

### Low Voltage/Low Power

### CMOS 16-bit Microcontrollers

### TMP93CM40F/TMP93CM41F

#### 1. Outline and Device Characteristics

TMP93CM40/M41 are high-speed advanced 16-bit microcontrollers developed for controlling medium to large-scale equipment. The TMP93CM41 does not have a ROM, the TMP96CM40 has a built-in ROM. Otherwise, the devices function in the same way.

TMP93CM40F/TMP93CM41F are housed in 100-pin mini flat package. Device characteristics are as follows:

- (1) Original 16-bit CPU (900L CPU)
  - TLCS-90 instruction mnemonic upward compatible.
  - 16M-byte linear address space
  - General-purpose registers and register bank system
  - 16-bit multiplication/division and bit transfer/arithmetic instructions
  - High-speed micro DMA
    - 4 channels (1.6  $\mu$ s/2 bytes at 20MHz)
- (2) Minimum instruction execution time
  - 200ns at 20MHz
- (3) Internal RAM: 2K byte  
Internal ROM:

TMP93CM40	32K-byte ROM
TMP93CM41	None

- (4) External memory expansion
  - Can be expanded up to 16M bytes (for both programs and data).
  - AM8/ $\overline{16}$  pin (select the external data bus width).
  - Can mix 8- and 16-bit external data buses.
    - ...Dynamic data bus sizing
- (5) 8-bit timer: 2 channels
- (6) 8-bit PWM timer: 2 channels
- (7) 16-bit timer: 2 channels
- (8) Pattern generator: 4 bits, 2 channels
- (9) Serial interface: 2 channels
- (10) 10-bit A/D converter: 4 channels
- (11) Watchdog timer
- (12) Chip select/wait controller: 3 blocks
- (13) Interrupt functions
  - 2 CPU interrupts... SWI instruction, and Illegal instruction
  - 14 internal interrupts  7-level priority can be set.
  - 6 external interrupts
- (14) I/O ports:
  - 79 pins for TMP93CM40 and 61 pins for TMP93CM41
- (15) Standby function : 4 halt modes (RUN, IDLE2, IDLE1, STOP)
- (16) Clock Gear Function
  - High-frequency clock can be changed  $f_c$  to  $f_c/16$
  - Dual clock operation
- (17) Wide Operating Voltage
  - $V_{CC} = 2.7$  to 5.5V

The information contained here is subject to change without notice.  
The information contained herein is presented only as guide for the applications of our products. No responsibility is assumed by TOSHIBA for any infringements of patents or other rights of the third parties which may result from its use. No license is granted by implication or otherwise under any patent or patent rights of TOSHIBA or others. These TOSHIBA products are intended for usage in general electronic equipments (office equipment, communication equipment, measuring equipment, domestic electrification, etc.) Please make sure that you consult with us before you use these TOSHIBA products in equipments which require high quality and/or reliability, and in equipments which could have major impact to the welfare of human life (atomic energy control, spaceship, traffic signal, combustion control, all types of safety devices, etc.). TOSHIBA cannot accept liability to any damage which may occur in case these TOSHIBA products were used in the mentioned equipments without prior consultation with TOSHIBA.

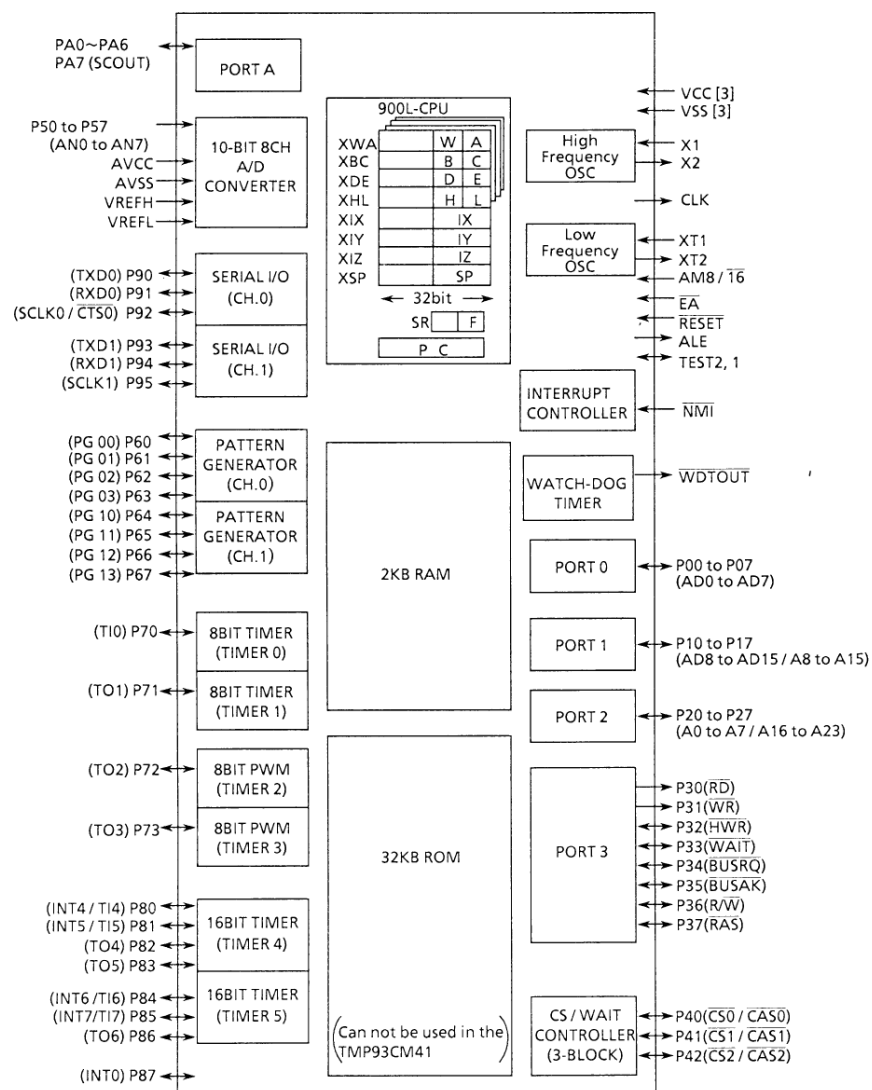

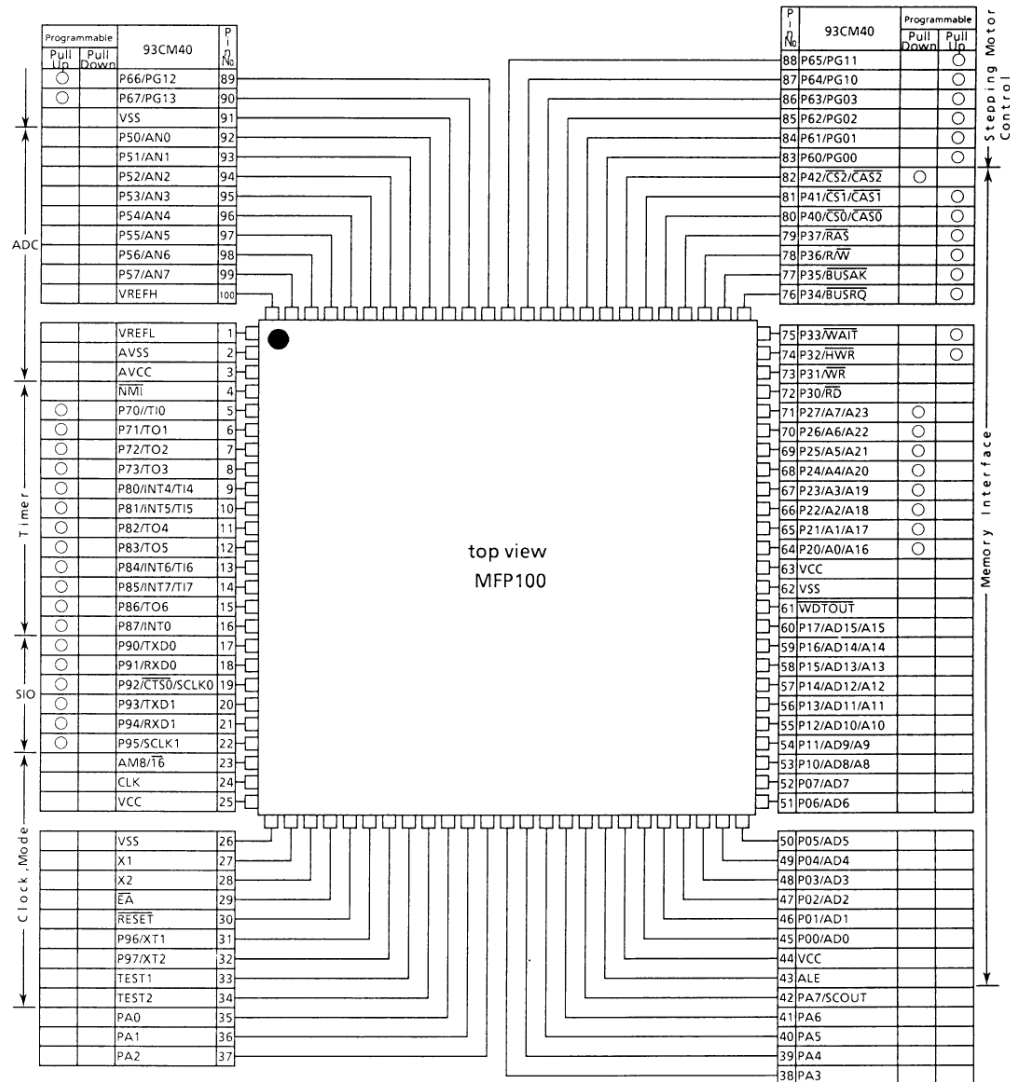

Figure 1. TMP93CM40/TMP93CM41 Block Diagram

## 2. Pin Assignment and Functions

The assignment of input/output pins for TMP93CM40/TMP93CM41, their name and outline functions are described below.

### 2.1 Pin Assignment

Figure 2.1 shows pin assignment of TMP93CM40F/TMP93CM41F.

(Note) Because the TMP93CM41 does not have an internal ROM, P00 to P17 pins are fixed to AD0 to AD15 (the case of AM8 / T6 = 0), or to AD0 to AD7, A8 to A15 (the case of AM8 / T6 = 1); P30 to RD; and P31 to WR.

Figure 2.1. Pin Assignment (100-pin MFP)

## 2.2 Pin Names and Functions

The names of input/output pins and their functions are described below.

**Table 2.2. Pin Names and Functions**

Pin Name	Number of Pins	I/O	Functions
P00 to P07 AD0 to AD7	8	I/O Tri-state	Port 0: I/O port that allows I/O to be selected on a bit basis Address / data (lower): 0 to 7 for address / data bus
P10 to P17 AD8 to AD15 A8 to A15	8	I/O Tri-state Output	Port 1: I/O port that allows I/O to be selected on a bit basis Address data (upper): 8 to 15 for address / data bus Address: 8 to 15 for address bus
P20 to P27 A0 to A7 A16 to A23	8	I/O Output Output	Port 2: I/O port that allows selection of I/O on a bit basis (with pull-down resistor) Address: 0 to 7 for address bus Address: 16 to 23 for address bus
P30 $\overline{RD}$	1	Output Output	Port 30: Output port Read: Strobe signal for reading external memory
P31 $\overline{WR}$	1	Output Output	Port 31: Output port Write: Strobe signal for writing data on pins AD0 to 7
P32 $\overline{HWR}$	1	I/O Output	Port 32: I/O port (with pull-up resistor) High write: Strobe signal for writing data on pins AD8 to 15
P33 $\overline{WAIT}$	1	I/O Input	Port 33: I/O port (with pull-up resistor) Wait: Pin used to request CPU bus wait
P34 $\overline{BUSRQ}$	1	I/O Input	Port 34: I/O port (with pull-up resistor) Bus request: Signal used to request high impedance for AD0 to 15, A0 to 23, $\overline{RD}$ , $\overline{WR}$ , $\overline{HWR}$ , $\overline{R/W}$ , $\overline{RAS}$ , $\overline{CS0}$ , $\overline{CS1}$ , and $\overline{CS2}$ pins. (For external DMAC)
P35 $\overline{BUSAK}$	1	I/O Output	Port 35: I/O (with pull-up resistor) Bus acknowledge: Signal indicating that AD0 to 15, A0 to 23, $\overline{RD}$ , $\overline{WR}$ , $\overline{HWR}$ , $\overline{R/W}$ , $\overline{RAS}$ , $\overline{CS0}$ , $\overline{CS1}$ , and $\overline{CS2}$ pins are at high impedance after receiving $\overline{BUSRQ}$ . (For external DMAC)
P36 $\overline{R/W}$	1	I/O Output	Port 36: I/O port (with pull-up resistor) Read/write: 1 represents read or dummy cycle; 0, write cycle.
P37 $\overline{RAS}$	1	I/O Output	Port 37: I/O port (with pull-up resistor) Row address strobe: Outputs RAS strobe for DRAM.
P40 $\overline{CS0}$ $\overline{CAS0}$	1	I/O Output Output	Port 40: I/O port (with pull-up resistor) Chip select 0: Outputs 0 when address is within specified address area. Column address strobe 0: Outputs CAS strobe for DRAM when address is within specified address area.

Note: With the external DMA controller, this device's built-in memory or built-in I/O cannot be accessed using the  $\overline{BUSRQ}$  and  $\overline{BUSAK}$  pins.

Pin Name	Number of Pins	I/O	Functions
P41 <u>CS1</u> <u>CAS1</u>	1	I/O Output Output	Port 41: I/O port (with pull-up resistor) Chip select 1: Outputs 0 if address is within specified address area. Column address strobe 1: Outputs <u>CAS</u> strobe for DRAM if address is within specified address area.
P42 <u>CS2</u> <u>CAS2</u>	1	I/O Output Output	Port 42: I/O port (with pull-up resistor) Chip select 2: Outputs 0 if address is within specified address area. Column address strobe 2: Outputs <u>CAS</u> strobe for DRAM if address is within specified address area.
P50 to P53 AN0 to AN3	4	Input Input	Port 5: Input port Analog input: Input to A/D converter
VREF	1	Input	Pin for reference voltage input to A/D converter
AGND	1	Input	Ground pin for A/D converter
P60 to P63 PG00 to PG03	4	I/O Output	Ports 60 to 63: I/O ports that allow selection of I/O on a bit basis (with pull-up resistor) Pattern generator ports: 00 to 03
P64 to P67 PG10 to PG13	4	I/O Output	Ports 64 to 67: I/O ports that allow selection of I/O on a bit basis (with pull-up resistor) Pattern generator ports: 10 to 13
P70 TI0	1	I/O Input	Port 70: I/O port (with pull-up resistor) Timer input 0: Timer 0 input
P71 TO1	1	I/O Output	Port 71: I/O port (with pull-up resistor) Timer output 1: Timer 0 or 1 output
P72 TO2	1	I/O Output	Port 72: I/O port (with pull-up resistor) PWM output 2: 8-bit PWM timer 2 output
P73 TO3	1	I/O Output	Port 73: I/O port (with pull-up resistor) PWM output 3: 8-bit PWM timer 3 output
P80 TI4 INT4	1	I/O Input Input	Port 80: I/O port (with pull-up resistor) Timer input 4: Timer 4 count/capture trigger signal input Interrupt request pin 4: Interrupt request pin with programmable rising/falling edge
P81 TI5 INT5	1	I/O Input Input	Port 81: I/O port (with pull-up resistor) Timer input 5: Timer 4 count/capture trigger signal input Interrupt request pin 5: Interrupt request pin with rising edge
P82 TO4	1	I/O Output	Port 82: I/O port (with pull-up resistor) Timer output 4: Timer 4 output pin
P83 TO5	1	I/O Output	Port 83: I/O port (with pull-up resistor) Timer output 5: Timer 4 output pin

Pin Name	Number of Pins	I/O	Functions
P84 TI6 INT6	1	I/O Input Input	Port 84: I/O port (with pull-up resistor) Timer input 6: Timer 5 count/capture trigger signal input Interrupt request pin 6: Interrupt request pin with programmable rising/falling edge
P85 TI7 INT7	1	I/O Input Input	Port 85: I/O port (with pull-up resistor) Timer input 7: Timer 5 count/capture trigger signal input Interrupt request pin 7: Interrupt request pin with rising edge
P86 TO6	1	I/O Output	Port 86: I/O port (with pull-up resistor) Timer output 6: Timer 5 output pin
P87 INT0	1	I/O Input	Port 87: I/O port (with pull-up resistor) Interrupt request pin 0: Interrupt request pin with programmable level/rising edge
P90 TXD0	1	I/O Output	Port 90: I/O port (with pull-up resistor) Serial send data 0
P91 RXD0	1	I/O Input	Port 91: I/O port (with pull-up resistor) Serial receive data 0
P92 CTS0 SCKL0	1	I/O Input I/O	Port 92: I/O port (with pull-up resistor) Serial data send enable 0 (Clear to Send) Serial Clock I/O
P93 TXD1	1	I/O Output	Port 93: I/O port (with pull-up resistor) Serial send data 1
P94 RXD1	1	I/O Input	Port 94: I/O port (with pull-up resistor) Serial receive data 1
P95 SCLK1	1	I/O I/O	Port 95: I/O port (with pull-up resistor) Serial clock I/O 1
PA7 SCOUT	1	I/O Output	Port A7: I/O port System clock output: Outputs system clock or 1/2 oscillation clock for synchronizing to external circuit.
WDTOUT	1	Output	Watchdog timer output pin
NMI	1	Input	Non-maskable interrupt request pin: Interrupt request pin with falling edge. Can also be operated at rising edge by program.
CLK	1	Output	Clock output: Outputs $\lceil \text{System Clock} \div 2 \rceil$ Clock. Pulled-up during reset (can be reset to Output Disable for reducing noise).
EA	1	Input	External access: "0" should be input with TMP93CM41 "1" should be input with TMP96CM40.
AM8/ $\overline{\text{I6}}$	1	Input	Address mode: Selects external data bus width For TMP93CM40: "1" should be input. The data bus width for external access is set by Chip Select/WAIT Control register, Port 1 Control register. For TMP93CM41: "0" should be input with fixed 16bit bus width or 16bit bus interlarded with 8bit bus. "1" should be input with fixed 8bit bus width.
ALE	1	Output	Address latch enable. Can be set Output disable for reducing noise.
$\overline{\text{RESET}}$	1	Input	Reset: Initializes LSI. (With pull-up resistor)
X1/X2	2	I/O	Oscillator connecting pin
XT1 P96	1	Input I/O	Low Frequency Oscillator connecting pin Port 96: I/O port (Open Drain Output)
XT2 P97	1	Output I/O	Low Frequency Oscillator connecting pin Port 97: I/O port (Open Drain Output)
TEST1/TEST2	2	Output Input	TEST1 Should be connected with TEST2 pin
VCC	3		Power supply pin
VSS	3		GND pin (0V)
AVCC	1		Power supply pin for A/D converter
AVSS	1		GND pin for A/D converter (0V)

Note: Pull-up/pull-down resistor can be released from the pin by software.

### 3. Operation

This section describes in blocks the functions and basic operations of TMP93CM40A/M41A devices.

Check the [7. Care Points and Restriction] because the Care Points, etc., are described.

#### 3.1 CPU

TMP93CM40A/M41A devices have a built-in high-performance 16-bit CPU (900L CPU). (For CPU operation, see TLCS-900 CPU in the previous section).

This section describes CPU functions unique to TMP93CM40/M41 that are not described in the previous section.

##### 3.1.1 Reset

To reset the TMP93CM40, the RESET input must be kept at 0 for at least 160 system clocks (160 states: 16μs at 20MHz) within an operating voltage range and with a stable oscillation.

When reset is accepted, the CPU sets as follows:

- Program counter (PC) to 8000H.  
PC (7 : 0) → stored data to 8000H  
PC (15 : 8) → stored data to 8001H  
PC (23 : 16) → stored data to 8002H

Note: Reset Vector address is different with each product.  
Set PC (23 : 16) to "00H" and locate Reset Vector within 64K-byte area for TMP93CM40/M41.

- Stack pointer (XSP) for system mode to 100H.
- IFF2 to 0 bits of status register to 111. (Sets mask register to interrupt level 7.)
- MAX bit of status register to 0. (Sets to minimum mode.)
- Bits RFP2 to 0 of status register to 000. (Sets register banks to 0.)

When reset is released, instruction execution starts from PC (reset vector). CPU internal registers other than the above are not changed.

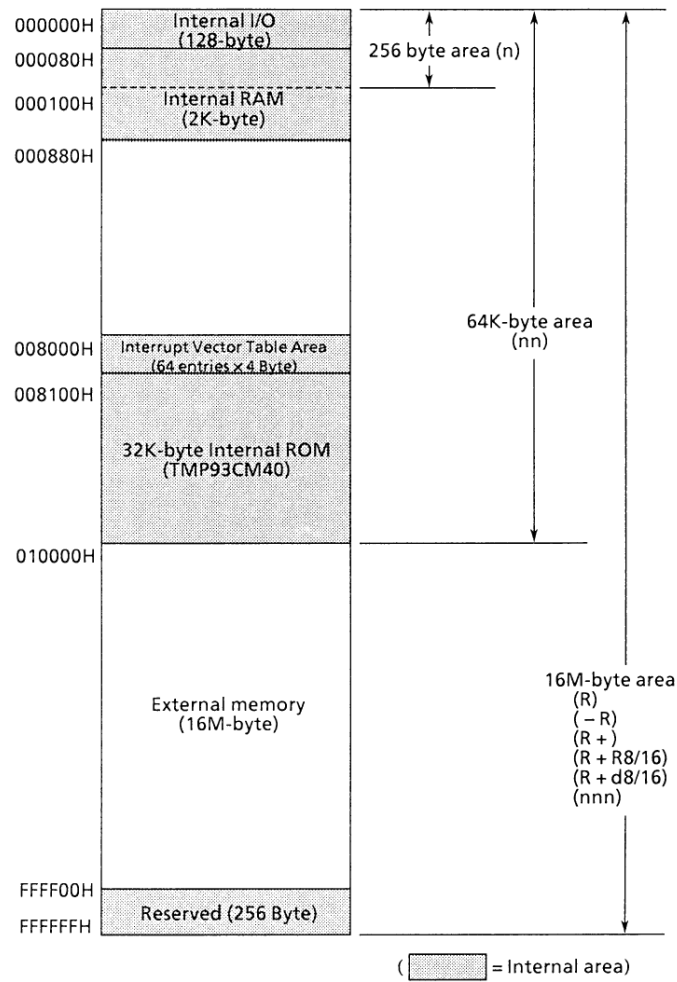

When reset is accepted, processing for built-in I/Os, ports, and other pins is as follows:

- Initializes built-in I/O registers as per specifications.
- Sets port pins (including pins also used as built-in I/Os) to general-purpose input/output port mode.
- Sets the WDTOUT pin to 0. (Watchdog timer is set to enable after reset.)
- Pulls up the CLK pin to 1.
- Sets the ALE pin to 0 (TMP93CM41), to High Impedance (Hz) (TMP93CM40).

Note: By resetting, register in the CPU except program counter (PC), status register (SR) and stack pointer (XSP) and the data in internal RAM are not changed.

3.2 Memory Map

Figure 3.2 is a memory map of the TMP93CM40/M41.

Note : Resetting sets the stack pointer (XSP) to 100H.  
The 256 Byte Area from FFFF00H to FFFFFFH can not be used.

Figure 3.2. Memory Map

### 3.3 Dual Clock Standby Function

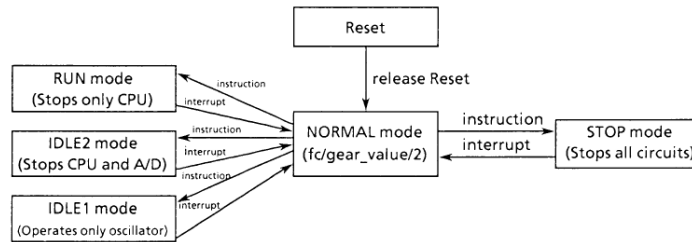

Dual Clock, Standby Control Circuits consist of (1) System Clock Controller, (2) Prescaler Clock Controller, and (3) Standby Controller.

The Oscillator operation mode is classified to (a) Single

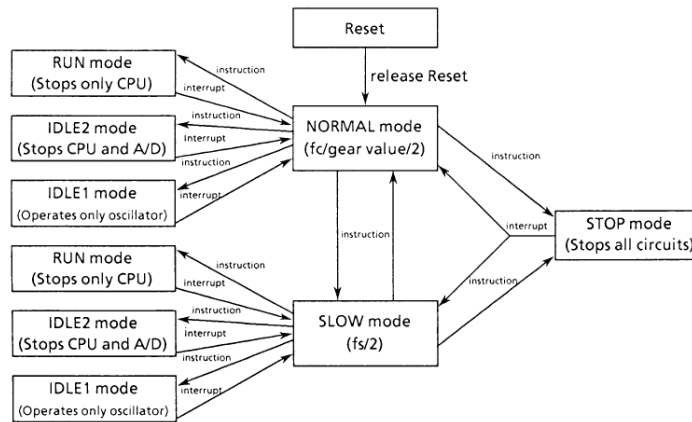

Clock mode (only X1, X2 pin), and (b) Dual Clock mode (X1, X2, XT1, XT2 pin).

