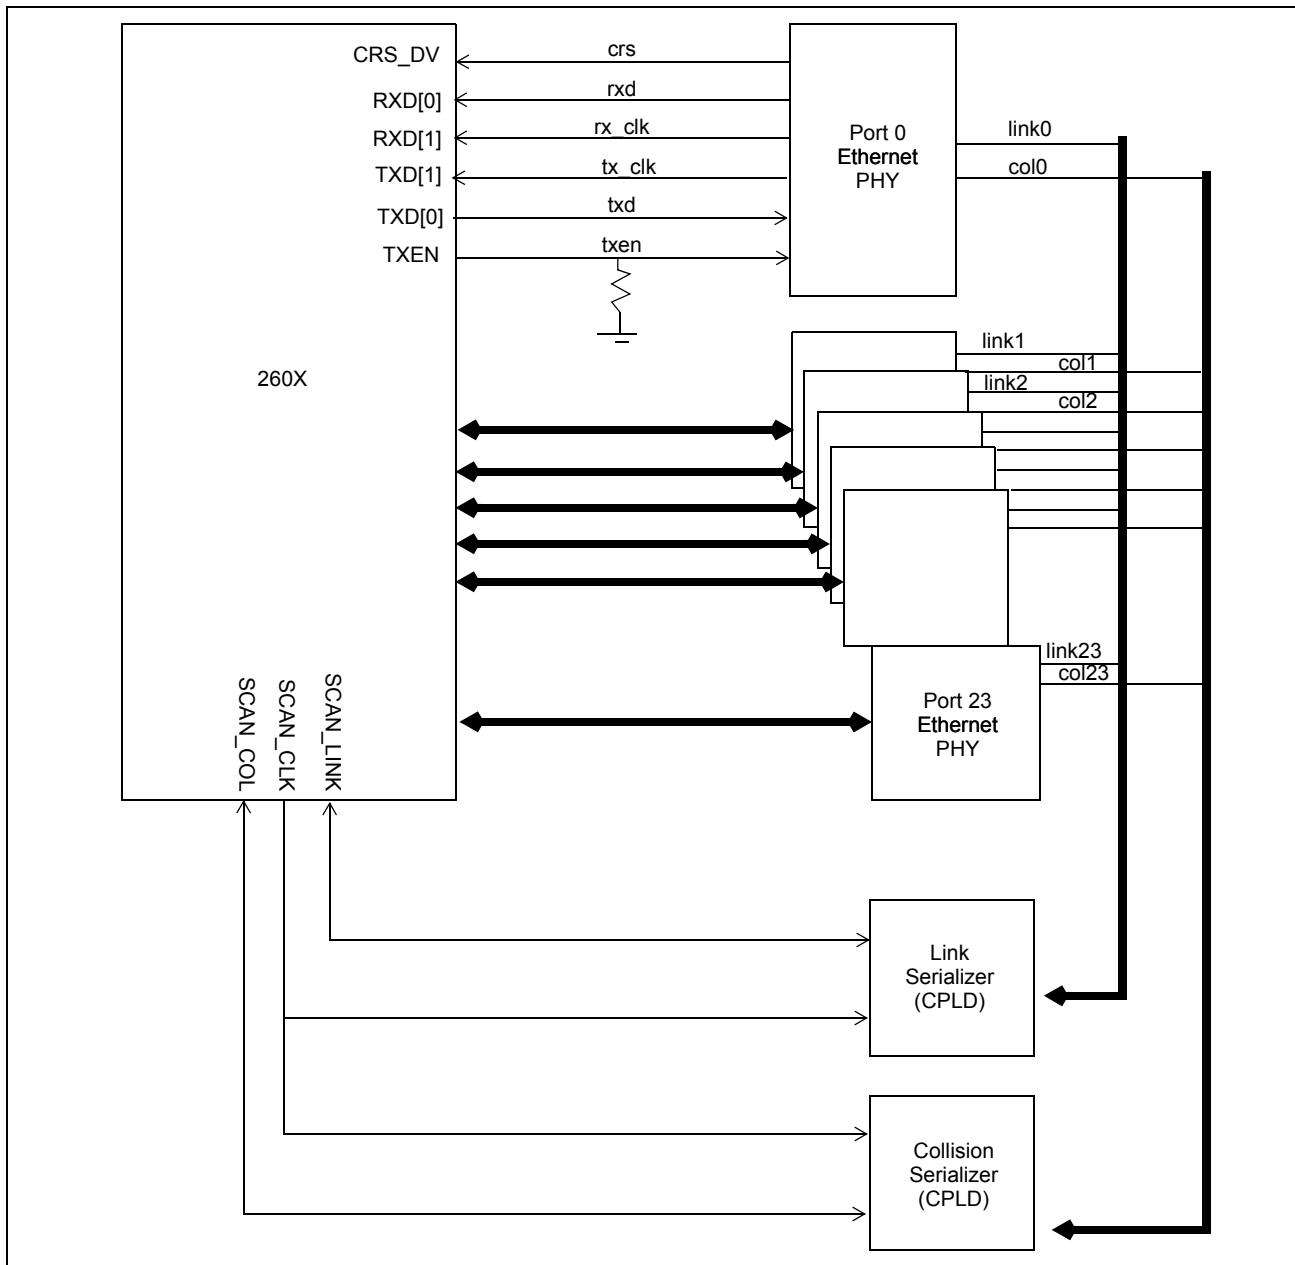

Figure 13 - GPSI (7WS) Mode Connection Diagram

11.2 SCAN LINK and SCAN COL interface

An external CPLD logic is required to take the link signals and collision signals from the GPSI PHYs and shift them into the switch device. The switch device will drive out a signature to indicate the start of the sequence. After that, the CPLD should shift in the link and collision status of the PHYS as shown in the figure. The extra link status indicates the polarity of the link signal. One indicates the polarity of the link signal is active high.

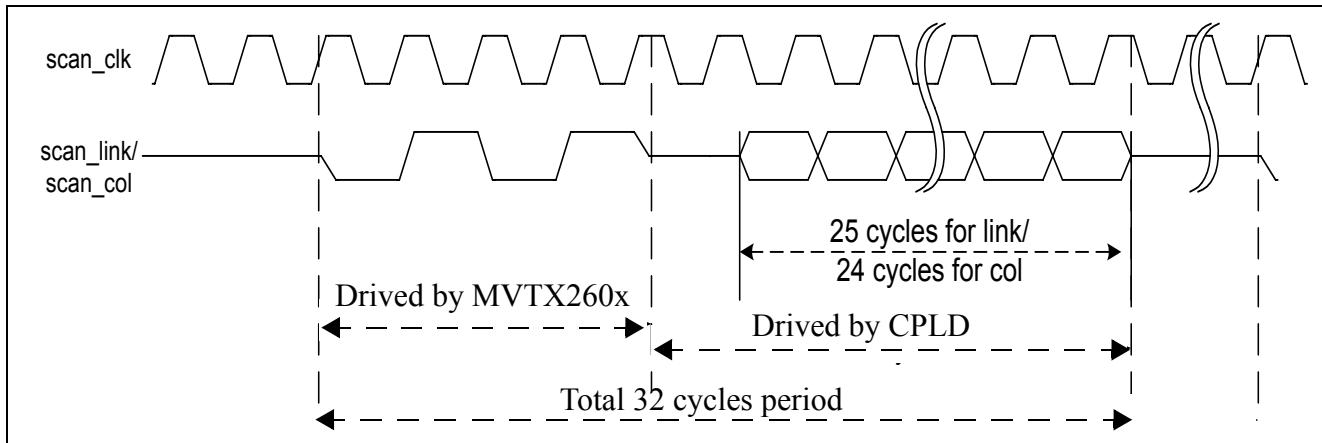

Figure 14 - SCAN LINK and SCAN COLLISION Status Diagram

12.0 LED Interface

12.1 LED Interface Introduction

A serial output channel provides port status information from the MVTX2604 chips. It requires three additional pins.

LED_CLK at 12.5 MHz

LED_SYN a sync pulse that defines the boundary between status frames

LED_DATA a continuous serial stream of data for all status LEDs that repeats once every frame time

A non-serial interface is also allowed, but in this case, only the Gigabit ports will have status LEDs.

A low cost external device (44 pin PAL) is used to decode the serial data and to drive an LED array for display. This device can be customized for different needs.

12.2 Port Status

In the VTX2604, each port has 8 status indicators, each represented by a single bit. The 8 LED status indicators are:

- Bit 0: Flow control
- Bit 1: Transmit data
- Bit 2: Receive data
- Bit 3: Activity (where activity includes either transmission or reception of data)
- Bit 4: Link up
- Bit 5: Speed (1= 100 Mb/s; 0= 10 Mb/s)
- Bit 6: Full-duplex
- Bit 7: Collision

Eight clocks are required to cycle through the eight status bits for each port.

When the LED_SYN pulse is asserted, the LED interface will present 256 LED clock cycles with the clock cycles providing information for the following ports.

Port 0 (10/100): cycles #0 to cycle #7

Port 1 (10/100): cycles#8 to cycle #15

Port 2 (10/100): cycle #16 to cycle #23

...

Port 22 (10/100): cycle #176 to cycle #183

Port 23 (10/100): cycle #184 to cycle #191

Port 24 (Gigabit 1): cycle #192 to cycle #199

Port 25 (Gigabit 2): cycle #200 to cycle #207

Byte 26 (additional status): cycle #208 to cycle #215

Byte 27 (additional status): cycle #216 to cycle #223

Cycles #224 to 256 present data with a value of zero.

The first two bits of byte 26 provides the speed information for the Gigabit ports while the remainder of byte 26 and byte 27 provides bist status.

26[0]: G0 port (1= port 24 is operating at Gigabit speed; 0= speed is either 10 or 100 Mb/s depending on speed bit of Port 24)

26[1]: G1 port (1= port 25 is operating at Gigabit speed; 0= speed is either 10 or 100 Mb/s depending on speed bit of Port 25)

26[2]: initialization done

26[3]: initialization start

26[4]: checksum ok

26[5]: link_init_complete

26[6]: bist_fail

26[7]: ram_error

27[0]: bist_in_process

27[1]: bist_done

12.3 LED Interface Timing Diagram

The signal from the MVTX2604 to the LED decoder is shown in Figure 15.

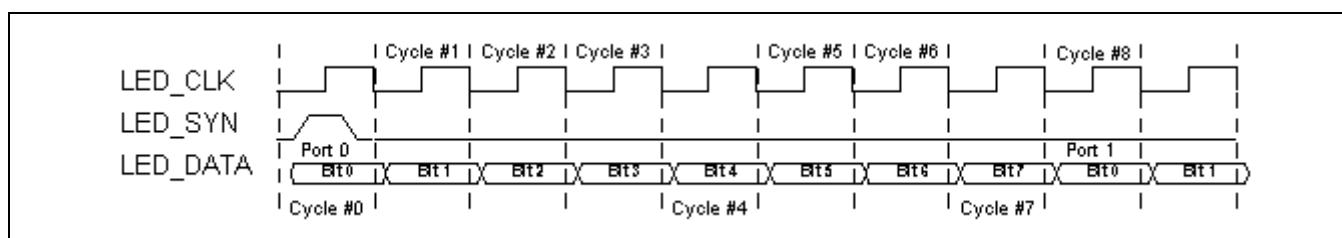

Figure 15 - Timing Diagram of LED Interface

13.0 Hardware Statistics Counter

13.1 Hardware Statistics Counters List

MVTX2604 hardware provides a full set of statistics counters for each Ethernet port. The CPU accesses these counters through the CPU interface. All hardware counters are rollover counters. When a counter rolls over the CPU is interrupted so that long-term statistics may be kept. The MAC detects all statistics except for the delay exceed discard counter (detected by buffer manager) and the filtering counter (detected by queue manager). The following is the wrapped signal sent to the CPU through the command block.

31	30	2	2	0
		6	5	

	Status Wrapped Signal	
--	-----------------------	--

B[0]	0-d	Bytes Sent (D)
B[1]	1-L	Unicast Frame Sent
B[2]	1-U	Frame Send Fail
B[3]	2-I	Flow Control Frames Sent
B[4]	2-u	Non-Unicast Frames Sent
B[5]	3-d	Bytes Received (Good and Bad) (D)
B[6]	4-d	Frames Received (Good and Bad) (D)
B[7]	5-d	Total Bytes Received (D)
B[8]	6-L	Total Frames Received
B[9]	6-U	Flow Control Frames Received
B[10]	7-I	Multicast Frames Received
B[11]	7-u	Broadcast Frames Received
B[12]	8-L	Frames with Length of 64 Bytes
B[13]	8-U	Jabber Frames
B[14]	9-L	Frames with Length Between 65-127 Bytes
B[15]	9-U	Oversize Frames
B[16]	A-I	Frames with Length Between 128-255 Bytes
B[17]	A-u	Frames with Length Between 256-511 Bytes
B[18]	B-I	Frames with Length Between 512-1023 Bytes
B[19]	B-u	Frames with Length Between 1024-1528 Bytes
B[20]	C-I	Fragments
B[21]	C-U1	Alignment Error
B[22]	C-U	Undersize Frames
B[23]	D-I	CRC

B[28]	F-U1	Delay Exceed Discard Counter
B[29]	F-U	Late Collision
B[30]		Link Status Change
B[31]		Current link status

Notation: X-Y

X: Address in the contain memory

Y: Size and bits for the counter

d: D Word counter

L: 24 bits counter bit[23:0]

U: 8 bits counter bit[31:24]

U1: 8 bits counter bit[23:16]

I: 16 bits counter bit[15:0]

u: 16 bits counter bit[31:16]

13.2 IEEE 802.3 HUB Management (RFC 1516)

13.2.1 Event Counters

13.2.1.1 Readablectet

Counts number of bytes (i.e. octets) contained in good valid frames received.

Frame size: ≥ 64 bytes, ≤ 1522 bytes if VLAN Tagged;
 1518 bytes if not VLAN Tagged

No FCS (i.e. checksum) error

No collisions

13.2.1.2 ReadableFrame

Counts number of good valid frames received.

Frame size: ≥ 64 bytes, ≤ 1522 bytes if VLAN Tagged;
 1518 bytes if not VLAN Tagged

No FCS error

No collisions

13.2.1.3 FCSErrors

Counts number of valid frames received with bad FCS.

Frame size: ≥ 64 bytes, ≤ 1522 bytes if VLAN Tagged;
 1518 bytes if not VLAN Tagged

No framing error

No collisions

13.2.1.4 AlignmentErrors

Counts number of valid frames received with bad alignment (not byte-aligned).

Frame size: ≥ 64 bytes, ≤ 1522 bytes if VLAN Tagged;
 1518 bytes if not VLAN Tagged

No framing error

No collisions

13.2.1.5 FrameTooLongs

Counts number of frames received with size exceeding the maximum allowable frame size.

Frame size: ≥ 64 bytes, > 1522 bytes if VLAN Tagged;
 1518 bytes if not VLAN Tagged

FCS error: don't care

Framing error: don't care

No collisions

13.2.1.6 ShortEvents

Counts number of frames received with size less than the length of a short event.

Frame size: < 10 bytes
FCS error: don't care

Framing error: don't care
No collisions

13.2.1.7 Runts

Counts number of frames received with size under 64 bytes, but greater than the length of a short event.

Frame size: ≥ 10 bytes, < 64 bytes
FCS error: don't care
Framing error: don't care
No collisions

13.2.1.8 Collisions

Counts number of collision events.

Frame size: any size

13.2.1.9 LateEvents

Counts number of collision events that occurred late (after LateEventThreshold = 64 bytes).

Frame size: any size
Events are also counted by collision counter

13.2.1.10 VeryLongEvents

Counts number of frames received with size larger than Jabber Lockup Protection Timer (TW3).

Frame size: $>$ Jabber

13.2.1.11 DataRateMisatches

For repeaters or HUB application only.

13.2.1.12 AutoPartitions

For repeaters or HUB application only.

13.2.1.13 TotalErrors

Sum of the following errors:

FCS errors
Alignment errors
Frame too long
Short events
Late events
Very long events

13.3 IEEE – 802.1 Bridge Management (RFC 1286)

13.3.1 Event Counters

13.3.1.1 InFrames

Counts number of frames received by this port or segment.

Note: A frame received by this port is only counted by this counter if and only if it is for a protocol being processed by the local bridge function.

13.3.1.2 OutFrames

Counts number of frames transmitted by this port.

Note: A frame transmitted by this port is only counted by this counter if and only if it is for a protocol being processed by the local bridge function.

13.3.1.3 InDiscards

Counts number of valid frames received which were discarded (i.e. filtered) by the forwarding process.

13.3.1.4 DelayExceededDiscards

Counts number of frames discarded due to excessive transmit delay through the bridge.

13.3.1.5 MtuExceededDiscards

Counts number of frames discarded due to excessive size.

13.4 RMON – Ethernet Statistic Group (RFC 1757)

13.4.1 Event Counters

13.4.1.1 Drop Events

Counts number of times a packet is dropped, because of lack of available resources. DOES NOT include all packet dropping -- for example, random early drop for quality of service support.

13.4.1.2 Octets

Counts the total number of octets (i.e. bytes) in any frames received.

13.4.1.3 BroadcastPkts

Counts the number of good frames received and forwarded with broadcast address.

Does not include non-broadcast multicast frames.

13.4.1.4 MulticastPkts

Counts the number of good frames received and forwarded with multicast address.

Does not include broadcast frames.

13.4.1.5 CRCAlignErrors

Frame size: ≥ 64 bytes, < 1522 bytes if VLAN tag (1518 if no VLAN)

No collisions:

Counts number of frames received with FCS or alignment errors

13.4.1.6 UndersizePkts

Counts number of frames received with size less than 64 bytes.

Frame size: < 64 bytes,

No FCS error

No framing error

No collisions

13.4.1.7 OversizePkts

Counts number of frames received with size exceeding the maximum allowable frame size.

Frame size: 1522 bytes if VLAN tag (1518 bytes if no VLAN)

FCS error don't care

Framing error don't care

No collisions

13.4.1.8 Fragments

Counts number of frames received with size less than 64 bytes and with bad FCS.

Frame size: < 64 bytes

Framing error don't care

No collisions

13.4.1.9 Jabbers

Counts number of frames received with size exceeding maximum frame size and with bad FCS.

Frame size: > 1522 bytes if VLAN tag (1518 bytes if no VLAN)

Framing error don't care

No collisions

13.4.1.10 Collisions

Counts number of collision events detected.

Only a best estimate since collisions can only be detected while in transmit mode, but not while in receive mode.

Frame size: any size

13.4.1.11 Packet Count for Different Size Groups

Six different size groups – one counter for each:

Pkts64Octets	for any packet with size = 64 bytes
Pkts65to127Octets	for any packet with size from 65 bytes to 127 bytes
Pkts128to255Octets	for any packet with size from 128 bytes to 255 bytes
Pkts256to511Octets	for any packet with size from 256 bytes to 511 bytes
Pkts512to1023Octets	for any packet with size from 512 bytes to 1023 bytes
Pkts1024to1518Octets	for any packet with size from 1024 bytes to 1518 bytes

Counts both good and bad packets.

13.5 Miscellaneous Counters

In addition to the statistics groups defined in previous sections, the MVTX2604 has other statistics counters for its own purposes. We have two counters for flow control – one counting the number of flow control frames received, and another counting the number of flow control frames sent. We also have two counters, one for unicast frames sent and one for non-unicast frames sent. A broadcast or multicast frame qualifies as non-unicast. Furthermore, we have a counter called “frame send fail.” This keeps track of FIFO under-runs, late collisions and collisions that have occurred 16 times.