Figure 3.3.1 shows a transition figure. Figure 3.3.2 shows the block diagram.

Figure 3.3.3 shows I/O registers.

(a) Signal Clock mode transition figure

(b) Dual Clock mode transition figure

**Figure 3.3.1 (1/2). Transition Figure**

The Clock Frequency input from X1, X2 pin is called  $f_c$ , and the Clock Frequency input from XT1, XT2 pin is called  $f_s$ . The clock frequency selected by SYSCR1 <SYSCK> is called

system clock  $f_{FPH}$ . The divided clock of  $f_{FPH}$  is called system clock  $f_{SYS}$ , and the 1 cycle of  $f_{SYS}$  is called 1 state.

Operating Mode		Oscillator		CPU	internal I/O	System clock f <sub>sys</sub>	
		High Frequency (fc)	Low Frequency (fs)				
Single Clock	RESET	oscillation	stop	reset	reset	fc/32	
	NORMAL			operate	operate	programmable (fc/2, fc/4, fc/8, fc/16, fc/32)	
	RUN			stop			stop only A/D
	IDLE2						stop
	IDLE1				stop		
	STOP	stop	—				
Dual Clock	RESET	oscillation	stop	reset	reset	fc/32	
	NORMAL		programmable	operate	operate	programmable (fc/2, fc/4, fc/8, fc/16, fc/32) fs/2	
	SLOW	programmable	oscillation			stop	stop only A/D
	RUN	Oscillator using as system clock : oscillation Other oscillator : programmable		stop			
	IDLE2						
	IDLE1						
	STOP	stop		—

Figure 3.3.3. I/O Register About Dual Clock, Standby

(1) System Clock Controller

The system clock controller generates system clock ( $f_{SYS}$ ) for CPU core and internal I/O. It contains two oscillation circuits and clock gear circuit for high frequency ( $f_c$ ). The register SYSCR1 <SYSCK> changes system clock to either  $f_c$  or  $f_s$ , SYSCR0 <XEN>, <XTEN> controls enable/disable each oscillator, SYSCR1 <GEAR 2 : 0> changes high frequency clock gear either 1, 2, 4, 8 or 16 ( $f_c$ ,  $f_c/2$ ,  $f_c/4$ ,  $f_c/8$  or  $f_c/16$ ), these functions can reduce the power consumption. The system clock ( $f_{SYS}$ ) is set to  $f_c/32$  ( $f_c/16 \times 1/2$ )

because of <XEN> = "1", <XEN> = "0", <SYSCK> = "0", <GEAR 2 : 0> = "100" by resetting.  
For example,  $f_{SYS}$  is set to 0.5MHz by resetting 16MHz oscillator is connected to X1, X2 pins.  
The high frequency ( $f_c$ ) and low frequency ( $f_s$ ) clocks can be easily obtained by connecting a resonator to the X1/X2, XT1/XT2 pins, respectively. Clock input from an external oscillator is also possible.  
The XT1, XT2 pins have also Port 96, 97 function. Therefore, single clock mode, the XT1, XT2 pins can be used as I/O port pins.

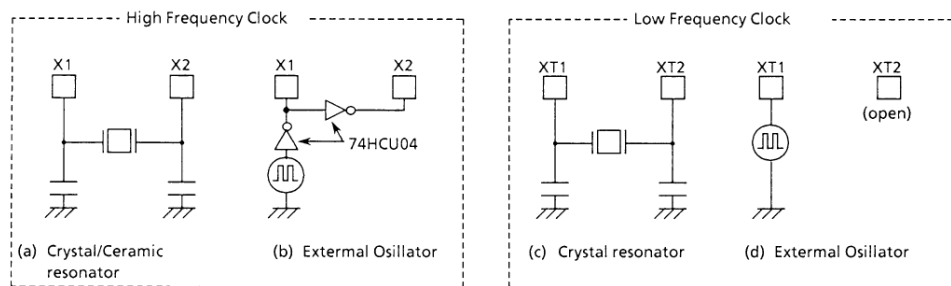

Figure 3.3.4. Examples of Resonator Connection

\* Accurate Adjustment of the Oscillation Frequency

The CLK pin outputs  $1/2$  clock frequency ( $f_{SYS}/2$ ) to monitor the oscillation clock.  
With a system requiring adjustment of the oscillation frequency, the adjusting program must be created beforehand.

\* Clock modes and Warming-up time

When the resonator is connected to X1, X2, or XT1, XT2 pin, the warming-up timer is used to change the operation frequency after getting stabilized oscillation. The warming up time can be selected by WDMOD <WARM>.

This starting and ending of warming up timer are performed like the following example 1, 2 by program.

- Note 1: The warming up timer is also used as a watchdog timer. So, when it is used as a warming up timer, the watchdog timer must be disabled.
- Note 2: When using the oscillator (not resonator) with stabilized oscillation, a warming up timer is not needed.
- Note 3: The warming up timer is operated by an oscillation clock. Therefore, warming up time has an error.

Table 3.3.1 Warming Up Time

Warming Up Time WDMOD<WARM>	Change to NORMAL	Change to SLOW	at $f_c = 16 \text{ MHz}$ , $f_s = 32.768 \text{ kHz}$
0 ( $2^{14}/\text{frequency}$ )	1.024 (ms)	500 (ms)	
1 ( $2^{16}/\text{frequency}$ )	4.096 (ms)	2000 (ms)	

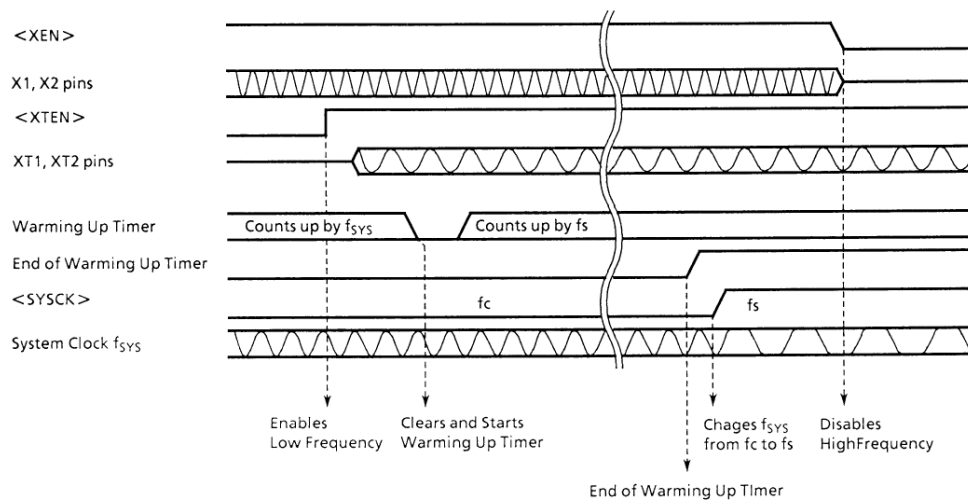

### Setting Example 1

The case of changing from High Frequency ( $f_c$ ) to Low Frequency ( $f_s$ ).

```

SET 6, (SYSCR0) ; Enables Low Frequency Oscillation
SET 2, (SYSCR0) ; Clears and starts Warming Up Timer.
WUP : BIT 2, (SYSCR0) ; } Detects End of Warming Up Timer.
JR NZ, WUP ; }
SET 3, (SYSCR1) ; Changes  $f_{SYS}$  from  $f_c$  to  $f_s$ .
RES 7, (SYSCR0) ; Disables High Frequency Oscillation.
SET 7, (WDMOD) ; Enables Watchdog Timer.
    
```

### Setting Example 2

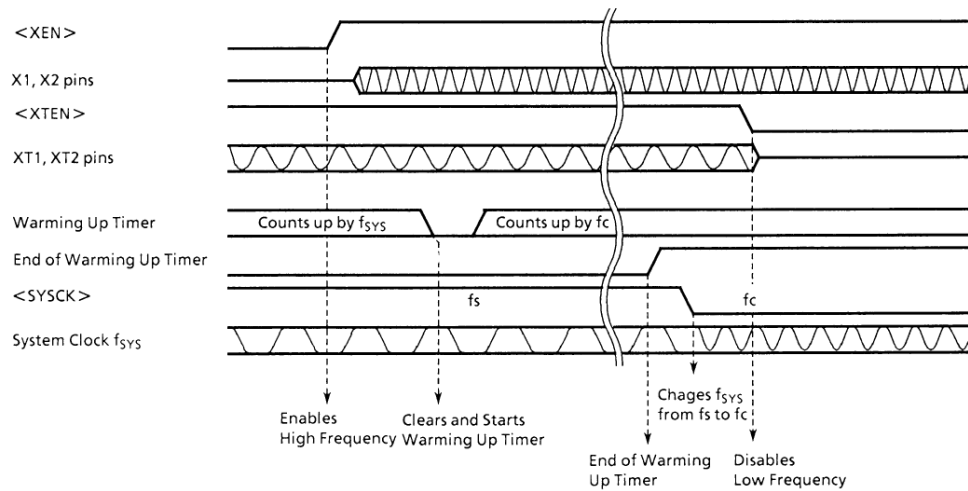

The case of changing from Low Frequency ( $f_s$ ) to High Frequency ( $f_c$ ).

```

SYSCR0 EQU 006EH
SYSCR1 EQU 006FH
WDCR EQU 005DH
WDMOD EQU 005CH

LD (WDCR), B1H ; } Disables Watchdog Timer.
RES 7, (WDMOD) ; }
RES 4, (WDMOD) ; Sets Warming Up Time to  $2^{14}/f_c$ .
SET 7, (SYSCR0) ; Enables High Frequency ( $f_c$ ).
SET 2, (SYSCR0) ; Clears and Starts Warming Up Timer.

WUP : BIT 2, (SYSCR0) ; } Detects End of Warming Up Timer.
JR NZ, WUP ; }
RES 3, (SYSCR1) ; Changes  $f_{SYS}$  from  $f_s$  to  $f_c$ .
RES 6, (SYSCR0) ; Disables Low Frequency Oscillation.
SET 7, (WDMOD) ; Enable Watchdog timer
    
```

### Setting Example 3

The case of changing gear value of high frequency

```

SYSCR1 EQU 006FH

LD (SYSCR1), XXXX0000B ; Changes  $f_{SYS}$  to  $f_c/2$ 
LD (SYSCR1), XXXX0100B ; Changes  $f_{SYS}$  to  $f_c/32$ 

X : don't care
    
```

(2) Prescaler Clock Controller

The 9 bit prescaler provides a clock to 8bit Timer 0, 1, 16bit Timer 4, 5, and Serial Interface 0, 1, and the 5 bit prescaler provides a clock to 8 bit PWM Timer 0,1. The clock input to the 5 bit prescaler is a clock divided by 2 which is selected either  $f_{FPH}$ ,  $f_c/16$ , or  $f_s$  by SYSCR0 <PRCH1 : 0> register. The clock input to the 9 bit prescaler is a clock divided by 4 which is selected either  $f_{FPH}$ ,  $f_c/16$ , or  $f_s$  by SYSCR0 <PRCH1 : 0> register. <PRCK1 : 0> register is initialized to “00” resetting. When the IDLE1 mode (operates only oscillator) is used, set TRUN <PRRUN> to “0” to stop 9, 5 bit prescaler before “HALT” instruction is executed.

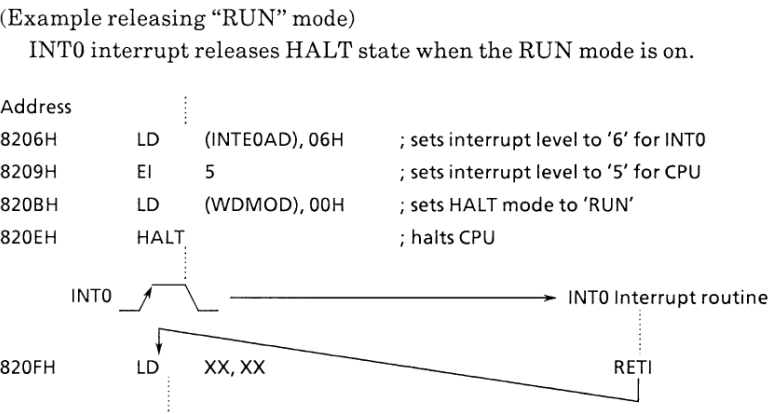

(3) Standby Controller

When the “HALT” instruction is executed at NORMAL or SLOW mode, the operating mode changes RUN, IDLE2, IDLE1, or STOP mode depending on the contents of the HALT mode setting register WDMOD <HALTM 1 : 0>.

① RUN: Only the CPU halts; power consumption remains unchanged.

- ② IDLE2: The built-in oscillator and the specified I/O operates.  
The power consumption is reduced to 1/3 than that during NORMAL operation.
- ③ IDLE1: Only the built-in oscillator operates, while all other built-in circuits stop. The power consumption is reduced to 1/10 or less than that during NORMAL operation.
- ④ STOP: All internal circuits including the built-in oscillator stop. This greatly reduces power consumption.

These HALT states can be released by resetting or requesting an interrupt. The methods for releasing the HALT status are shown in Table 3.3 (2).  
Either a non-maskable or maskable interrupt with EI (enable interrupt) condition is acknowledged and interrupt processing is processed. A maskable interrupt with DI (disable interrupt) condition is also acknowledged and CPU starts executing an instruction that follows the HALT instruction, but the interrupt request flag is held at “1”.

When the halt state is released by a reset, that status in effect before entering the halt status (including built-in RAM) is held.

# ① RUN mode

Figure 3.3.5 shows the timing for releasing the HALT state by interrupts in the RUN/IDLE2 mode.

In the RUN mode, the system clock in the MCU continues to operate even after a HALT instruction is executed.

Only the CPU stops executing the instruction. Until the HALT state is released, the CPU repeats dummy cycles. In the HALT state, an interrupt request is sampled with the rising edge of the "CLK" signal. The external interrupts (INT4, 5, 6, 7) releases only RUN and IDLE2 mode.

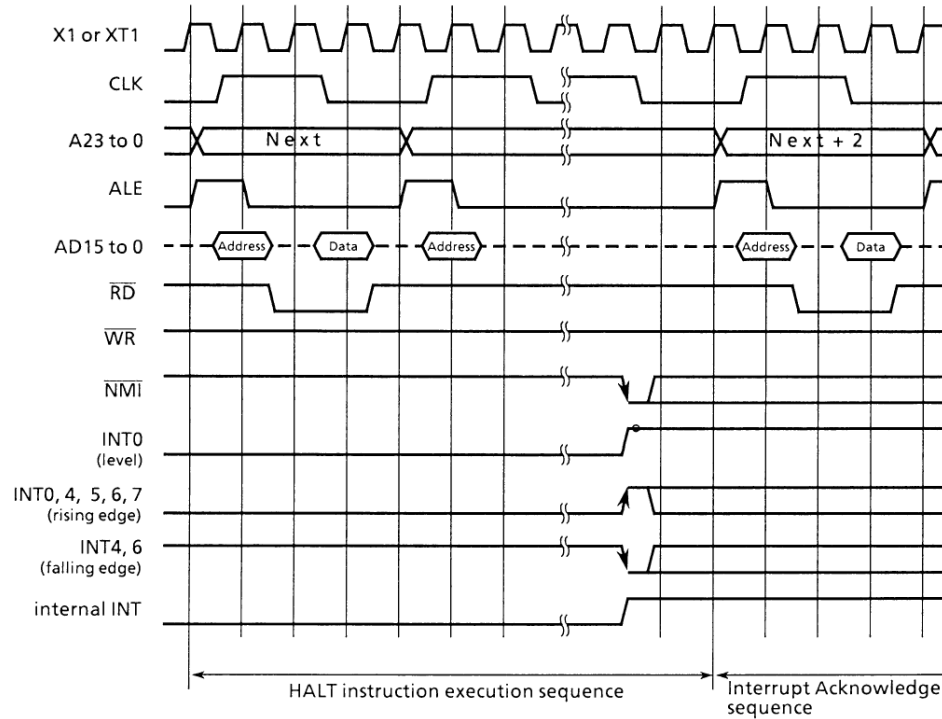

Figure 3.3.5. Timing Chart for Releasing the HALT State by Interrupt in RUN/IDLE2 Modes

### ② IDLE2 mode

Figure 3.3.5 shows the timing for releasing the HALT state by interrupts in the RUN/IDLE2 mode.

In the IDLE2 mode, the HALT state is released by an interrupt with the same timing as in the RUN mode,

except the internal operation of the MCU. In the RUN mode, only the CPU stops executing the current instruction, and the system clock is supplied to all internal devices. In the IDLE2 mode, however, the system clock is supplied to only specific internal I/O devices.

## ③ IDLE1 mode

Figure 3.3.6 illustrates the timing for releasing the HALT state by interrupts in the IDLE1 mode.

In the IDLE1 mode, only the internal oscillator operates. The system clock in the MCU stops, and the CLK pin is fixed at the "1" level.

In the HALT state, an interrupt request is sampled

asynchronously with the system clock, however the HALT release (restart of operation) is performed synchronously with it.

The interrupts except  $\overline{\text{NMI}}$  and  $\text{INT0}$  are disabled during this mode.

When the IDLE1 mode is used, set TRUN <PRRUN> to "0" to stop 9, 5 bit prescaler before "HALT" instruction is executed.

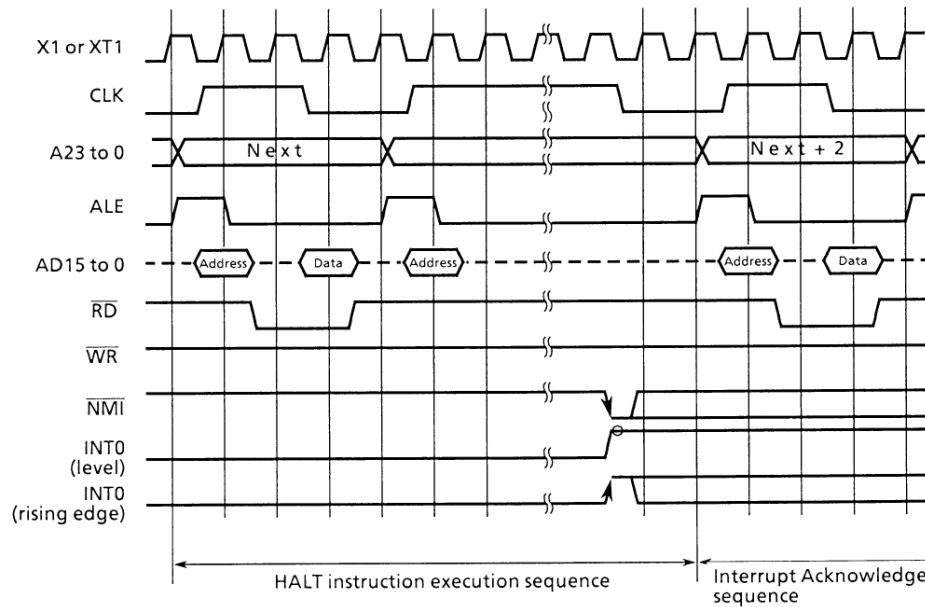

Figure 3.3.6. Timing Chart of HALT Released by Interrupts in IDLE1 Mode

④ STOP mode

Figure 3.3.7 is a timing chart for releasing the HALT state by interrupts in the STOP mode. The STOP mode is selected to stop all internal circuits including the internal oscillator. In this mode, all pins except the special ones are put in the high-impedance

state, independent of the internal operation of the MCU. Table 3.3 (1) summarizes the state of these pins in the STOP mode. Note, however, that the pre-halt state (The status prior to execution of HALT instruction) of all output pins can be retained by setting the internal I/O register WDMOD <DRVE> to “1”. The content of this register is initialized to “0” by resetting.

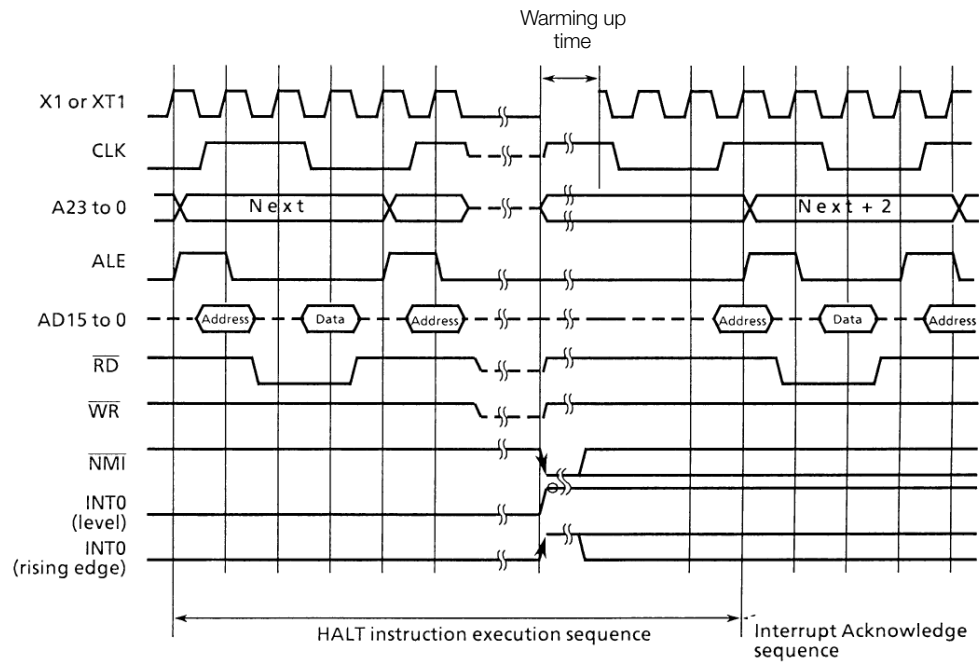

Figure 3.3.7. Timing Chart of HALT Released by Interrupt in STOP Mode

Only either the  $\overline{\text{NMI}}$ ,  $\text{INT0}$ , or  $\overline{\text{RESET}}$  can release the STOP mode.

When the STOP mode is released except by the  $\overline{\text{RESET}}$ , the system clock starts outputting after warming up time to get the stabilized oscillation.

A warming up time can be set using WDMOD <WARM> bit.

See the example of warming up time in Table 3.3.2.

When the STOP mode is released by  $\overline{\text{RESET}}$ , it is necessary to keep the  $\overline{\text{RESET}}$  signal at "0" long enough to release to get the stabilized oscillation because the warming up counter is ignored.

The warming up counter operates when the STOP mode is released even when the system which is used as an external oscillator. As a result, it takes warming up time from inputting the releasing request to output-

ting the system clock.

The NORMAL/SLOW mode selection is possible after released STOP mode.

This is selected by SYSCR0 <RSYSCK> register.

Therefore, setting to <RSYSCK>, <RXEN>, <RXTEN> is necessary before "HALT" instruction is executed.

Additionally, setting value to <SYSCK>, <XEN>, <XTEN> are ignored.

(Setting Example)

The STOP mode is entered when the low frequency (fs) operates, and after that high frequency operates after releasing by  $\overline{\text{NMI}}$ .