14.0 Register Definition

14.1 MVTX2604 Register Description

Register	Description	CPU Addr (Hex)	R/W	I ² C Addr (Hex)	Default	Notes
0. ETHERNET Port Control Registers Substitute [N] with Port number (0..1A)						
ECR1P" N"	Port Control Register 1 for Port N	0000 + 2 x N	R/W	000-01A	020	
ECR2P" N"	Port Control Register 2 for Port N	001 + 2 x N	R/W	01B-035	000	
GGC	Extra GIGA bit control register	036	R/W	NA	000	
1. VLAN Control Registers Substitute [N] with Port number (0..1A)						
AVTCL	VLAN Type Code Register Low	100	R/W	036	000	
AVTCH	VLAN Type Code Register High	101	R/W	037	081	
PVMAP" N" _0	Port "N" Configuration Register 0	102 + 4N	R/W	038-052	OFF	
PVMAP" N" _1	Port "N" Configuration Register 1	103 + 4N	R/W	053-06D	OFF	
PVMAP" N" _2	Port "N" Configuration Register 2	104 + 4N	R/W	06E-088	OFF	
PVMAP" N" _3	Port "N" Configuration Register 3	105 + 4N	R/W	089-0A3	007	
PVMODE	VLAN Operating Mode	170	R/W	0A4	000	
PVROUTE7-0	VLAN Router Group Enable	171-178	R/W	NA	000	
2. TRUNK Control Registers						
TRUNK0_L	Trunk Group 0 Low	200	R/W	NA	000	
TRUNK0_M	Trunk Group 0 Medium	201	R/W	NA	000	
TRUNK0_H	Trunk Group 0 High	202	R/W	NA	000	
TRUNK0_MODE	Trunk Group 0 Mode	203	R/W	0A5	003	
TRUNK0_HASH0	Trunk Group 0 Hash 0 Destination Port	204	R/W	NA	000	
TRUNK0_HASH1	Trunk Group 0 Hash 1 Destination Port	205	R/W	NA	001	
TRUNK0_HASH2	Trunk Group 0 Hash 2 Destination Port	206	R/W	NA	002	
TRUNK0_HASH3	Trunk Group 0 Hash 3 Destination Port	207	R/W	NA	003	
TRUNK1_L	Trunk Group 1 Low	208	R/W	NA	000	
TRUNK1_M	Trunk Group 1 Medium	209	R/W	NA	000	

Register	Description	CPU Addr (Hex)	R/W	I ² C Addr (Hex)	Default	Notes
TRUNK1_H	Trunk Group 1 High	20A	R/W	NA	000	
TRUNK1_MODE	Trunk Group 1 Mode	20B	R/W	0A6	003	
TRUNK1_HASH0	Trunk Group 1 Hash 0 Destination Port	20C	R/W	NA	004	
TRUNK1_HASH1	Trunk Group 1 Hash 1 Destination Port	20D	R/W	NA	005	
TRUNK1_HASH2	Trunk Group 1 Hash 2 Destination Port	20E	R/W	NA	006	
TRUNK1_HASH3	Trunk Group 1 Hash 3 Destination Port	20F	R/W	NA	007	
TRUNK2_MODE	Trunk Group 2 Mode	210	R/W	NA	003	
TRUNK2_HASH0	Trunk Group 2 Hash 0 Destination Port	211	R/W	NA	019	
TRUNK2_HASH1	Trunk Group 2 Hash 1 Destination Port	212	R/W	NA	01A	
Multicast_HASH0-0	Multicast hash result 0 mask byte 0	220	R/W	NA	0FF	
Multicast_HASH0-1	Multicast hash result 0 mask byte 1	221	R/W	NA	0FF	
Multicast_HASH0-2	Multicast hash result 0 mask byte 2	222	R/W	NA	0FF	
Multicast_HASH0-3	Multicast hash result 0 mask byte 3	223	R/W	NA	0FF	
Multicast_HASH1-0	Multicast hash result 1 mask byte 0	224	R/W	NA	0FF	
Multicast_HASH1-1	Multicast hash result 1 mask byte 1	225	R/W	NA	0FF	
Multicast_HASH1-2	Multicast hash result 1 mask byte 2	226	R/W	NA	0FF	
Multicast_HASH1-3	Multicast hash result 1 mask byte 3	227	R/W	NA	0FF	
Multicast_HASH2-0	Multicast hash result 2 mask byte 0	228	R/W	NA	0FF	
Multicast_HASH2-1	Multicast hash result 2 mask byte 1	229	R/W	NA	0FF	

Register	Description	CPU Addr (Hex)	R/W	I ² C Addr (Hex)	Default	Notes
Multicast_HASH2-2	Multicast hash result 2 mask byte 2	22A	R/W	NA	0FF	
Multicast_HASH2-3	Multicast hash result 2 mask byte 3	22B	R/W	NA	0FF	
Multicast_HASH3-0	Multicast hash result 3 mask byte 0	22C	R/W	NA	0FF	
Multicast_HASH3-1	Multicast hash result 3 mask byte 1	22D	R/W	NA	0FF	
Multicast_HASH3-2	Multicast hash result 3 mask byte 2	22E	R/W	NA	0FF	
Multicast_HASH3-3	Multicast hash result 3 mask byte 3	22F	R/W	NA	0FF	

3. CPU Port Configuration

MAC0	CPU MAC Address byte 0	300	R/W	NA	000	
MAC1	CPU MAC Address byte 1	301	R/W	NA	000	
MAC2	CPU MAC Address byte 2	302	R/W	NA	000	
MAC3	CPU MAC Address byte 3	303	R/W	NA	000	
MAC4	CPU MAC Address byte 4	304	R/W	NA	000	
MAC5	CPU MAC Address byte 5	305	R/W	NA	000	
INT_MASK0	Interrupt Mask 0	306	R/W	NA	000	
INTP_MASK"N"	Interrupt Mask for MAC Port 2N, 2N+1	310+N (310 - 313)	R/W	NA	000	
RQS	Receive Queue Select	323	R/W	NA	000	
RQSS	Receive Queue Status	324	RO	NA	N/A	
TX_AGE	Transmission Queue Aging Time	325	R/W	0A7	008	

4. Search Engine Configurations

AGETIME_LOW	MAC Address Aging Time Low	400	R/W	0A8	2M:05C/ 4M:02E	
AGETIME_HIGH	MAC Address Aging Time High	401	R/W	0A9	000	
V_AGETIME	VLAN to Port Aging Time	402	R/W	NA	0FF	
SE_OPMODE	Search Engine Operating Mode	403	R/W	NA	000	
SCAN	Scan control register	404	R/W	NA	000	

Register	Description	CPU Addr (Hex)	R/W	I ² C Addr (Hex)	Default	Notes
5. Buffer Control and QOS Control						
FCBAT	FCB Aging Timer	500	R/W	0AA	0FF	
QOSC	QOS Control	501	R/W	0AB	000	
FCR	Flooding Control Register	502	R/W	0AC	008	
AVPML	VLAN Priority Map Low	503	R/W	0AD	000	
AVPMM	VLAN Priority Map Middle	504	R/W	0AE	000	
AVPMH	VLAN Priority Map High	505	R/W	0AF	000	
TOSPML	TOS Priority Map Low	506	R/W	0B0	000	
TOSPMM	TOS Priority Map Middle	507	R/W	0B1	000	
TOSPMH	TOS Priority Map High	508	R/W	0B2	000	
AVDM	VLAN Discard Map	509	R/W	0B3	000	
TOSDML	TOS Discard Map	50A	R/W	0B4	000	
BMRC	Broadcast/Multicast Rate Control	50B	R/W	0B5	000	
UCC	Unicast Congestion Control	50C	R/W	0B6	2M:008/ 4M:010	
MCC	Multicast Congestion Control	50D	R/W	0B7	050	
PR100	Port Reservation for 10/100 Ports	50E	R/W	0B8	2M:024/ 4M:036	
PRG	Port Reservation for Giga Ports	50F	R/W	0B9	2M:035/ 4M:058	
SFCB	Share FCB Size	510	R/W	0BA	2M:014/ 4M:064	
C2RS	Class 2 Reserve Size	511	R/W	0BB	000	
C3RS	Class 3 Reserve Size	512	R/W	0BC	000	
C4RS	Class 4 Reserve Size	513	R/W	0BD	000	
C5RS	Class 5 Reserve Size	514	R/W	0BE	000	
C6RS	Class 6 Reserve Size	515	R/W	0BF	000	
C7RS	Class 7 Reserve Size	516	R/W	0C0	000	
QOSC"N"	QOS Control (N=0 - 5)	517- 51C	R/W	0C1-0C6	000	
	QOS Control (N=6 - 11)	51D- 522	R/W	NA	000	

Register	Description	CPU Addr (Hex)	R/W	I ² C Addr (Hex)	Default	Notes
	QOS Control (N=12 - 23)	523- 52E	R/W	0C7-0D2	000	
	QOS Control (N=24 - 59)	52F- 552	R/W	NA	000	
RDRC0	WRED Drop Rate Control 0	553	R/W	0FB	08F	
RDRC1	WRED Drop Rate Control 1	554	R/W	0FC	088	
USER_PORT" N" _LOW	User Define Logical Port "N" Low (N=0-7)	580 + 2N	R/W	0D6-0DD	000	
USER_PORT" N" _HIGH	User Define Logical Port "N" High	581 + 2N	R/W	0DE-0E5	000	
USER_PORT1:0_PRIORITY	User Define Logic Port 1 and 0 Priority	590	R/W	0E6	000	
USER_PORT3:2_PRIORITY	User Define Logic Port 3 and 2 Priority	591	R/W	0E7	000	
USER_PORT5:4_PRIORITY	User Define Logic Port 5 and 4 Priority	592	R/W	0E8	000	
USER_PORT7:6_PRIORITy	User Define Logic Port 7 and 6 Priority	593	R/W	0E9	000	
USER_PORT_ENABLE	User Define Logic Port Enable	594	R/W	0EA	000	
WLPP10	Well known Logic Port Priority for 1 and 0	595	R/W	0EB	000	
WLPP32	Well known Logic Port Priority for 3 and 2	596	R/W	0EC	000	
WLPP54	Well known Logic Port Priority for 5 and 4	597	R/W	0ED	000	
WLPP76	Well-known Logic Port Priority for 7 & 6	598	R/W	0EE	000	
WLPE	Well known Logic Port Enable	599	R/W	0EF	000	
RLOWL	User Define Range Low Bit7:0	59A	R/W	0F4	000	
RLOWH	User Define Range Low Bit 15:8	59B	R/W	0F5	000	
RHIGHL	User Define Range High Bit 7:0	59C	R/W	0D3	000	
RHIGHH	User Define Range High Bit 15:8	59D	R/W	0D4	000	
RPRIORITY	User Define Range Priority	59E	R/W	0D5	000	

Register	Description	CPU Addr (Hex)	R/W	I ² C Addr (Hex)	Default	Notes
CPUQOSC1~3	Byte limit for TxQ on CPU port	5A0-5A2	R/W	NA	000	
6. MISC Configuration Registers

DA	DA Register	FFF	RO	N/A	DA	

14.2 Directly Accessed Registers

14.2.1 INDEX_REG0

- Address bits [7:0] for indirectly accessed register addresses
- Address = 0 (write only)

14.2.2 INDEX_REG1 (only needed for 8-bit mode)

- Address bits [15:8] for indirectly accessed register addresses
- Address = 1 (write only)

14.2.3 DATA_FRAME_REG

- Data of indirectly accessed registers. (8 bits)
- Address = 2 (read/write)

14.2.4 CONTROL_FRAME_REG

- CPU transmit/receive switch frames. (8/16 bits)
- Address = 3 (read/write)
- Format:
 - Send frame from CPU: In sequence)
 - Frame Data (size should be in multiple of 8-byte)
 - 8-byte of Frame status (Frame size, Destination port #, Frame O.K. status)
 - CPU Received frame: In sequence)
 - 8-byte of Frame status (Frame size, Source port #, VLAN tag)
 - Frame Data

14.2.5 COMMAND&STATUS Register

- CPU interface commands (write) and status
- Address = 4 (read/write)
- When the CPU **writes** to this register

- | | |
|----------|--|
| Bit [0]: | <ul style="list-style-type: none"> • Set Control Frame Receive buffer ready after CPU writes a complete frame into the buffer. This bit is self-cleared. |
| Bit [1]: | <ul style="list-style-type: none"> • Set Control Frame Transmit buffer1 ready after CPU reads out a complete frame from the buffer. This bit is self-cleared. |
| Bit [2]: | <ul style="list-style-type: none"> • Set Control Frame Transmit buffer2 ready after CPU reads out a complete frame from the buffer. This bit is self-cleared. |
| Bit [3]: | <ul style="list-style-type: none"> • Set this bit to indicate CPU received a whole frame (transmit FIFO frame receive done), and flushed the rest of frame fragment. This bit will be self-cleared. |
| Bit [4]: | <ul style="list-style-type: none"> • Set this bit to indicate that the following Write to the Receive FIFO is the last one (EOF). This bit will be self-cleared. |

- Bit [5]:
 - Set this bit to re-start the data that is sent from the CPU to Receive FIFO (re-align). This feature can be used for software debug. For normal operation must be '0'.
- Bit [6]:
 - Do not use. Must be '0'
- Bit [7]:
 - Reserved

When the CPU reads this register:

- Bit [0]:
 - Control Frame receive buffer ready, CPU can write a new frame
 - 1 – CPU can write a new control command 1
 - 0 – CPU has to wait until this bit is 1 to write a new control command 1
- Bit [1]:
 - Control Frame transmit buffer1 ready for CPU to read
 - 1 – CPU can read a new control command 1
 - 0 – CPU has to wait until this bit is 1 to read a new control command
- Bit [2]:
 - Control Frame transmit buffer2 ready for CPU to read
 - 1 – CPU can read a new control command 1
 - 0 – CPU has to wait until this bit is 1 to read a new control command
- Bit [3]:
 - Transmit FIFO has data for CPU to read (TXFIFO_RDY)
- Bit [4]:
 - Receive FIFO has space for incoming CPU frame (RXFIFO_SPOK)
- Bit [5]:
 - Transmit FIFO End Of Frame (TXFIFO_EOF)
- Bit [6]:
 - Reserve
- Bit [7]:
 - Reserve

14.2.6 Interrupt Register

- Interrupt sources (8 bits)
- Address = 5 (read only)
- When CPU **reads** this register

Bit [0]:	• CPU frame interrupt
Bit [1]:	• Control Frame 1 interrupt. Control Frame receive buffer1 has data for CPU to read
Bit [2]:	• Control Frame 2 interrupt. Control Frame receive buffer2 has data for CPU to read
Bit [3]:	• Gigabit port A interrupt
Bit [4]:	• Gigabit port B interrupt
Bit [7:5]:	• Reserve

Note: This register is not self-cleared. After reading CPU has to clear the bit writing 0 to it.

14.2.7 Control Command Frame Buffer1 Access Register

- Address = 6 (read/write)
- When CPU writes to this register, data is written to the Control Command Frame Receive Buffer
- When CPU reads this register, data is read from the Control Command Frame Transmit Buffer1

14.2.8 Control Command Frame Buffer2 Access Register

- Address = 7 (read only)
- When CPU reads this register, data is read from the Control Command Frame Transmit Buffer1

14.3 Indirectly Accessed registers

14.4 Group 0 Address MAC Ports Group

14.4.1 ECR1Pn: Port N Control Register

I²C Address 000 - 01A; CPU Address:0000+2xN (N = port number)

Accessed by CPU, serial interface and I²C (R/W)

7	6	5	4	3	2	1	0
Security En	QoS Sel	Reserve		DisL	Ftf	Futf	

- Bit [0]: • Filter untagged frame (**Default 0**)
 - 0: Disable
 - 1: All untagged frames from this port are discarded or follow security option when security is enable
- Bit [1]: • Filter Tag frame (**Default 0**)
 - 0: Disable
 - 1: All tagged frames from this port are discarded or follow security option when security is enable
- Bit [2]: • Learning Disable (**Default 0**)
 - 1 Learning is disabled on this port
 - 0 Learning is enabled on this port
- Bit [3]: • Must be '1'
- Bit [5:4]: • QOS mode selection (**Default 00**)
 - Determines which of the 4 sets of QoS settings is used for 10/100 ports.
 - Note that there are 4 sets of per-queue byte thresholds, and 4 sets of WFQ ratios programmed. These bits select among the 4 choices for each 10/100 port. Refer to QOS Application Note.
 - 00: select class byte limit set 0 and classes WFQ credit set 0
 - 01: select class byte limit set 1 and classes WFQ credit set 1
 - 10: select class byte limit set 2 and classes WFQ credit set 2
 - 11: select class byte limit set 3 and classes WFQ credit set 3

- Bit[7:6] • Security Enable (**Default 00**). The MVTX2604 checks the incoming data for one of the following conditions:

1. If the source MAC address of the incoming packet is in the MAC table and is defined as secure address but the ingress port is not the same as the port associated with the MAC address in the MAC table.

A MAC address is defined as secure when its entry at MAC table has static status and bit 0 is set to 1. MAC address bit 0 (the first bit transmitted) indicates whether the address is unicast or multicast. As source addresses are always unicast bit 0 is not used (always 0). MVTX2600 uses this bit to define secure MAC addresses.

2. If the port is set as learning disable and the source MAC address of the incoming packet is not defined in the MAC address table.

3. If the port is configured to filter untagged frames and an untagged frame arrives or if the port is configured to filter tagged frames and a tagged frame arrives.

If one of these three conditions occurs the packet will be handled according to one of the following specified options:

- CPU installed
 - 00 – Disable port security
 - 01 – Discard violating packets
 - 10 – Send packet to CPU and destination port
 - 11 – Send packet to CPU only

14.4.3 GGControl – Extra GIGA Port Control

CPU Address:h036

Accessed by CPU and serial interface (R/W)

7	6	5	4	3	2	1	0
DF	DI	MiiB	RstA	DF	DI	MiiA	RstA

- Bit [0]: • Reset GIGA port A
 - 0: Normal operation (**default**)
 - 1: Reset Gigabit port A. Normally used when a new Phy is connected (Hot swap).
- Bit [1]: • GIGA port A use MII interface (10/100M)
 - 0: Gigabit port operations at 1000 mode (**default**)
 - 1: Gigabit port operations at 10/100 mode
- Bit [2]: • Device information insertion enable for Gigabit port A
 - 0: Disable preamble stack device ID insertion (**default**).
 - 1: Insert stack device ID into the preamble (must be enabled for ring mode).
- Bit [3]: • GIGA port A direct flow control (MAC to MAC connection). The MVTX2604 supports direct flow control mechanism; the flow control frame is therefore not sent through the Gigabit port data path.
 - 0: Direct flow control disabled (**default**)
 - 1: Direct flow control enabled

- Bit [4]: • Reset GIGA port B
 - 0: Normal operation (**default**)
 - 1: Reset Gigabit port B
- Bit [5]: • GIGA port B use MII interface (10/100M)
 - 0: Gigabit port operates at 1000 mode (**default**)
 - 1: Gigabit port operates at 10/100 mode
- Bit [6]: • Device information attach enable for Gigabit port B
 - 0: Disable preamble stack device ID insertion (**default**)
 - 1: Insert stack device ID into the preamble (must be enabled for ring mode).
- Bit [7]: • GIGA port B direct flow control (MAC to MAC connection). MVTX2604 supports direct flow control mechanism; the flow control frame is therefore not sent through the Gigabit port data path.
 - 0: Direct flow control disabled (**default**)
 - 1: Direct flow control enabled

14.5 Group 1 Address VLAN Group

14.5.1 AVTCL – VLAN Type Code Register Low

I²C Address 036; CPU Address:h100

Accessed by CPU, serial interface and I²C (R/W)

Bit [7:0]: VLANType_LOW: Lower 8 bits of the VLAN type code (**Default 00**)

14.5.2 AVTCH – VLAN Type Code Register High

I²C Address 037; CPU Address:h101

Accessed by CPU, serial interface and I²C (R/W)

Bit [7:0]: VLANType_HIGH: Upper 8 bits of the VLAN type code (**Default is 81**)

14.5.3 PVMAP00_0 – Port 00 Configuration Register 0

I²C Address 038, CPU Address:h102

Accessed by CPU, serial interface and I²C (R/W)

In Port Based VLAN Mode

Bit [7:0]: VLAN Mask for ports 7 to 0 (**Default FF**)

This register indicates the legal egress ports. A “1” on bit 7 means that the packet can be sent to port 7. A “0” on bit 7 means that any packet destined to port 7 will be discarded. This register works with registers 1, 2 and 3 to form a 27 bit mask to all egress ports.

In Tag based VLAN Mode

Bit [7:0]: PVID [7:0] (**Default is FF**)

This is the default VLAN tag. It works with configuration register PVMAP00_1 [7:5] [3:0] to form a default VLAN tag. If the received packet is untagged, then the packet is classified with the default VLAN tag. If the received packet has a VLAN ID of 0, then PVID is used to replace the packet's VLAN ID.

14.5.4 PVMAP00_1 – Port 00 Configuration Register 1

I²C Address h53, CPU Address:h103

Accessed by CPU, serial interface and I²C (R/W)

In Port based VLAN Mode

Bit [7:0]: VLAN Mask for ports 15 to 8 (**Default is FF**)

In Tag based VLAN Mode

7	5	4	3	0
Unitag Port Priority	Ultrust	PVID		

Bit [3:0]: PVID [11:8] (**Default is F**)

Bit [4]: • Untrusted Port. (**Default is 1**)

This register is used to change the VLAN priority field of a packet to a predetermined priority.

- 1 : VLAN priority field is changed to Bit[7:5] at ingress port
- 0 : Keep VLAN priority field

Bit [7:5]: • Untag Port Priority (**Default 7**)

14.5.5 PVMAP00_2 – Port 00 Configuration Register 2

I²C Address h6E, CPU Address:h104

Accessed by CPU, serial interface and I²C (R/W)

In Port Based VLAN Mode

Bit [7:0]: • VLAN Mask for ports 23 to 16 (**Default FF**)

In Tag based VLAN Mode

This register is unused

14.5.6 PVMAP00_3 – Port 00 Configuration Register 3

I²C Address h89, CPU Address:h105

Accessed by CPU, serial interface and I²C (R/W)

In Port Based VLAN Mode

7	6	5	3	2	0
FP en	Drop	Default priority	tx	VLAN Mask	

Bit [2:0]: VLAN Mask for ports 26 to 24 (**Default 7**). Port 24 is the CPU port

Bit [5:3]: Default Transmit priority. Used when Bit [7] = 1 (**Default 0**)

- 000 Transmit Priority Level 0 (Lowest)
- 001 Transmit Priority Level 1
- 010 Transmit Priority Level 2
- 011 Transmit Priority Level 3
- 100 Transmit Priority Level 4
- 101 Transmit Priority Level 5
- 110 Transmit Priority Level 6
- 111 Transmit Priority Level 7 (Highest)

Bit [6]: Default Discard priority. Used when Bit[7]=1 (**Default 0**)

- 0 - Discard Priority Level 0 (Lowest)
- 1 - Discard Priority Level 1(Highest)

Bit [7]: Enable Fix Priority (**Default 0**)

- 0 Disable fix priority. All frames are analyzed. Transmit Priority and Discard Priority are based on VLAN Tag, TOS or Logical Port.
- 1 Transmit Priority and Discard Priority are based on values programmed in bit [6:3]

In Tag-based VLAN Mode

Bit [0]: • Not used

Bit [1]: Ingress Filter Enable (**Default 1**)

- 0 Disable Ingress Filter. Packets with VLAN not belonging to source port are forwarded, if destination port belongs to the VLAN. Symmetric VLAN.
- 1 Enable Ingress Filter. Packets with VLAN not belonging to source port are filtered. Asymmetric VLAN.

Bit [2]: Force untag out (VLAN tagging is based on 802.1q rule) (**Default 1**).

- 0 Disable (Default)
- 1 Force untagged output

All packets transmitted from this port are untagged. This register is used when this port is connected to legacy equipment that does not support VLAN tagging.

Bit [5:3]: Default Transmit priority. Used when Bit [7] = 1 (**Default 0**)

- 000 Transmit Priority Level 0 (Lowest)
- 001 Transmit Priority Level 1
- 010 Transmit Priority Level 2
- 011 Transmit Priority Level 3
- 100 Transmit Priority Level 4
- 101 Transmit Priority Level 5
- 110 Transmit Priority Level 6
- 111 Transmit Priority Level 7 (Highest)

Bit [6]: Default Discard priority Used when Bit [7] =1 (**Default 0**)

- 0 - Discard Priority Level 0 (Lowest)
- 1 Discard Priority Level 1 (Highest)

Bit [7]: Enable Fix Priority (**Default 0**)

- 0 Disable fix priority. All frames are analyzed. Transmit Priority and Discard Priority are based on VLAN Tag, TOS or Logical Port.
- 1 Transmit Priority and Discard Priority are based on values programmed in bit [6:3]

14.6.1 PVMODE

I²C Address: h0A4, CPU Address:h170

Accessed by CPU, serial interface (R/W)

7	6	5	4	3	2	1	0
MAC05	MMA	STP	SM0	rPCS	DF	SL	Vmod

- Bit [0]: • VLAN Mode (Default = 0)
 - 1 Tag based VLAN Mode
 - 0 Port based VLAN Mode
- Bit [1]: • Slow learning (Default = 0)

Same function as SE_OP MODE bit 7. Either bit can enable the function; both need to be turned off to disable the feature.
- Bit [2]: • Disable dropping of frames with destination MAC addresses 0180C2000001 to 0180C200000F (Default = 0)
 - 0: Drop all frames in this range
 - 1: Disable dropping of frames in this range
- Bit [3]: • Disable Reset PCS (Default = 0)
 - 0: Enable reset PCS. PCS FIFO will be reset when received a PCS symbol error.
 - 1: Disable reset PCS
- Bit [4]: • Support MAC address 0 (Default = 0)
 - 0: MAC address 0 is not learned.
 - 1: MAC address 0 is learned.
- Bit [5]: • Disable IEEE multicast control frame (0180C2000000 to 0180C20000FF) to CPU in managed mode (Default = 0)
 - 0: Packet is forwarded to CPU
 - 1: Packet is forwarded as multicast
- Bit [6]: • Multiple MAC addresses (Default = 0)
 - 0: Single MAC address is assigned to CPU. Registers MAC0 to MAC5 are used to program the CPU MAC address.
 - 1: One block of 32 MAC addresses are assigned to CPU. The block is defined in an increase way from the MAC address programmed in registers MAC0 to MAC5.

- Bit [7]:
- Disable registers MAC 5 – 0 (CPU MAC address) in comparison with Ethernet frame destination MAC address. When disable, unicast frames are not forward to CPU. (Default = 0)
 - 1: Disable
 - 0: Enable

14.6.2 PVROUTE 0

Registers PVROUTE0 to PVROUTE7 allows the VLAN Index to be assigned an address of a router group. This feature is useful during IP Multicast mode when data is being sent to the VLAN group and no member of the group registers. By assigning a router group the VLAN group always has a default address to handle the multicast traffic.

CPU Address:h171

Accessed by CPU, serial interface (R/W)

0x19 = Gigabit port 1

0x1A = Gigabit port 2

14.7.19 TRUNK2_HASH1 – Trunk group 2 hash result 1 destination port number

CPU Address:h211

Accessed by CPU, serial interface (R/W)

Bit [4:0] Hash result 1 destination port number (Default 0x1A)

0x19 = Gigabit port 1

0x1A = Gigabit port 2

14.7.20 Multicast Hash Registers

Multicast Hash registers are used to distribute multicast traffic. 16 registers are used to form a 4-entry array; each entry has 27 bits, with each bit representing one port. Any port not belonging to a trunk group should be programmed with 1. Ports belonging to the same trunk group should only have a single port set to “1” per entry. The port set to “1” is picked to transmit the multicast frame when the hash value is met.

Hash Value =0	HASH0_3	HASH0_2	HASH0_1	HASH0_0			
Hash Value =1	HASH1_3	HASH1_2	HASH1_1	HASH1_0			
Hash Value =2	HASH2_3	HASH2_2	HASH2_1	HASH2_0			
Hash Value =3	HASH3_3	HASH3_2	HASH3_1	HASH3_0

Multicast_HASH0-0 – Multicast hash result 0 mask byte 0

CPU Address:h220

Accessed by CPU, serial interface (R/W)

Bit [7:0] (Default FF)

14.7.20.1 Multicast_HASH0-1 – Multicast hash result 0 mask byte 1

CPU Address:h221

Accessed by CPU, serial interface (R/W)

Bit [7:0] (Default FF)

14.7.20.2 Multicast_HASH0-2 – Multicast hash result 0 mask byte 2

CPU Address:h222

Accessed by CPU, serial interface (R/W)

Bit [7:0] (Default FF)

14.7.20.3 MULTICAST_HASH0-3 – MULTICAST HASH RESULT 0 MASK BYTE 3

CPU Address:h223

Accessed by CPU, serial interface (R/W)

Bit [7:0] (Default FF)

14.7.20.4 Multicast_HASH1-0 – Multicast hash result 1 mask byte 0

CPU Address:h224

Accessed by CPU, serial interface (R/W)

Bit [7:0] (Default FF)

14.7.20.5 MULTICAST_HASH1-1 – MULTICAST HASH RESULT 1 MASK BYTE 1

CPU Address:h225

Accessed by CPU, serial interface (R/W)

Bit [7:0] (Default FF)

14.7.20.6 Multicast_HASH1-2 – Multicast hash result 1 mask byte 2

CPU Address:h226

Accessed by CPU, serial interface (R/W)

Bit [7:0] (Default FF)

14.7.20.7 Multicast_HASH1-3 – Multicast hash result 1 mask byte 3

CPU Address:h227

Accessed by CPU, serial interface (R/W)

Bit [7:0] (Default FF)

14.7.20.8 Multicast_HASH2-0 – Multicast hash result 2 mask byte 0

CPU Address:h228

Accessed by CPU, serial interface (R/W)

Bit [7:0] (Default FF)

14.7.20.9 MULTICAST_HASH2-1 – MULTICAST HASH RESULT 2 MASK BYTE 1

CPU Address:h229

Accessed by CPU, serial interface (R/W)

Bit [7:0] (Default FF)

14.7.20.10 MULTICAST_HASH2-2 – MULTICAST HASH RESULT 2 MASK BYTE 2

CPU Address:h22A

Accessed by CPU, serial interface (R/W)

Bit [7:0] (Default FF)

14.7.20.11 MULTICAST_HASH2-3 – MULTICAST HASH RESULT 2 MASK BYTE 3

CPU Address:h22B

Accessed by CPU, serial interface (R/W)

Bit [7:0] (Default FF)

14.7.20.12 MULTICAST_HASH3-0 – MULTICAST HASH RESULT 3 MASK BYTE 0

CPU Address:h22C

Accessed by CPU, serial interface (R/W)

Bit [7:0] (Default FF)

14.7.20.13 MULTICAST_HASH3-1 – MULTICAST HASH RESULT 3 MASK BYTE 1

CPU Address:h22D

Accessed by CPU, serial interface (R/W)

Bit [7:0] (Default FF)

14.7.20.14 MULTICAST_HASH3-2 – MULTICAST HASH RESULT 3 MASK BYTE 2

CPU Address:h22E

Accessed by CPU, serial interface (R/W)

Bit [7:0] (Default FF)

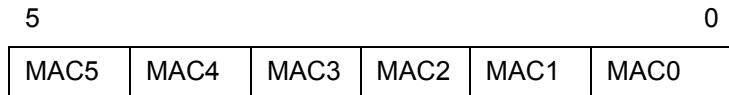

14.7.20.15 Multicast_HASH3-3 – Multicast hash result 3 mask byte 3

CPU Address:h22F

Accessed by CPU, serial interface (R/W)

Bit [7:0] (Default FF)

14.8 Group 3 Address CPU Port Configuration Group

MAC5 to MAC0 registers form the CPU MAC address. When a packet with destination MAC address match MAC [5:0], the packet is forwarded to the CPU.

14.8.1 MAC0 – CPU Mac address byte 0

CPU Address:h300

Accessed by CPU

Bit [7:0] Byte 0 of the CPU MAC address. (Default 00)

14.8.2 MAC1 – CPU Mac address byte 1

CPU Address:h301

Accessed by CPU

Bit [7:0] Byte 1 of the CPU MAC address. (Default 00)

14.8.3 MAC2 – CPU Mac address byte 2

CPU Address:h302

Accessed by CPU

Bit [7:0] Byte 2 of the CPU MAC address. (Default 00)

14.8.4 MAC3 – CPU Mac address byte 3

CPU Address:h303

Accessed by CPU

Bit [7:0] Byte 3 of the CPU MAC address. (Default 00)

14.8.5 MAC4 – CPU Mac address byte 4

CPU Address:h304

Accessed by CPU

Bit [7:0] Byte 4 of the CPU MAC address. (Default 00)

14.8.6 MAC5 – CPU Mac address byte 5

CPU Address:h305

Accessed by CPU

Bit [7:0] Byte 5 of the CPU MAC address. (Default 00).

14.8.7 INT_MASK0 – Interrupt Mask 0

CPU Address:h306

Accessed by CPU, serial interface (R/W)

The CPU can dynamically mask the interrupt when it is busy and doesn't want to be interrupted. (**Default 0xFF**)

Bit [7:0] MASK

- 1: Mask the interrupt
- 0: Unmask the interrupt (Enable interrupt)

Bit [0]: • CPU frame interrupt. CPU frame buffer has data for CPU to read

Bit [1]: • Control Command 1 interrupt. Control Command Frame buffer1 has data for CPU to read

Bit [2]: • Control Command 2 interrupt. Control command Frame buffer2 has data for CPU to read

Bit [7:3]: • Reserved

14.8.8 INTP_MASK0 – Interrupt Mask for MAC Port 0,1

CPU Address:h310

Accessed by CPU, serial interface (R/W)

The CPU can dynamically mask the interrupt when it is busy and doesn't want to be interrupted (**Default 0xFF**)

7	6	5	4	3	2	1	0
		P1			P0		

- 1: Mask the interrupt
- 0: Unmask the interrupt

Bit [0]: Port 0 statistic counter wrap around interrupt mask. An Interrupt is generated when a statistic counter wraps around. Refer to hardware statistic counter for interrupt sources.

Bit [1]: Port 0 link change mask

Bit [4]: Port 1 statistic counter wrap around interrupt mask. Refer to hardware statistic counter for interrupt sources.

Bit [5]: Port 1 link change mask

14.8.9 INTP_MASK1 – Interrupt Mask for MAC Port 2,3

CPU Address:h311

Accessed by CPU, serial interface (R/W)

14.8.10 INTP_MASK2 – Interrupt Mask for MAC Port 4,5

CPU Address:h312

Accessed by CPU, serial interface (R/W)

14.8.11 INTP_MASK3 – Interrupt Mask for MAC Port 6,7

CPU Address:h313

Accessed by CPU, serial interface (R/W)

14.8.12 INTP_MASK4 – Interrupt Mask for MAC Port 8,9

CPU Address:h314

Accessed by CPU, serial interface (R/W)

14.8.13 INTP_MASK5 – Interrupt Mask for MAC Port 10,11

CPU Address:h315

Accessed by CPU, serial interface (R/W)

14.8.14 INTP_MASK6 – Interrupt Mask for MAC Port 12,13

CPU Address:h316

Accessed by CPU, serial interface (R/W)

14.8.15 INTP_MASK7 – Interrupt Mask for MAC Port 14,15

CPU Address:h317

Accessed by CPU, serial interface (R/W)

14.8.16 INTP_MASK8 – Interrupt Mask for MAC Port 16,17

CPU Address:h318

Accessed by CPU, serial interface (R/W)

14.8.17 NTP_MASK9 – Interrupt Mask for MAC Port 18,19

CPU Address:h319

Accessed by CPU, serial interface (R/W)

14.8.18 INTP_MASK10 – Interrupt Mask for MAC Port 20,21

CPU Address:h31A

Accessed by CPU, serial interface (R/W)

14.8.19 INTP_MASK11 – Interrupt Mask for MAC Port 22,23

CPU Address:h31B

Accessed by CPU, serial interface (R/W)

14.8.20 INTP_MASK12 – Interrupt Mask for MAC Port G1,G2

CPU Address:h31C

Accessed by CPU, serial interface (R/W)

14.8.21 RQS – Receive Queue Select CPU Address:h323)

Accessed by CPU, serial interface (RW)

Select which receive queue is used.

7	6	5	4	3	2	1	0
FQ3	FQ2	FQ1	FQ0	SQ3	SQ2	SQ1	SQ0

Bit [0]: Select Queue 0. If set to one this queue may be scheduled to CPU port. If set to zero, this queue will be blocked. If multiple queues are selected, a strict priority will be applied. Q3> Q2> Q1> Q0. Same applies to bits [3:1]. See QoS Application Note for more information.

Bit [1]: Select Queue 1

Bit[2]: Select Queue 2

Bit [3]: Select Queue 3

Note: Strip priority applies between different selected queues (Q3>Q2>Q1>Q0)

Bit [4]: Enable flush Queue 0

Bit [5]: Enable flush Queue 1

Bit [6]: Enable flush Queue 2

Bit [7]: Enable flush Queue 3

When flush (drop frames) is enable, it starts when queue is too long or entry is too old. A queue is too long when it reaches WRED thresholds. Queue 0 is not subject to early drop. Packets in queue 0 are dropped only when the queue is too old. An entry is too old when it is older than the time programmed in the register TX_AGE [5:0]. CPU can dynamically program this register reading register RQSS [7:4].

14.8.22 RQSS – Receive Queue Status

CPU Address:h324

Accessed by CPU, serial interface (RO)

7	5	4	3	0
LQ3	LQ2	LQ1	LQ0	NeQ3

CPU receive queue status

Bit [3:0]: Queue 3 to 0 not empty

Bit [4]: Head of line entry for Queue 0 is valid for too long. CPU Queue 0 has no WRED threshold.

Bit [7:5]: Head of line entry for Queue 3 to 1 is valid for too long or Queue length is longer than WRED threshold.

14.8.23 TX_AGE – Tx Queue Aging timer

I²C Address: h07; CPU Address:h324

Accessed by CPU, serial interface (RW)

7	6	5	0
Tx Queue Agent			

Bit [5:0]: Unit of 100ms (**Default 8**)

Disable transmission queue aging if value is zero. Aging timer for all ports and queues.

This register must be set to 0 for 'No Packet Loss Flow Control Test'.

14.9 Group 4 Address Search Engine Group

14.9.1 AGETIME_LOW – MAC address aging time Low

I²C Address h0A8; CPU Address:h400

Accessed by CPU, serial interface and I²C (R/W)

The MVTX2600 removes the MAC address from the data base and sends a Delete MAC Address Control Command to the CPU. MAC address aging is enable/disable by boot strap TSTOUT9.

Bit [7:0] Low byte of the MAC address aging timer.

14.9.2 AGETIME_HIGH – MAC address aging time High

I²C Address h0A9; CPU Address h401

Accessed by CPU, serial interface and I²C (R/W)

Bit [7:0]: High byte of the MAC address aging timer.

The default setting provide 300 seconds aging time. Aging time is based on the following equation:

{AGETIME_TIME,AGETIME_LOW} X (# of MAC entries in the memory X100 μ sec). Number of MAC entries = 32 K when 1 MB is used per Bank. Number of entries = 64 K when 2 MB is used per Bank.

14.9.3 V_AGETIME – VLAN to Port aging time

CPU Address h402

Accessed by CPU (R/W)

Bit [7:0] (Default FF) V_AGETIME X 256 X 100 msec is the age time for the VLAN. This timer is for controlling how long a port is associated to a particular VLAN. It can use dynamic shrinking of a VLAN domain if no packet arrives for the VLAN. The 2600 does not remove the port from the VLAN domain. It sends an Age VLAN Port Control Command to the CPU. The CPU has to remove the port.

14.9.4 SE_OPMODE – Search Engine Operation Mode

CPU Address:h403

Accessed by CPU (R/W)

Note: ECR2[2] enable/disable learning for each port.

7	6	5	4	3	2	1	0
SL	DMS	ARP	DRA	DA	DRD	DRN	FL

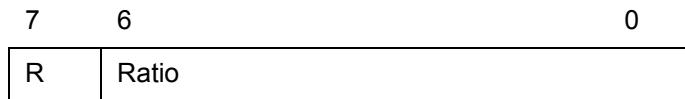

- Bit [0]: 1 – Enable fast learning mode. In this mode, the hardware learns all the new MAC addresses at highest rate, and reports to the CPU while the hardware scans the MAC database. When the CPU report queue is full, the MAC address is learned and marked as “Not reported”. When the hardware scans the database and finds a MAC address marked as “Not Reported” it tries to report it to the CPU. The scan rate must be set. SCAN Control register sets the scan rate. (Default 0)
0 – Search Engine learns a new MAC address and sends a message to the CPU report queue. If queue is full, the learning is temporarily halted.
- Bit [1]: 1 – Disable report new VLAN port association(Default 0)
0 – Report new VLAN port association
- Bit [2]: Report control
 - 1 – Disable report MAC address deletion (Default 0)
 - 0 – Report MAC address deletion (MAC address is deleted from MCT after aging time)
- Bit [3]: Delete Control
 - 1 – Disable aging logic from removing MAC during aging (Default 0)
 - 0 – MAC address entry is removed when it is old enough to be aged.
However, a report is still sent to the CPU in both cases, when bit[2] = 0
- Bit [4]: 1 – Disable report aging VLAN port association (Default 0)
0 – Enable Report aging VLAN. VLAN is not removed by hardware. The CPU needs to remove the VLAN –port association.
- Bit [5]: 1 - Report ARP packet to CPU (Default 0)

- Bit [6]: Disable MCT speedup aging (Default 0)
- 1 – Disable speedup aging when MCT resource is low.
 - 0 – Enable speedup aging when MCT resource is low.
- Bit [7]: Slow Learning (Default 0)
- 1 – Enable slow learning. Learning is temporary disabled when search demand is high
 - 0 – Learning is performed independent of search demand

14.9.5 SCAN – SCAN Control Register (default 00)

CPU Address h404

Accessed by CPU (R/W)

SCAN is used when fast learning is enabled (SE_OPMODE bit 0). It is used for setting up the report rate for newly learned MAC addresses to the CPU.

- Bit [6:0]:
- Ratio between database scanning and aging round (Default 00)
- Bit [7]:
- Reverse the ratio between scanning round and aging round (Default 0)

Examples:

R= 0, Ratio = 0: All rounds are used for aging. Never scan for new MAC addresses.

R= 0, Ratio = 1: Aging and scanning in every other aging round

R= 1, Ratio = 7: In eight rounds, one is used for scanning and seven are used for aging

R= 0, Ratio = 7: In eight rounds, one is used for aging and seven are used for scanning

14.10 Group 5 Address Buffer Control/QOS Group

14.10.1 FCBAT – FCB Aging Timer

I²C Address h0AA; CPU Address:h500

- Bit [7:0]:
- FCB Aging time. Unit of 1ms. (Default FF)
 - This is for buffer aging control. It is used to configure the buffer aging time. This function can be enabled/disabled through bootstrap pin. It is not suggested to use this function for normal operation.

14.10.2 QOSC – QOS Control

I²C Address h0AB; CPU Address:h501

Accessed by CPU, serial interface and I²C (R/W)

7	6	5	4	3	1	0
Tos-d	Tos-p	PMQ	VF1c			L

- Bit [0]:
- QoS frame lost is OK. Priority will be available for flow control enabled source only when this bit is set (Default 0)
- Bit [4]:
- Per VLAN Multicast Flow Control (Default 0)
 - 0 – Disable
 - 1 – Enable
- Bit [5]:
- Select processor multicast queue size
 - 0 = 16 entries
 - 1 = 64 entries
- Bit [6]:
- Select TOS bits for Priority (Default 0)
 - 0 – Use TOS [4:2] bits to map the transmit priority
 - 1 – Use TOS [7:5] bits to map the transmit priority
- Bit [7]:
- Select TOS bits for Drop priority(Default 0)
 - 0 – Use TOS [4:2] bits to map the drop priority
 - 1 – Use TOS [7:5] bits to map the drop priority

14.10.3 FCR – Flooding Control Register

I²C Address h0AC; CPU Address:h502

Accessed by CPU, serial interface and I²C (R/W)

7	6	4	3	0
Tos	TimeBase			U2MR

- Bit [3:0]:
- U2MR: Unicast to Multicast Rate. Units in terms of time base defined in bits [6:4]. This is used to limit the amount of flooding traffic. The value in U2MR specifies how many packets are allowed to flood within the time specified by bit [6:4]. To disable this function, program U2MR to 0. (Default = 8)

Bit [6:4]: Time Base: (Default = 000)

000 = 100 us

001 = 200 us

010 = 400 us

011 = 800 us

100 = 1.6 ms

101 = 3.2 ms

110 = 6.4 ms

111 = 100 us, same as 000.

Bit [7]: Select VLAN tag or TOS (IP packets) to be preferentially picked to map transmit priority and drop priority (**Default = 0**).

0 – Select VLAN Tag priority field over TOS

1 – Select TOS over VLAN tag priority field

14.10.4 AVPML – VLAN Tag Priority Map

I²C Address h0AD; CPU Address:h503

Accessed by CPU, serial interface and I²C (R/W)

7	6	5	3	2	0
VP2		VP1		VP0	

Registers AVPML, AVPMM and AVPMH allow the eight VLAN Tag priorities to map into eight Internal level transmit priorities. Under the Internal transmit priority, seven is the highest priority where as zero is the lowest. This feature allows the user the flexibility of redefining the VLAN priority field. For example, programming a value of 7 into bit 2:0 of the AVPML register would map packet VLAN priority 0 into Internal transmit priority 7. The new priority is used inside the 2600. When the packet goes out it carries the original priority.