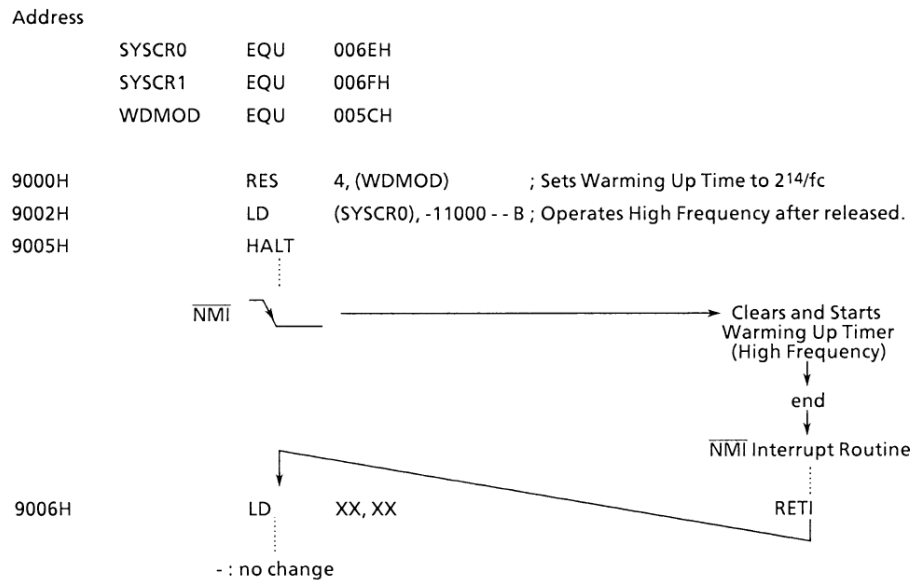

Table 3.3 (1) Pin States in STOP Mode

Pin Name	I/O	TMP93CM40		TMP93CM41	
		DRVE = 0	DRVE = 1	DRVE = 0	DRVE = 1
P0	Input mode / AD0 to 7 Output mode	– –	– Output	– x	– x
P1	Input mode / AD8 to 15 Output mode / A8 to 15	– –	– Output	– x	– x
P2	Input mode Output mode / A0 to 7, A16 to 23	PD* PD*	PD* Output	PD* PD*	PD* Output
P30 (RD), P31 (WR)	Output	–	Output	–	"1" Output
P32 to P37	Input mode Output mode	PU PU	PU Output	←	
P40, P41	Input mode Output mode	PU* PU*	PU Output		
P42 (CS2 / CAS2)	Input mode Output mode	PD* PD*	PD Output		
P5	Input	–	–		
P6	Input mode Output mode	PU* PU*	PU Output		
P7	Input mode Output mode	PU* PU*	PU Output		
P80 to P86	Input mode Output mode	PU* PU*	PU Output		
P87 (INT0)	Input mode Output mode	PU PU	PU Output		
P90 to P95	Input mode Output mode	PU* PU*	PU Output		
PA7 to PA0	Input mode Output mode SCOUT	– – –	– Output "0"		
NM̄i	Input	Input	Input		
WDTOUT	Output	Output	Output		
ALE	Output	"0"	"0"		
CLK	Output	–	"1"		
RESET	Input	Input	Input		
EA, AM8/16	Input	Input	Input		
X1	Input	–	–		
X2	Output	"1"	"1"		
P97 to 96	Input mode Output mode	– –	– Output		
P96	XT1	–	–		
P97	XT2	"1"	"1"		

- : Input for input mode / input pin is invalid; output mode / output pin is at high impedance.
- Input : Input enable state.
- Input : Input gate in operation. Fix input voltage to 0 or 1 so that input pin stays constant.
- Output : Output state
- PU : Programmable pull-up pin. Fix the pin to avoid through current since the input gate operates when a pull-up pin resistor is not set.
- PD : Programmable pull-down pin. Fix the pin like a pull-up pin when a pull-down resistor is not set.
- \* : Input gate disable state. No through current even if the pin is set to high impedance.
- x : Cannot set.

Note: Port registers are used for controlling programmable pull-up / pull-down. If a pin is also used for an output function (eg, TO1) and the output function is specified, whether pull-up or pull-down is selected depends on the output function data. If a pin is also used for an input function, whether pull-up or pull-down is selected depends on the port register setting value only.

Table 3.3 (2) Operation During Halt and How to Release the Halt Mode

Halt mode		RUN	IDLE2	IDLE1	STOP
WDMOD<HALTM1, 0>		00	11	10	01
Block	CPU	Halt

Note: On condition that your system allows the interruption to insert during HALT (STOP) operation and chooses the different clock source before and after HALT operation, when the system receives the interrupt during HALT (STOP) operation, the oscillation may be chosen the frequency the system operates before HALT operation. If your system avoids this, match the value <SYSCK> and <RSYSCK> before HALT operation.

Note: On the condition that the system allows the interruption to insert during HALT (STOP) operation and chooses the different clock source before and after HALT operation, when the system receives the interrupt during HALT (STOP) operation, the oscillation may

be chosen in the frequency the system operates before HALT operation. If your system avoids this, match the value <SYSCK> and <RSYSCK> before HALT operation.

Table 3.3.2 Warming up Time After Releasing the STOP Mode Example

Operation clock after the stop mode	Warming-up time [ms]		Clock
	WDMOD <WARM> = 0	WDMOD <WARM> = 1	
fc	1.024	4.096	fc = 16MHz
fc/2	2.048	8.192	
fc/4	4.096	16.384	
fc/8	8.192	32.768	
fc/16	16.384	65.536	
fs	500	200	fs = 32.768kHz

### 3.4 Interrupts

TLCS-900 interrupts are controlled by the CPU interrupt mask flip-flop (IFF2 to 0) and the built-in interrupt controller.

TMP93CM40/M41 have altogether the following 22 interrupt sources:

- Interrupts from the CPU...2  
(Software interrupts, and Illegal (undefined) instruction execution)
- Interrupts from external pins ( $\overline{\text{NMI}}$ , INT0, and INT4 to 7)...6
- Interrupts from built-in I/Os...14

A fixed individual interrupt vector number is assigned to each interrupt source; six levels of priority (variable) can also be assigned to each maskable interrupt. Non-maskable interrupts have a fixed priority of 7.

When an interrupt is generated, the interrupt controller sends the value of the priority of the interrupt source to the CPU. When more than one interrupt is generated simultaneously, the interrupt controller sends the value of the highest priority (7 for non-maskable interrupts is the highest) to the CPU.

The CPU compares the value of the priority sent with the value in the CPU interrupt mask register (IFF2 to 0). If the value is greater than that of the CPU interrupt mask register, the interrupt is accepted. The value in the CPU interrupt mask register (IFF2 to 0) can be changed using the EI instruction (contents of the EI num/IFF <2:0> = num). For example, programming EI 3 enables acceptance of maskable interrupts

with a priority of 3 or greater, and non-maskable interrupts which are set in the interrupt controller. The DI instruction (IFF <2 : 0> = 7) operates in the same way as the EI 7 instruction. Since the priority values for maskable interrupts are 0 to 6, the DI instruction is used to disable maskable interrupts to be accepted. The EI instruction becomes effective immediately after execution. (With the TLCS-90, the EI instruction becomes effective after execution of the subsequent instruction.)

In addition to the general-purpose interrupt processing mode described above, there is also a high-speed  $\mu$ DMA processing mode. High-speed  $\mu$ DMA is a mode used by the CPU to automatically transfer byte or word data. It enables the CPU to process interrupts such as data saves to built-in I/Os at high speed.

Figure 3.4 (1) is a flowchart showing overall interrupt processing.

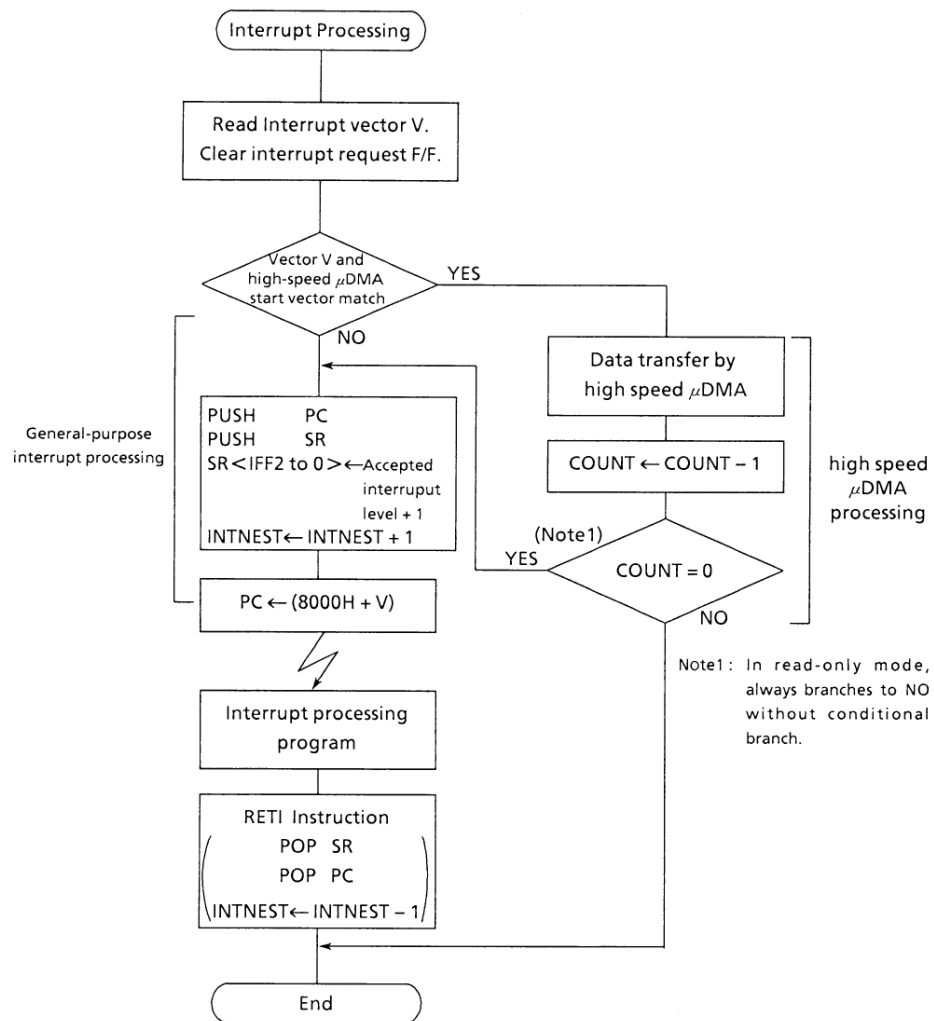

Figure 3.4 (1). Interrupt Processing Flowchart

### 3.4.1 General-Purpose Interrupt Processing

When accepting an interrupt, the CPU operates as follows:

- (1) The CPU reads the interrupt vector from the interrupt controller. When more than one interrupt with the same level is generated simultaneously, the interrupt controller generates interrupt vectors in accordance with the default priority (which is fixed as follows: the smaller the vector value, the higher the priority), then clears the interrupt request.
- (2) The CPU pushes the program counter and the status register to the system stack area (area indicated by the system mode stack pointer (XSP)).
- (3) The CPU sets a value in the CPU interrupt mask register <IFF2 to 0> that is higher by 1 than the value of the accepted interrupt level. However, if the value is 7, 7 is set without an increment.
- (4) The CPU increments the INTNEST (Interrupt Nesting Counter).
- (5) The CPU jumps to address 8000H + interrupt vector, then starts the interrupt processing routine.

The following diagram shows all the above processing state number.

Bus Width of Stack Area	Bus Width of Interrupt Vector Area	Interrupt Processing State Number	
		MAX mode	MIN mode
8 bit	8 bit	35	31
	16 bit	31	27
16 bit	16 bit	29	27
	8 bit	25	23

To return to the main routine after completion of the interrupt processing, the RETI instruction is usually used. Executing this instruction restores the contents of the program counter and the status registers.

Though acceptance of non-maskable interrupts cannot be disabled by program, acceptance of maskable interrupts can. A priority can be set for each source of maskable interrupts. The CPU accepts an interrupt request with a priority higher than the value in the CPU mask register <IFF2 to 0>. The CPU mask register <IFF2 to 0> is set to a value higher by 1 than the priority of the accepted interrupt. Thus, if an interrupt with a level higher than the interrupt being processed is generated, the CPU accepts the interrupt with the higher level, causing interrupt processing to nest.

The interrupt request with a priority higher than the accepted now interrupt during the CPU is processing above (1) to (5) is accepted before the 1st instruction in the interrupt processing routine, causing interrupt processing to nest. This is the overlapped Non-Maskable interrupt (level "7"). The CPU does not accept an interrupt of the same level as that of the interrupt being processed.

Resetting initializes the CPU mask registers <IFF2 to 0> to 7; therefore, maskable interrupts are disabled.

The addresses 008000H to 0080FFH (256 bytes) of the TMP93CM40/M41 are assigned for interrupt processing entry area.

Table 3.4 (1) TMP93CM40/M41 Interrupt Table

Default priority	Type	Interrupt source	Vector value "V"	Address refer to vector	High-speed $\mu$ DMA start vector
1	Non-maskable	Reset , or SWI0 instruction	0 0 0 0 H	8 0 0 0 H	–
2		SWI 1 instruction	0 0 0 4 H	8 0 0 4 H	–
3		INTUNDEF : Illegal instruction, or SWI2	0 0 0 8 H	8 0 0 8 H	–

### 3.4.2 High-Speed $\mu$ DMA

In addition to the conventional interrupt processing, the TLCS-900 also has a high-speed  $\mu$ DMA function. When an interrupt is accepted, in addition to an interrupt vector, the CPU receives data indicating whether processing is high-speed  $\mu$ DMA mode or general-purpose interrupt. If high-speed  $\mu$ DMA mode is requested, the CPU performs high-speed  $\mu$ DMA processing.

The TLCS-900 can process at very high speed compared with the TLCS-90  $\mu$ DMA because it has transfer parameters in dedicated registers in the CPU. Since those dedicated registers are assigned as CPU control registers, they can only be accessed by the LDC instruction.

#### (1) High-Speed $\mu$ DMA Operation

High-speed  $\mu$ DMA operation starts when the accepted interrupt vector value matches the  $\mu$ DMA start vector value set in the interrupt controller. The high-speed  $\mu$ DMA has four channels so that it can be set for up to four types of interrupt source.

When a high-speed  $\mu$ DMA interrupt is accepted, data is automatically transferred from the transfer source address to the transfer destination address set in the control register, and the transfer counter is decremented. If the value in the counter after decrementing is other than 0, high-speed  $\mu$ DMA processing is completed. If the value in the counter after decrementing is

0, general-purpose interrupt processing is performed. In read-only mode, which is provided for DRAM refresh, the value in the counter is ignored and dummy read is repeated.

32-bit control registers are used for setting transfer source/destination addresses. However, the TLCS-900 has only 24 address pins for output. A 16M-byte space is available for the high-speed  $\mu$ DMA.

There are two data transfer modes: one-byte mode and one-word mode. Incrementing, decrementing, and fixing the transfer source/destination address after transfer can be done in both modes. Therefore, data can easily be transferred between I/O and memory and between I/Os. For details of transfer modes, see the description of transfer mode registers.

The transfer counter has 16 bits, so up to 65536 transfers (the maximum when the initial value of the transfer counter is 0000H) can be performed for one interrupt source by high-speed  $\mu$ DMA processing.

Interrupt sources processed by high-speed  $\mu$ DMA processing are those with the high-speed  $\mu$ DMA start vectors listed in Table 3.4 (1).

The following timing chart is a high-speed  $\mu$ DMA cycle of the Transfer Address Increment mode (the other mode except the Read-only mode is same as this).

(Condition: MIN mode, 16bit Bus width for 16M Byte, 0 wait).

## Setting to Reset / Interrupt Vector

### ① Reset Vector

8000H	PC (7:0)
8001H	PC (15:8)
8002H	PC (23:16)
8003H	XX

Though the register mode is the maximum (MAX) mode after reset, The Reset Vector must be defined with in 64K byte area form 0000H to FFFFH.

### ② Interrupt Vector (except Reset Vector)

Address refer to vector	+ 0	PC (7:0)
	+ 1	PC (15:8)
	+ 2	PC (23:16)
	+ 3	XX

XX : don't care

### (Setting Example)

Reset Vectir : 8100H,  $\overline{\text{NMI}}$  Vector : 9ABCH, INTAD Vector : 123456h.

ORG 8000H  
DL 99008100H ; Reset = 8100H

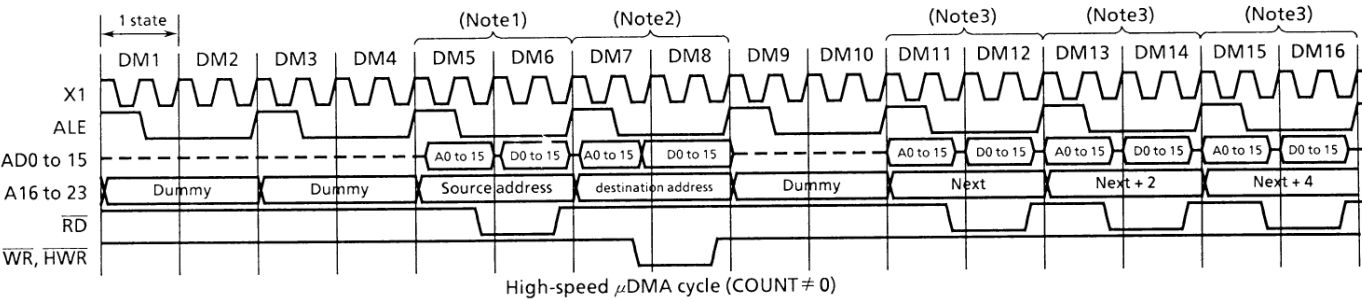

ORG 8020H  
DL 99009ABCH ;  $\overline{\text{NMI}}$  = 9ABCH

ORG 8070H  
DL 99123456H ; INTAD = 123456H

ORG 8100H  
LD A, B (cf)  
.....  
ORG 9ABCH  
LD B, C  
.....  
ORG 123456H  
LD C, A  
.....

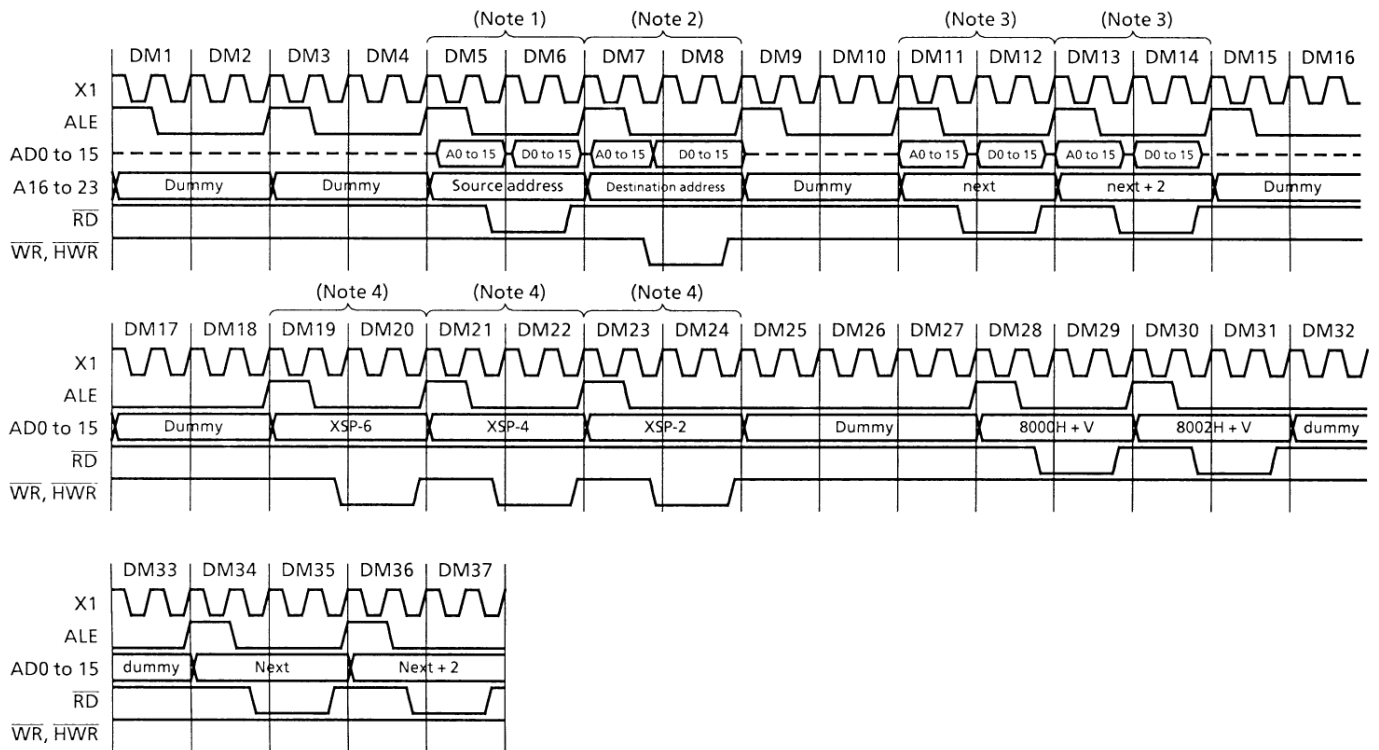

(The value "99H" as a vector is for the explaining and it does not have a special meaning.)

ORG, DL are the Assembler Directive.  
ORG : control location counter  
DL : define the long word (32 bits) data

- (Note 1) This is added 2 states the case of the bus width of source address area is 8 bit.

(Note 2) This added 2 states the case of the bus width of destination address area is 8 bit.
- (Note 3) This may be a dummy cycle with instruction queue buffer.

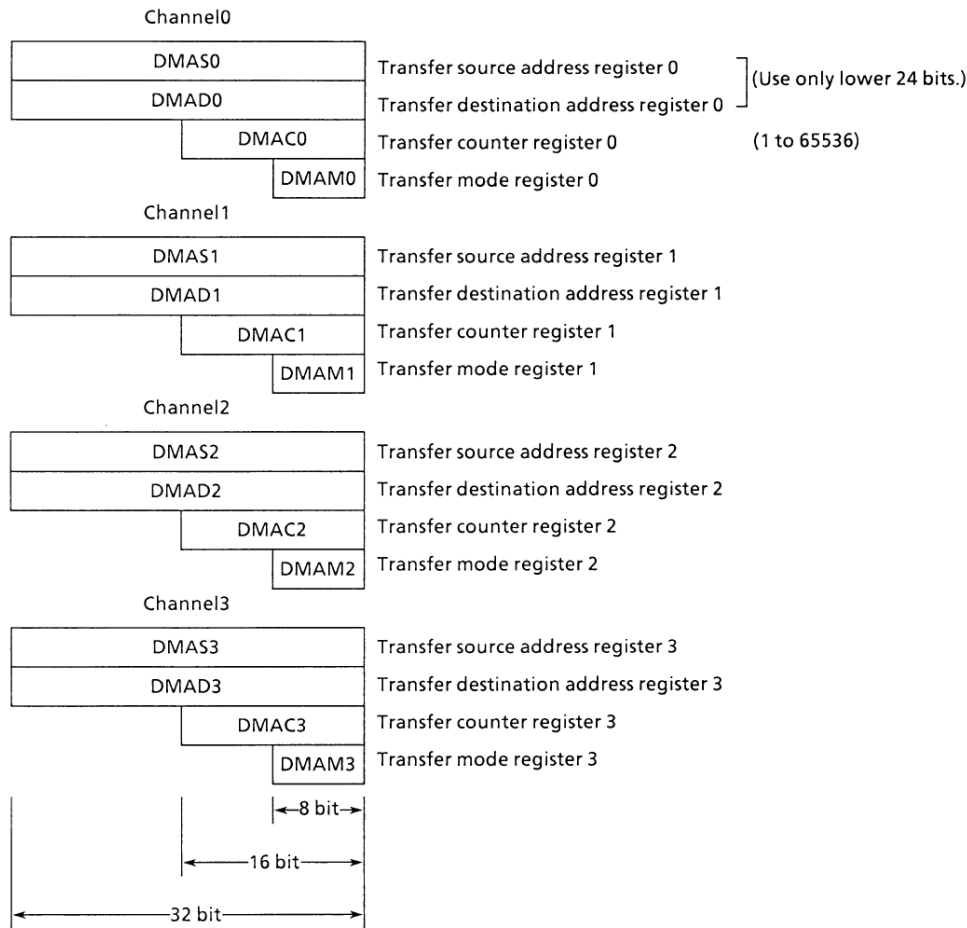

High-speed  $\mu$ DMA cycle (COUNT = 0)

- (Note 1) This is added 2 states the case of the bus width of source address area is 8 bit.  
 (Note 2) This added 2 states the case of the bus width of destination address area is 8 bit.

- (Note 3) This be a dummy cycle with instruction queue buffer.  
 (Note 4) This is added 2 states the case of the bus width of stack address area is 8 bit.

(2) Register Configuration (CPU Control Register)

These Control Registers cannot be set only “LCD cr, r” instruction.

### (3) Transfer Mode Register Details

(DMAM0 to 3)				Note : When setting values for this register, set the upper 4 bits to 0.	execution time (Min) at 20 MHz
0	0	0	0		
Mode				Z: 0 = byte transfer, 1 = word transfer	
0	0	0	Z		
0	0	1	Z		
0	1	0	Z		
0	1	1	Z		
1	0	0	Z		
1	0	1	0		
1	0	1	1		

Note : n : corresponds to high-speed  $\mu$ DMA channels 0 to 3.  
 DMADn + / DMASn + : Post-increment (Increments register value after transfer.)  
 DMADn - / DMASn - : Post-decrement (Decrement register value after transfer.)

Do not use undefined codes for transfer mode control.

<Example for Usage of read only mode (DRAM refresh)>

\* Clock Condition

System Clock: fc  
Clock Gear : 1 (fc)

When the hardware configuration is as follows:

DRAM mapping size: = 1MB  
DRAM data bus size: = 8 bits  
DRAM mapping address range: = 100000H to 1FFFFFFH

Set the following registers first; refresh is performed automatically.

① Register initial value setting

```
LD    XIX, 100000H
LDC   DMAS0, XIX    ...mapping start address
LD    A, 00001010B
LDC   DMAM0, A      ...read only mode (for
                    DRAM refresh)
```

② Timer Setting

Set the timers so that interrupts are generated at intervals of 62.5μs or less.