Bit [2:0]: Priority when the VLAN tag priority field is 0 (**Default 0**)

Bit [5:3]: Priority when the VLAN tag priority field is 1 (**Default 0**)

Bit [7:6]: Priority when the VLAN tag priority field is 2 (**Default 0**)

14.10.5 AVPMM – VLAN Priority Map

I²C Address h0AE, CPU Address:h504

Accessed by CPU, serial interface and I²C (R/W)

Map VLAN priority into eight level transmit priorities:

7	6	4	3	1	0
VP5	VP4		VP3	VP2	

Bit [0]: Priority when the VLAN tag priority field is 2 (**Default 0**)

Bit [3:1]: Priority when the VLAN tag priority field is 3 (**Default 0**)

Bit [6:4]: Priority when the VLAN tag priority field is 4 (**Default 0**)

Bit [7]: Priority when the VLAN tag priority field is 5 (**Default 0**)

14.10.6 AVPMH – VLAN Priority Map

I²C Address h0AF, CPU Address:h505

Accessed by CPU, serial interface and I²C (R/W)

7	5	4	2	1	0
	VP7		VP6	VP5	

Map VLAN priority into eight level transmit priorities:

Bit [1:0]: Priority when the VLAN tag priority field is 5 (**Default 0**)

Bit [4:2]: Priority when the VLAN tag priority field is 6 (**Default 0**)

Bit [7:5]: Priority when the VLAN tag priority field is 7 (**Default 0**)

14.10.7 TOSPML – TOS Priority Map

I²C Address h0B0, CPU Address:h506

Accessed by CPU, serial interface and I²C (R/W)

7	6	5	3	2	0
TP2		TP1		TP0	

Map TOS field in IP packet into eight level transmit priorities

Bit [2:0]: Priority when the TOS field is 0 (**Default 0**)

Bit [5:3]: Priority when the TOS field is 1 (**Default 0**)

Bit [7:6]: Priority when the TOS field is 2 (**Default 0**)

14.10.8 TOSPM – TOS Priority Map

I²C Address h0B1, CPU Address:h507

Accessed by CPU, serial interface and I²C (R/W)

7	6	4	3	1	0
TP5	TP4		TP3	TP2	

Map TOS field in IP packet into eight level transmit priorities

Bit [0]: Priority when the TOS field is 2 (**Default 0**)

Bit [3:1]: Priority when the TOS field is 3 (**Default 0**)

Bit [6:4]: Priority when the TOS field is 4 (**Default 0**)

Bit [7]: Priority when the TOS field is 5 (**Default 0**)

14.10.9 TOSPMH – TOS Priority Map

I²C Address h0B2, CPU Address:h508

Accessed by CPU, serial interface and I²C (R/W)

7	5	4	2	1	0
	TP7		TP6		TP5

Map TOS field in IP packet into eight level transmit priorities:

Bit [1:0]: Priority when the TOS field is 5 (**Default 0**)

Bit [4:2]: Priority when the TOS field is 6 (**Default 0**)

Bit [7:5]: Priority when the TOS field is 7 (**Default 0**)

14.10.10 AVDM – VLAN Discard Map

I²C Address h0B3, CPU Address:h509

Accessed by CPU, serial interface and I²C (R/W)

7	6	5	4	3	2	1	0
FDV7	FDV6	FDV5	FDV4	FDV3	FDV2	FDV1	FDV0

Map VLAN priority into frame discard when low priority buffer usage is above threshold

Bit [0]: Frame drop priority when VLAN Tag priority field is 0 (**Default 0**)

Bit [1]: Frame drop priority when VLAN Tag priority field is 1 (**Default 0**)

Bit [2]: Frame drop priority when VLAN Tag priority field is 2 (**Default 0**)

Bit [3]: Frame drop priority when VLAN Tag priority field is 3 (**Default 0**)

- Bit [4]: Frame drop priority when VLAN Tag priority field is 4 (**Default 0**)
 Bit [5]: Frame drop priority when VLAN Tag priority field is 5 (**Default 0**)
 Bit [6]: Frame drop priority when VLAN Tag priority field is 6 (**Default 0**)
 Bit [7]: Frame drop priority when VLAN Tag priority field is 7 (**Default 0**)

14.10.11 TOSDML – TOS Discard Map

I²C Address h0B4, CPU Address:h50A

Accessed by CPU, serial interface and I²C (R/W)

7	6	5	4	3	2	1	0
FDT7	FDT6	FDT5	FDT4	FDT3	FDT2	FDT1	FDT0

Map TOS into frame discard when low priority buffer usage is above threshold

- Bit [0]: Frame drop priority when TOS field is 0 (**Default 0**)
 Bit [1]: Frame drop priority when TOS field is 1 (**Default 0**)
 Bit [2]: Frame drop priority when TOS field is 2 (**Default 0**)
 Bit [3]: Frame drop priority when TOS field is 3 (**Default 0**)
 Bit [4]: Frame drop priority when TOS field is 4 (**Default 0**)
 Bit [5]: Frame drop priority when TOS field is 5 (**Default 0**)
 Bit [6]: Frame drop priority when TOS field is 6 (**Default 0**)
 Bit [7]: Frame drop priority when TOS field is 7 (**Default 0**)

14.10.12 BMRC - Broadcast/Multicast Rate Control

I²C Address h0B5, CPU Address:h50B)

Accessed by CPU, serial interface and I²C (R/W)

7	4	3	0
Broadcast Rate		Multicast Rate	

This broadcast and multicast rate defines for each port, the number of packets allowed to be forwarded within a specified time. Once the packet rate is reached, packets will be dropped. To turn off the rate limit, program the field to 0. Time base is based on register FCR [6:4]

- Bit [3:0] : Multicast Rate Control. Number of multicast packets allowed within the time defined in bits 6 to 4 of the Flooding Control Register (FCR). (**Default 0**).

Bit [7:4] : Broadcast Rate Control. Number of broadcast packets allowed within the time defined in bits 6 to 4 of the Flooding Control Register (FCR). **(Default 0)**

14.10.13 UCC – Unicast Congestion Control

I²C Address h0B6, CPU Address: 50C

Accessed by CPU, serial interface and I²C (R/W)

7	0
Unicast congest threshold	

Bit [7:0] : Number of frame count. Used for best effort dropping at B% when destination port's best effort queue reaches UCC threshold and shared pool is all in use. Granularity 1 frame. (Default: h10 for 2 MB/bank or h08 for 1 MB/bank)

14.10.14 MCC – Multicast Congestion Control

I²C Address h0B7, CPU Address: 50D

Accessed by CPU, serial interface and I²C (R/W)

7	5	4	0
FC reaction period		Multicast congest threshold	

Bit [4:0]: In multiples of two frames (granularity). Used for triggering MC flow control when destination port's multicast best effort queue reaches MCC threshold.(Default 0x10)

Bit [7:5]: Flow control reaction period (Default 2) Granularity 4uSec.

14.10.15 PR100 – Port Reservation for 10/100 ports

I²C Address h0B8, CPU Address 50E

Accessed by CPU, serial interface and I²C (R/W)

7	4	3	0
Buffer low threshold		SP Buffer reservation	

Bit [3:0]: Per source port buffer reservation.

Define the space in the FDB reserved for each 10/100 port and CPU. Expressed in multiples of 4 packets. For each packet 1536 bytes are reserved in the memory.

Bits [7:4]: Expressed in multiples of 4 packets. Threshold for dropping all best effort frames when destination port best efforts queues reaches UCC threshold, shared pool is all used and source port reservation is at or below the PR100[7:4] level. Also the threshold for initiating UC flow control.

- Default:
 - h36 for 24+2 configuration with memory 2 MB/bank;
 - h24 for 24+2 configuration with 1MB/bank;

14.10.16 PRG – Port Reservation for Giga ports

I²C Address h0B9, CPU Address 50F

Accessed by CPU, serial interface and I²C (R/W)

7	4	3	0
Buffer low threshold			SP buffer reservation

Bit [3:0]: Per source port buffer reservation.

Define the space in the FDB reserved for each Gigabit port. Expressed in multiples of 16 packets. For each packet 1536 bytes are reserved in the memory.

Bits [7:4]: Expressed in multiples of 16 packets. Threshold for dropping all best effort frames when destination port best effort queues reach UCC threshold, shared pool is all used and source port reservation is at or below the PRG[7:4] level. Also the threshold for initiating UC flow control.

- Default:
 - h58 for memory 2 MB/bank;
 - h35 for 1 MB/bank;

14.10.17 SFCB – Share FCB Size

I²C Address h0BA), CPU Address 510

Accessed by CPU, serial interface and I²C (R/W)

7	0
Shared pool buffer size	

Bits [7:0]: Expressed in multiples of 4 packets. Buffer reservation for shared pool.

- Default:
 - h64 for 24+2 configuration with memory of 2 MB/bank;
 - h14 for 24+2 configuration with memory of 1 MB/bank;

14.10.18 C2RS – Class 2 Reserve Size

I²C Address h0BB, CPU Address 511

Accessed by CPU, serial interface and I²C (R/W)

7	0
Class 2 FCB Reservation	

Buffer reservation for class 2 (third lowest priority). Granularity 1. (**Default 0**)

14.10.19 C3RS – Class 3 Reserve Size

I²C Address h0BC, CPU Address 512

Accessed by CPU, serial interface and I²C (R/W)

7	0
Class 3 FCB Reservation	

Buffer reservation for class 3. Granularity 1. (**Default 0**)

14.10.20 C4RS – Class 4 Reserve Size

I²C Address h0BD, CPU Address 513

Accessed by CPU, serial interface and I²C (R/W)

7	0
Class 4 FCB Reservation	

Buffer reservation for class 4. Granularity 1. (**Default 0**)

14.10.21 C5RS – Class 5 Reserve Size

I²C Address h0BE; CPU Address 514

Accessed by CPU, serial interface and I²C (R/W)

7	0
Class 5 FCB Reservation	

Buffer reservation for class 5. Granularity 1. (**Default 0**)

14.10.22 C6RS – Class 6 Reserve Size

I²C Address h0BF; CPU Address 515

Accessed by CPU, serial interface and I²C (R/W)

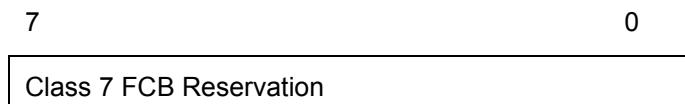

7	0
Class 6 FCB Reservation	

Buffer reservation for class 6 (second highest priority). Granularity 1. (**Default 0**)

14.10.23 C7RS – Class 7 Reserve Size

I²C Address h0C0; CPU Address 516

Accessed by CPU, serial interface and I²C (R/W)

Buffer reservation for class 7 (highest priority). Granularity 1. (**Default 0**)

14.10.24 QOSCn - Classes Byte Limit Set 0

Accessed by CPU; serial interface and I²C (R/W):

C — QOSC00 – BYTE_C01 (I²C Address h0C1, CPU Address 517)

B — QOSC01 – BYTE_C02 (I²C Address h0C2, CPU Address 518)

A — QOSC02 – BYTE_C03 (I²C Address h0C3, CPU Address 519)

QOSC00 through QOSC02 represents one set of values A-C for a 10/100 port when using the Weighted Random Early Drop (WRED) Scheme described in Chapter 7. There are four such sets of values A-C specified in Classes Byte Limit Set 0, 1, 2, and 3. For CPU port A-C values are defined using register CPUQOSC1, 2 and 3.

Each 10/ 100 port can choose one of the four Byte Limit Sets as specified by the QoS Select field located in bits 5 to 4 of the ECR2n register. The values A-C are per-queue byte thresholds for random early drop. QOSC02 represents A, and QOSC00 represents C.

Granularity when Delay bound is used: QOSC02: 128 bytes, QOSC01: 256 bytes, QOSC00: 512 bytes. Granularity when WFQ is used: QOSC02: 512 bytes, QOSC01: 512 bytes, QOSC00: 512 bytes.

14.10.25 Classes Byte Limit Set 1

Accessed by CPU, serial interface and I²C (R/W):

C - QOSC03 – BYTE_C11 (I²C Address h0C4, CPU Address 51a)

B - QOSC04 – BYTE_C12 (I²C Address h0C5, CPU Address 51b)

A - QOSC05 – BYTE_C13 (I²C Address h0C6, CPU Address 51c)

QOSC03 through QOSC05 represents one set of values A-C for a 10/100 port when using the Weighted Random Early Drop (WRED) scheme.

Granularity when Delay bound is used: QOSC05: 128 bytes, QOSC04: 256 bytes, QOSC03: 512 bytes. Granularity when WFQ is used: QOSC05: 512 bytes, QOSC04: 512 bytes, QOSC03: 512 bytes.

14.10.26 Classes Byte Limit Set 2

Accessed by CPU and serial interface (R/W):

C - QOSC06 – BYTE_C21 (CPU Address 51d)

B - QOSC07 – BYTE_C22 (CPU Address 51e)

A - QOSC08 – BYTE_C23 (CPU Address 51f)

QOSC06 through QOSC08 represents one set of values A-C for a 10/100 port when using the Weighted Random Early Drop (WRED) scheme.

Granularity when Delay bound is used: QOSC08: 128 bytes, QOSC07: 256 bytes, QOSC06: 512 bytes.

Granularity when WFQ is used: QOSC08: 512 bytes, QOSC07: 512 bytes, QOSC06: 512 bytes

14.10.27 Classes Byte Limit Set 3

Accessed by CPU and serial interface (R/W):

C - QOSC09 – BYTE_C31 (CPU Address 520)

B - QOSC10 – BYTE_C32 (CPU Address 521)

A - QOSC11 – BYTE_C33 (CPU Address 522)

QOSC09 through QOSC011 represents one set of values A-C for a 10/100 port when using the Weighted Random Early Drop (WRED) scheme.

Granularity when Delay bound is used: QOSC11: 128 bytes, QOSC10: 256 bytes, QOSC09: 512 bytes.

Granularity when WFQ is used: QOSC11: 512 bytes, QOSC10: 512 bytes, QOSC09: 512 bytes

14.10.28 Classes Byte Limit Giga Port 1

Accessed by CPU, serial interface and I²C (R/W):

F - QOSC12 – BYTE_C2_G1 (I²C Address h0C7, CPU Address 523)

E - QOSC13 – BYTE_C3_G1 (I²C Address h0C8, CPU Address 524)

D - QOSC14 – BYTE_C4_G1 (I²C Address h0C9, CPU Address 525)

C - QOSC15 – BYTE_C5_G1 (I²C Address h0CA, CPU Address 526)

B - QOSC16 – BYTE_C6_G1 (I²C Address h0CB, CPU Address 527)

A - QOSC17 – BYTE_C7_G1 (I²C Address h0CC, CPU Address 528)

QOSC12 through QOSC17 represent the values A-F for Gigabit port 1. They are per-queue byte thresholds for random early drop. QOSC17 represents A, and QOSC12 represents F.

Granularity when Delay bound is used: QOSC17 and QOSC16: 256 bytes, QOSC15 and QOSC14: 512 bytes, QOSC13 and QOSC12: 1024 bytes.

Granularity when WFQ is used: QOSC17 to QOSC12: 1024 bytes

14.10.29 Classes Byte Limit Giga Port 2

Accessed by CPU, serial interface and I²C (R/W)

F - QOSC18 – BYTE_C2_G2 (I²C Address h0CD, CPU Address 529)

E - QOSC19 – BYTE_C3_G2 (I²C Address h0CE, CPU Address 52a)

D - QOSC20 – BYTE_C4_G2 (I²C Address h0CF, CPU Address 52b)

C - QOSC21 – BYTE_C5_G2 (I²C Address h0D0, CPU Address 52c)

B - QOSC22 – BYTE_C6_G2 (I²C Address h0D1, CPU Address 52d)

A - QOSC23 – BYTE_C7_G2 (I²C Address h0D2, CPU Address 52e)

QOSC12 through QOSC17 represent the values A-F for Gigabit port 2. They are per-queue byte thresholds for random early drop. QOSC17 represents A, and QOSC12 represents F.

Granularity when Delay bound is used: QOSC17 and QOSC16: 256 bytes, QOSC15 and QOSC14: 512 bytes, QOSC13 and QOSC12: 1024 bytes.

Granularity when WFQ is used: QOSC17 to QOSC12: 1024 bytes

14.10.30 Classes WFQ Credit Set 0

Accessed by CPU and serial interface

W0 - QOSC24[5:0] – CREDIT_C00 (CPU Address 52f)

W1 - QOSC25[5:0] – CREDIT_C01 (CPU Address 530)

W2 - QOSC26[5:0] – CREDIT_C02 (CPU Address 531)

W3 - QOSC27[5:0] – CREDIT_C03 (CPU Address 532)

QOSC24 through QOSC27 represents one set of WFQ parameters for a 10/100 port. There are four such sets of values. The granularity of the numbers is 1, and their sum must be 64. QOSC27 corresponds to W3 and QOSC24 corresponds to W0.

QOSC24[7:6]: Priority service type for the ports select this parameter set. Option 1 to option 4.

QOSC25[7]: Priority service allow flow control for the ports select this parameter set.

QOSC25[6]: Flow control pause best effort traffic only

Both flow control allow and flow control best effort only can take effect only the priority type is WFQ.

14.10.31 Classes WFQ Credit Set 1

Accessed by CPU and serial interface

W0 - QOSC28[5:0] – CREDIT_C10 (CPU Address 533)

W1 - QOSC29[5:0] – CREDIT_C11 (CPU Address 534)

W2 - QOSC30[5:0] – CREDIT_C12 (CPU Address 535)

W3 - QOSC31[5:0] – CREDIT_C13 (CPU Address 536)

QOSC28 through QOSC31 represents one set of WFQ parameters for a 10/100 port. There are four such sets of values. The granularity of the numbers is 1, and their sum must be 64. QOSC31 corresponds to W3 and QOSC28 corresponds to W0.

QOSC28[7:6]: Priority service type for the ports select this parameter set. Option 1 to option 4.

QOSC29[7]: Priority service allow flow control for the ports select this parameter set.

QOSC29[6]: Flow control pause best effort traffic only

14.10.32 Classes WFQ Credit Set 2

Accessed by CPU and serial interface

W0 - QOSC32[5:0] – CREDIT_C20 (CPU Address 537)

W1 - QOSC33[5:0] – CREDIT_C21 (CPU Address 538)

W2 - QOSC34[5:0] – CREDIT_C22 (CPU Address 539)

W3 - QOSC35[5:0] – CREDIT_C23 (CPU Address 53a)

QOSC35 through QOSC32 represents one set of WFQ parameters for a 10/100 port. There are four such sets of values. The granularity of the numbers is 1 and their sum must be 64. QOSC35 corresponds to W3 and QOSC32 corresponds to W0.

QOSC32[7:6]: Priority service type for the ports select this parameter set. Option 1 to option 4.

QOSC33[7]: Priority service allow flow control for the ports select this parameter set.

QOSC33[6]: Flow control pause for best effort traffic only

14.10.33 Classes WFQ Credit Set 3

Accessed by CPU and serial interface

W0 - QOSC36[5:0] – CREDIT_C30 (CPU Address 53b)

W1 - QOSC37[5:0] – CREDIT_C31 (CPU Address 53c)

W2 - QOSC38[5:0] – CREDIT_C32 (CPU Address 53d)

W3 - QOSC39[5:0] – CREDIT_C33 (CPU Address 53e)

QOSC39 through QOSC36 represents one set of WFQ parameters for a 10/100 port. There are four such sets of values. The granularity of the numbers is 1 and their sum must be 64. QOSC39 corresponds to W0 and QOSC36 corresponds to W0.

QOSC36[7:6]: Priority service type for the ports select this parameter set. Option 1 to option 4.

QOSC37[7]: Priority service allow flow control for the ports select this parameter set.

QOSC37[6]: Flow control pause best effort traffic only

14.10.34 Classes WFQ Credit Port G1

Accessed by CPU and serial interface

W0 - QOSC40[5:0] - CREDIT_C0_G1(CPU Address 53f)

[7:6]: Priority service type. Option 1 to 4.

W1 - QOSC41[5:0] – CREDIT_C1_G1 (CPU Address 540)

[7]: Priority service allow flow control for the ports select this parameter set.

[6]: Flow control pause best effort traffic only

W2 - QOSC42[5:0] – CREDIT_C2_G1 (CPU Address 541)

W3 - QOSC43[5:0] – CREDIT_C3_G1 (CPU Address 542)

W4 - QOSC44[5:0] – CREDIT_C4_G1 (CPU Address 543)

W5 - QOSC45[5:0] – CREDIT_C5_G1 (CPU Address 544)

W6 - QOSC46[5:0] – CREDIT_C6_G1 (CPU Address 545)

W7 - QOSC47[5:0] – CREDIT_C7_G1 (CPU Address 546)

QOSC40 through QOSC47 represents the set of WFQ parameters for Gigabit port 24. The granularity of the numbers is 1 and their sum must be 64. QOSC47 corresponds to W7 and QOSC40 corresponds to W0. In the 2G trunk configuration, the sum of all values QOSC40 through QOSC47 must be equal to 128.

14.10.35 Classes WFQ Credit Port G2

Accessed by CPU and serial interface

W0 - QOSC48[5:0] – CREDIT_C0_G2(CPU Address 547)
 [7:6]: Priority service type. Option 1 to 4

W1 - QOSC49[5:0] – CREDIT_C1_G2(CPU Address 548)
 [7]: Priority service allow flow control for the ports select this parameter set.
 [6]: Flow control pause best effort traffic only

W2 - QOSC50[5:0] – CREDIT_C2_G2(CPU Address 549)

W3 - QOSC51[5:0] – CREDIT_C3_G2(CPU Address 54a)

W4 - QOSC52[5:0] – CREDIT_C4_G2(CPU Address 54b)

W5 - QOSC53[5:0] – CREDIT_C5_G2(CPU Address 54c)

W6 - QOSC54[5:0] – CREDIT_C6_G2(CPU Address 54d)

W7 - QOSC55[5:0] – CREDIT_C7_G2(CPU Address 54e)

QOSC48 through QOSC55 represents the set of WFQ parameters for Gigabit port 2. The granularity of the numbers is 1 and their sum must be 64. QOSC55 corresponds to W7 and QOSC48 corresponds to W0. In the 2G trunk configuration, the sum of all values QOSC48 through QOSC55 must be equal to 128.

14.10.36 Class 6 Shaper Control Port G1

Accessed by CPU and serial interface

QOSC56[5:0] – TOKEN_RATE_G1 (CPU Address 54f). Programs de average rate for gigabit port 1. When equal to 0, shaper is disable. Granularity is 1.

QOSC57[7:0] – TOKEN_LIMIT_G1 (CPU Address 550). Programs the maximum counter for gigabit port 1. Granularity is 16 bytes.

Shaper is implemented to control the peak and average rate for outgoing traffic with priority 6 (queue 6). Shaper is limited to gigabit ports and queue P6 when it is in strict priority. QOSC41 programs the peak rate for gigabit port 1. See Programming QoS Registers Application Note for more information.

14.10.37 Class 6 Shaper Control Port G2

Accessed by CPU and serial interface

QOSC58[5:0] – TOKEN_RATE_G2 (CPU Address 551). Programs de average rate for gigabit port 2. When equal to 0, shaper is disable. Granularity is 1.

QOSC59[7:0] – TOKEN_LIMIT_G2 (CPU Address 552). Programs the maximum counter for gigabit port 2. Granularity is 16 bytes.

Shaper is implemented to control the peak and average rate for outgoing traffic with priority 6 (queue 6). Shaper is limited to gigabit ports and queue P6 when it is in strict priority. QOSC49 programs the peak rate for gigabit port 2. See Programming QoS Register application note for more information.

14.10.38 RDRC0 – WRED Rate Control 0

I²C Address 0FB, CPU Address 553

Accessed by CPU, Serial Interface and I²C (R/W)

7	4	3	0
X Rate		Y Rate	

Bits [7:4]: Corresponds to the frame drop percentage X% for WRED. Granularity 6.25%.

Bits [3:0]: Corresponds to the frame drop percentage Y% for WRED. Granularity 6.25%.

See Programming QoS Registers application note for more information

14.10.39 RDRC1 – WRED Rate Control 1

I²C Address 0FC, CPU Address 554

Accessed by CPU, Serial Interface and I²C (R/W)

7	4	3	0
Z Rate		B Rate	

Bits [7:4]: Corresponds to the frame drop percentage Z% for WRED. Granularity 6.25%.

Bits [3:0]: Corresponds to the best effort frame drop percentage B%, when shared pool is all in use and destination port best effort queue reaches UCC. Granularity 6.25%.

See Programming QoS Registers application note for more information

14.10.40 User Defined Logical Ports and Well Known Ports

The MVTX2600AG supports classifying packet priority through layer 4 logical port information. It can be setup by 8 Well Known Ports, 8 User Defined Logical Ports, and 1 User Defined Range. The 8 Well Known Ports supported are:

- 0:23
- 1:512
- 2:6000
- 3:443
- 4:111
- 5:22555
- 6:22
- 7:554

Their respective priority can be programmed via Well_Known_Port [7:0] priority register. Well_Known_Port_Enable can individually turn on/off each Well Known Port if desired.

Similarly, the User Defined Logical Port provides the user programmability to the priority, plus the flexibility to select specific logical ports to fit the applications. The 8 User Logical Ports can be programmed via User_Port 0-7 registers. Two registers are required to be programmed for the logical port number. The respective priority can be programmed to the User_Port [7:0] priority register. The port priority can be individually enabled/disabled via User_Port_Enable register.

The User Defined Range provides a range of logical port numbers with the same priority level. Programming is similar to the User Defined Logical Port. Instead of programming a fixed port number, an upper and lower limit need to be programmed, they are: {RHIGHH, RHIGHL} and {RLOWH, RLOWL} respectively. If the value in the upper limit is smaller or equal to the lower limit, the function is disabled. Any IP packet with a logical port that is less than the upper limit and more than the lower limit will use the priority specified in RPRIORITY.

14.10.40.1 USER_PORT0_(0~7) – USER DEFINE LOGICAL PORT (0~7)

USER_PORT_0 - I²C Address h0D6 + 0DE; CPU Address 580(Low) + 581(high)

USER_PORT_1 - I²C Address h0D7 + 0DF; CPU Address 582 + 583

USER_PORT_2 - I²C Address h0D8 + 0E0; CPU Address 584 + 585

USER_PORT_3 - I²C Address h0D9 + 0E1; CPU Address 586 + 587

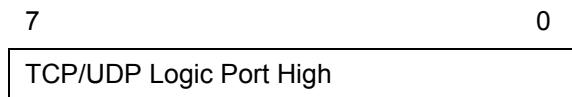

USER_PORT_4 - I²C Address h0DA + 0E2; CPU Address 588 + 589

USER_PORT_5 - I²C Address h0DB + 0E3; CPU Address 58A + 58B

USER_PORT_6 - I²C Address h0DC + 0E4; CPU Address 58C + 58D

USER_PORT_7 - I²C Address h0DD + 0E5; CPU Address 58E + 58F

Accessed by CPU, serial interface and I²C (R/W)

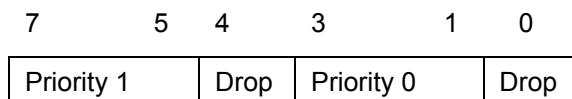

(Default 00) This register is duplicated eight times from PORT 0 through PORT 7 and allows the CPU to define eight separate ports.

14.10.40.2 USER_PORT_[1:0]_PRIORITY - User Define Logic Port 1 and 0 Priority

I²C Address h0E6, CPU Address 590

Accessed by CPU, serial interface and I²C (R/W)

The chip allows the CPU to define the priority

Bits [3:0]: Priority setting, transmission + dropping, for logic port 0

Bits [7:4]: Priority setting, transmission + dropping, for logic port 1 (Default 00)

14.10.40.3 USER_PORT_[3:2]_PRIORITY - User Define Logic Port 3 and 2 PriorityI²C Address h0E7, CPU Address 591Accessed by CPU, serial interface and I²C (R/W)

7	5	4	3	1	0
Priority 3	Drop	Priority 2	Drop		

14.10.40.4 USER_PORT_[5:4]_PRIORITY - User Define Logic Port 5 and 4 PriorityI²C Address h0E8, CPU Address 592Accessed by CPU, serial interface and I²C (R/W)

7	5	4	3	1	0
Priority 5	Drop	Priority 4	Drop		

(Default 00)

14.10.40.5 USER_PORT_[7:6]_PRIORITY - USER DEFINE LOGIC PORT 7 AND 6 PRIORITYI²C Address h0E9, CPU Address 593Accessed by CPU, serial interface and I²C (R/W)

7	5	4	3	1	0
Priority 7	Drop	Priority 6	Drop		

(Default 00)

14.10.40.6 USER_PORT_ENABLE[7:0] – User Define Logic 7 to 0 Port EnablesI²C Address h0EA, CPU Address 594Accessed by CPU, serial interface and I²C (R/W)

7	6	5	4	3	2	1	0
P7	P6	P5	P4	P3	P2	P1	P0

(Default 00)

14.10.40.7 WELL_KNOWN_PORT[1:0] PRIORITY- Well Known Logic Port 1 and 0 PriorityI²C Address h0EB, CPU Address 595Accessed by CPU, serial interface and I²C (R/W)

7	5	4	3	1	0
Priority 1	Drop	Priority 0	Drop		

Priority 0 - Well known port 23 for telnet applications.

Priority 1 - Well Known port 512 for TCP/UDP.

(Default 00)

14.10.40.8 WELL_KNOWN_PORT[3:2] PRIORITY- Well Known Logic Port 3 and 2 Priority

I²C Address h0EC, CPU Address 596

Accessed by CPU, serial interface and I²C (R/W)

7	5	4	3	1	0
Priority 3	Drop	Priority 2	Drop		

Priority 2 - Well known port 6000 for XWIN.

Priority 3 - Well known port 443 for http.sec

(Default 00)

14.10.40.9 WELL_KNOWN_PORT [5:4] PRIORITY- Well Known Logic Port 5 and 4 Priority

I²C Address h0ED, CPU Address 597

Accessed by CPU, serial interface and I²C (R/W)

7	5	4	3	1	0
Priority 5	Drop	Priority 4	Drop		

Priority 4 - Well Known port 111 for sun remote procedure call.

Priority 5 - Well Known port 22555 for IP Phone call setup.

(Default 00)

14.10.40.10 WELL_KNOWN_PORT [7:6] PRIORITY- WELL KNOWN LOGIC PORT 7 AND 6 PRIORITY

I²C Address h0EE, CPU Address 598

Accessed by CPU, serial interface and I²C (R/W)

7	5	4	3	1	0
Priority 7	Drop	Priority 6	Drop		

Priority 6 - well know port 22 for ssh.

Priority 7 – well Known port 554 for rtsp.

(Default 00)

14.10.40.11 WELL_KNOWN_PORT_ENABLE [7:0] – Well Known Logic 7 to 0 Port EnablesI²C Address h0EF, CPU Address 599Accessed by CPU, serial interface and I²C (R/W)

7	6	5	4	3	2	1	0
P7	P6	P5	P4	P3	P2	P1	P0

1 – Enable

0 - Disable

(Default 00)

14.10.40.12 RLOWL – USER DEFINE RANGE LOW BIT 7:0I²C Address h0F4, CPU Address: 59aAccessed by CPU, serial interface and I²C (R/W)

(Default 00)

14.10.40.13 RLOWH – User Define Range Low Bit 15:8I²C Address h0F5, CPU Address: 59bAccessed by CPU, serial interface and I²C (R/W)

(Default 00)

14.10.40.14 RHIGHL – User Define Range High Bit 7:0I²C Address h0D3, CPU Address: 59cAccessed by CPU, serial interface and I²C (R/W)

(Default 00)

14.10.40.15 RHIGHH – User Define Range High Bit 15:8I²C Address h0D4, CPU Address: 59dAccessed by CPU, serial interface and I²C (R/W)

(Default 00)

14.10.40.16 RPRIORITY – User Define Range PriorityI²C Address h0D5, CPU Address: 59eAccessed by CPU, serial interface and I²C (R/W)

7	4	3	0
	Range Transmit Priority		Drop

RLOW and RHIGH form a range for logical ports to be classified with priority specified in RPRIORITY.

Bit[3:1]	Transmit Priority
Bits[0]:	Drop Priority

14.10.41 CPUQOSC123

CPU Address: 5a0, 5a1, 5a2

Accessed by CPU and serial interface (R/W)

C - CPUQOSC1 – CPU BYTE_C1 I²C Address h0C1, CPU Address 517)

B - CPUQOSC2 – CPU BYTE_C2 I²C Address h0C2, CPU Address 518)

A - CPUQOSC3 – CPU BYTE_C3 I²C Address h0C3, CPU Address 519)

Represents values A-C for a CPU port. The values A-C are per-queue byte thresholds for random early drop.

QOSC3 represents A, and QOSC1 represents C. Granularity: 256 bytes

14.11 Group 6 Address MISC Group

14.11.1 MII_OP0 – MII Register Option 0

I²C Address F0, CPU Address:h600

Accessed by CPU, serial interface and I²C (R/W)

7	6	5	4	0
hfc	1prst	DisJ	Vendor Spc. Reg Addr	

Bits [7]: Half duplex flow control feature

0 = Half duplex flow control always enable

1 = Half duplex flow control by negotiation

Bits [6]: Link partner reset auto-negotiate disable

Bits [5]: Disable jabber detection. This is for HomePNA applications or any serial operation slower than 10 Mbps.

0 = Enable

1 = Disable

Bit [4:0]: Vendor specified link status register address (null value means don't use it) (Default 00). This is used if the Linkup bit position in the PHY is non-standard.

14.11.2 MII_OP1 – MII Register Option 1

I²C Address F1, CPU Address:h601

Accessed by CPU, serial interface and I²C (R/W)

7	4	3	0
Speed bit location		Duplex bit location	

Bits [3:0]: Duplex bit location in vendor specified register

Bits [7:4]: Speed bit location in vendor specified register
(Default 00)

14.11.3 FEN – Feature Register

I²C Address F2, CPU Address:h602)

Accessed by CPU, serial interface and I²C (R/W)

7	6	5	4	3	2	1	0
DML	Mii	Rp	IP Mul	V-Sp	DS	RC	SC

Bits [0]: Statistic Counter Enable (**Default 0**)

- 0 – Disable
- 1 – Enable (all ports)

When statistic counter is enable, an interrupt control frame is generated to the CPU, every time a counter wraps around. This feature requires an external CPU.

Bits [1]: Rate Control Enable (**Default 0**)

- 0 – Disable
- 1 – Enable; Must also set ECR2Pn[3] = 1

This bit enables/disables the rate control for all 10/100 ports. To start rate control in a 10/100 port the rate control memory must be programmed. This feature requires an external CPU. See Programming QoS Registers Application Note and Processor Interface Application Note for more information.

Bit [2]: Support DS EF Code. (**Default 0**)

- 0 – Disable
- 1 – Enable (all ports)

When 101110 is detected in DS field (TOS[7:2]), the frame priority is set for 110 and drop is set for 0.

- Bit [3]: Enable VLAN spanning tree support (**Default 0**)
- 0 – Disable
 - 1 – Enable
- When VLAN spanning tree is enable the registers ECR1Pn are NOT used to program the port spanning tree status. The port status is programmed using the Control Command Frame.
- Bit [4]: Disable IP Multicast Support (**Default 1**)
- 0 – Enable IP Multicast Support
 - 1 – Disable IP Multicast Support
- When enable, IGMP packets are identified by search engine and are passed to the CPU for processing. IP multicast packets are forwarded to the IP multicast group members according to the VLAN port mapping table.
- Bit [5]: Enable report to CPU(**Default 0**)
- 0 – Disable report to CPU
 - 1 – Enable report to CPU
- When disable new VLAN port association report, new MAC address report or aging reports are disable for all ports. When enable, register SE_OPEMODE is used to enable/disable selectively each function.
- Bit [6]: Disable MII Management State Machine (**Default 0**)
- 0: Enable MII Management State Machine
 - 1: Disable MII Management State Machine
- Bit [7]: Disable using MCT Link List structure (**Default 0**)
- 0 – Enable using MCT Link structure
 - 1 - Disable using MCT Link List structure

14.11.4 MIIC0 – MII Command Register 0

CPU Address:h603

Accessed by CPU and serial interface only (R/W)

Bit [7:0] - MII Data [7:0]

Note: Before programming MII command: set FEN[6], check MIIC3, making sure no RDY, and no VALID; then program MII command.

14.11.5 MIIC1 – MII Command Register 1

CPU Address:h604

Accessed by CPU and serial interface only (R/W)

Bit [7:0] - MII Data [15:8]

Note: Before programming MII command: set FEN[6], check MIIC3, making sure no RDY and no VALID; then program MII command.

14.11.6 MIIC2 – MII Command Register 2

CPU Address:h605

Accessed by CPU and serial interface only (R/W)

7	6	5	4	0
	Mii OP	Register address		

Bit [4:0] - REG_AD – Register PHY Address

Bit [6:5] - OP – Operation code “10” for read command and “01” for write command

Note: Before programming MII command: set FEN[6], check MIIC3, making sure no RDY and no VALID; then program MII command.

14.11.7 MIIC3 – MII Command Register 3

CPU Address:h606

Accessed by CPU and serial interface only (R/W)

7	6	5	4	0
Rdy	Valid		PHY address	

Bits [4:0] - PHY_AD – 5 Bit PHY Address

Bit [6] - VALID – Data Valid from PHY (Read Only)

Bit [7] - RDY – Data is returned from PHY (Ready Only)

Note: Before programming MII command: set FEN[6], check MIIC3, making sure no RDY and no VALID; then program MII command. Writing this register will initiate a serial management cycle to the MII management interface.

14.11.8 MIID0 – MII Data Register 0

CPU Address:h607

Accessed by CPU and serial interface only (RO)

Bit [7:0] - MII Data [7:0]

14.11.9 MIID1 – MII Data Register 1

CPU Address:h608

Accessed by CPU and serial interface only (RO)

Bit [7:0] - MII Data [15:8]

14.11.10 LED Mode – LED Control

CPU Address:h609

Accessed by CPU, serial interface and I²C (R/W)

7	5	4	3	2	1	0
		Clock rate	Hold Time			

Bit [0] Reserved(Default 0)

Bit [2:1]: Hold time for LED signal (**Default 00**)

00=8 msec	01=16 msec
10=32 msec	11=64 msec

Bit [4:3]: LED clock frequency (**Default 0**)

For 100MHz SCLK

00 = 100 M/8 = 12.5 MHz	01 = 100 M/16 = 6.25 MHz
10 = 100 M/32 = 3.125 MHz	11 = 100 M/64 = 1.5625 MHz

For 125 MHz SCLK

00 = 125 M/64 = 1953 KHz	01 = 125 M/128 = 977 KHz
10 = 125 M/512 = 244 KHz	11 = 125 M/1024 = 122 KHz

Bit [7:5]: Reserved. Must be set to '0' (**Default 0**)

14.11.11 DEVICE Mode

CPU Address:h60a

Accessed by CPU and serial interface (R/W)

7	4	3	0
Device ID			

Bit [1:0]: Reserved. Must be set to '0' (Default 0)

Bit [2]: Support < = 1536 frames

0: < = 1518 bytes (< = 1522 bytes with VLAN tag) (Default)

1: < = 1536 bytes

Bit [3:0]: Reserved. Must be set to '0' (**Default 0**)

Bit [7:4]: DEVICE ID (**Default 0**). This is for stacking operation. This is the stack ID for loop topology.

14.11.12 CHECKSUM - EEPROM Checksum

I²C Address FF, CPU Address:h60b

Accessed by CPU, serial interface and I²C (R/W)

Bit [7:0]: (**Default 0**)

This register is used in unmanaged mode only. Before requesting that the MVTX2604 updates the EEPROM device, the correct checksum needs to be calculated and written into this checksum register. The checksum formula is:

$$\sum_{i=0}^{FF} i^2C \text{ register} = 0$$

When the MVTX2604 boots from the EEPROM the checksum is calculated and the value must be zero. If the checksum is not zeroed the MVTX2604 does not start and pin CHECKSUM_OK is set to zero.

14.12 Group 7 Address Port Mirroring Group

14.12.1 MIRROR1_SRC - Port Mirror source port

CPU Address 700

Accessed by CPU and serial interface (R/W) (Default 7F)

7	6	5	4	0
		I/O	Src Port Select	

Bit [4:0]: Source port to be mirrored. Use illegal port number to disable mirroring

Bit [5]: 1 - select ingress data

0 - select egress data

Bit [6]: Reserved

Bit [7]: Reserved must be set to '1'

14.12.2 MIRROR1_DEST – Port Mirror destination

CPU Address 701

Accessed by CPU, serial interface (R/W) (Default 17)

7	5	4	0
		Dest Port Select	

Bit [4:0]: Port Mirror Destination

When port mirroring is enable, destination port can not serve as a data port.

14.12.3 MIRROR2_SRC – Port Mirror source port

CPU Address 702

Accessed by CPU, serial interface (R/W) (Default FF)

7	6	5	4	0
		I/O	Src Port Select	

- Bit [4:0]: Source port to be mirrored. Use illegal port number to disable mirroring
- Bit [5]: 1 – select ingress data
0 – select egress data
- Bit [6]: Reserved
- Bit [7]: Reserved must be set to '1'

14.12.4 MIRROR2_DEST – Port Mirror destination

CPU Address 703

Accessed by CPU, serial interface (R/W) (Default 00)

7	5	4	0
	Dest Port Select		

- Bit [4:0]: Port Mirror Destination

When port mirroring is enable, destination port can not serve as a data port.

14.13 Group F Address CPU Access Group

14.13.1 GCR-Global Control Register

CPU Address: hF00

Accessed by CPU and serial interface. (R/W)

7	5	4	3	2	1	0
	Init	Reset	Bist	SR	SC	

- Bit [0]: Store configuration (**Default = 0**)
Write '1' followed by '0' to store configuration into external EEPROM
- Bit [1]: Store configuration and reset (**Default = 0**)
Write '1' to store configuration into external EEPROM and reset chip
- Bit [2]: Start BIST (Default = 0)
Write '1' followed by '0' to start the device's built-in self-test. The result is found in the DCR register.
- Bit [3]: Soft Reset (Default = 0)
Write '1' to reset chip

Bit [4]: Initialization Done (Default = 0).

This bit is meaningless in unmanaged mode. In managed mode, CPU write this bit with '1' to indicate initialization is completed and ready to forward packets.

1 = Initialization is done.

0 = Initialization is not complete.

14.13.2 DCR-Device Status and Signature Register

CPU Address: hF01

Accessed by CPU and serial interface. (RO)

7	6	5	4	3	2	1	0
Revision	Signature		RE	BinP	BR	BW	

Bit [0]: 1: Busy writing configuration to I²C

0: Not busy (not writing configuration to I²C)

Bit [1]: 1: Busy reading configuration from I²C

0: Not busy (not reading configuration from I²C)

Bit [2]: 1: BIST in progress

0: BIST not running

Bit [3]: 1: RAM Error

0: RAM OK

Bit [5:4]: Device Signature

11: MVTX2604 device

Bit [7:6]: Revision

00: Initial Silicon

01: XA1 Silicon

10: Production Silicon

14.3.13 DCR1-Giga port status

CPU Address: hF02

Accessed by CPU and serial interface. (RO)

7	6	4	3	2	1	0
CIC			GIGA1		GIGA0	

Bit [1:0]: Giga port 0 strap option

- 00 – 100 Mb MII mode
- 01 – 2 G mode
- 10 – GMII
- 11 – PCS

Bit [3:2] Giga port 1 strap option

- 00 – 100 Mb MII mode
- 01 – 2 G mode
- 10 – GMII
- 11 – PCS

Bit [7] Chip initialization completed

14.3.14 DPST – Device Port Status Register

CPU Address:hF03

Accessed by CPU and serial interface (R/W)

- Bit [4:0]: Read back index register. This is used for selecting what to read back from DTST. **(Default 00)**
- 5'b00000 - Port 0 Operating mode and Negotiation status
 - 5'b00001 - Port 1 Operating mode and Negotiation status
 - 5'b00010 - Port 2 Operating mode and Negotiation status
 - 5'b00011 - Port 3 Operating mode and Negotiation status
 - 5'b00100 - Port 4 Operating mode and Negotiation status
 - 5'b00101 - Port 5 Operating mode and Negotiation status
 - 5'b00110 - Port 6 Operating mode and Negotiation status
 - 5'b00111 - Port 7 Operating mode and Negotiation status
 - 5'b01000 - Port 8 Operating mode and Negotiation status
 - 5'b01001 - Port 9 Operating mode and Negotiation status
 - 5'b01010 - Port 10 Operating mode and Negotiation status
 - 5'b01011 - Port 11 Operating mode and Negotiation status
 - 5'b01100 - Port 12 Operating mode and Negotiation status
 - 5'b01101 - Port 13 Operating mode and Negotiation status
 - 5'b01110 - Port 14 Operating mode and Negotiation status
 - 5'b01111 - Port 15 Operating mode and Negotiation status
 - 5'b10000 - Port 16 Operating mode and Negotiation status
 - 5'b10001 - Port 17 Operating mode and Negotiation status
 - 5'b10010 - Port 18 Operating mode and Negotiation status
 - 5'b00011 - Port 19 Operating mode and Negotiation status
 - 5'b10100 - Port 20 Operating mode and Negotiation status
 - 5'b10101 - Port 21 Operating mode and Negotiation status
 - 5'b10110 - Port 22 Operating mode and Negotiation status
 - 5'b10111 - Port 23 Operating mode and Negotiation status
 - 5'b11000 - Port 24 Operating mode/Neg status (CPU port)
 - 5'b11001 - Port 25 Operating mode/Neg status (Gigabit 1)
 - 5'b11010 - Port 26 Operating mode/Neg status (Gigabit 2)

14.3.15 DTST – Data read back register

CPU Address: hF04

Accessed by CPU and serial interface (RO)

This register provides various internal information as selected in DPST bit[4:0]. Refer to the PHY Control Application Note.

7	6	5	4	3	2	1	0
MD	Info	Sig	Giga	Inkdn	FE	Fdpd	FcEn

When bit is 1:

Bit [0] – Flow control enable

Bit [1] – Full duplex port

Bit [2] – Fast Ethernet port (if not gigabit port)

Bit [3] – Link is down

Bit [4] – Giga port

Bit [5] – Signal detect (when PCS interface mode)

Bit [6] - 2G signal detect (2G mode only)

Bit [7] – Module detected (for hot swap purpose)

14.3.16 DA – DA Register

CPU Address: hFFF

Accessed by CPU and serial interface (RO)

Always return 8'h **DA**. Indicate the CPU interface or serial port connection is good.

14.4 TBI Registers

Two sets of TBI registers are used for configure the two Gigabit ports if they are operating in TBI mode. These TBI registers are located inside the switching chip and they are accessed through the MII command and MII data registers.

14.4.1 Control Register

MII Address: h00

Read/Write

Bit [15] Reset PCS logic and all TBI registers

1 = Reset.

0 = Normal operation.

Bit [14] Reserved. Must be programmed with "0".

Bit [13] Speed selection (See bit 6 for complete details)

Bit [12]	Auto Negotiation Enable
	1 = Enable auto-negotiation process.
	0 = Disable auto-negotiation process (Default).
Bit [11:10]	Reserved. Must be programmed with “0”
Bit [9]	Restart Auto Negotiation.
	1 = Restart auto-negotiation process.
	0 = Normal operation (Default).
Bit [8:7]	Reserved.
Bit [6]	Speed Selection
	Bit[6][13]
	1 1 = Reserved
	1 0 =1000 Mb/s (Default)
	0 1 =100 Mb/s
	0 0 =10 Mb/s
Bit [5:0]	Reserved. Must be programmed with “0”.