③ Interrupt controller setting

Set the timer interrupt mask higher than the other interrupt mask. Write the above timer interrupt vector value in the High-Speed μDMA start vector register, DMA0V.

(Operation description)

The DRAM data bus is an 8-bit bus and the μDMA is in read-only mode (4 bytes), so refresh is performed four times per interrupt.

When a 512 refresh/8ms DRAM is connected, DRAM refresh is performed sufficiently if the μDMA is started every  $15.625\mu\text{s} \times 4 = 62.4\mu\text{s}$  or less, since the timing is 15.625μs/refresh.

(Overhead)

Each processing time by the High-Speed μDMA is 1.8μs (18 states) at 20MHz with an 8-bit data bus.

In the above example, the micro DMA is started every 62.5μs,  $1.8\mu\text{s}/62.5\mu\text{s} = 0.029$ ; thus, the overhead is 2.88%.

(Note)

When the Bus is released ( $\overline{\text{BUSAK}} = "0"$ ) which must wait to accept the interrupt, DRAM refresh is not performed because of the high-speed μDMA is generated by an interrupt.

### 3.4.3 Interrupt Controller

Figure 3.4.3 (1) is a block diagram of the interrupt circuits. The left half of the diagram shows the interrupt controller; the right half includes the CPU interrupt request signal circuit and the HALT release signal circuit.

Each interrupt channel (total of 20 channels) in the interrupt controller has an interrupt request flip-flop, interrupt priority setting register, and a register for storing the high-speed  $\mu$ DMA start vector. The interrupt request flip-flop is used to latch interrupt requests from peripheral devices. The flip-flop is cleared to 0 at reset, when the CPU reads the interrupt channel vector after the acceptance of interrupt, or when the CPU executes an instruction that clears the interrupt of that channel (writes 0 in the clear bit of the interrupt priority setting register).

For example, to clear the INT0 interrupt request, set the register after the DI instruction as follows.

INTE0AD←----- 0 ---      Zero-clears the INT0 Flip-Flop.

The status of the interrupt request flip-flop is detected by reading the clear bit. Detects whether there is an interrupt request for an interrupt channel.

The interrupt priority can be set by writing the priority in the interrupt priority setting register (e.g., INTE0AD, INTE45, etc.) provided for each interrupt source. Interrupt levels to be set are from 1 to 6. Writing 0 or 7 as the interrupt priority disables the corresponding interrupt request. The priority of the

non-maskable interrupt ( $\overline{\text{NMI}}$  pin, watchdog timer, etc.) is fixed to 7. If interrupt requests with the same interrupt level are generated simultaneously, interrupts are accepted in accordance with the default priority (the smaller the vector value, the higher the priority).

The interrupt controller sends the interrupt request with the highest priority among the simultaneous interrupts and its vector address to the CPU. The CPU compares the priority value <IFF2 to 0> set in the Status Register by the interrupt request signal with the priority value sent; if the latter is higher, the interrupt is accepted. Then the CPU sets a value higher than the priority value by 1 in the CPU SR <IFF2 to 0>. Interrupt requests where the priority value equals or is higher than the set value are accepted simultaneously during the previous interrupt routine. When interrupt processing is completed (after execution of the RETI instruction), the CPU restores the priority value saved in the stack before the interrupt was generated to the CPU SR <IFF2 to 0>.

The interrupt controller also has four registers used to store the high-speed  $\mu$ DMA start vector. These are I/O registers; unlike other DMA registers (DMAS, DMAD, DMAM, and DMAC), they can be accessed in either normal or system mode. Writing the start vector of the interrupt source for the  $\mu$ DMA processing (see Table 3.4 (1)), enables the corresponding interrupt to be processed by  $\mu$ DMA processing. The values must be set in the  $\mu$ DMA parameter registers (e.g., DMAS and DMAD) prior to the  $\mu$ DMA processing.

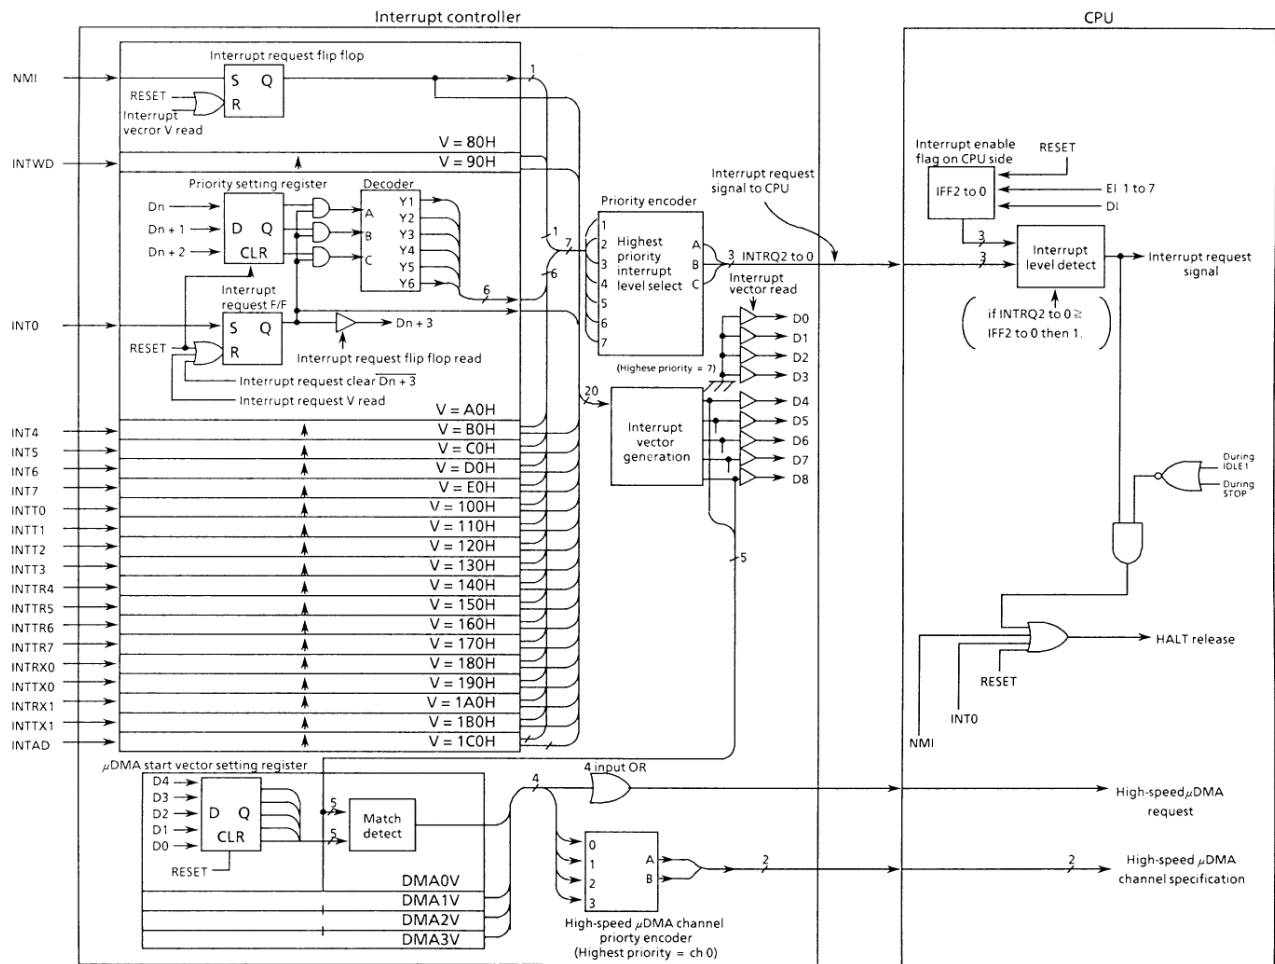

Figure 3.4.3 (1). Block Diagram of Interrupt Controller

IxxM2	IxxM1	IxxM0	Function (Write)
0	0	0	Prohibits interrupt request.
0	0	1	Sets interrupt request level to "1".
0	1	0	Sets interrupt request level to "2".
0	1	1	Sets interrupt request level to "3".
1	0	0	Sets interrupt request level to "4".
1	0	1	Sets interrupt request level to "5".
1	1	0	Sets interrupt request level to "6".
1	1	1	Prohibits interrupt request.

IxxC	Function (Read)	Function (Write)
0	Indicates no interrupt request.	Clears interrupt request flag.
1	Indicates interrupt request.	----- Don't care -----

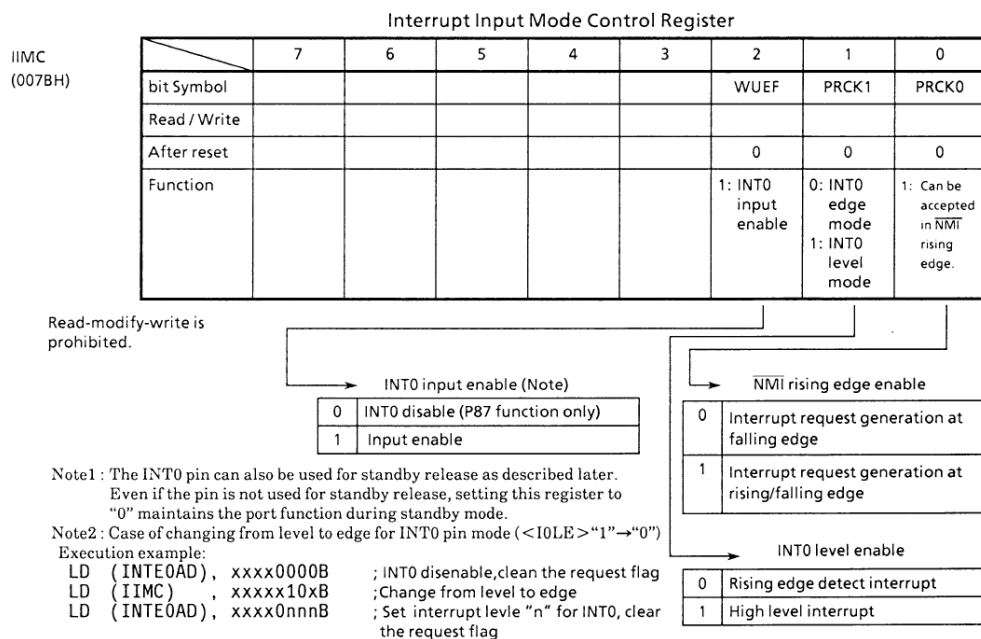

\* Note about clearing interrupt request flag

The interrupt request flag of INTAD, INTRX0, INTRX1 are not cleared by writing "00" to IXXC because they

are level interrupts.

They can be cleared only by resetting or reading ADREGn/SCBUFn.

## (2) External Interrupt Control

## Setting of External Interrupt Pin Functions

Interrupt	Pin name	Mode	Setting method
NMI	—	 Falling edge	IIMC<NMIREE> = 0
		 Falling and rising edges	IIMC<NMIREE> = 1
INT0	P87	 Rising edge	IIMC<IOLE> = 0, <IOIE> = 1
		 Level	IIMC<IOLE> = 1, <IOIE> = 1
INT4	P80	 Rising edge	T4MOC<CAP12M1,0> = 0,0 or 0,1 or 1,1
		 Falling edge	T4MOD<CAP12M1,0> = 1, 0
INT5	P81	 Rising edge	—
INT6	P84	 Rising edge	T5MOC<CAP34M1,0> = 0,0 or 0,1 or 1,1
		 Falling edge	T5MOD<CAP34M1,0> = 1, 0
INT7	P85	 Rising edge	—

(3) High-Speed  $\mu$ DMA Start Vector

When the CPU reads the interrupt vector after accepting an interrupt, it simultaneously compares the interrupt vector with each channel's  $\mu$ DMA start vector (bits 4 to 8 of the interrupt vector). When both match,

the interrupt is processed in  $\mu$ DMA mode for the channel whose value matched.

If the interrupt vector matches more than one channel, the channel with the lower channel number has a higher priority.

		High Speed $\mu$ DMA0 Start Vector (read-modify-write is not possible.)							
DMA0V (007CH)		7	6	5	4	3	2	1	0
	bit Symbol				DMA0V8	DMA0V7	DMA0V6	DMA0V5	DMA0V4
	Read / Write				W				
	After reset				0	0	0	0	0
		High Speed $\mu$ DMA1 Start Vector (read-modify-write is not possible.)

	bit Symbol				DMA2V8	DMA2V7	DMA2V6	DMA2V5	DMA2V4
	Read / Write				W				
	After reset				0	0	0	0	0
		High Speed $\mu$ DMA3 Start Vector (read-modify-write is not possible.)							
DMA3V (007FH)		7	6	5	4	3	2	1	0
	bit Symbol				DMA3V8	DMA3V7	DMA3V6	DMA3V5	DMA3V4
	Read / Write				W				
	After reset				0	0	0	0	0

(4) Notes

The instruction execution unit and the bus interface unit of this CPU operate independently of each other. Therefore, if the instruction used to clear an interrupt request flag of an interrupt is fetched before the interrupt is generated, it is possible that the CPU might execute the fetched instruction to clear the interrupt

request flag while reading the interrupt vector after accepting the interrupt. If so, the CPU would read the default vector "0028H" and start the interrupt processing from the address "8028H".

To avoid this, make sure that the instruction used to clear the interrupt request flag comes after the DI instruction.

### 3.5 Functions of Ports

The TMP93CM40/TMP96PM40 has 79 bits for I/O ports. The TMP93CM41 has 61 bits for I/O ports because Port0, Port1, P30, and P31 are dedicated pins for AD0 to 7, AD8 to 15,  $\overline{RD}$ , and  $\overline{WR}$ .

These port pins have I/O functions for the built-in CPU and internal I/Os as well as general-purpose I/O port functions. Table 3.5 lists the function of each port pin.

(R:  $\uparrow$  = With programmable pull-up resistor  
 $\downarrow$  = With programmable pull-down)

**Table 3.5 Functions of Ports**

Port Name	Pin Name	Number of Pins	Direction	R	Direction Setting Unit	Pin Name for Built-in Function
Port0	P00 to P07	8	I/O	—	Bit	AD0 to AD7
Port1	P10 to P17	8	I/O	—	Bit	AD8 to AD15/ A8 to A15
Port2	P20 to P27	8	I/O	$\downarrow$	Bit	A0 to A7/ A16 to A23
Port 3	P30	1	Output	—	(Fixed)	$\overline{RD}$
	P31	1	Output	—	(Fixed)	$\overline{WR}$
	P32	1	I/O	$\uparrow$	Bit	$\overline{HWR}$
	P33	1	I/O	$\uparrow$	Bit	$\overline{WAIT}$
	P34	1	I/O	$\uparrow$	Bit	$\overline{BUSRQ}$
	P35	1	I/O	$\uparrow$	Bit	$\overline{BUSAk}$
	P36	1	I/O	$\uparrow$	Bit	R/W
	P37	1	I/O	$\uparrow$	Bit	$\overline{RAS}$
Port4	P40	1	I/O	$\uparrow$	Bit	$\overline{CS0}$ / $\overline{CAS0}$
	P41	1	I/O	$\uparrow$	Bit	$\overline{CS1}$ / $\overline{CAS1}$
	P42	1	I/O	$\downarrow$	Bit	$\overline{CS2}$ / $\overline{CAS2}$
Port5	P50 to P57	8	Input	—	(Fixed)	AN0 to AN7
Port6	P60 to P67	8	I/O	$\uparrow$	Bit	PG00 to PG03, PG10 to PG13
Port7	P70	1	I/O	$\uparrow$	Bit	TI0
	P71	1	I/O	$\uparrow$	Bit	TO1
	P72	1	I/O	$\uparrow$	Bit	TO2
	P73	1	I/O	$\uparrow$	Bit	TO3
Port8	P80	1	I/O	$\uparrow$	Bit	T14/INT4
	P81	1	I/O	$\uparrow$	Bit	T15/INT5
	P82	1	I/O	$\uparrow$	Bit	TO4
	P83	1	I/O	$\uparrow$	Bit	TO5
	P84	1	I/O	$\uparrow$	Bit	TI6 / INT6
	P85	1	I/O	$\uparrow$	Bit	TI7 / INT7
	P86	1	I/O	$\uparrow$	Bit	TO6
	P87	1	I/O	$\uparrow$	Bit	INT0
Port9	P90	1	I/O	$\uparrow$	Bit	TXD0
	P91	1	I/O	$\uparrow$	Bit	RXD0
	P92	1	I/O	$\uparrow$	Bit	$\overline{CTS0}$
	P93	1	I/O	$\uparrow$	Bit	TXD1
	P94	1	I/O	$\uparrow$	Bit	RXD1
	P95	1	I/O	$\uparrow$	Bit	SCLK1
	P96	1	I/O	—	Bit	XT1
	P97	1	I/O	—	Bit	XT2
PortA	PA7 to PA0	8	I/O	—	Bit	SCOUT (PA7)

Resetting makes the port pins listed below function as general-purpose I/O ports.

I/O pins programmable for input or output function as input ports except P96/XT1, P97/XT2.

To set port pins for built-in functions, a program is required.

Since the TMP96C141 has an external ROM, some ports are permanently assigned to the CPU.

- P00 to P07 → AD0 to AD7
- P10 to P17 → AD8 to AD15
- P30 →  $\overline{RD}$
- P31 →  $\overline{WR}$

\* Notes about the bus release and programmable pull-up/down I/O ports:

When buses are released ( $\overline{BUSAK} = 0$ ), the TMP96C141/TMP96CM40/TMP96PM40 sets the output buffer for AD0 to AD15, A0 to A23, and bus control signals ( $\overline{RD}$ ,  $\overline{WR}$ ,  $\overline{HWR}$ ,  $\overline{R/W}$ ,  $\overline{RAS}$ ,  $\overline{CS0/CAS0} - \overline{CS2/CAS2}$ ) to off to set them to high impedance. The internal programmable pull-up/pull-down resistors continue to operate. Resistors are programmable only for operations in input mode; not in output mode.

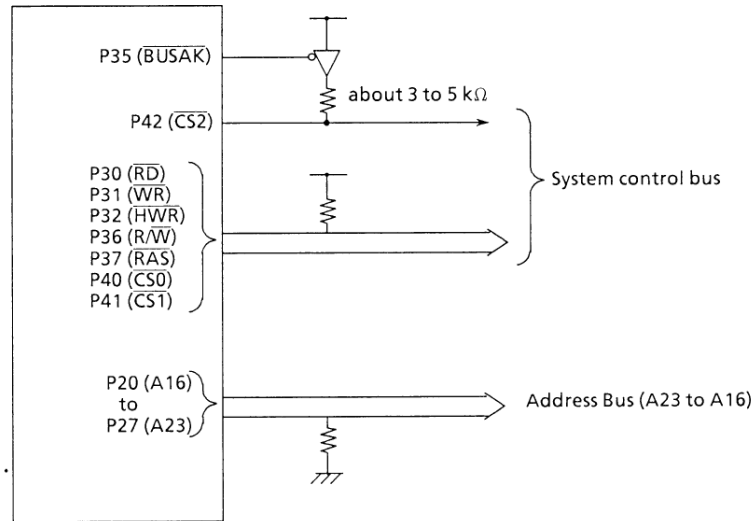

Pin states at bus release are shown below.

Pin Name	Pin state at bus release	
	Port mode	Function mode
P00 to P07 (AD0 to AD7) P10 to P17 (AD8 to AD15)	The state is not changed (does not become high-impedance (HZ).)	becomes high-impedance (HZ)
P30 ( $\overline{RD}$ ) P31 ( $\overline{WR}$ )	becomes high-impedance (HZ)	←
P32 ( $\overline{HWR}$ ) P37 ( $\overline{RAS}$ )	The output buffer to OFF. The programmable pull-up resistor is ON only when the output latch is equal to "1".	The output buffer to OFF. The programmable pull-up resistor is ON regardless of the output latch.
P36 ( $\overline{R/W}$ ) P40 ( $\overline{CS0/CAS0}$ ) P41 ( $\overline{CS1/CAS1}$ )	↑	The output buffer to OFF. The programmable pull-down resistor is undefined.
P42 ( $\overline{CS2/CAS2}$ )	The output buffer to OFF. The programmable pull-up resistor is ON only when the output latch is equal to "0".	The output buffer to OFF. The programmable pull-down resistor is undefined.
P20 to P27 (A16 to A23)	The state is not changed. (does not become high-impedance (HZ).)	The output buffer to OFF. The programmable pull-up resistor is ON only when the output latch is equal to "0".

The following are the example of the interface circuit of the above pins when the bus releasing function is used.

When the bus is released, both internal memory and internal I/O cannot be accessed, but the internal I/O continues to operate.

So, the watchdog timer also continues to run. Therefore, be careful about bus releasing time and set the detection time of WDT.

Example of external bus interface using bus release function.

The above circuit is necessary to fix the signal level when the bus is released.

Reset sets P30 ( $\overline{RD}$ ), P31 ( $\overline{WR}$ ) to output, P40 ( $\overline{CS0}$ ), P41 ( $\overline{CS1}$ ), P32 ( $\overline{HWR}$ ), P36 ( $R/\overline{W}$ ), P37 ( $\overline{RAS}$ ), and P35 ( $\overline{BUSAK}$ ) are set to input mode using a pull-up resistor, P42 ( $\overline{CS2}$ ) and P20 to P27 (A16 to 23) to input with pull-down resistor.

The above circuit is necessary to fix the signal level after reset because of the external pull-up resistor collisions with the

internal pull-down resistor.

The value of this external pull-up resistor value must be 3 to 5 k $\Omega$ . (The value of the internal pull-down resistor is about 50 to 150k $\Omega$ )

P20 to 27 (A16 to 23) also needs a circuit like circuit P42 ( $\overline{CS2}$ ) to fix the signal level.

But for the P20 to P27 (A16 to 23) which does not have the means ("L" is active), add pull down directly like the above circuit.

### 3.5.1 Port 0 (P00 to P07)

Port 0 is an 8-bit general-purpose I/O port. I/O can be set on a bit basis using control register P0CR to 0 and sets Port 0 to input mode.

In addition to functioning as a general purpose I/O port, Port 0 also functions as an address data bus (AD0 to 7). To

access external memory, Port 0 functions as an address data bus (AD 0 to 7) and all bits of the control register P0CR are cleared to 0.

With the TMP9eCM041, which needs external ROMs, Port 0 always functions as an address data bus (AD0 to 7) regardless of the value set in control register P0CR.

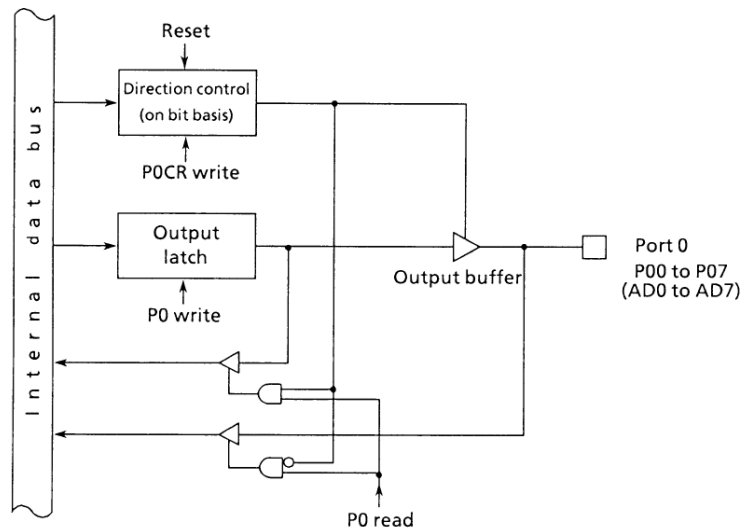

Figure 3.5 (1). Port 0

### 3.5.2 Port 1 (P10 to P17)

Port 1 is an 8-bit general-purpose I/O port. I/O can be set on a bit basis using control register P1CR and function register P1FC. Resetting resets all bits of output latch P1, control register P1CR, and function register P1FC to 0 and sets Port 1 to input mode.

In addition to functioning as a general purpose I/O port, Port 1 also functions as an address data bus (AD8 to 15) or an address bus (A8 to 15).

With the TMP93CM41, which needs external ROMs, Port 1 always functions as an address data bus (AD8 to 15) ( $AM8/\overline{16} = "0"$ ), as an address bus (A8 to 15) ( $AM8/\overline{16} = "1"$ ) regardless of the value set in control register P1CR.