14.4.2 Status Register

MII Address: h01

Read Only

Bit [15:9]	Reserved. Always read back as “0”.
Bit [8]	Reserved. Always read back as “1”.
Bit [7:6]	Reserved. Always read back as “0”.
Bit [5]	Auto-Negotiation Complete
	1 = Auto-negotiation process completed.
	0 = Auto-negotiation process not completed.
Bit [4]	Reserved. Always read back as “0”
Bit [3]	Reserved. Always read back as “1”
Bit [2]	Link Status
	1 = Link is up.
	0 = Link is down.
Bit [1]	Reserved. Always read back as “0”.
Bit [0]	Reserved. Always read back as “1”.

14.4.3 Advertisement Register

MII Address: h04

Read/Write

Bit [15]	Next Page 1 = Has next page capabilities. 0 = Do not has next page capabilities (Default).
Bit [14]	Reserved. Always read back as "0". Read Only.
Bit [13:12]	Remote Fault. Default is "0".
Bit [11:9]	Reserved. Always read back as "0". Read Only.
Bit [8:7]	Pause. Default is "00"
Bit [6]	Half Duplex 1 = Support half duplex (Default). 0 = Do not support half duplex.
Bit [5]	Full duplex 1 = Support full duplex (Default). 0 = Do not support full duplex.
Bit [4:0]	Reserved. Always read back as "0". Read Only.

14.4.4 Link Partner Ability Register

MII Address: h05

Read Only

Bit [15]	Next Page 1 = Has next page capabilities. 0 = Do not has next page capabilities.
Bit [14]	Acknowledge
Bit [13:12]	Remote Fault.
Bit [11:9]	Reserved. Always read back as "0".
Bit [8:7]	Pause.
Bit [6]	Half Duplex 1 = Support half duplex. 0 = Do not support half duplex.
Bit [5]	Full duplex 1 = Support full duplex. 0 = Do not support full duplex.
Bit [4:0]	Reserved. Always read back as "0".

14.4.5 Expansion Register

MII Address: h06

Read Only

- Bit [15:2] Reserved. Always read back as “0”.
- Bit [1] Page Received.
 - 1 = A new page has been received.
 - 0 = A new page has not been received.
- Bit [0] Reserved. Always read back as “0”.

14.4.6 Extended Status Register

MII Address: h15

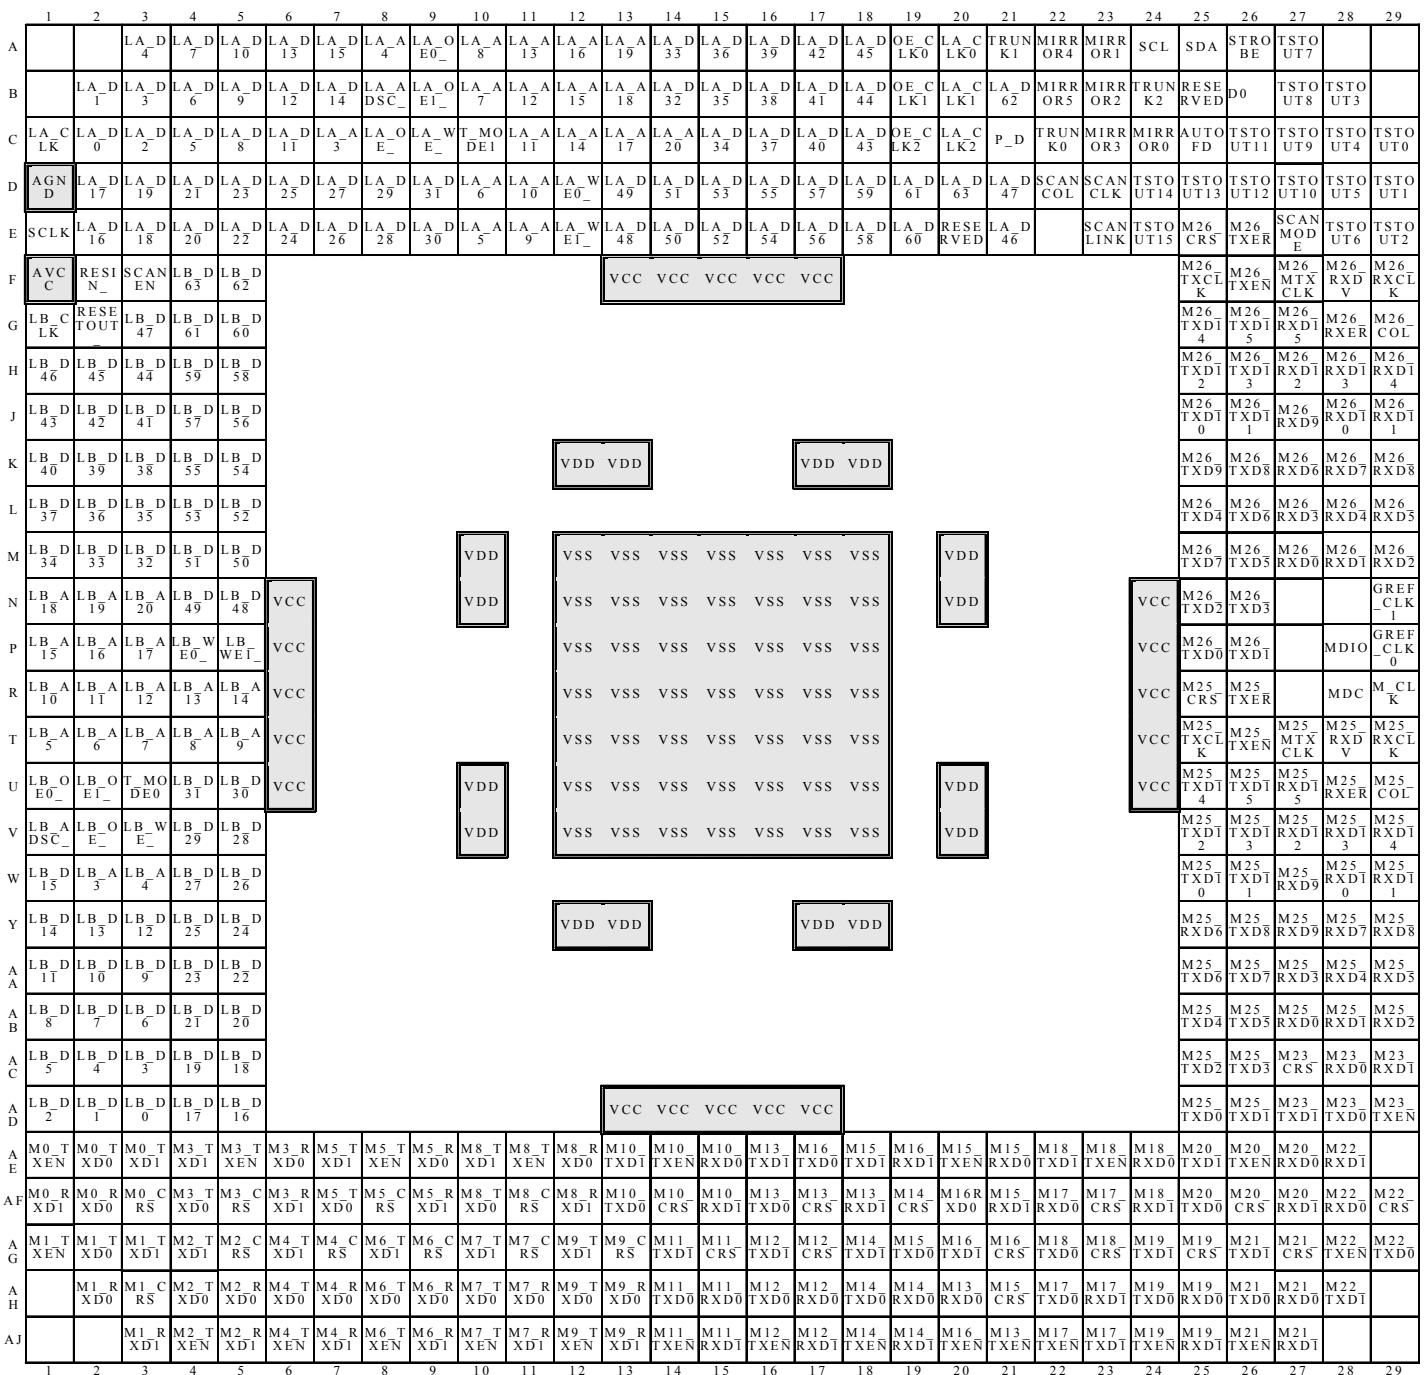

Read Only

- Bit [15] 1000 Full Duplex
 - 1 = Support 1000 full duplex operation (Default).
 - 0 = Do not support 1000 full duplex operation.
- Bit [14] 1000 Half Duplex
 - 1 = Support 1000 half duplex operation (Default).
 - 0 = Do not support 1000 half duplex operation.
- Bit [13:0] Reserved. Always read back as “0”.

15.2 Ball – Signal Descriptions in Managed Mode

All pins are CMOS type; all Input Pins are 5 Volt tolerance; and all Output Pins are 3.3 CMOS drive.

15.2.1 Ball Signal Descriptions in Managed Mode

Ball No(s)	Symbol	I/O	Description
CPU BUS Interface in Managed Mode			
C19, B19, A19, C20, B20, A20, C21, E20, A21, B24, B22, A22, C23, B23, A23, C24	P_DATA[15:0]	I/O-TS with pull up Except P_DATA[7:6] I/O-TS with pull down	Processor Bus Data Bit [15:0]. P_DATA[7:0] is used in 8-bit mode.
C22, A24, A25	P_A[2:0]	Input	Processor Bus Address Bit [2:0]
A26	P_WE#	Input with weak internal pull up	CPU Bus-Write Enable
B26	P_RD#	Input with weak internal pull up	CPU Bus-Read Enable
C25	P_CS#	Input with weak internal pull up	Chip Select
B25	P_INT#	Output	CPU Interrupt
Frame Buffer Interface			
D20, B21, D19, E19, D18, E18, D17, E17, D16, E16, D15, E15, D14, E14, D13, E13, D21, E21, A18, B18, C18, A17, B17, C17, A16, B16, C16, A15, B15, C15, A14, B14, D9, E9, D8, E8, D7, E7, D6, E6, D5, E5, D4, E4, D3, E3, D2, E2, A7, B7, A6, B6, C6, A5, B5, C5, A4, B4, C4, A3, B3, C3, B2, C2	LA_D[63:0]	I/O-TS with pullup	Frame Bank A – Data Bit [63:0]
C14, A13, B13, C13, A12, B12, C12, A11, B11, C11, D11, E11, A10, B10, D10, E10, A8, C7	LA_A[20:3]	Output	Frame Bank A – Address Bit [20:3]

Ball No(s)	Symbol	I/O	Description
B8	LA_ADSC#	Output with pull up	Frame Bank A Address Status Control
C1	LA_CLK	Output	Frame Bank A Clock Input
C9	LA_WE#	Output with pull up	Frame Bank A Write Chip Select for one layer SRAM configuration
D12	LA_WE0#	Output with pull up	Frame Bank A Write Chip Select for lower layer of two layers SRAM configuration
E12	LA_WE1#	Output with pull up	Frame Bank A Write Chip Select for upper layer of two layers SRAM configuration
C8	LA_OE#	Output with pull up	Frame Bank A Read Chip Select for one bank SRAM configuration
A9	LA_OE0#	Output with pull up	Frame Bank A Read Chip Select for lower layer of two layers SRAM configuration
B9	LA_OE1#	Output with pull up	Frame Bank A Read Chip Select for upper layer of two layers SRAM configuration
F4, F5, G4, G5, H4, H5, J4, J5, K4, K5, L4, L5, M4, M5, N4, N5, G3, H1, H2, H3, J1, J2, J3, K1, K2, K3, L1, L2, L3, M1, M2, M3, U4, U5, V4, V5, W4, W5, Y4, Y5, AA4, AA5, AB4, AB5, AC4, AC5, AD4, AD5, W1, Y1, Y2, Y3, AA1, AA2, AA3, AB1, AB2, AB3, AC1, AC2, AC3, AD1, AD2, AD3	LB_D[63:0]	I/O-TS with pullup.	Frame Bank B– Data Bit [63:0]
N3, N2, N1, P3, P2, P1, R5, R4, R3, R2, R1, T5, T4, T3, T2, T1, W3, W2	LB_A[20:3]	Output	Frame Bank B – Address Bit [20:3]
V1	LB_ADSC#	Output with pull up	Frame Bank B Address Status Control
G1	LB_CLK	Output with pull up	Frame Bank B Clock Input
V3	LB_WE#	Output with pull up	Frame Bank B Write Chip Select for one layer SRAM configuration

Ball No(s)	Symbol	I/O	Description
P4	LB_WE0#	Output with pull up	Frame Bank B Write Chip Select for lower layer of two layer SRAM configuration
P5	LB_WE1#	Output with pull up	Frame Bank B Write Chip Select for upper layer of two layers SRAM configuration
V2	LB_OE#	Output with pull up	Frame Bank B Read Chip Select for one layer SRAM configuration
U1	LB_OE0#	Output with pull up	Frame Bank B Read Chip Select for lower layer of two layers SRAM configuration
U2	LB_OE1#	Output with pull up	Frame Bank B Read Chip Select for upper layer of two layers SRAM configuration

Fast Ethernet Access Ports [23:0] RMII

R28	M_MDC	Output	MII Management Data Clock – (Common for all MII Ports [23:0])
P28	M_MDIO	I/O-TS with pull up	MII Management Data I/O – (Common for all MII Ports –[23:0]))
R29	M_CLKI	Input	Reference Input Clock
AC29, AE28, AJ27, AF27, AJ25, AF24, AH23, AE19, AF21, AJ19, AF18, AJ17, AJ15, AF15, AJ13, AF12, AJ11, AJ9, AF9, AJ7, AF6, AJ5, AJ3, AF1	M[23:0]_RXD[1]	Input with weak internal pull up resistors.	Ports [23:0] – Receive Data Bit [1]
AC28, AF28, AH27, AE27, AH25, AE24, AF22, AF20, AE21, AH19, AH20, AH17, AH15, AE15, AH13, AE12, AH11, AH9, AE9, AH7, AE6, AH5, AH2, AF2	M[23:0]_RXD[0]	Input with weak internal pull up resistors	Ports [23:0] – Receive Data Bit [0]

Ball No(s)	Symbol	I/O	Description
AC27, AF29, AG27, AF26, AG25, AG23, AF23, AG21, AH21, AF19, AF17, AG17, AG15, AF14, AG13, AF11, AG11, AG9, AF8, AG7, AF5, AG5, AH3, AF3	M[23:0]_CRS_DV	Input with weak internal pull down resistors.	Ports [23:0] – Carrier Sense and Receive Data Valid
AD29, AG28, AJ26, AE26, AJ24, AE23, AJ22, AJ20, AE20, AJ18, AJ21, AJ16, AJ14, AE14, AJ12, AE11, AJ10, AJ8, AE8, AJ6, AE5, AJ4, AG1, AE1	M[23:0]_TXEN	I/O- TS with pull up , slew	Ports [23:0] – Transmit Enable Strap option for RMII/GPSI
AD27, AH28, AG26, AE25, AG24, AE22, AJ23, AG20, AE18, AG18, AE16, AG16, AG14, AE13, AG12, AE10, AG10, AG8, AE7, AG6, AE4, AG4, AG3, AE3	M[23:0]_TXD[1]	Output, slew	Ports [23:0] – Transmit Data Bit [1]
AD28, AG29, AH26, AF25, AH24, AG22, AH22, AE17, AG19, AH18, AF16, AH16, AH14, AF13, AH12, AF10, AH10, AH8, AF7, AH6, AF4, AH4, AG2, AE2	M[23:0]_TXD[0]	Output, slew	Ports [23:0] – Transmit Data Bit [0]
GMII/TBI GiGabit Ethernet Access Ports 0 & 1			
U26, U25, V26, V25, W26, W25, Y27, Y26, AA26, AA25, AB26, AB25, AC26, AC25, AD26, AD25	M25_TXD[15:0]	Output	Transmit Data Bit [15:0] [7:0] - GMII [9:0] - TBI [15:0] - 2G
T28	M25_RX_DV	Input w/ pull down	Receive Data Valid
U28	M25_RX_ER	Input w/ pull up	Receive Error
R25	M25_CRS	Input w/ pull down	Carrier Sense

Ball No(s)	Symbol	I/O	Description
U29	M25_COL	Input w/ pull up	Collision Detected
T29	M25_RXCLK	Input w/ pull up	Receive Clock
U27, V29, V28, V27, W29, W28, W27, Y29, Y28, Y25, AA29, AA28, AA27, AB29, AB28, AB27	M25_RXD[15:0]	Input w/ pull up	Receive Data Bit [15:0] [7:0] - GMII [9:0] - TBI [15:0] - 2G
T26	M25_TX_EN	Output w/ pull up	Transmit Data Enable
R26	M25_TX_ER	Output w/ pull up	Transmit Error
T27	M25_MTXCLK	Input w/ pull down	MII Mode Transmit Clock
T25	M25_TXCLK	Output	Gigabit Transmit Clock
P29	GREF_CLK0	Input w/ pull up	Gigabit Reference Clock
G26, G25, H26, H25, J26, J25, K25, K26, M25, L26, M26, L25, N26, N25, P26, P25	M26_TXD[15:0]	Output	Transmit Data Bit [15:0] [7:0] - GMII [9:0] - TBI [15:0] - 2G
F28	M26_RX_DV	Input w/ pull down	Receive Data Valid
G28	M26_RX_ER	Input w/ pull up	Receive Error
E25	M26_CRS	Input w/ pull down	Carrier Sense
G29	M26_COL	Input w/ pull up	Collision Detected
F29	M26_RXCLK	Input w/ pull up	Receive Clock
G27, H29, H28, H27, J29, J28, J27, K29, K28, K27, L29, L28, L27, M29, M28, M27	M26_RXD[15:0]	Input w/ pull up	Receive Data Bit [15:0] [7:0] - GMII [9:0] - TBI [15:0] - 2G
F26	M26_TX_EN	Output w/ pull up	Transmit Data Enable
E26	M26_TX_ER	Output w/ pull up	Transmit Error
F27	M26_MTXCLK	Input w/ pull down	MII Mode Transmit Clock
F25	M26_TXCLK	Output	Gigabit Transmit Clock
N29	GREF_CLK1	Input w/ pull up	Gigabit Reference Clock
LED Interface			
C29	LED_CLK/TSTOUT0	I/O- TS with pull up	LED Serial Interface Output Clock
D29	LED_SYN/TSTOUT1	I/O- TS with pull up	LED Output Data Stream Envelope

Ball No(s)	Symbol	I/O	Description
E29	LED_BIT/TSTOUT2	I/O- TS with pull up	LED Serial Data Output Stream
B28	G1_RXTX#/TSTOUT3	I/O- TS with pull up	LED for Gigabit port 1 (receive + transmit)
C28	G1_DPCOL#/TSTOUT4	I/O- TS with pull up	LED for Gigabit port 1 (full duplex + collision)
D28	G1_LINK#/TSTOUT5	I/O- TS with pull up	LED for Gigabit port 1
E28	G2_RXTX#/TSTOUT6	I/O- TS with pull up	LED for Gigabit port 2 (receive + transmit)
A27	G2_DPCOL#/TSTOUT7	I/O- TS with pull up	LED for Gigabit port 2 (full duplex + collision)
B27	G2_LINK#/TSTOUT8	I/O- TS with pull up	LED for Gigabit port 2
C27	INIT_DONE/TSTOUT9	I/O- TS with pull up	System start operation
D27	INIT_START/TSTOUT10	I/O- TS with pull up	Start initialization
C26	CHECKSUM_OK/TS	I/O- TS with pull up	EEPROM read OK
D26	FCB_ERR/TSTOUT12	I/O- TS with pull up	FCB memory self test fail
D25	MCT_ERR/TSTOUT13	I/O- TS with pull up	MCT memory self test fail
D24	BIST_IN_PRC/TSTOUT14	I/O- TS with pull up	Processing memory self test
E24	BIST_DONE/TSTOUT15	I/O- TS with pull up	Memory self test done
Test Facility			
U3, C10	T_MODE0, T_MODE1	I/O-TS	Test Pins 00 – Test mode – Set Mode upon Reset, and provides NAND Tree test output during test mode 01 - Reserved - Do not use 10 - Reserved - Do not use 11 – Normal mode. Use external pull up for normal mode
F3	SCAN_EN	Input with pull down	Scan Enable
E27	SCANMODE	Input with pull down	1 – Enable Test mode 0 - Normal mode (open)

Ball No(s)	Symbol	I/O	Description
System Clock, Power, and Ground Pins			
E1	SCLK	Input	System Clock at 100 MHz
K12, K13, K17, K18 M10, N10, M20, N20, U10, V10, U20, V20, Y12, Y13, Y17, Y18	VDD	Power	+2.5 Volt DC Supply
F13, F14, F15, F16, F17, N6, P6, R6, T6, U6, N24, P24, R24, T24, U24, AD13, AD14, AD15, AD16, AD17	VCC	Power	+3.3 Volt DC Supply
M12, M13, M14, M15, M16, M17, M18, N12, N13, N14, N15, N16, N17, N18, P12, P13, P14, P15, P16, P17, P18, R12, R13, R14, R15, R16, R17, R18, T12, T13, T14, T15, T16, T17, T18, U12, U13, U14, U15, U16, U17, U18, V12, V13, V14, V15, V16, V17, V18,	VSS	Power Ground	Ground
F1	AVCC	Analog Power	Analog +2.5 Volt DC Supply
D1	AGND	Analog Ground	Analog Ground
MISC			
D22	SCANCOL	Input/ output	Scans the Collision signal of Home PHY
D23	SCANCLK	Output	Clock for scanning Home PHY collision and link
E23	SCANLINK	Input/ output	Link up signal from Home PHY
F2	RESIN#	Input	Reset Input
G2	RESETOUT#	Output	Reset PHY
Bootstrap Pins (Default = pull up, 1= pull up 0= pull down)			
After reset TSTOUT0 to TSTOUT15 are used by the LED interface.			
C29	TSTOUT0	Default 1	GIGA Link polarity 0 – active low 1 – active high

Ball No(s)	Symbol	I/O	Description
D29	TSTOUT1	Default 1	RMII MAC Power Saving Enable 0 – No power saving 1 – power saving
E29	TSTOUT2	Default: Enable (1) Recommend disable (0) with pull-down	Giga Half Duplex Support 0 - Disable 1 - Enable
B28	TSTOUT3	Default 1	Module detect enable 0 – Hot swap enable 1 – Hot swap disable
C28	TSTOUT4	Default 1	Memory is SBRAM/ZBT 0 – ZBT 1 – Pipeline SBRAM
D28	TSTOUT5	Default 1	Scan Speed: $\frac{1}{4}$ SCLK or SCLK 0 – $\frac{1}{4}$ SCLK (HPNA) 1 - SCLK
E28	TSTOUT6	Default 1	CPU Port Mode 0 - 8 bit Bus Mode 1 - 16 bit Bus Mode
A27	TSTOUT7	Default 1	Memory Size 0 - 256 K x 32 or 256 K x 64 (4 M total) 1 - 128 K x 32 or 128 K x 64 (2 M total)
B27	TSTOUT8	Default 1	EEPROM Installed 0 – EEPROM installed 1 – EEPROM not installed
C27	TSTOUT9	Default 1	MCT Aging 0 – MCT aging disable 1 – MCT aging enable
D27	TSTOUT10	Default 1	FCB Aging 0 - FCB aging disable 1 – FCB aging enable
C26	TSTOUT11	Default 1	Timeout Reset 0 – Time out reset disable 1 – Time out reset enable. Issue reset if any state machine did not go back to idle for 5sec.
D26	TSTOUT12		Reserved
D25	TSTOUT13	Default 1	FDB RAM depth (1 or 2 layers) 0 – 2 layer 1 – 1 layer
D24	TSTOUT14	Default 1	CPU installed 0 – CPU installed 1 – CPU not installed
E24	TSTOUT15	Default 1	SRAM Test Mode 0 – Enable test mode 1 – Normal operation

Ball No(s)	Symbol	I/O	Description
T26, R26	G0_TXEN, G0_TXER	Default: PCS	Giga0 Mode: G0_TXEN G0_TXER 0 0 MII 0 1 2G 1 0 GMII 1 1 PCS
F26, E26	G1_TXEN, G1_TXER	Default: PCS	Giga1 Mode: G1_TXEN G1_TXER 0 0 MII 0 1 2G 1 0 GMII 1 1 PCS
AD29, AG28, AJ26, AE26, AJ24, AE23, AJ22, AJ20, AE20, AJ18, AJ21, AJ16, AJ14, AE14, AJ12, AE11, AJ10, AJ8, AE8, AJ6, AE5, AJ4, AG1, AE1	M[23:0] TXEN	Default: RMII	0 – GPSI 1 – RMII
C21	P_D[9]	Must be pulled-down	Reserved. Must be pulled-down.
C19, B19, A19	P_D[15:13]	Default: 111	Programmable delay for internal OE_CLK from SCLK input. The OE_CLK is used for generating the OE0 and OE1 signals Suggested value is 001.
C20, B20, A20	P_D[12:10]	Default: 111	Programmable delay for LA_CLK and LB_CLK from internal OE_CLK. The LA_CLK and LB_CLK delay from SCLK is the sum of the delay programmed in here and the delay in P_D[15:13]. Suggested value is 011.
B22, A22, C23, B23, A23, C24	P_D[5:0]	Default: 111111	Dedicated Port Mirror Mode. The first 5 bits select the port to be mirrored. The last bit selects either ingress or egress data.