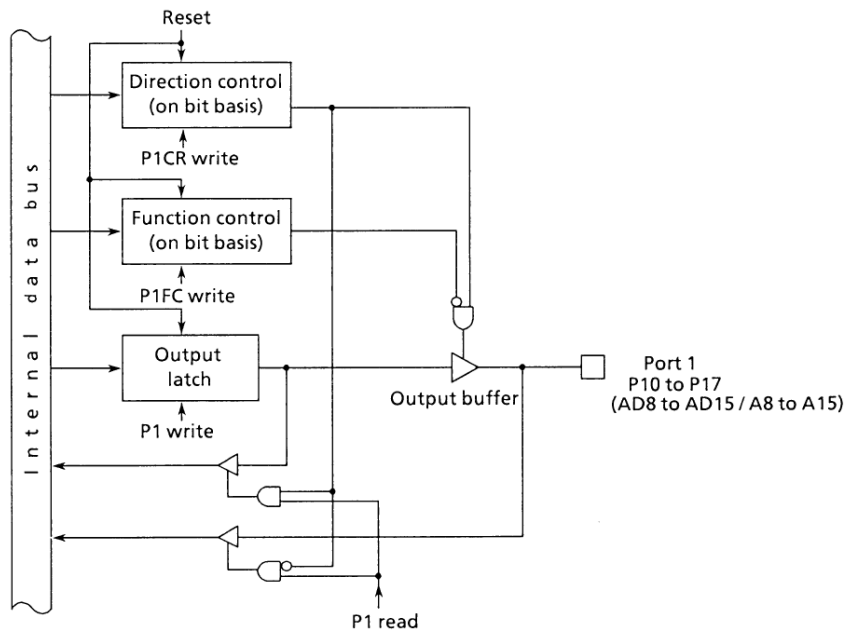

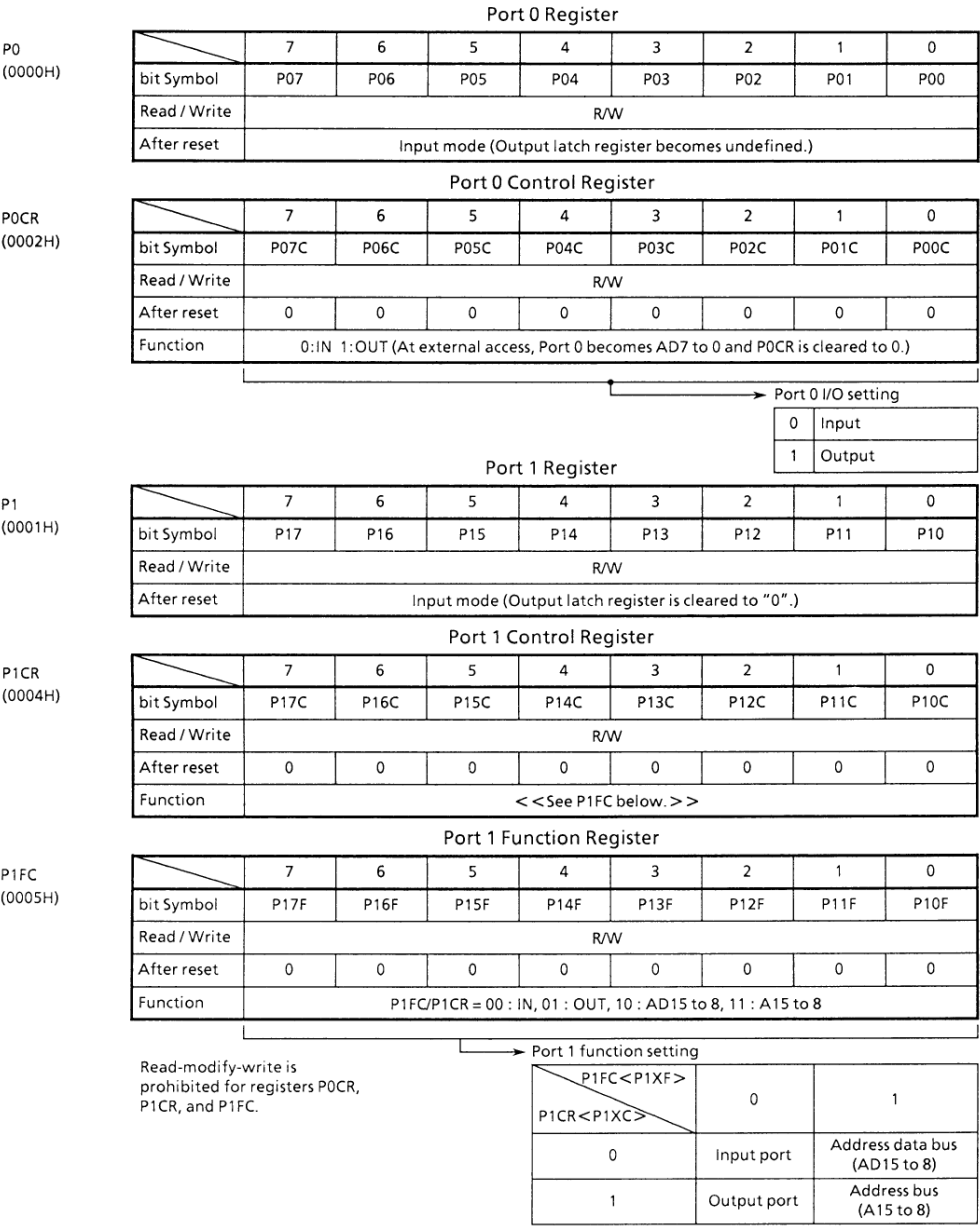

Figure 3.5 (2). Port 1

Note : <P1XF> is bit X in register P1FC; <P1XC>, in register

Figure 3.5 (3). Registers for Ports 0 and 1

### 3.5.3 Port 2 (P20 to P27)

Port 2 is an 8-bit general-purpose I/O port. I/O can be set on bit basis using the control register P2CR and function register P2FC. Resetting resets all bits of output latch P2, control register P2CR and function register P2FC to 0. It also sets Port 2 to

input mode and connects a pull-down resistor. To disconnect the pull-down resistor, write 1 in the output latch.

In addition to functioning as a general-purpose I/O port, Port 2 also functions as an address data bus (A0 to 7) and an address bus (A16 to 23).

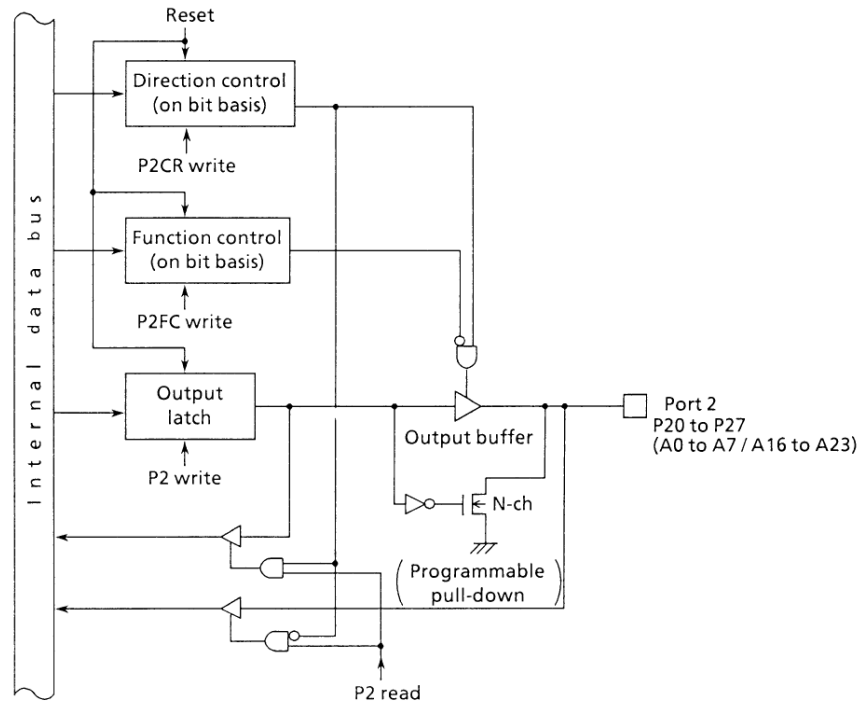

Figure 3.5 (4). Port 2

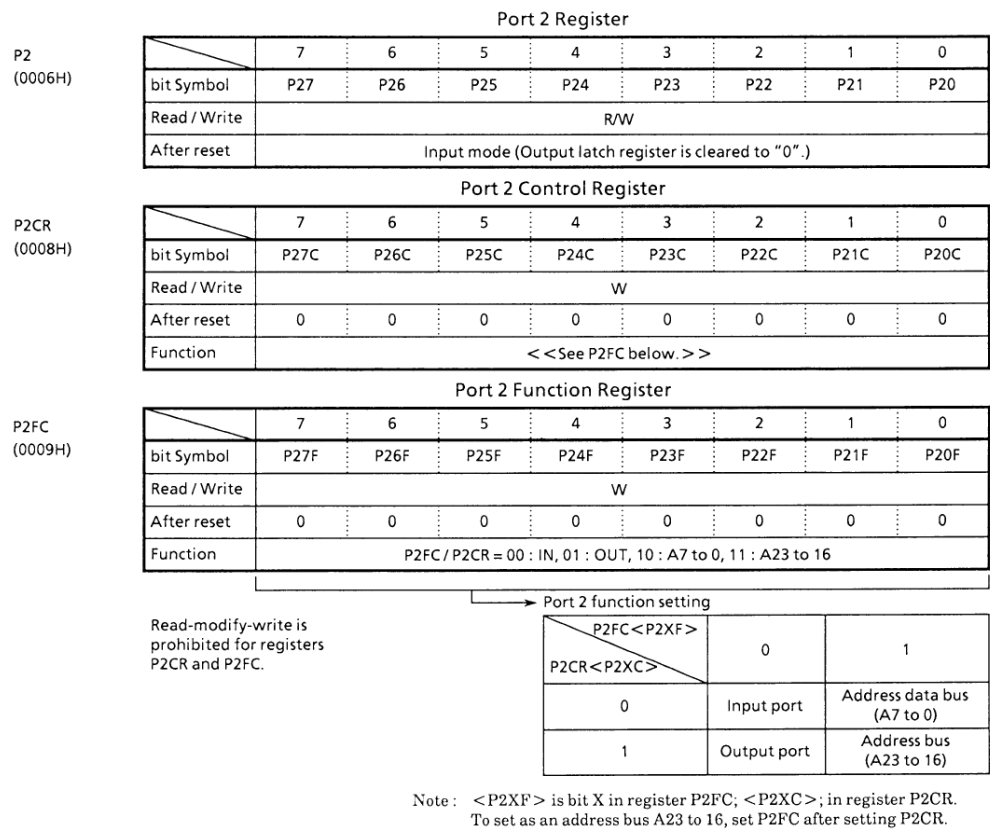

Figure 3.5 (5). Registers for Port 2

### 3.5.4 Port 3 (P30 to P37)

Port 3 is an 8-bit general-purpose I/O port.

I/O can be set on a bit basis, but note that P30 and P31 are used for output only. I/O is set using control register P3CR and function register P3FC. Resetting resets all bits of output latch P3, control register P3CR (bits 0 and 1 are unused), and function register P3FC to 0. Resetting also outputs 1 from P30 and P31, sets P32 to P37 to input mode, and connects a pull-up resistor.

In addition to functioning as a general-purpose I/O port, Port 3 also functions as an I/O for the CPU's control/status signal.

With the TMP96C140, when P30 pin is defined as  $\overline{RD}$  signal output mode ( $\langle P30F \rangle = 1$ ), clearing the output latch register  $\langle P30 \rangle$  to 0 outputs the  $\overline{RD}$  strobe (used for the pseudo static RAM) from the P30 pin even when the internal address area is accessed.

If the output latch register  $\langle P30 \rangle$  remains 1, the  $\overline{RD}$  strobe signal is output only when the external address area is accessed.

With the TMP93CM41, which comes with an external ROM, Port 30 outputs the  $\overline{RD}$  signal; P31, the  $\overline{WR}$  signal, regardless of the values set in function registers P30F and P31F.

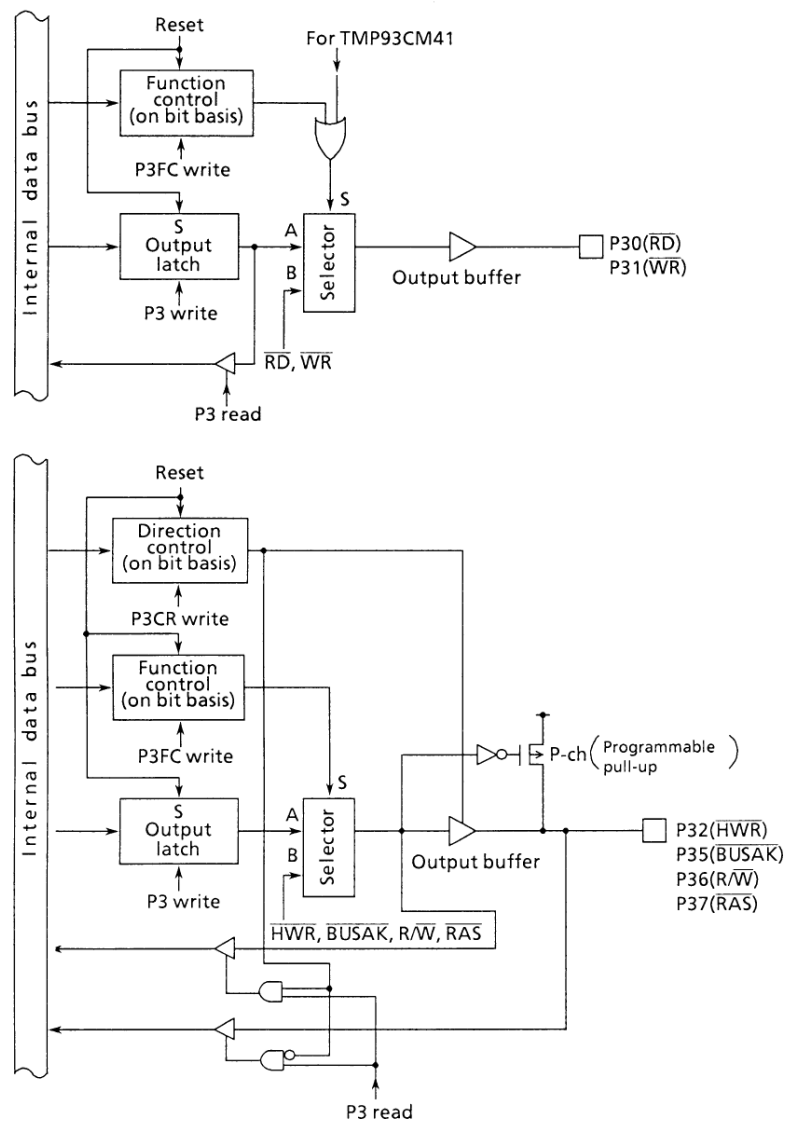

Figure 3.5 (6). Port 3 (P30, P31, P32, P35, P36, P37)

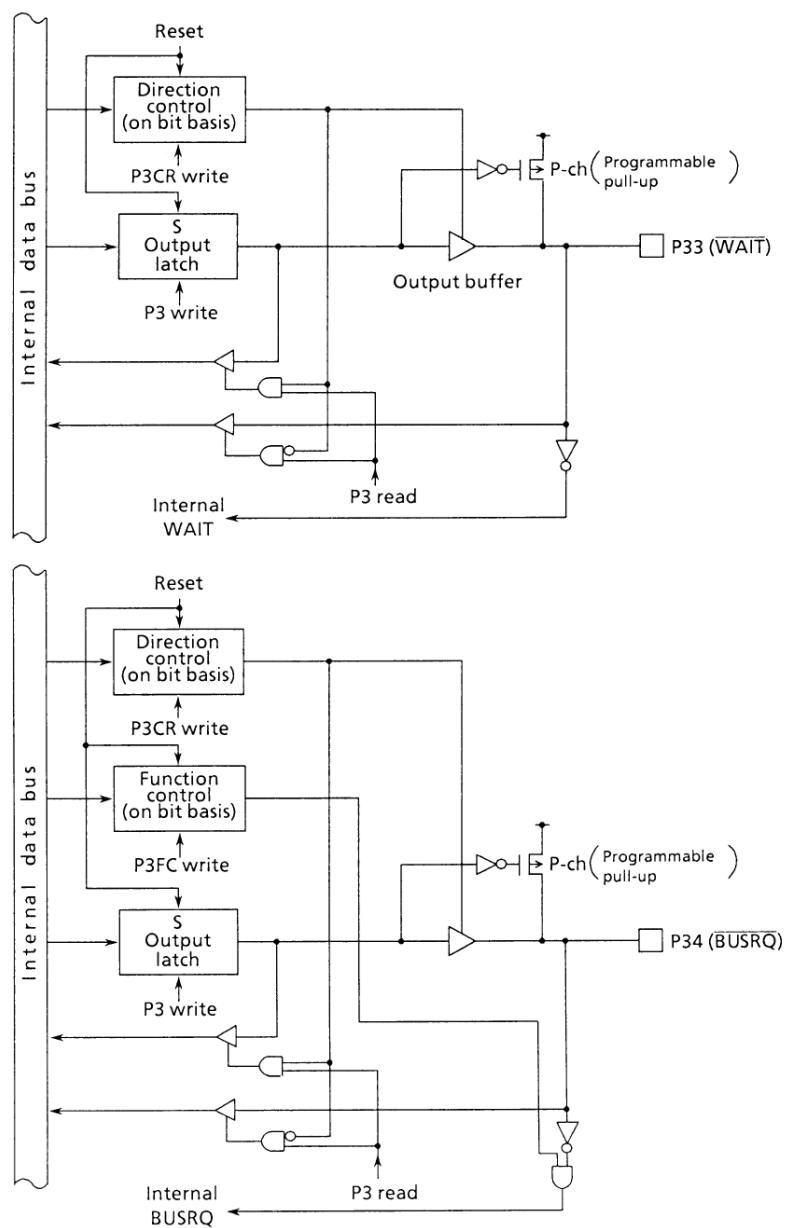

Figure 3.5 (7). Port 3 (P33, P34)

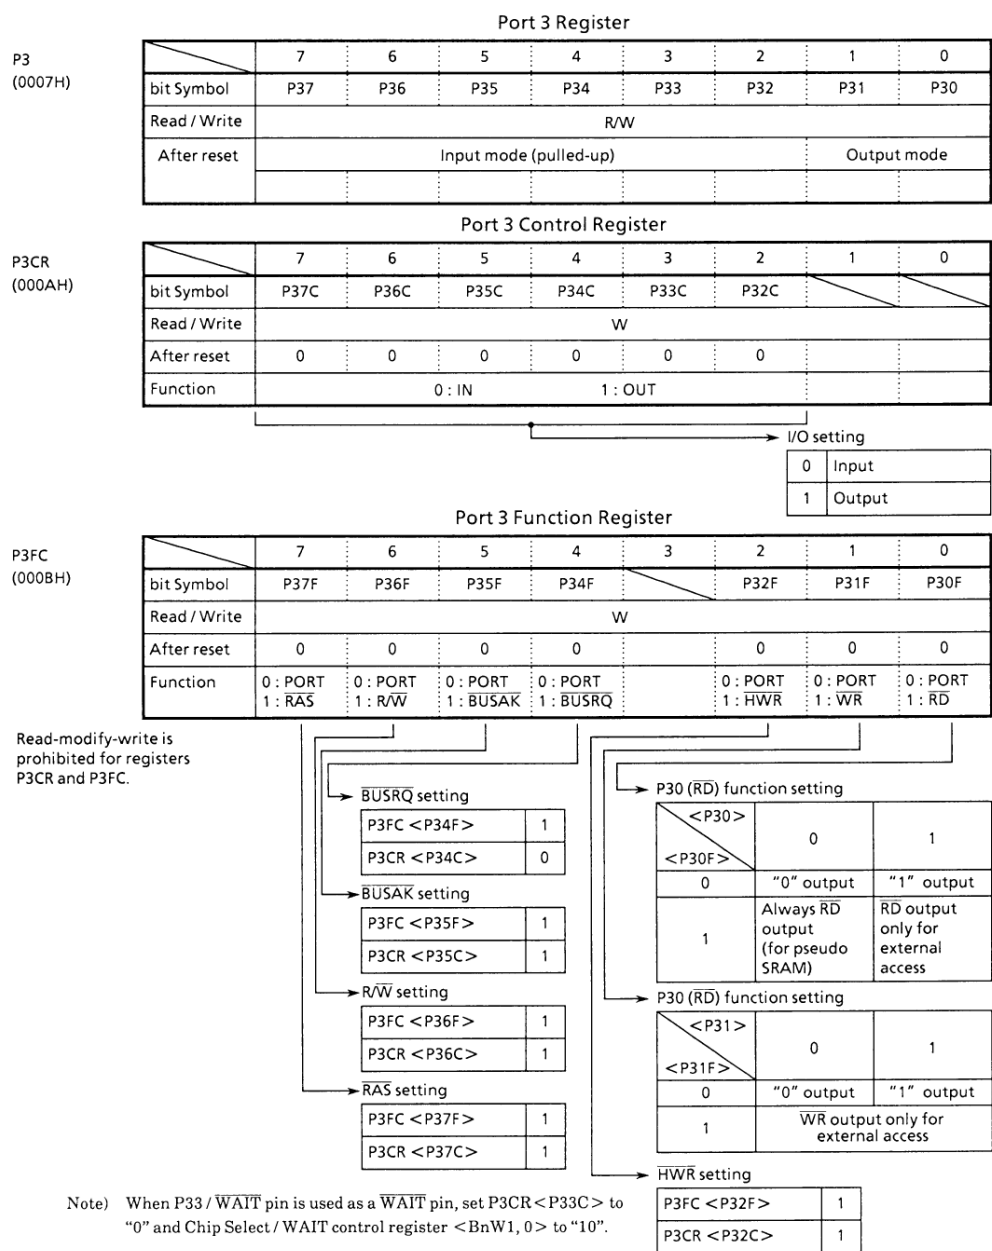

Figure 3.5 (8). Registers for Port 3

### 3.5.5 Port 4 (P40 to P42)

Port 4 is a 3-bit general-purpose I/O port. I/O can be set on a bit basis using control register P4CR and function register P4FC. Resetting does the following:

- Sets the P40 and P42 output latch registers to 1.
- Resets all bits of the P42 output latch register, the control register P4CR, and the function register P4FC to 0.
- Sets P40 and P41 to input mode and connects a pull-up resistor.
- Sets P42 to input mode and connects a pull-down resistor.

In addition to functioning as a general-purpose I/O port, Port 4 also functions as a chip select output signal ( $\overline{CS0}$  to  $\overline{CS2}$  or  $\overline{CAS0}$  to  $\overline{CAS2}$ ).

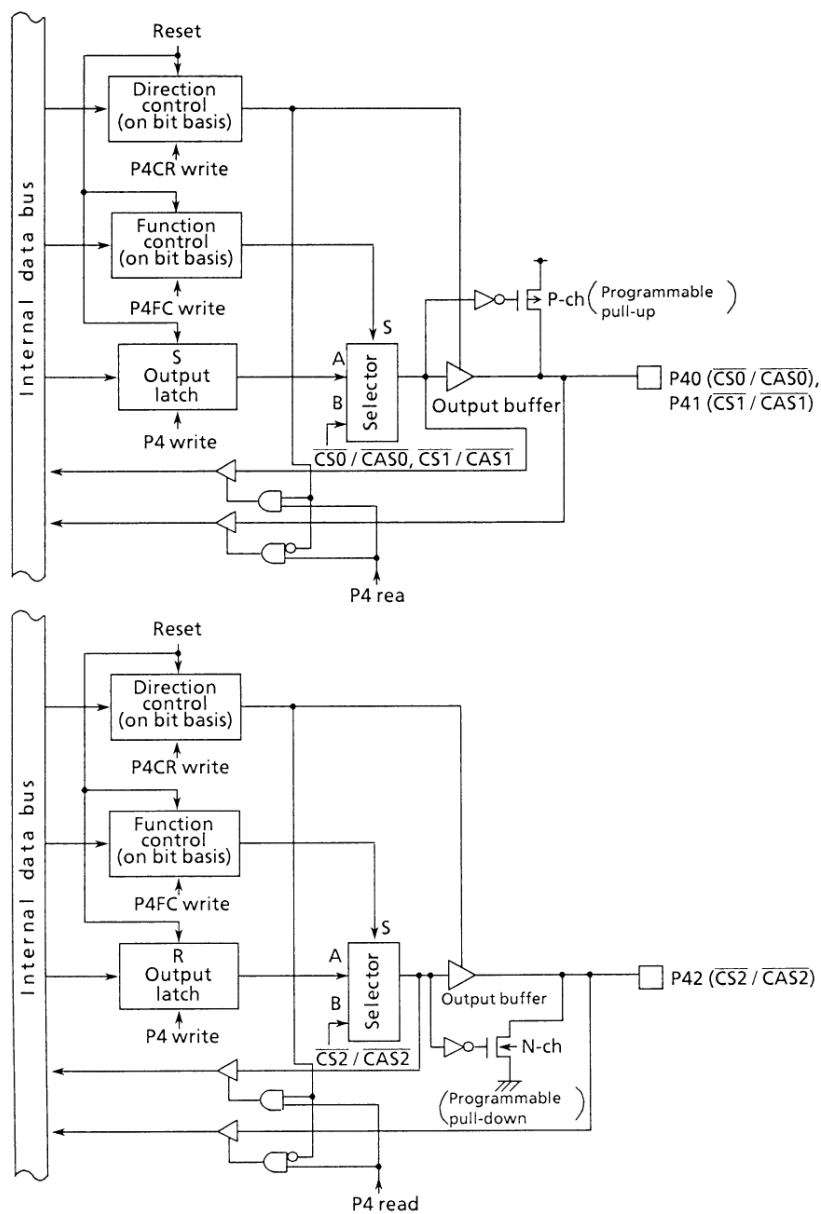

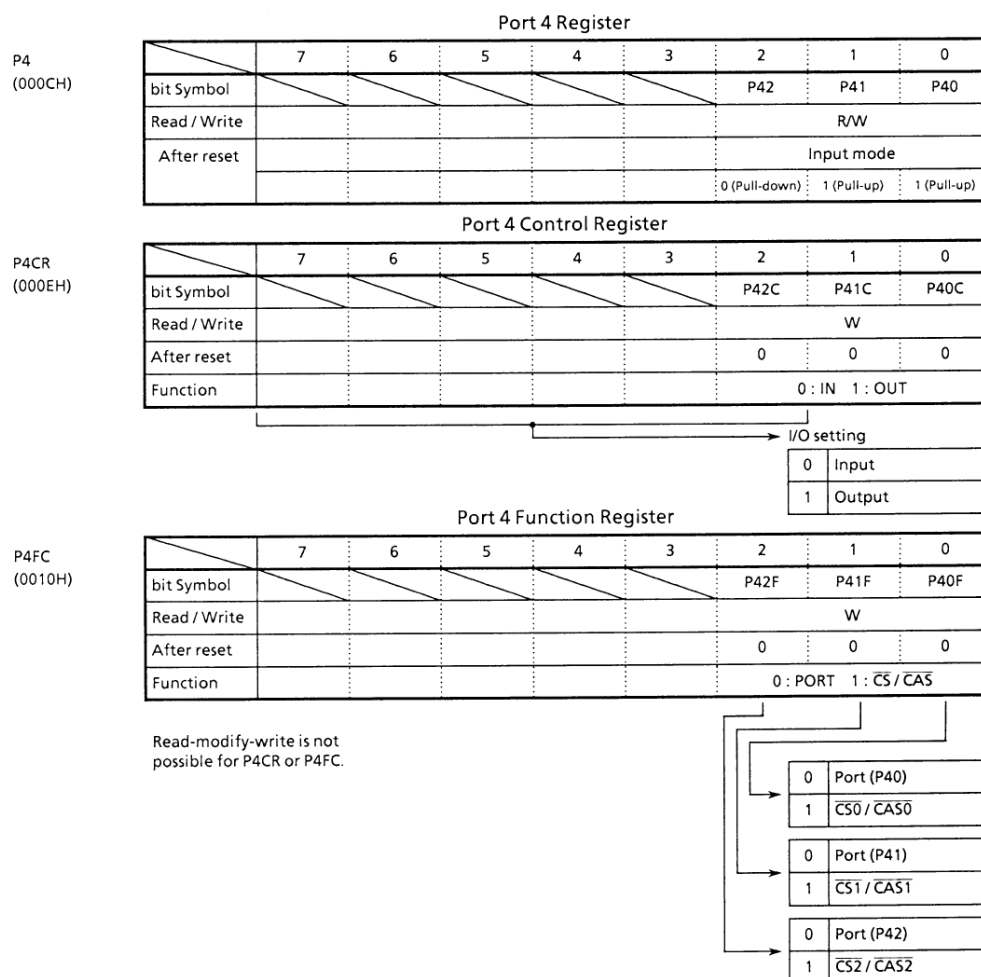

Figure 3.5 (9). Port 4

Note : To output chip select signal ( $\overline{CS0}$  /  $\overline{CAS0}$  to  $\overline{CS2}$  /  $\overline{CAS2}$ ), set the corresponding bits of the control register P4CR and the function register P4FC.  
The B0CS, B1CS, and B2CS registers of the chip select / wait controller are used to select the  $\overline{CS}$  /  $\overline{CAS}$  function.

Figure 3.5 (10). Registers for Port 4

3.5.6 Port 5 (P50 to P57)

for the internal A/D Converter.

Port 5 is an 8-bit input port, also used as an analog input pin

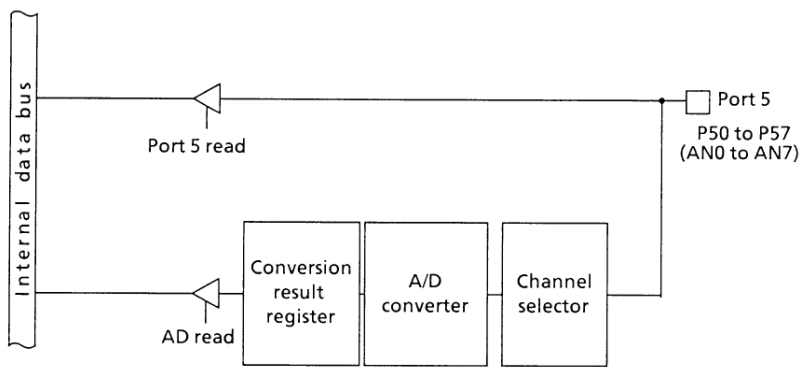

Figure 3.5 (11). Port 5

Port 5 Register									
P5 (000DH)		7	6	5	4	3	2	1	0
	bit Symbol	P57	P56	P55	P54	P53	P52	P51	P50
	Read / Write	R							
	After reset	Input mode							

Note) The input channel selection of A/D Converter is set by A/D Converter mode register ADMOD2.

Figure 3.5 (12). Registers for Port 5

### 3.5.7 Port 6 (P60 to P67)

Port 6 is an 8-bit general-purpose I/O port. I/O can be set on bit basis. Resetting sets Port 6 as an input port and connects a pull-up resistor. It also sets all bits of the output latch to 1. In addition to functioning as a general-purpose I/O port, Port 6

also functions as a pattern generator PG0/PG1 output. PG0 is assigned to P60 to P63; PG1, to P64 to P67. Writing 1 in the corresponding bit of the port 6 function register (P6FC) enables PG output. Resetting resets the function register P6FC value to 0, and sets all bits to ports.

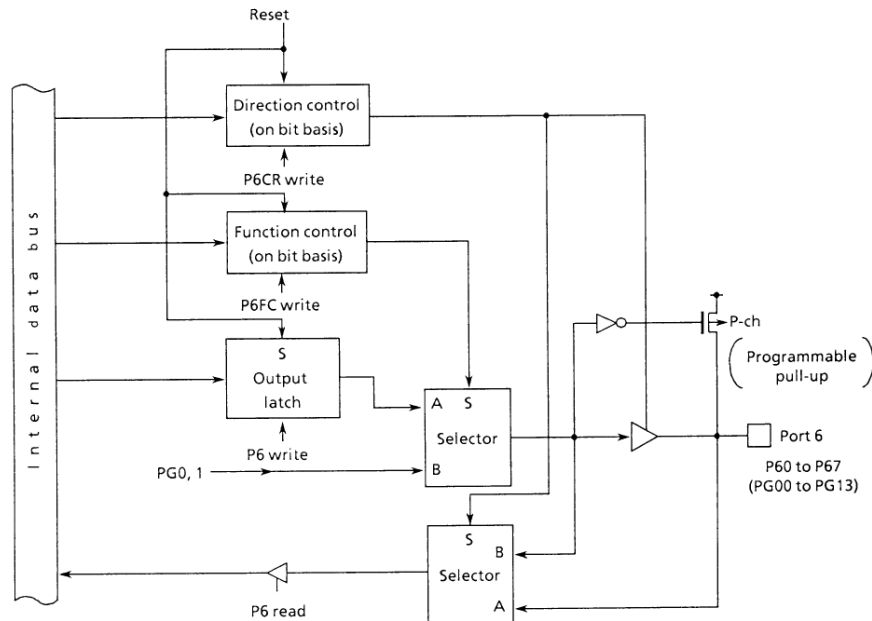

Figure 3.5 (13). Port 6

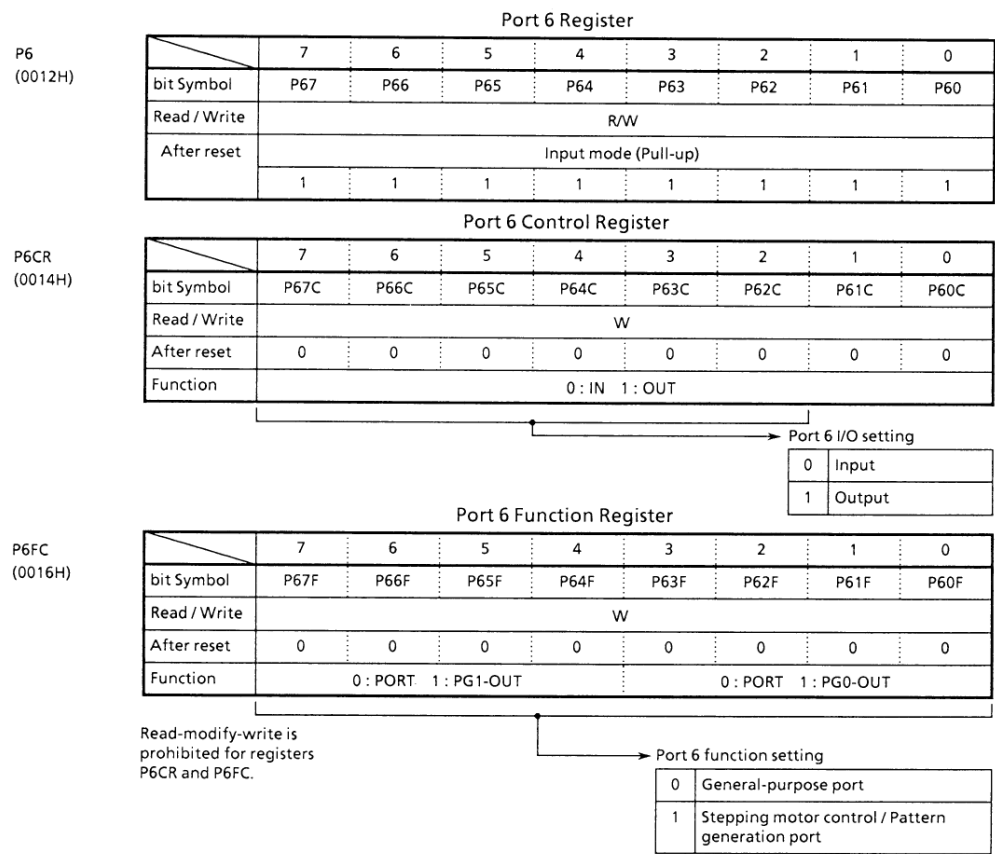

Figure 3.5 (14). Registers for Port 6

### 3.5.8 Port 7 (P70 to P73)

Port 7 is a 4-bit general-purpose I/O port. I/O can be set on bit basis. Resetting sets Port 7 as an input port and connects a pull-up resistor. In addition to functioning as a general-purpose I/O port, Port 70 also functions as an input clock pin TIO; Port

71 as an 8-bit timer output (TO1), Port 72 as a PWM0 output (TO2), and Port 73 as a PWM1 output (TO3) pin. Writing 1 in the corresponding bit of the Port 7 function register (P7FC) enables output of the timer. Resetting resets the function register P7FC value to 0, and sets all bits to ports.

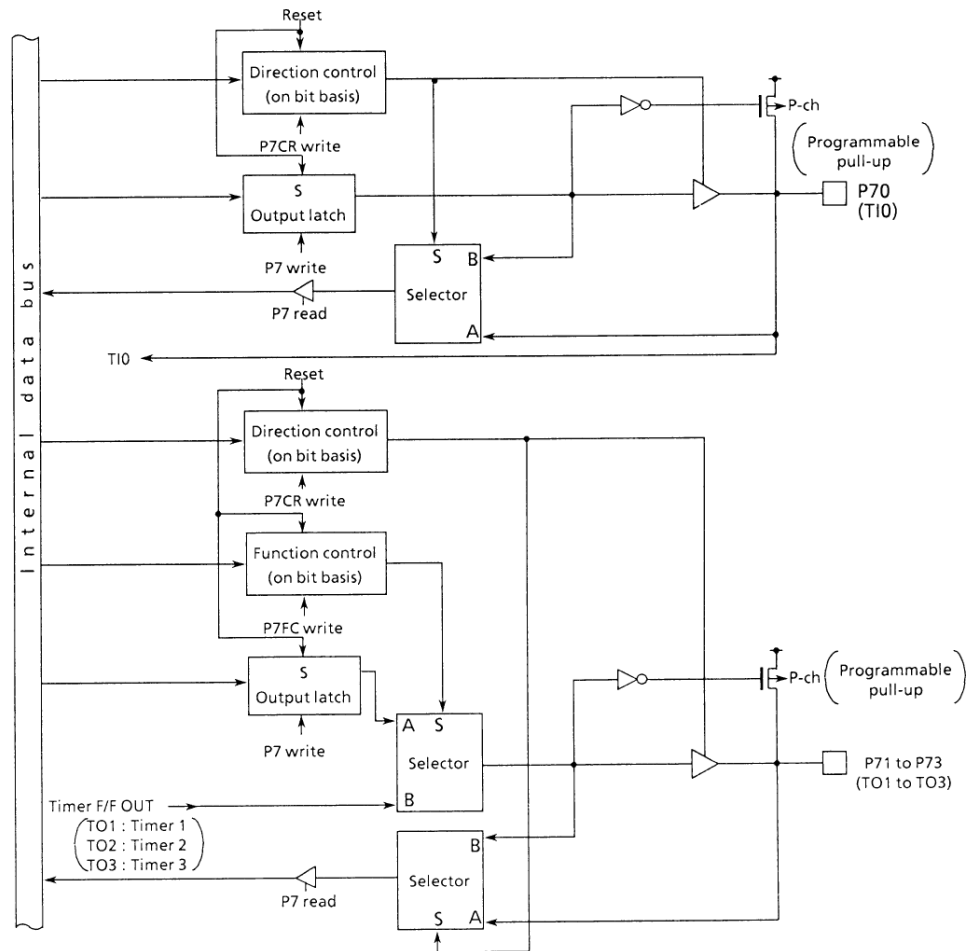

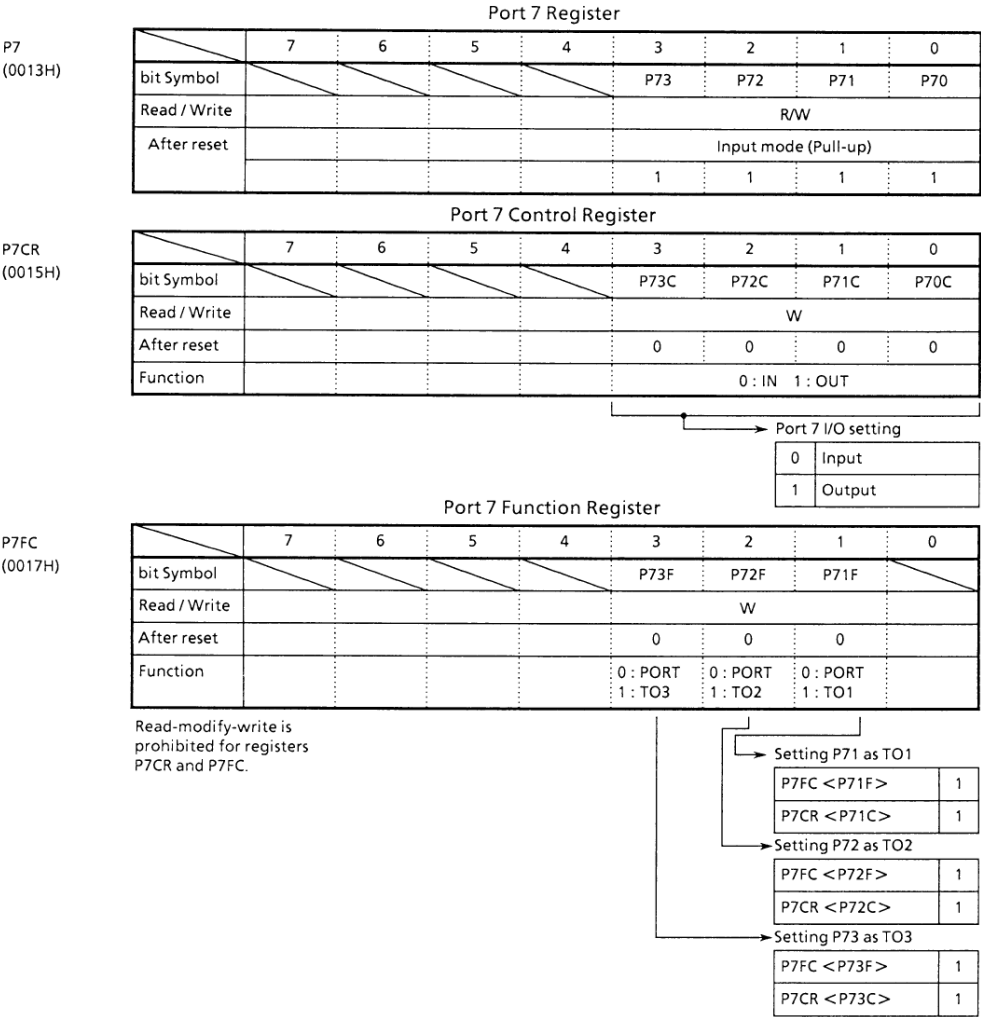

Figure 3.5 (15). Port 7

Note) P70 / TI0 pin does not have a register changing PORT / FUNCTION.  
For example, when it is used as an input port (P70), the input signal for P70 is inputted to 8 bit Timer 0 as a timer input 0 (TI0).

Figure 3.5 (16). Registers for Port 7

### 3.5.9 Port 8 (P80 to P83)

Port 8 is an 8-bit general-purpose I/O port. I/O can be set on a bit basis. Resetting sets Port 8 as an input port and connects a pull-up resistor. It also sets all bits of the output latch register P8 to 1. In addition to functioning as a general-purpose I/O port, Port 8 also functions as an input for 16-bit timer 4 and 5

clocks, an output for 16-bit timer F/F 4, 5 and 6 output, and an input for INT0. Writing "1" in the corresponding bit of the Port 8 function register (P8FC) enables those functions. Resetting resets the function register P8FC value to "0", and sets all bits to ports.

(1) P80 to P86

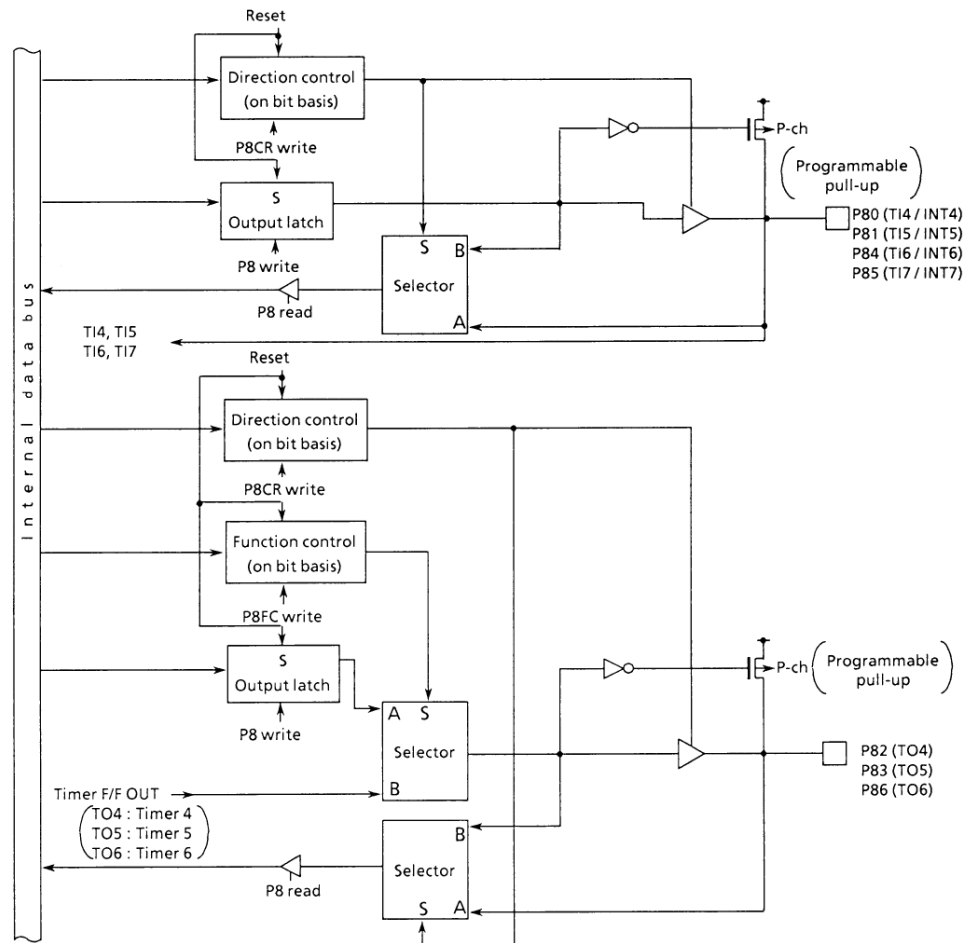

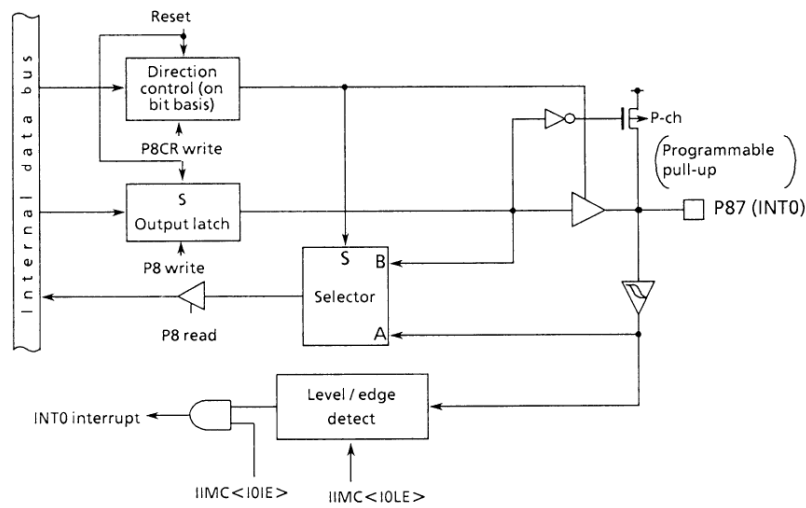

Figure 3.5 (17). Port 8 (P80 to P86)

(2) P87 (INT0)

an INT0 pin for external interrupt request input.

Port 87 is a general-purpose I/O port, and also used as

**Figure 3.5 (18). Port 87**

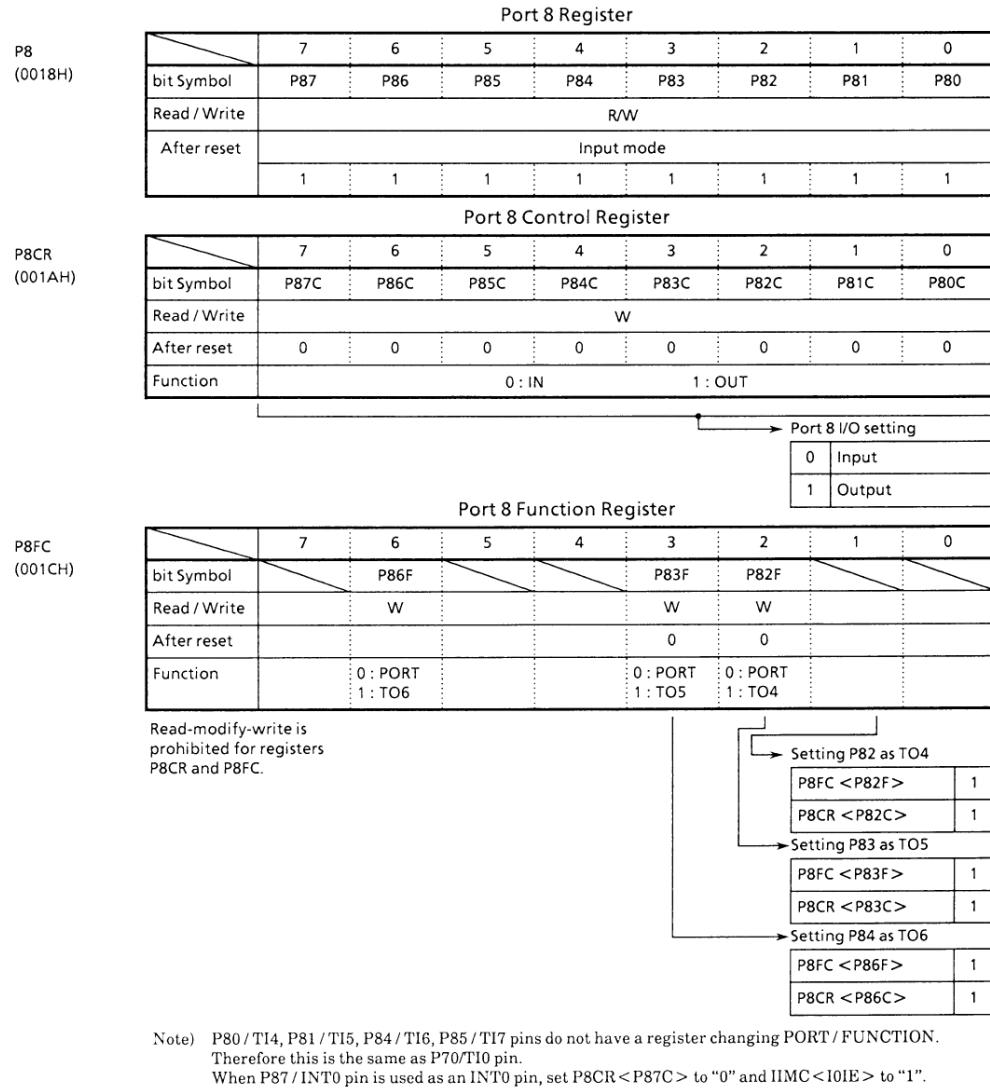

Figure 3.5 (19). Registers for Port 8

### 3.5.10 Port 9 (P90 to P95)

- Port 90 to 95

Ports 90 to 95 is a 6-bit general-purpose I/O port. I/Os can be set on a bit basis.