Notes

= Active low signal

Input = Input signal

In-ST = Input signal with Schmitt-Trigger

Output = Output signal (Tri-State driver)

Out-OD = Output signal with Open-Drain driver

I/O-TS = Input & Output signal with Tri-State driver

I/O-OD = Input & Output signal with Open-Drain driver

15.2.2 Ball – Signal Descriptions in Unmanaged Mode

Ball No(s)	Symbol	I/O	Description
I²C Interface Note: In unmanaged mode, Use I²C and Serial control interface to configure the system			
A24	SCL	Output	I ² C Data Clock
A25	SDA	I/O-TS with internal pull up	I ² C Data I/O
Serial Control Interface			
A26	STROBE	Input with weak internal pull up	Serial Strobe Pin
B26	D0	Input with weak internal pull up	Serial Data Input
C25	AUTOFD	Output with pull up	Serial Data Output (AutoFD)
Frame Buffer Interface			
D20, B21, D19, E19, D18, E18, D17, E17, D16, E16, D15, E15, D14, E14, D13, E13, D21, E21, A18, B18, C18, A17, B17, C17, A16, B16, C16, A15, B15, C15, A14, B14, D9, E9, D8, E8, D7, E7, D6, E6, D5, E5, D4, E4, D3, E3, D2, E2, A7, B7, A6, B6, C6, A5, B5, C5, A4, B4, C4, A3, B3, C3, B2, C2	LA_D[63:0]	I/O-TS with pull up	Frame Bank A– Data Bit [63:0]
C14, A13, B13, C13, A12, B12, C12, A11, B11, C11, D11, E11, A10, B10, D10, E10, A8, C7	LA_A[20:3]	Output	Frame Bank A – Address Bit [20:3]
B8	LA_ADSC#	Output with pull up	Frame Bank A Address Status Control
C1	LA_CLK	Output with pull up	Frame Bank A Clock Input
C9	LA_WE#	Output with pull up	Frame Bank A Write Chip Select for one layer SRAM application

Ball No(s)	Symbol	I/O	Description
D12	LA_WE0#	Output with pull up	Frame Bank A Write Chip Select for lower layer of two bank SRAM application
E12	LA_WE1#	Output with pull up	Frame Bank A Write Chip Select for upper bank of two layer SRAM application
C8	LA_OE#	Output with pull up	Frame Bank A Read Chip Select for one layer SRAM application
A9	LA_OE0#	Output with pull up	Frame Bank A Read Chip Select for lower layer of two layers SRAM application
B9	LA_OE1#	Output with pull up	Frame Bank A Read Chip Select for upper layer of two layers SRAM application
F4, F5, G4, G5, H4, H5, J4, J5, K4, K5, L4, L5, M4, M5, N4, N5, G3, H1, H2, H3, J1, J2, J3, K1, K2, K3, L1, L2, L3, M1, M2, M3, U4, U5, V4, V5, W4, W5, Y4, Y5, AA4, AA5, AB4, AB5, AC4, AC5, AD4, AD5, W1, Y1, Y2, Y3, AA1, AA2, AA3, AB1, AB2, AB3, AC1, AC2, AC3, AD1, AD2, AD3	LB_D[63:0]	I/O-TS with pull up.	Frame Bank B– Data Bit [63:0]
N3, N2, N1, P3, P2, P1, R5, R4, R3, R2, R1, T5, T4, T3, T2, T1, W3, W2	LB_A[20:3]	Output	Frame Bank B – Address Bit [20:3]
V1	LB_ADSC#	Output with pull up	Frame Bank B Address Status Control
G1	LB_CLK	Output with pull up	Frame Bank B Clock Input
V3	LB_WE#	Output with pull up	Frame Bank B Write Chip Select for one layer SRAM application

Ball No(s)	Symbol	I/O	Description
P4	LB_WE0#	Output with pull up	Frame Bank B Write Chip Select for lower layer of two layers SRAM application
P5	LB_WE1#	Output with pull up	Frame Bank B Write Chip Select for upper layer of two layers SRAM application
V2	LB_OE#	Output with pull up	Frame Bank B Read Chip Select for one layer SRAM application
U1	LB_OE0#	Output with pull up	Frame Bank B Read Chip Select for lower layer of two layers SRAM application
U2	LB_OE1#	Output with pull up	Frame Bank B Read Chip Select for upper layer of two layers SRAM application
Fast Ethernet Access Ports [23:0] RMII			
R28	M_MDC	Output	MII Management Data Clock – (Common for all MII Ports [23:0])

C29	LED_CLK/TSTOUT0	I/O- TS with pull up	LED Serial Interface Output Clock
D29	LED_SYN/TSTOUT1	I/O- TS with pull up	LED Output Data Stream Envelope
E29	LED_BIT/TSTOUT2	I/O- TS with pull up	LED Serial Data Output Stream
B28	G1_RXTX#/TSTOUT3	I/O- TS with pull up	LED for Gigabit port 1 (receive + transmit)
C28	G1_DPCOL#/TSTOUT4	I/O- TS with pull up	LED for Gigabit port 1 (full duplex + collision)
D28	G1_LINK#/TSTOUT5	I/O- TS with pull up	LED for Gigabit port 1
E28	G2_RXTX#/TSTOUT6	I/O- TS with pull up	LED for Gigabit port 2 (receive + transmit)
A27	G2_DPCOL#/TSTOUT7	I/O- TS with pull up	LED for Gigabit port 2 (full duplex + collision)
B27	G2_LINK#/TSTOUT8	I/O- TS with pull up	LED for Gigabit port 2
C27	INIT_DONE/TSTOUT9	I/O- TS with pull up	System start operation
D27	INIT_START/TSTOUT10	I/O- TS with pull up	Start initialization
C26	CHECKSUM_OK/TSTOUT11	I/O- TS with pull up	EEPROM read OK
D26	FCB_ERR/TSTOUT12	I/O- TS with pull up	FCB memory self test fail
D25	MCT_ERR/TSTOUT13	I/O- TS with pull up	MCT memory self test fail
D24	BIST_IN_PRC/TSTOUT14	I/O- TS with pull up	Processing memory self test
E24	BIST_DONE/TSTOUT15	I/O- TS with pull up	Memory self test done
Trunk Enabale			
C22	TRUNK0	Input w/ weak internal pull down resistors	Trunk Port Enable in unmanaged mode In managed mode doesn't care
A21	TRUNK1	Input w/ weak internal pull down resistors	Trunk Port Enable in unmanaged mode In managed mode doesn't care
B24	TRUNK2	Input w/ weak internal pull down resistors	Trunk Port Enable in unmanaged mode In managed mode doesn't care

Ball No(s)	Symbol	I/O	Description
Test Facility			
U3, C10	T_MODE0, T_MODE1	I/O-TS	<p>Test Pins</p> <p>00 – Test mode – Set Mode upon Reset, and provides NAND Tree test output during test mode</p> <p>01 - Reserved - Do not use</p> <p>10 - Reserved - Do not use</p> <p>11 – Normal mode. Use external pull up for normal mode</p>
F3	SCAN_EN	Input with pull down	Scan Enable 0 - Normal mode (open)
E27	SCANMODE	Input with pull down	1 – Enable Test mode 0 - Normal mode (open)
System Clock, Power, and Ground Pins			
E1	SCLK	Input	System Clock at 100 MHz
K12, K13, K17, K18 M10, N10, M20, N20, U10, V10, U20, V20, Y12, Y13, Y17, Y18	VDD	Power	+2.5 Volt DC Supply
F13, F14, F15, F16, F17, N6, P6, R6, T6, U6, N24, P24, R24, T24, U24, AD13, AD14, AD15, AD16, AD17	VCC	Power	+3.3 Volt DC Supply
M12, M13, M14, M15, M16, M17, M18, N12, N13, N14, N15, N16, N17, N18, P12, P13, P14, P15, P16, P17, P18, R12, R13, R14, R15, R16, R17, R18, T12, T13, T14, T15, T16, T17, T18, U12, U13, U14, U15, U16, U17, U18, V12, V13, V14, V15, V16, V17, V18,	VSS	Power Ground	Ground

Ball No(s)	Symbol	I/O	Description
F1	AVCC	Analog Power	Analog +2.5 Volt DC Supply
D1	AGND	Analog Ground	Analog Ground
MISC			
D22	SCANCOL	Input	Scans the Collision signal of Home PHY
D23	SCANCLK	Input/ output	Clock for scanning Home PHY collision and link
E23	SCANLINK	Input	Link up signal from Home PHY
F2	RESIN#	Input	Reset Input
G2	RESETOUT#	Output	Reset PHY
E20, B25	RESERVED	N/A	Reserved Pins. Leave unconnected.
Bootstrap Pins (Default = pull up, 1= pull up 0= pull down)			
After reset TSTOUT0 to TSTOUT15 are used by the LED interface.			
C29	TSTOUT0	Default 1	GIGA Link polarity 0 – active low 1 – active high
D29	TSTOUT1	Default 1	RMII MAC Power Saving Enable 0 – No power saving 1 – power saving
E29	TSTOUT2		Reserved
B28	TSTOUT3	Default 1	Module detect enable 0 – Hot swap enable 1 – Hot swap disable
C28	TSTOUT4	Default 1	Memory is SBRAM/ZBT 0 – ZBT 1 – Pipeline SBRAM
D28	TSTOUT5	Default 1	Scan Speed: $\frac{1}{4}$ SCLK or SCLK 0 – $\frac{1}{4}$ SCLK (HPNA) 1 - SCLK
E28	TSTOUT6	Default 1	CPU Port Mode 0 - 8 bit Bus Mode 1 - 16 bit Bus Mode
A27	TSTOUT7	Default 1	Memory Size 0 - 256 K x 32 or 256 K x 64 (4 M total) 1 - 128 K x 32 or 128 K x 64 (2 M total)

Ball No(s)	Symbol	I/O	Description
B27	TSTOUT8	Default 1	EEPROM Installed 0 – EEPROM installed 1 – EEPROM not installed
C27	TSTOUT9	Default 1	MCT Aging 0 – MCT aging disable 1 – MCT aging enable
D27	TSTOUT10	Default 1	FCB Aging 0 – FCB aging disable 1 – FCB aging enable
C26	TSTOUT11	Default 1	Timeout Reset 0 – Time out reset disable 1 – Time out reset enable. Issue reset if any state machine did not go back to idle for 5sec.
D26	TSTOUT12		Reserved
D25	TSTOUT13	Default 1	FDB RAM depth (1 or 2 layers) 0 – 2 layer 1 – 1 layer
D24	TSTOUT14	Default 1	CPU installed 0 – CPU installed 1 – CPU not installed
E24	TSTOUT15	Default 1	SRAM Test Mode 0 – Enable test mode 1 – Normal operation
T26, R26	G0_TXEN, G0_TXER	Default: PCS	Giga0 Mode: G0_TXEN G0_TXER 0 0 MII 0 1 2G 1 0 GMII 1 1 PCS
F26, E26	G1_TXEN, G1_TXER	Default: PCS	Giga1 Mode: G1_TXEN G1_TXER 0 0 MII 0 1 2G 1 0 GMII 1 1 PCS

Ball No(s)	Symbol	I/O	Description
AD29, AG28, AJ26, AE26, AJ24, AE23, AJ22, AJ20, AE20, AJ18, AJ21, AJ16, AJ14, AE14, AJ12, AE11, AJ10, AJ8, AE8, AJ6, AE5, AJ4, AG1, AE1,	M[23:0]_TXEN	Default: RMII	0 – GPSI 1 - RMII
C21	P_D	Must be pulled-down	Reserved. Must be pulled-down.
C19, B19, A19	OE_CLK[2:0]	Default: 111	Programmable delay for internal OE_CLK from SCLK input. The OE_CLK is used for generating the OE0 and OE1 signals Suggested value is 001.
C20, B20, A20	LA_CLK[2:0]	Default: 111	Programmable delay for LA_CLK and LB_CLK from internal OE_CLK. The LA_CLK and LB_CLK delay from SCLK is the sum of the delay programmed in here and the delay in P_D[15:13]. Suggested value is 011.
B22, A22, C23, B23, A23, C24	MIRROR[5:0]	Default: 111111	Dedicated Port Mirror Mode. The first 5 bits select the port to be mirrored. The last bit selects either ingress or egress data.

Note:

= Active low signal

Input = Input signal

In-ST = Input signal with Schmitt-Trigger

Output = Output signal (Tri-State driver)

Out-OD = Output signal with Open-Drain driver

I/O-TS = Input & Output signal with Tri-State driver

I/O-OD = Input & Output signal with Open-Drain driver

15.5 AC/DC Timing

15.5.1 Absolute Maximum Ratings

Storage Temperature -65°C to $+150^{\circ}\text{C}$

Operating Temperature -40°C to $+85^{\circ}\text{C}$

Maximum Junction Temperature $+125^{\circ}\text{C}$

Supply Voltage VCC with Respect to VSS $+3.0\text{ V}$ to $+3.6\text{ V}$

Supply Voltage VDD with Respect to VSS $+2.38\text{ V}$ to $+2.75\text{ V}$

Voltage on Input Pins -0.5 V to $(\text{VCC} + 3.3\text{ V})$

Caution: Stress above those listed may damage the device. Exposure to the Absolute Maximum Ratings for extended periods may affect device reliability. Functionality at or above these limits is not implied.

15.5.2 DC Electrical Characteristics

$\text{VCC} = 3.0\text{ V}$ to 3.6 V ($3.3\text{ V} \pm 10\%$) $T_{\text{AMBIENT}} = -40^{\circ}\text{C}$ to $+85^{\circ}\text{C}$

$\text{VDD} = 2.5\text{ V} \pm 10\% - 5\%$

15.5.3 Recommended Operating Conditions

Symbol	Parameter Description	Min.	Typ.	Max.	Unit
f_{osc}	Frequency of Operation		100		MHz
I_{CC}	Supply Current – @ 100 MHz (VCC=3.3 V)			450	mA
I_{DD}	Supply Current – @ 100 MHz (VDD=2.5 V)			1500	mA
V_{OH}	Output High Voltage (CMOS)	2.4			V
V_{OL}	Output Low Voltage (CMOS)			0.4	V
V_{IH-TTL}	Input High Voltage (TTL 5 V tolerant)	2.0		VCC + 2.0	V
V_{IL-TTL}	Input Low Voltage (TTL 5 V tolerant)			0.8	V
I_{IL}	Input Leakage Current (0.1 V < V_{IN} < VCC) (all pins except those with internal pull-up/pull-down resistors)			10	μ A
I_{OL}	Output Leakage Current (0.1 V < V_{OUT} < VCC)			10	μ A
C_{IN}	Input Capacitance			5	pF
C_{OUT}	Output Capacitance			5	pF
$C_{I/O}$	I/O Capacitance			7	pF
θ_{ja}	Thermal resistance with 0 air flow			11.2	C/W
θ_{ja}	Thermal resistance with 1 m/s air flow			10.2	C/W
θ_{ja}	Thermal resistance with 2 m/s air flow			8.9	C/W
θ_{jc}	Thermal resistance between junction and case			3.1	C/W
θ_{jb}	Thermal resistance between junction and board			6.6	C/W

15.5.4 Typical Reset & Bootstrap Timing Diagram

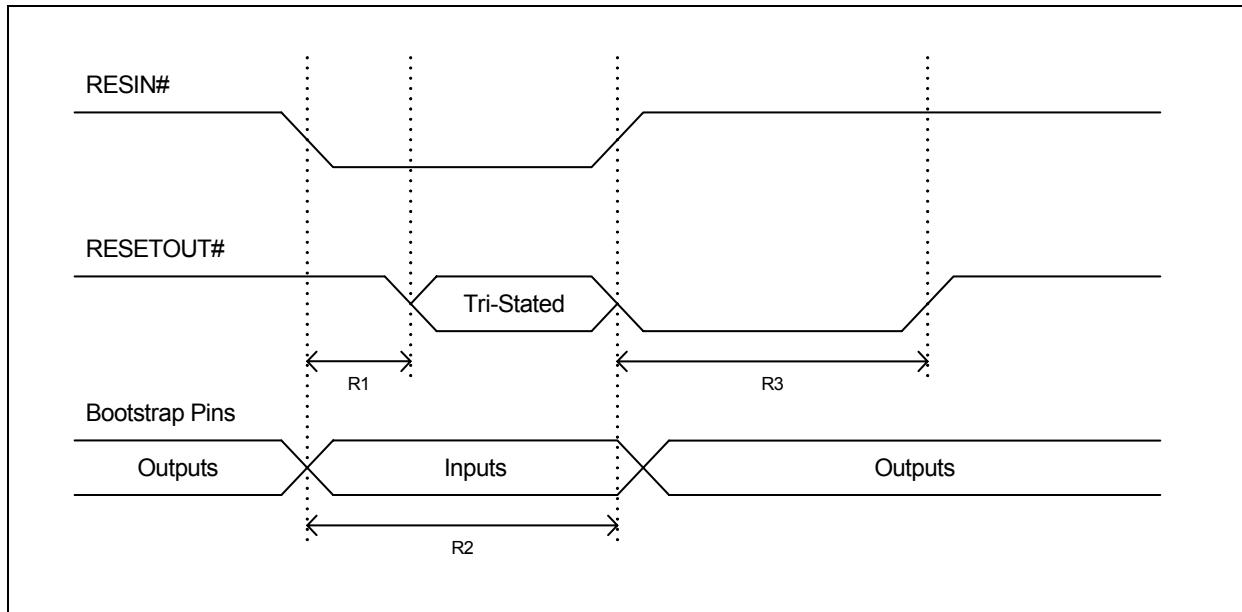

Figure 16 - Typical Reset & Bootstrap Timing Diagram

Symbol	Parameter	Min.	Typ.	Note:
R1	Delay until RESETOUT# is tri-stated		10 ns	RESETOUT# state is then determined by the external pull-up/down resistor
R2	Bootstrap stabilization	1 μ s	10 μ s	Bootstrap pins sampled on rising edge of RESIN# ^a
R3	RESETOUT# assertion		2 ms	

Table 14 - Reset & Bootstrap Timing

a. The TSTOUT[8:0] pins will switch over to the LED interface functionality in 3 SCLK cycles after RESIN# goes high

15.5.5 Typical CPU Timing Diagram for a CPU Write Cycle

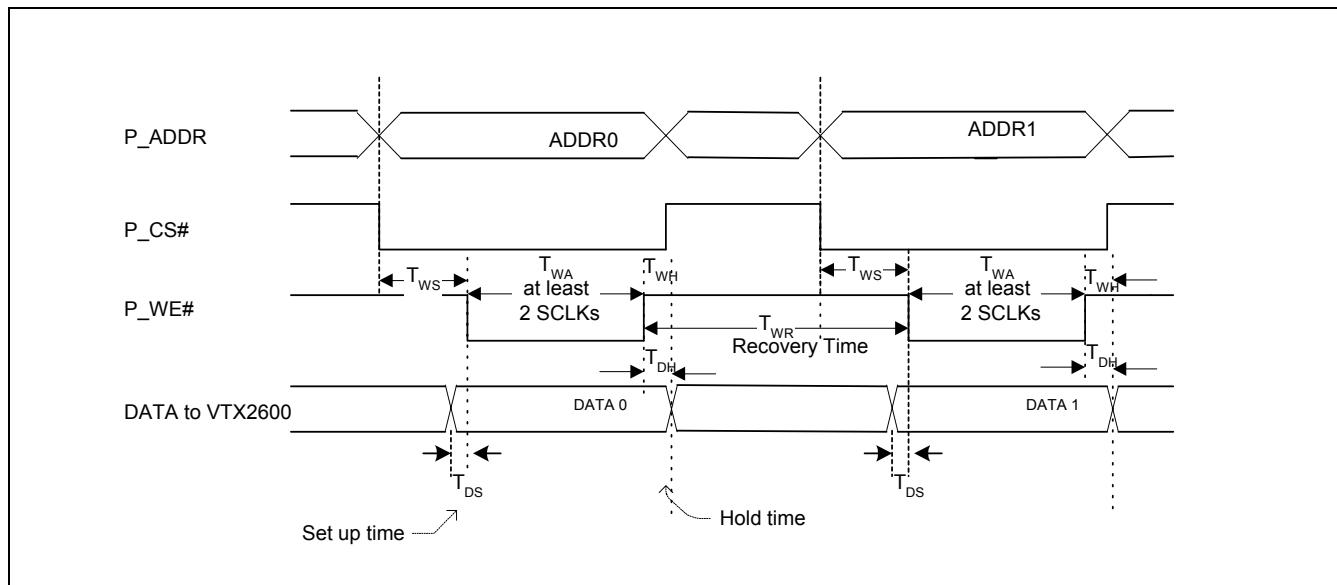

Figure 17 - Typical CPU Timing Diagram for a CPU Write Cycle

Description		(SCLK=100 Mhz)		(SCLK=125 Mhz)		Refer to Figure 17
Write Cycle	Symbol	Min.	Max.	Min.	Max.	
Write Set up Time	T _{WS}	10		10		
Write Active Time	T _{WA}	20		16		At least 2 SCLK
Write Hold Time	T _{WH}	2		2		
Write Recovery time	T _{WR}	30		24		At least 3 SCLK
Data Set Up time	T _{DS}	10		10		
Data Hold time	T _{DH}	2		2		