Resetting sets P90 to 95 to an input port and connects a pull-up resistor.

It also sets all bits of the output latch register to 1.

In addition to functioning as a general-purpose I/O port, P90 to 95 can also function as an I/O for serial channels 0 and 1. Writing "1" in the corresponding bit of the port 9 function register (P9FC) enables this function.

Resetting resets the function register value to "0" and sets all bits to ports.

- Port 96 to 97

Ports 96 to 97 is a 2-bit general-purpose I/O port. I/Os can be set on a bit basis.

The output buffer for P96 to 97 is an open drain type buffer.

Resetting sets P96 to 97 to an output port and outputs high-impedance (HZ) because output latch and control register are set to "1".

In addition to functioning as a general-purpose I/O port, P96 to 97 can also function as a low frequency oscillator pin for dual clock mode. The dual clock function can be set by programming system clock control register SYSCR0, 1.

(1) Port 90, 93 (TXD0/TXD1)

Ports 90 and 93 also function as serial channel TXD output pins in addition to I/O ports.

They have a programmable open drain function.

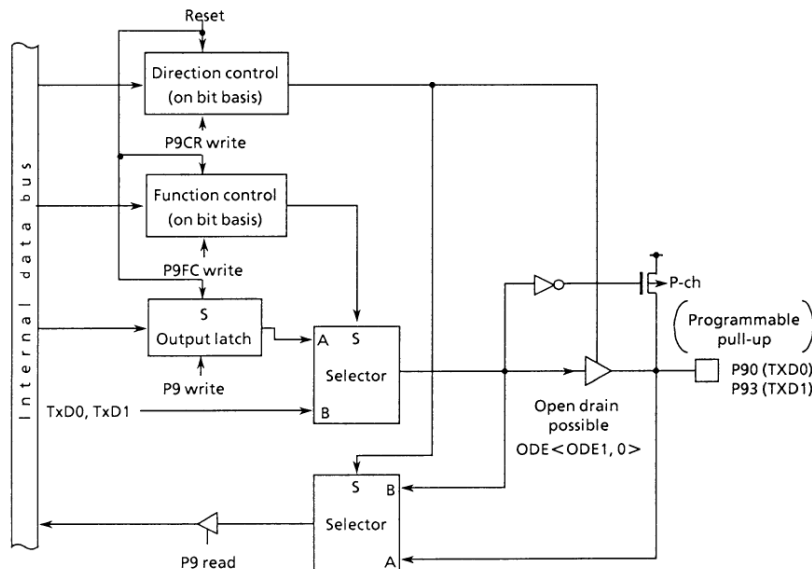

Figure 3.5 (20). Ports 90 and 93

- (2) Ports 91, 94 (RXD0, 1) input pins for serial channels.

Ports 91 and 94 are I/O ports, and also used as RXD

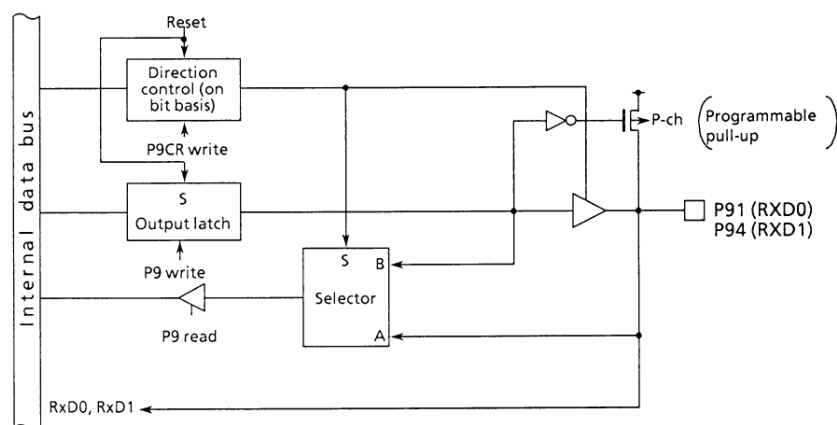

Figure 3.5 (21). Ports 91 and 94

(3) Port 92 ( $\overline{\text{CTS}}$ )

pin and as a SCLK0 I/O pin for serial channels.

Port 92 is an I/O port, and also used as a  $\overline{\text{CTS}}$  input

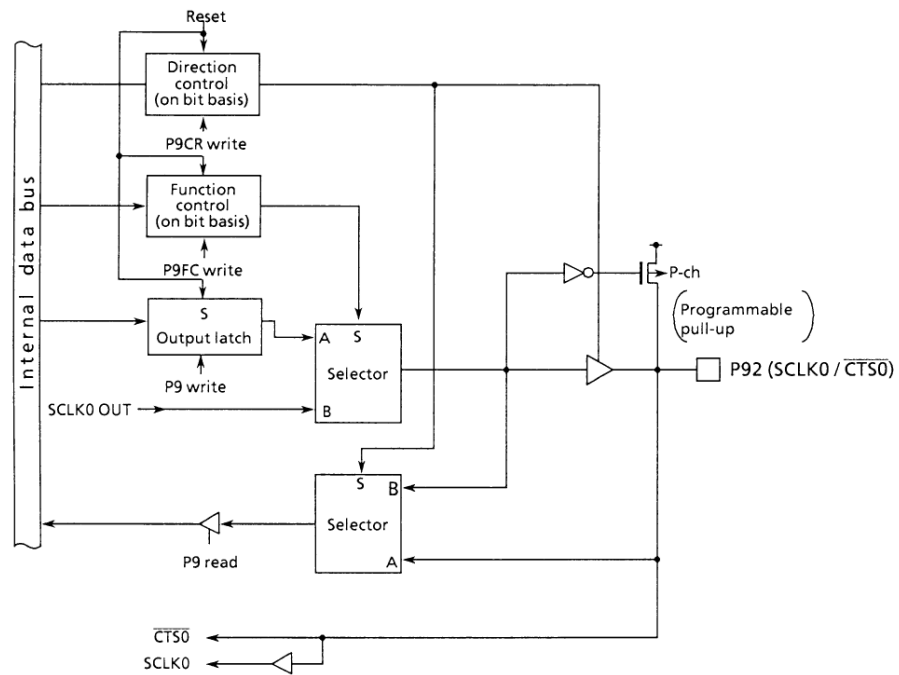

Figure 3.5 (22). Port 92

(4) Port 95 (SCLK)

an SCLK1 I/O pin for serial channel 1.

Port 95 is a general-purpose I/O port. It is also used as

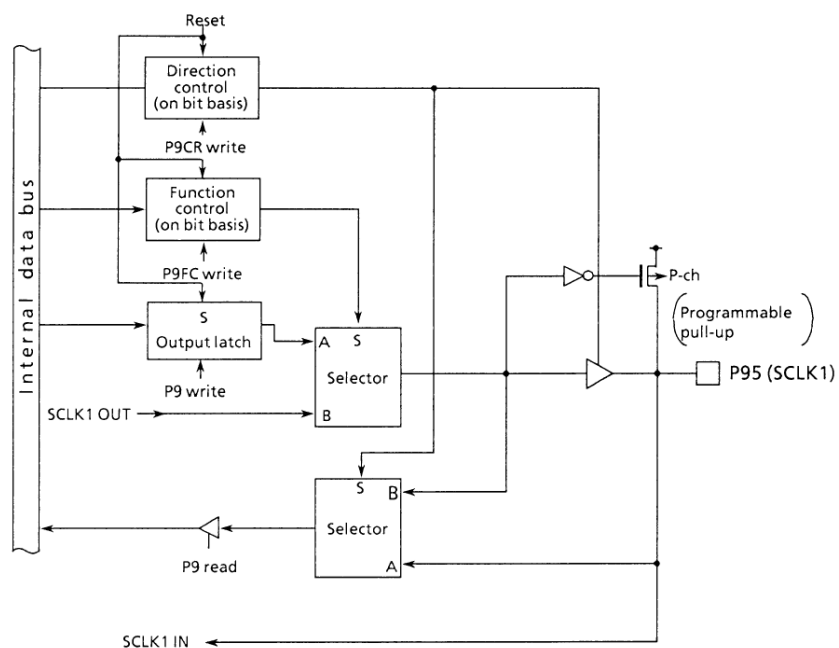

Figure 3.5 (23). Port 95

(5) Port 96 (XT1), 97 (XT2)

used as a low frequency connecting pin.

Port 96, 97 are general-purpose I/O ports. It is also

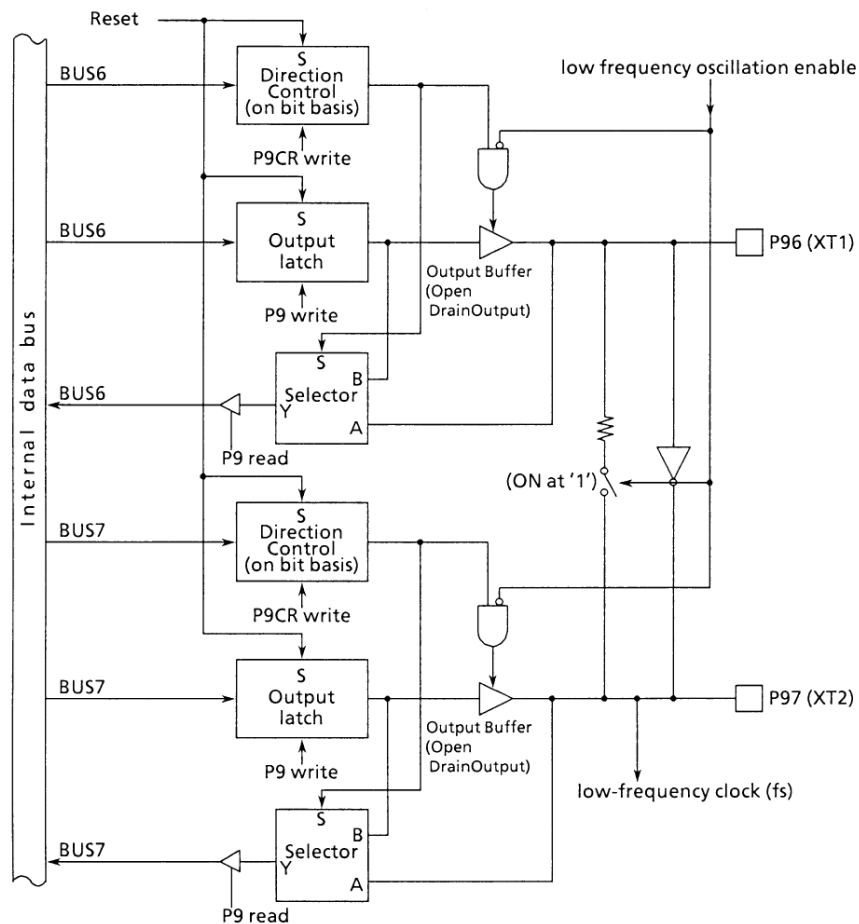

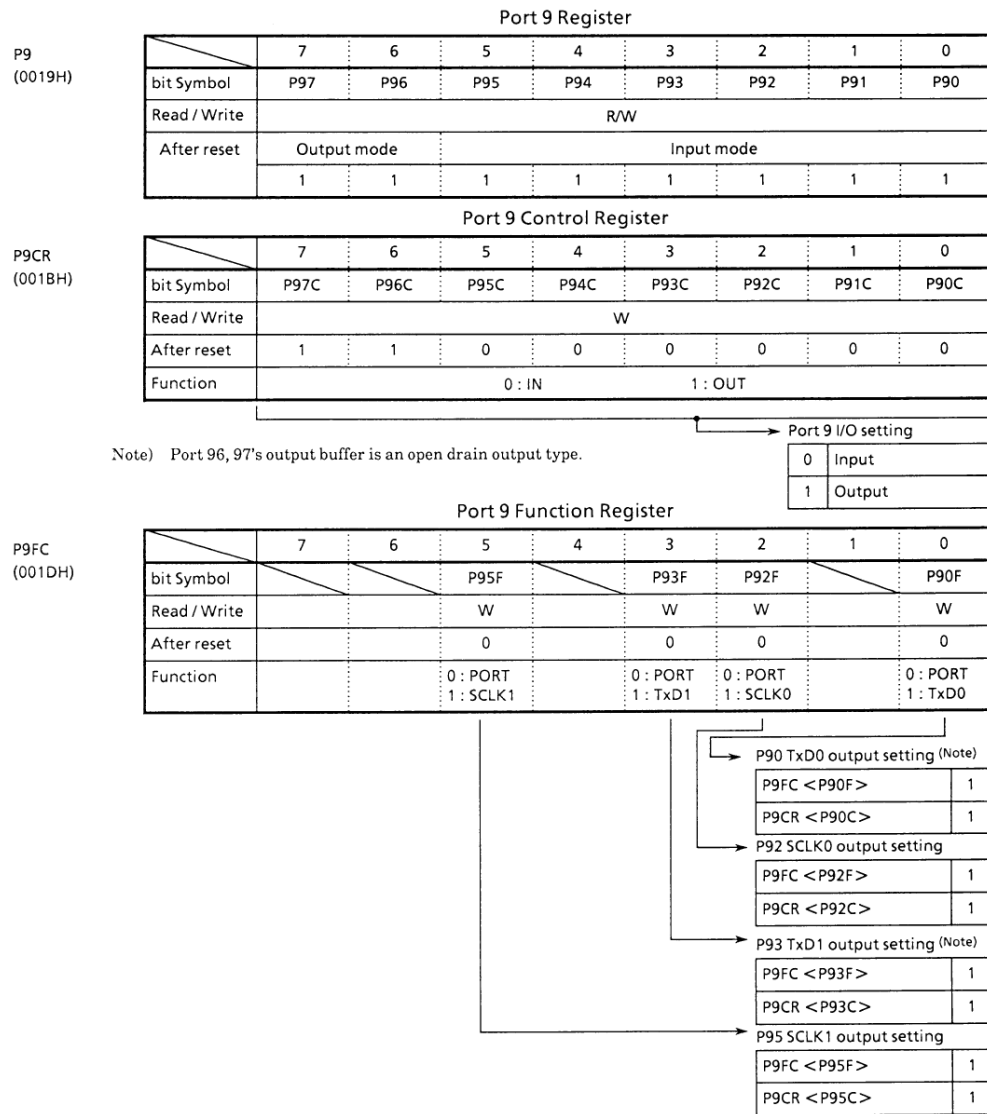

Figure 3.5 (24). Port 96 to 97

Note) To set the TxD pin to open drain, write "1" in bit 0 (for TxD0 pin) or bit 1 (for TxD1 pin) of the ODE register.  
P91 / RXD0, P94 / RXD1 pins do not have a register changing PORT / FUNCTION.  
Therefore this is the same as P70 / TI0 pin.

**Figure 3.5 (25). Register for Port 9**

### 3.5.11 Port A (PA0 to PA7)

Port A is an 8-bit general-purpose I/O port. I/O can be set on a bit basis by control register PACR.

Resetting sets Port A as an input port by resetting PACR. It also sets all bits of the output latch register to "1".

In addition to functioning as a general-purpose I/O port

(only PA7), PA7 can also function as a clock output pin.

The clock output is  $f_{FPH}$  or  $f_{SYS}$  that is selected oscillator output clock. It is selected by CKOCR <SCOSEL>.

SCOUT function is enabled by setting PACR <PA7C> and CKOCR <SCOEN>.

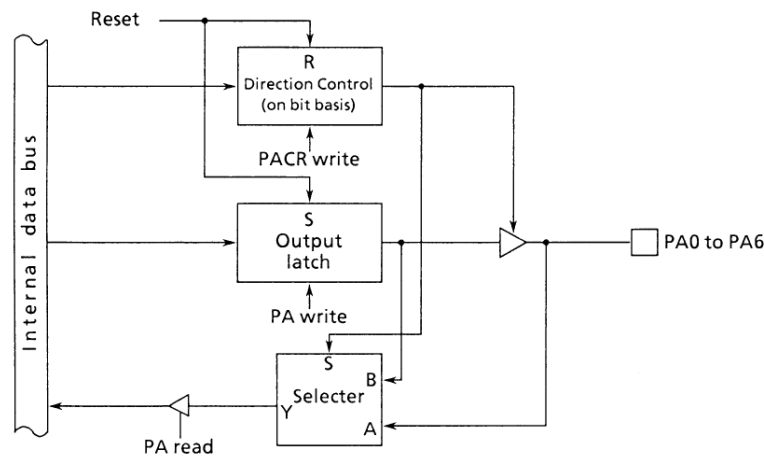

Figure 3.5 (26). Port A0 to A6

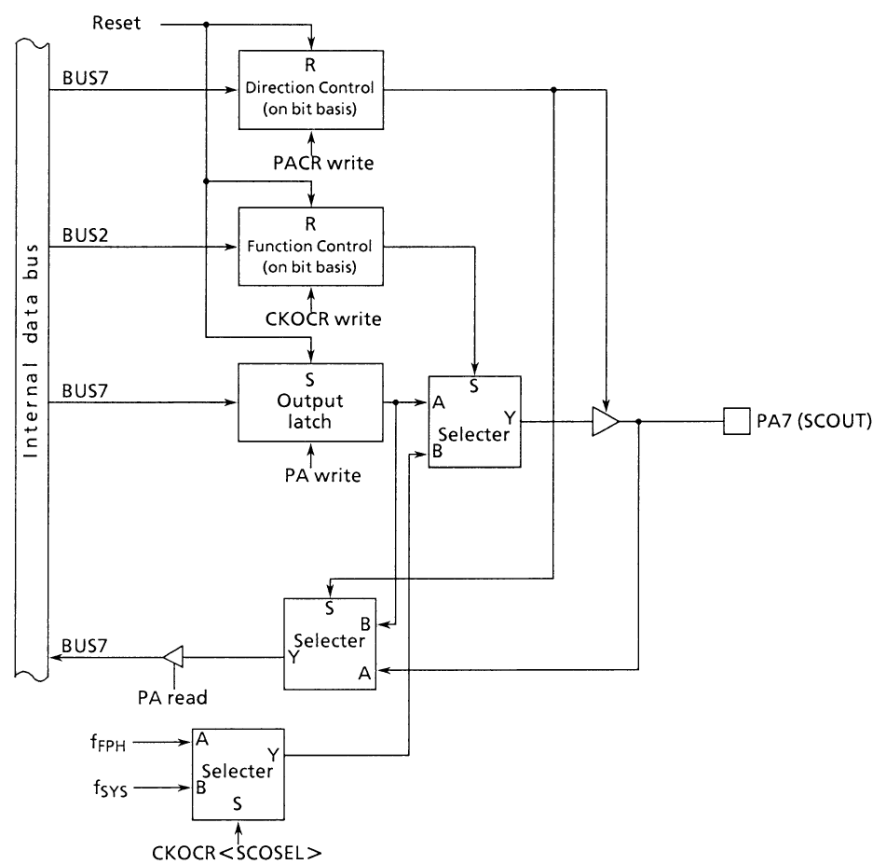

Figure 3.5 (27). Port A7

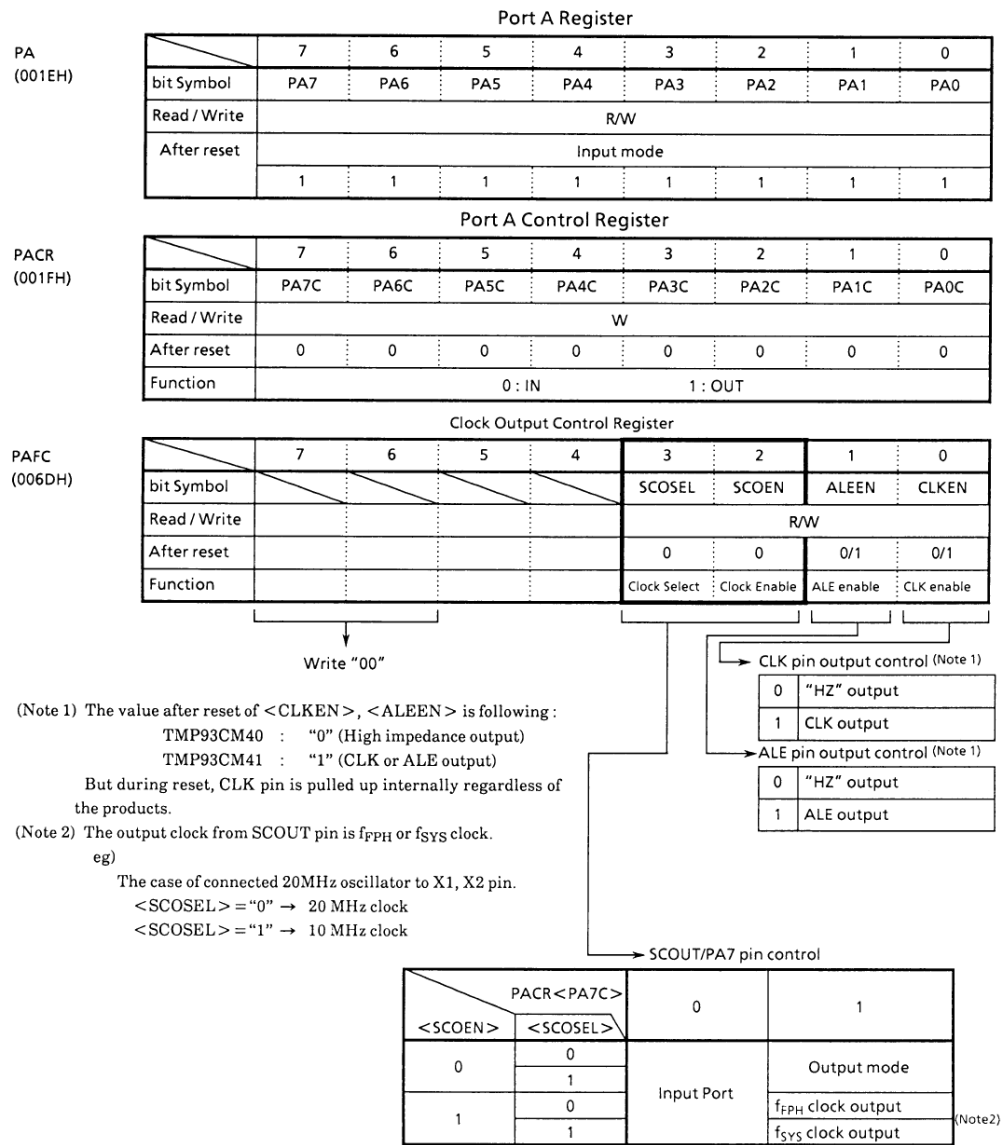

Figure 3.5 (28). Registers for Port A

### 3.6 Chip Select/Wait Control, AM8/ $\overline{16}$ pin

TMP93CM40/M41 has a built-in chip select/wait controller used to control chip select ( $\overline{CS0}$  -  $\overline{CS2}$  pins), wait ( $\overline{WAIT}$  pin), and data bus size (8 or 16 bits) for any of the three block address areas, and AM8/ $\overline{16}$  pin selects external data bus width for TMP93CM41.

#### 3.6.1 AM8/ $\overline{16}$ pin

##### (1) TMP93CM40

Set this pin to "1". After reset, the CPU accesses the internal ROM with 16 bit bus width. When the CPU access an external bus area, the bus width is set by Chip Select/Wait Control Register (described at 3.6.2), P1CR and P1FC (The value "1" of this pin is ignored and the value set by register is active).