15.5.6 Typical CPU Timing Diagram for a CPU Read Cycle

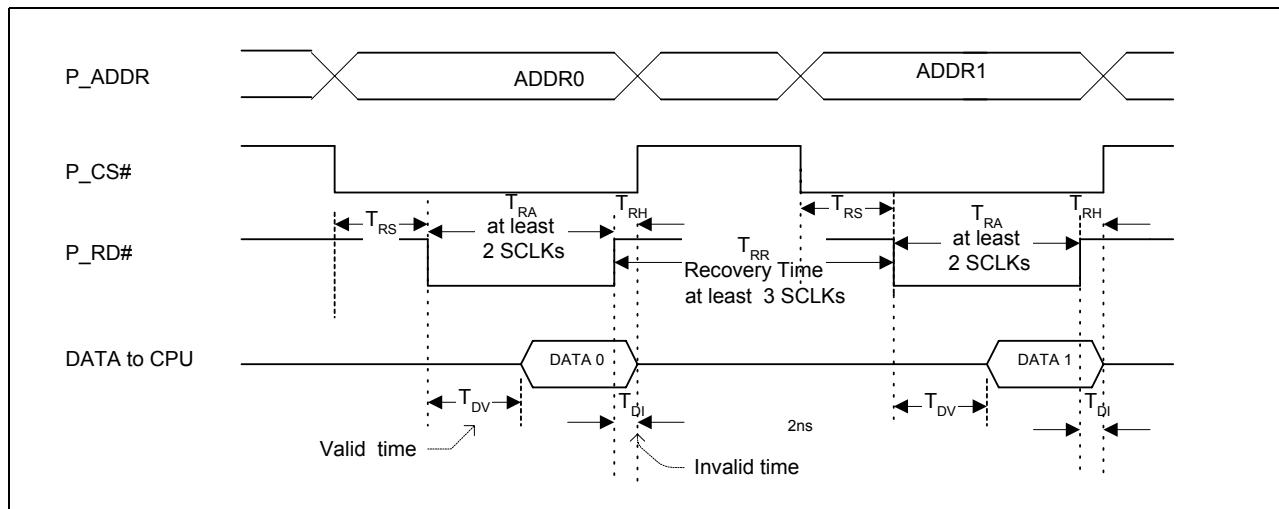

Figure 18 - Typical CPU Timing Diagram for a CPU Read Cycle

Description		(SCLK=100 Mhz)		(SCLK=125 Mhz)		Refer to Figure 18
Read Cycle	Symbol	Min.	Max.	Min.	Max.	
Read Set up Time	T_{RS}	10		10		
Read Active Time	T_{RA}	20		16		At least 2 SCLK
Read Hold Time	T_{RH}	2		2		
Read Recovery time	T_{RR}	30		24		At least 3 SCLK
Data Valid time	T_{DV}		10		10	
Data Invalid time	T_{DI}		6		6	

15.6 Local Frame Buffer SBRAM Memory Interface

15.6.1 Local SBRAM Memory Interface

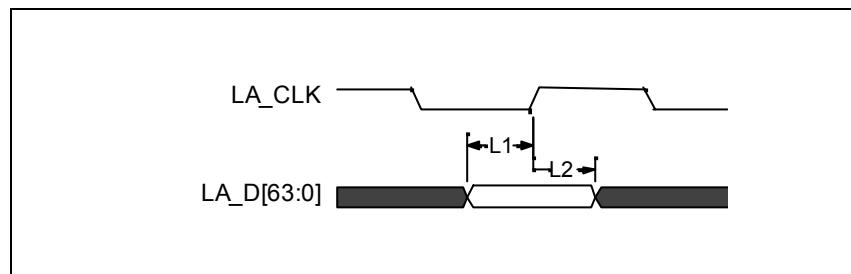

Figure 19 - Local Memory Interface – Input Setup and Hold Timing

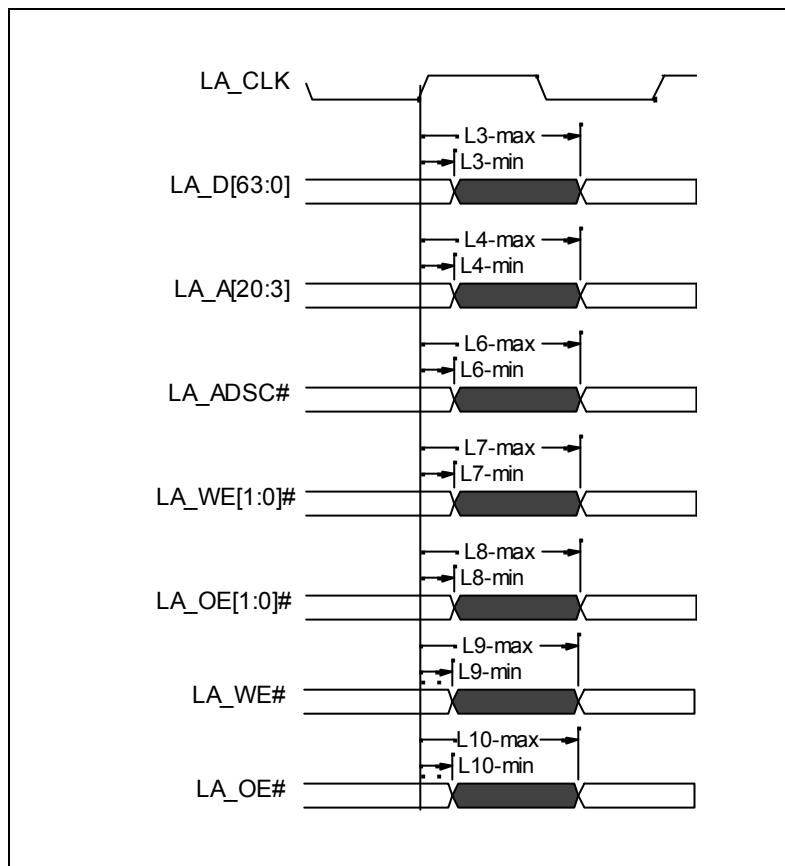

Figure 20 - Local Memory Interface - Output Valid Delay Timing

Symbol	Parameter	-100 MHz		Note
		Min. (ns)	Max. (ns)	
L1	LA_D[63:0] input set-up time	4		
L2	LA_D[63:0] input hold time	1.5		
L3	LA_D[63:0] output valid delay	1.5	7	$C_L = 25 \text{ pf}$
L4	LA_A[20:3] output valid delay	2	7	$C_L = 30 \text{ pf}$
L6	LA_ADSC# output valid delay	1	7	$C_L = 30 \text{ pf}$
L7	LA_WE[1:0]# output valid delay	1	7	$C_L = 25 \text{ pf}$
L8	LA_OE[1:0]# output valid delay	-1	1	$C_L = 25 \text{ pf}$
L9	LA_WE# output valid delay	1	7	$C_L = 25 \text{ pf}$
L10	LA_OE# output valid delay	1	5	$C_L = 25 \text{ pf}$

Table 15 - AC Characteristics – Local Frame Buffer SBRAM Memory Interface

15.7 Local Switch Database SBRAM Memory Interface

15.7.1 Local SBRAM Memory Interface

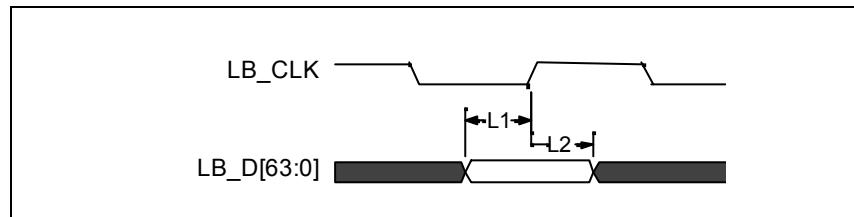

Figure 21 - Local Memory Interface – Input Setup and Hold Timing

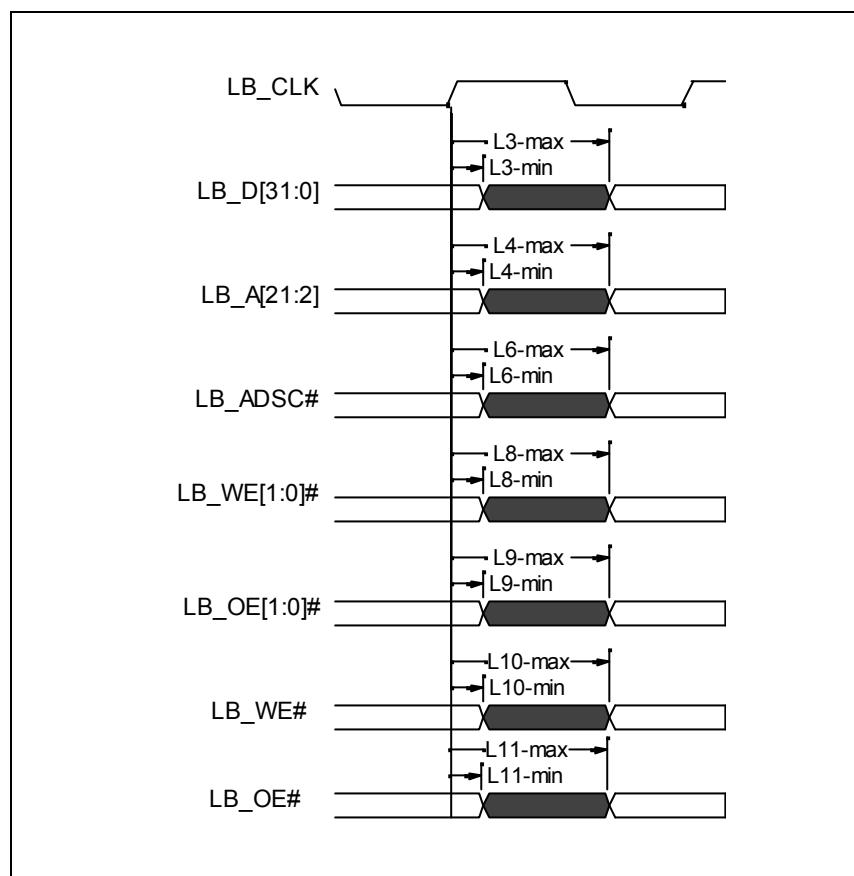

Figure 22 - Local Memory Interface - Output Valid Delay Timing

Symbol	Parameter	-100 MHz		Note:
		Min. (ns)	Max. (ns)	
L1	LB_D[63:0] input set-up time	4		
L2	LB_D[63:0] input hold time	1.5		
L3	LB_D[63:0] output valid delay	1.5	7	$C_L = 25 \text{ pf}$
L4	LB_A[20:3] output valid delay	2	7	$C_L = 30 \text{ pf}$
L6	LB_ADSC# output valid delay	1	7	$C_L = 30 \text{ pf}$
L8	LB_WE[1:0]#output valid delay	1	7	$C_L = 25 \text{ pf}$
L9	LB_OE[1:0]# output valid delay	-1	1	$C_L = 25 \text{ pf}$
L10	LB_WE# output valid delay	1	7	$C_L = 25 \text{ pf}$
L11	LB_OE# output valid delay	1	5	$C_L = 25 \text{ pf}$

15.8.7 SCANLINK SCANCOL Output Delay Timing

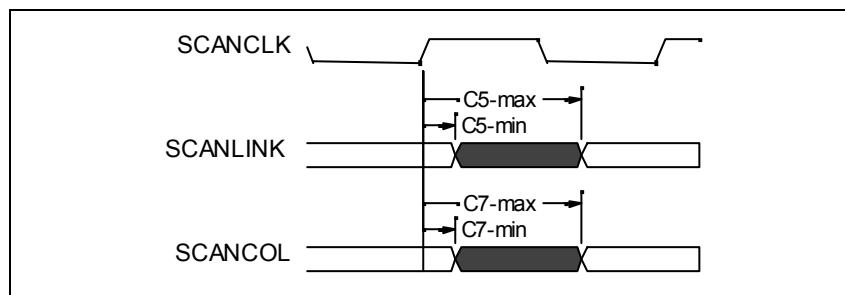

Figure 34 - SCANLINK SCANCOL Output Delay Timing

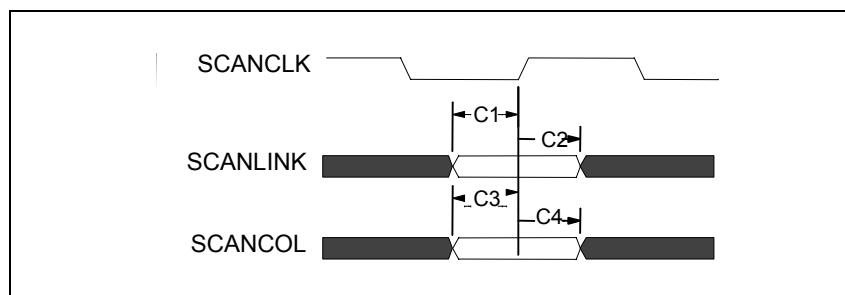

Figure 35 - SCANLINK, SCANCOL Setup Timing

Symbol	Parameter	-25 MHz		Note
		Min. (ns)	Max. (ns)	
C1	SCANLINK input set-up time	20		
C2	SCANLINK input hold time	2		
C3	SCANCOL input setup time	20		
C4	SCANCOL input hold time	1		
C5	SCANLINK output valid delay	0	10	$C_L = 30\text{pf}$
C7	SCANCOL output valid delay	0	10	$C_L = 30\text{pf}$

Table 25 - SCANLINK, SCANCOL Timing

15.9 MDIO Input Setup and Hold Timing

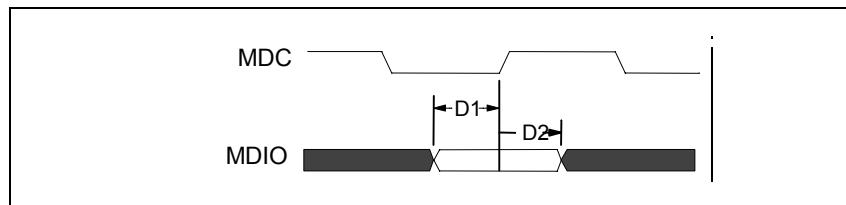

Figure 36 - MDIO Input Setup and Hold Timing

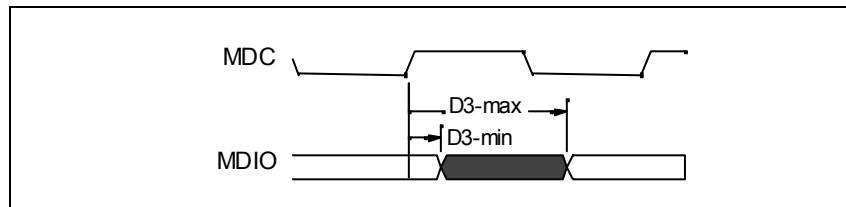

Figure 37 - MDIO Output Delay Timing

Symbol	Parameter	1 MHz		Note:
		Min. (ns)	Max. (ns)	
D1	MDIO input setup time	10		
D2	MDIO input hold time	2		
D3	MDIO output delay time	1	20	$C_L = 50 \text{ pf}$

Table 26 - MDIO Timing

15.9.1 I²C Input Setup Timing

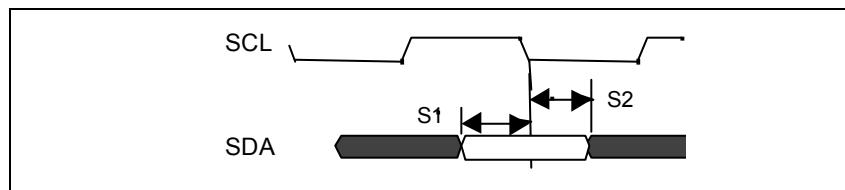

Figure 38 - I²C Input Setup Timing

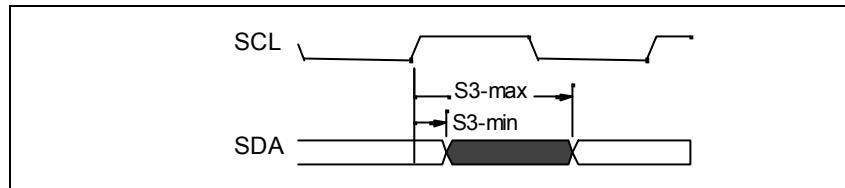

Figure 39 - I²C Output Delay Timing

Symbol	Parameter	50 KHz		Note
		Min. (ns)	Max. (ns)	
S1	SDA input setup time	20		
S2	SDA input hold time	1		
S3*	SDA output delay time	4 usec	6 usec	$C_L = 30 \text{ pf}$

* Open Drain Output. Low to High transistor is controlled by external pullup resistor.

Table 27 - I²C Timing

15.9.2 Serial Interface Setup Timing

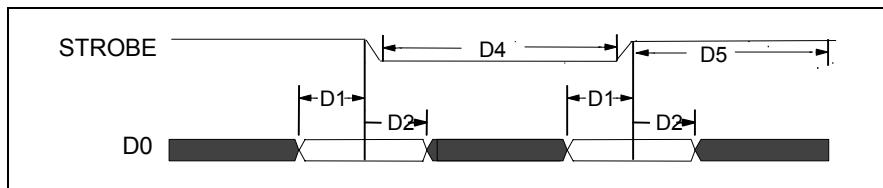

Figure 40 - Serial Interface Setup Timing

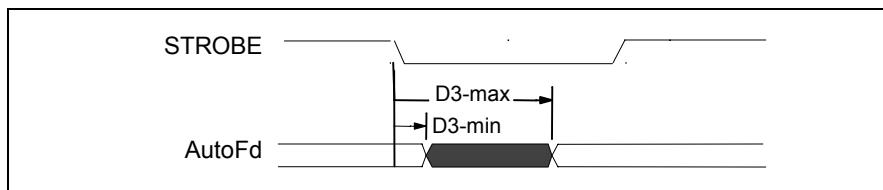

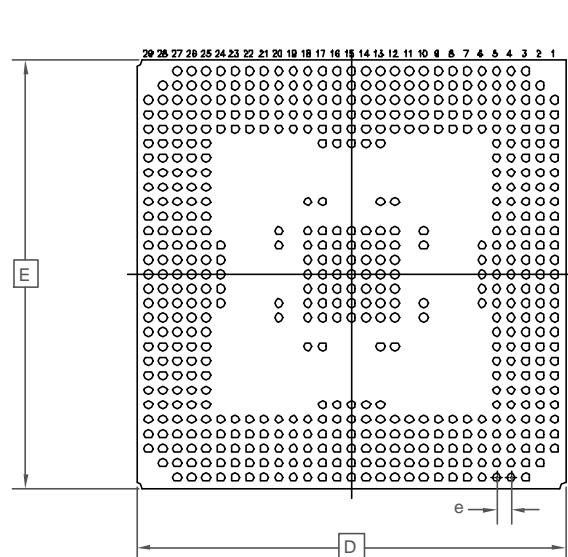

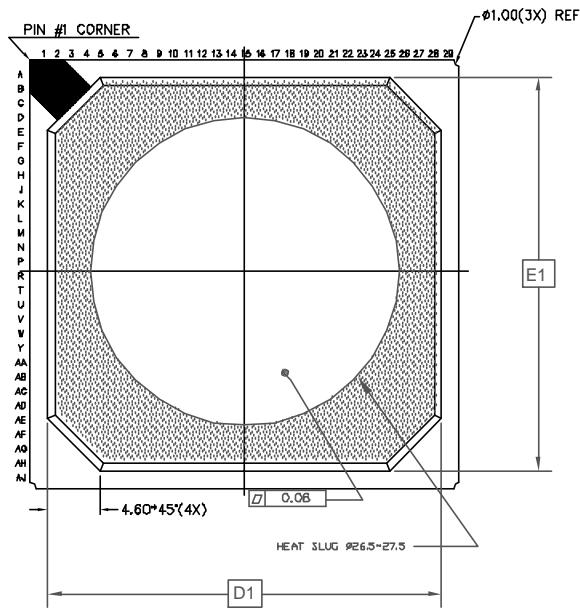

Figure 41 - Serial Interface Output Delay Timing

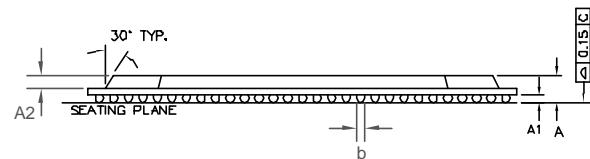

Symbol	Parameter	Min. (ns)	Max. (ns)	Note
D1	D0 setup time	20		
D2	D0 hold time	3 μ s		
D3	AutoFd output delay time	1	50	$C_L = 100 \text{ pf}$
D4	Strobe low time	5 μ s		
D5	Strobe high time	5 μ s		

Table 28 - Serial Interface Timing

DIMENSION	MIN	MAX
A	2.20	2.46
A1	0.50	0.70
A2	1.17	REF
D	37.30	37.70
D1	34.50	REF
E	37.30	37.70
E1	34.50	REF
b	0.60	0.90
e	1.27	
N	553	

Conforms to JEDEC MS - 034

NOTE:

1. CONTROLLING DIMENSIONS ARE IN MM
2. DIMENSION "b" IS MEASURED AT THE MAXIMUM SOLDER BALL DIAMETER
3. SEATING PLANE IS DEFINED BY THE SPHERICAL CROWNS OF THE SOLDER BALLS.
4. N IS THE NUMBER OF SOLDER BALLS
5. NOT TO SCALE.
6. SUBSTRATE THICKNESS IS 0.56 MM