##### (2) TMP93CM41

(2-1) 16 bit bus width interlarded with 8 bit bus width or fixed 16 bit bus width

Set this pin to "0". Port 1/AD8 to 15/A8 to 15 pins are then fixed to A8 to 15 function compulsorily and the value of P1CR, P1FC are ignored.

When the CPU accesses an external bus area, the bus width is set by Chip Select/Wait Control Register as described in section 3.6.2.

However, the bus width program memory only after reset must be 16 bit bus width.

(2-2) fixed bit bus width

Set this pin to "1". Port 1/AD8 to 15/A8 to 15 pins are then fixed to A8 to 15 function compulsorily and the value of P1CR, P1FC are ignored. The value of bit 4: <B0BUS>, <B1BUS>, or <B2BUS> described at 3.6.2 are ignored and the bus width is fixed to 8 bit.

### 3.6.2 Control Registers

Table 3.6 (1) shows control registers

One block address areas are controlled by 1-byte CS/ WAIT control registers (B0CS, B1CS, and B2CS). Registers can be written to only when the CPU is in system mode. (There are two CPU modes: system and normal.) The reason is that the settings of these registers have an important effect on the system.

##### (1) Enable

Control register bit 7 (B0E, B1E, and B2E) is a master bit used to specify enable (1)/disable (0) of the setting. Resetting B0E and B1E to disable (0) and B2E to enable (1).

##### (2) CS/CAS Waveform select

Control register bit 5 (B0CAS, B1CAS, and B2CAS) is used to specify waveform mode output from the chip select pin ( $\overline{CS0}/\overline{CAS0}$  -  $\overline{CS2}/\overline{CAS2}$ ). Setting this bit to 0 specifies  $\overline{CS0}$  to  $\overline{CS2}$  waveforms; setting it to 1 specifies  $\overline{CAS0}$  to  $\overline{CAS2}$  waveforms. Resetting clears bit 5 to 0.

##### (3) Data bus size select

Bit 4 (B0BUS, B1BUS, and B2BUS) of the control register is used to specify data bus size. Setting this bit to 0 accesses the memory in 16-bit data bus mode; setting it to 1 accesses the memory in 8-bit data bus mode.

Changing data bus size depending on the access address is called dynamic bus sizing. Table 3.6 (2) shows the details of the bus operation.

(4) Wait control

Control register bits 3 and 2 (B0W1, 0; B1W1, 0; B2W1, 0) are used to specify the number of waits. Setting these bits to 00 inserts a 2-state wait regardless of the  $\overline{\text{WAIT}}$  pin status. Setting them to 01 inserts a 1-state wait regardless of the  $\overline{\text{WAIT}}$  status. Setting them to 10 inserts a 1-state wait and samples the  $\overline{\text{WAIT}}$  pin status. If the pin is low, inserting the wait maintains the bus cycle until the pin goes high. Setting them to 11 completes the bus cycle without a wait regardless of the  $\overline{\text{WAIT}}$  pin status.

Resetting sets these bits to 00 (2-state wait mode).

(5) Address area specification

Control register bits 1 and 0 (B0C1, 0; B1C1, 0; B2C1, 0) are used to specify the target address area. Setting these bits to 00 enables settings ( $\overline{\text{CS}}$  output, Wait state, Bus size, etc.) as follows:

- \* CS0 setting enabled when 7F00H to 7FFFH is accessed.
- \* CS1 setting enabled when 880H to 7FFFH is accessed.
- \* CS2 setting enabled when 8000H to 3FFFFFFFH is accessed, for the TMP93CM41, which does not have a built-in ROM.

CS2 setting enabled when 10000H to 3FFFFFFFH is accessed for the TMP93CM40, which has built-in ROM.

Setting bits to 01 enables setting for all CS's blocks and outputs a low strobe signal ( $\overline{\text{CS0/CAS0}} \sim \overline{\text{CS2/CAS2}}$ ) from chip select pins when 400000H to 7FFFFFFFH is accessed. Setting bits to 10 enables them 800000H to BFFFFFFFH is accessed. Setting bits to 11 enables them when C00000H to FFFFFFFFH is accessed.

xxxxx: During a read, data input to the bus is ignored. At write, the bus is at high impedance and the write strobe signal remains non-active.

### 3.6.3 Chip Select Image

An image of the actual chip select is shown below. Out of the whole memory area, address areas that can be specified are divided into four parts. Addresses from 000000H to 3FFFFFFH are divided differently: 7F00H to 7FFFH is specified for CS0; 880H to 7FFFH, for CS1; and 8000H to 3FFFFFFH, for CS2. The reason is that a device other than ROM (i.e., RAM or I/O) might be connected externally.

7F00 to 7FFFH (256 bytes) for CS0 are mapped mainly for possible expansions to external I/O.

880H to 7FFFH (approximately 31K bytes) for CS1 are

mapped there mainly for possible extensions to external RAM.

8000H to 3FFFFFFH (approximately 4M bytes) for CS2 are mapped mainly for possible extensions to external ROM. After reset, CS2 is enabled in 16-bit bus and 2-wait. With the TMP93CM41, which does not have a built-in ROM, the program is externally read at address 8000H in this setting (16-bit bus, 2-wait). With the TMP93CM40, which has a built-in ROM, addresses from 8000H to FFFFFH are used as the internal ROM area; CS2 is disabled in this area. After reset, the CPU reads the program from the built-in ROM in 16-bit bus, 0-wait mode.

	$\overline{CS0}$	$\overline{CS1}$	$\overline{CS2}$
000000H			
7F00H	B0C1, 0 = "00"	B1C1, 0 = "00"	
8000H			B2C1, 0 = "00"
400000H	B0C1, 0 = "01"	B1C1, 0 = "01"	B2C1, 0 = "01"
800000H	B0C1, 0 = "10"	B1C1, 0 = "10"	B2C1, 0 = "10"
C00000H	B0C1, 0 = "11"	B1C1, 0 = "11"	B2C1, 0 = "11"
FFFFFFH			
	(Mainly for I/O)	(Mainly for RAM)	(Mainly for ROM)

Note 1: Access priority is highest for built-in I/O, then built-in memory, and lowest for the chip select / wait controller.

Note 2: External areas other than  $\overline{CS0}$  to  $\overline{CS2}$  are accessed in 16-bit data bus ( 0 wait) mode.

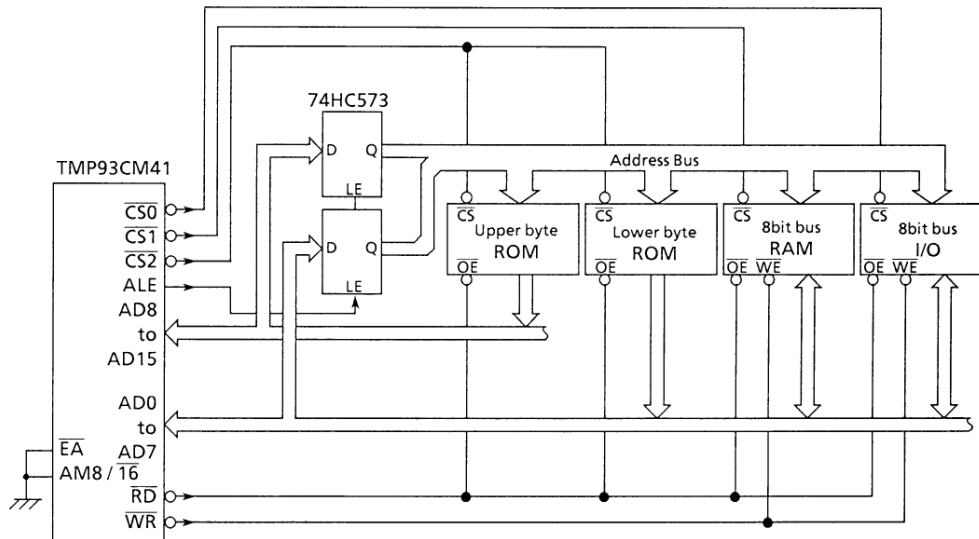

When using the chip select/wait controller, do not specify the same address area more than once. (However, when addresses 7F00H to 7FFFH for CS0 and 880H to 7FFFH for CS1 are specified, in other words, specifications overlap, only the CS0 setting / pin is active.)

Note 3: When the bus is released ( $\overline{BUSA\overline{K}} = "0"$ ),  $\overline{CS0}$  to  $\overline{CS2}$  pins are also released (the output buffer is OFF). Refer to 「 Note about the bus release 」 in 3.5 Functions of Ports about the state of pins.

### 3.6.4 Example of Usage

#### (1) Example of Usage - 1

Figure 3.6 (1) is an example in which an external memory is connected to the TMP93CM41. In this example, a ROM is connected using 16-bit Bus; a RAM is connected using 8-bit Bus.

**Figure 3.6 (1). Example of External Memory Connection (ROM = 16 bits, RAM and I/O = 8 bits)**

Resetting sets pins  $\overline{CS0}$  to  $\overline{CS2}$  to input port mode.  $\overline{CS0}$  and  $\overline{CS1}$  are set high due to an internal pull-up

resistor;  $\overline{CS2}$ , low due to an internal pull-down resistor. The program used to set these pins is as follows:

```

P4CR EQU 0EH
P4FC EQU 10H
B0CS EQU 68H
B1CS EQU 69H
B2CS EQU 6AH
LD (B0CS), 1X010000B ; CS0 = 8 bit, 2WAIT, 7F00H to 7FFFH
LD (B1CS), 1X011100B ; CS1 = 8 bit, 0WAIT, 880H to 7EFFH
LD (B2CS), 1X000100B ; CS2 = 16 bit, 1WAIT, 8000H to 3FFFFFH
LD (P4CR), XXXXX111B
LD (P4FC), XXXXX111B }  $\overline{CS0}$ ,  $\overline{CS1}$ ,  $\overline{CS2}$  output mode setting

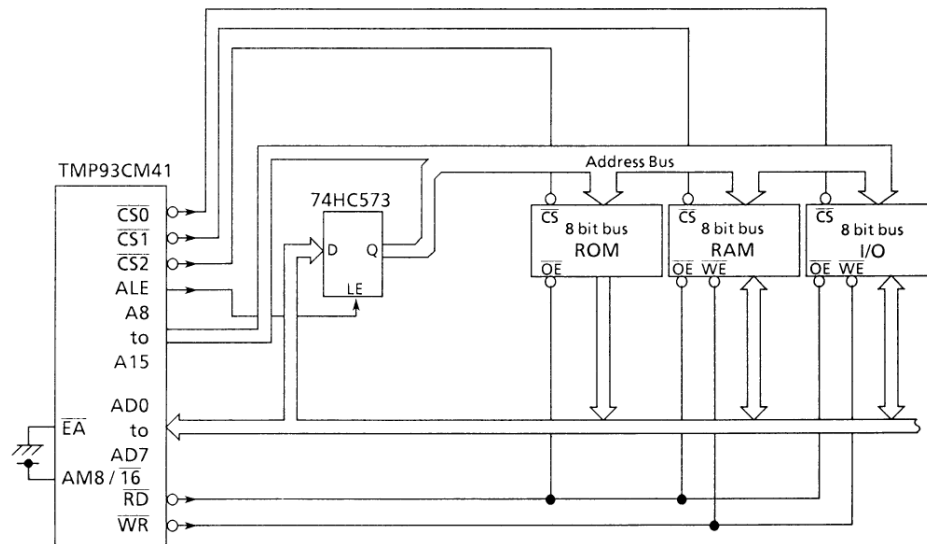

```

(Note) X: don't care

(2) Example of Usage - 2

Figure 3.6 (2) is an example in which an external mem-

ory is connected to the TMP93CM41. In this example, a ROM, a RAM, and I/O are connected using 8-bit bus.

**Figure 3.6 (2). Example of External Memory Connection (ROM and RAM and I/O = 8 bits)**

Resetting sets pins  $\overline{CS0}$  to  $\overline{CS2}$  to input port mode.  $\overline{CS0}$  and  $\overline{CS1}$  are set high due to an internal pull-up

resistor;  $\overline{CS2}$ , low due to an internal pull-down resistor. The program used to set these pins is as follows:

```

P4CR EQU 0EH
P4FC EQU 10H
B0CS EQU 68H
B1CS EQU 69H
B2CS EQU 6AH
LD (B0CS), 1X0X0000B ; CS0 = 8 bit, 2WAIT, 7F00H to 7FFFH
LD (B1CS), 1X0X1100B ; CS1 = 8 bit, 0WAIT, 880H to 7EFFH
LD (B2CS), 1X0X0100B ; CS2 = 8 bit, 1WAIT, 8000H to 3FFFFFH
LD (P4CR), XXXXX111B }  $\overline{CS0}$ ,  $\overline{CS1}$ ,  $\overline{CS2}$  output mode setting
LD (P4FC), XXXXX111B

```

(Note) X : don't care

### 3.7 8-bit Timers

TMP93CM40/M41 contains two 8-bit timers (timers 0 and 1), each of which can be operated independently. The cascade connection allows these timers to be used as 16-bit timer. The following four operating modes are provided for the 8-bit timers.

- 8-bit interval timer mode (2 timers)
- 16-bit interval timer mode (1 timer)
- 8-bit programmable square wave pulse generation (PPG : variable duty with variable cycle) output mode (1 timer)
- 8-bit pulse width modulation (PWM: variable duty with constant cycle) output mode (1 timer)

stant cycle) output mode (1 timer)

Figure 3.7 (1) shows the block diagram of 8-bit timer (timer 0 and timer 1).

Each interval timer consists of an 8-bit up-counter, 8-bit comparator, and 8-bit timer register. Besides, one timer flip-flop (TFF1) is provided for pair of timer 0 and timer 1.

Among the input clock sources for the interval timers, the internal clocks of  $\phi$  T1,  $\phi$  T4,  $\phi$  T16, and  $\phi$  T256 are obtained from the 9-bit prescaler shown in Figure 3.7 (2).

The operation modes and timer flip-flops of the 8-bit timer are controlled by three control registers TMOD, TFFCR, and TRUN.

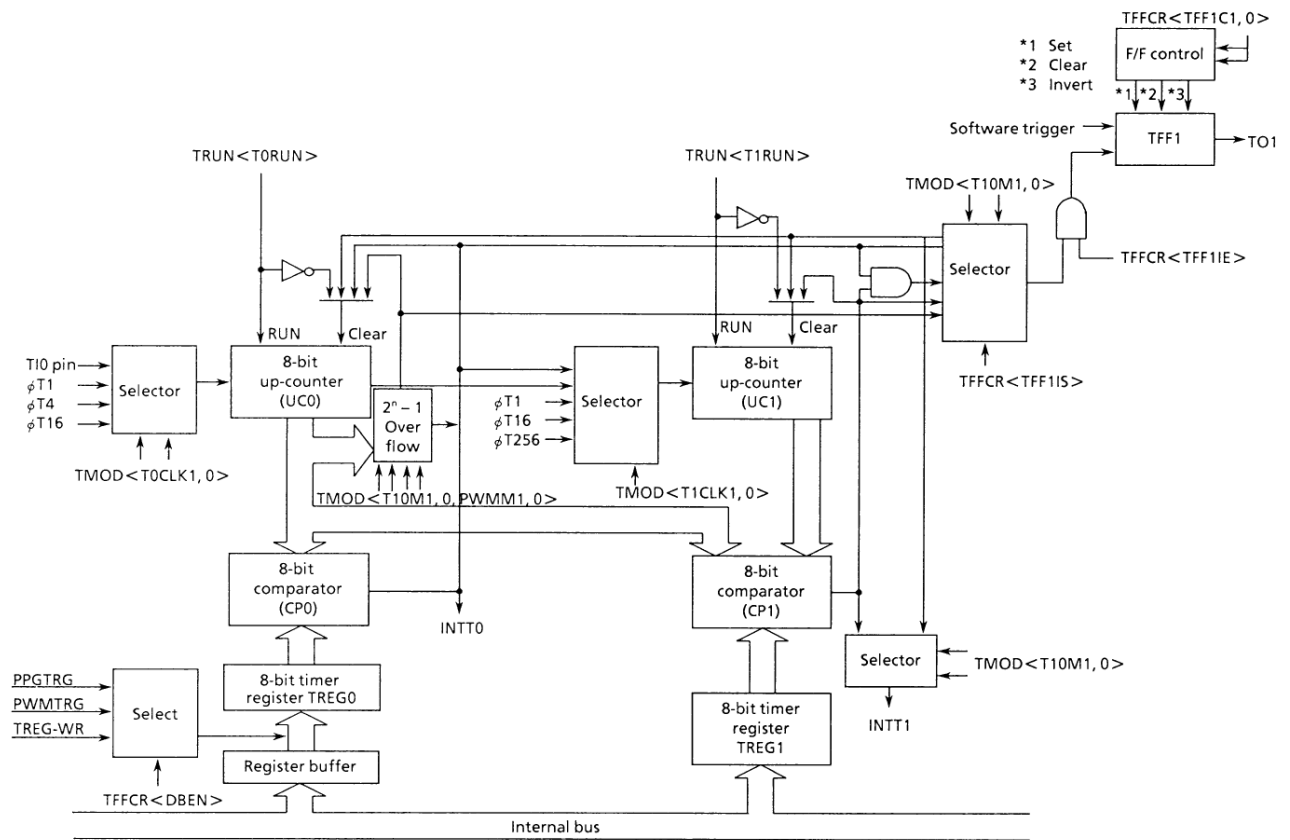

Figure 3.7 (1). Block Diagram of 8-Bit Timers (Timers 0 and 1)

① Prescaler

There are 9 bit prescaler and prescaler clock selection register to generate input clock for 8 bit Timer 0, 1, 16 bit Timer 4, 5 and Serial Interface.

Figure 3.7 (2) shows the block diagram. Table 3.7 (1) shows prescaler clock resolution to 8, 16 bit Timer.

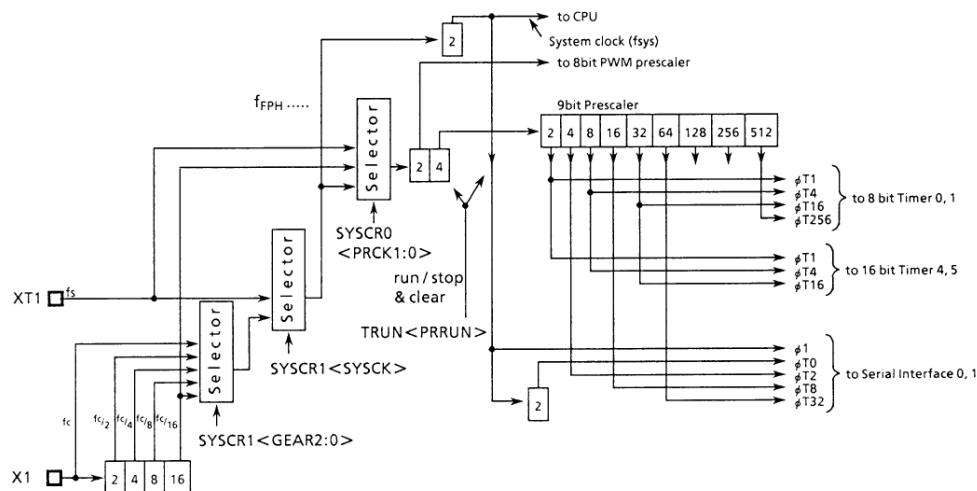

Figure 3.7 (2). Prescaler Block Diagram

Table 3.7 (1) Prescaler Clock Resolution to 8, 16 bit Timer

XXX : don't care

(Note) The  $f_c/16$  clock as a prescaler clock can not be

16 bit Timer

8 bit Timer

The 1/4 times clock selected among  $f_{FPH}$  clock is input to this prescaler. This is selected by prescaler clock selection register SYSCR0 <PRCK1 : 0>.

Resetting sets <PRCK1 : 0> to "00", therefore,  $f_{FPH}/4$  clock is input.

The 8 bit Timer 0, 1 uses 4 types of clock:  $\phi T1$ ,  $\phi T4$ ,  $\phi T16$ , and  $\phi T256$  among the prescaler output.

The prescaler can be run or stopped by the timer control register TRUN <PRRUN>. Counting starts when <PRRUN> is set to "1", while the prescaler is cleared to zero and stops operation when <PRRUN> is set to "0".

When the IDLE1 mode (operates only oscillator) is used, set TRUN <PRRUN> to "0" to stop this prescaler before "HALT" instruction is executed.

## ② Up-counter

This is an 8-bit binary counter which counts up by the input clock pulse specified by TMOD.

The input clock of timer 0 is selected from the external clock from T10 pin and the three internal clocks  $\phi T1$ ,  $\phi T4$ , and  $\phi T16$ , according to the set value of TMOD register.

The input clock of timer 1 differs depending on the operation mode. When set to 16-bit timer mode, the overflow output of timer 0 is used as the input clock. When set to any other mode than 16-bit timer mode, the input clock is selected from the internal clocks  $\phi T1$ ,  $\phi T16$ , and  $\phi T256$  as well as the comparator output (match detection signal) of timer 0 according to the set value of TMOD register.

Example : When TMOD <T10M1,0> = 01, the overflow output of timer 0 becomes the input clock of timer 1 (16 bit timer mode).

When TMOD <T10M1,0> = 00 and TMOD <T1CLK1, 0> = 01,  $\phi T1$  becomes the input of timer 1 (8 bit timer mode).

Operation mode is also set by TMOD register. When reset, it is initialized to TMOD <T01M1, 0> = 00 whereby the up-counter is placed in the 8-bit timer mode.

The counting and stop and clear of up-counter can be controlled for each interval timer by the timer operation control register TRUN. When reset, all up-counters will be cleared to stop the timers.

### ③ Timer register

This is an 8-bit register for setting an interval time. When the set value of timer registers TREG0, TREG1, matches the value of up-counter, the comparator match detect signal becomes active. If the set value is 00H, this signal becomes active when the up-counter overflows.

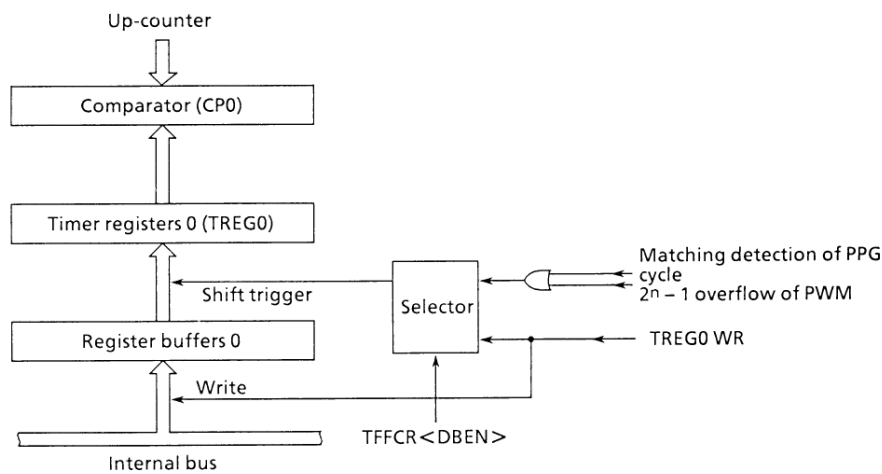

Timer register TREG0 is of double buffer structure, each of which makes a pair with register buffer.

The timer flip-flop control register TFFCR <DBEN> bit controls whether the double buffer structure in the

TREG0 should be enabled or disabled. It is disabled when <DBEN> = 0 and enabled when they are set to 1.

In the condition of double buffer enable state, the data is transferred from the register buffer to the timer register when the  $2^n - 1$  overflow occurs in PWM mode, or at the PPG cycle in PPG mode. Therefore, during timer mode, the double buffer cannot be used.

When reset, it will be initialized to <DBEN> = 0 to disable the double buffer. To use the double buffer, write data in the timer register, set <DBEN> to 1, and write the following data in the register buffer.

**Figure 3.7 (3). Configuration of Timer Register 0**

Note : Timer register and the register buffer are allocated to the same memory address. When <DBEN> = 0, the same value is written in the register buffer as well as the timer register, while when <DBEN> = 1 only the register buffer is written.

The memory address of each timer register is as follows.

TREG0: 000022H  
TREG1: 000023H

All registers are write-only and cannot be read.

#### ④ Comparator

A comparator compares the value in the up-counter with the values to which the timer register is set. When they match, the up-counter is cleared to zero and an interrupt signal (INTT0, INTT1) is generated. If the timer flip-flop inversion is enabled, the timer flip-flop is inverted at the same time.

#### ⑤ Timer flip-flop (timer F/F: TFF1)

The status of the timer flip-flop is inverted by the match detect signal (comparator output) of each interval timer and the value can be output to the timer output pins TO1 (also used as P71).

A timer F/F is provided for a pair of timer 0 and timer 1 and is called TFF1. TFF1 is output to TO1 pin.

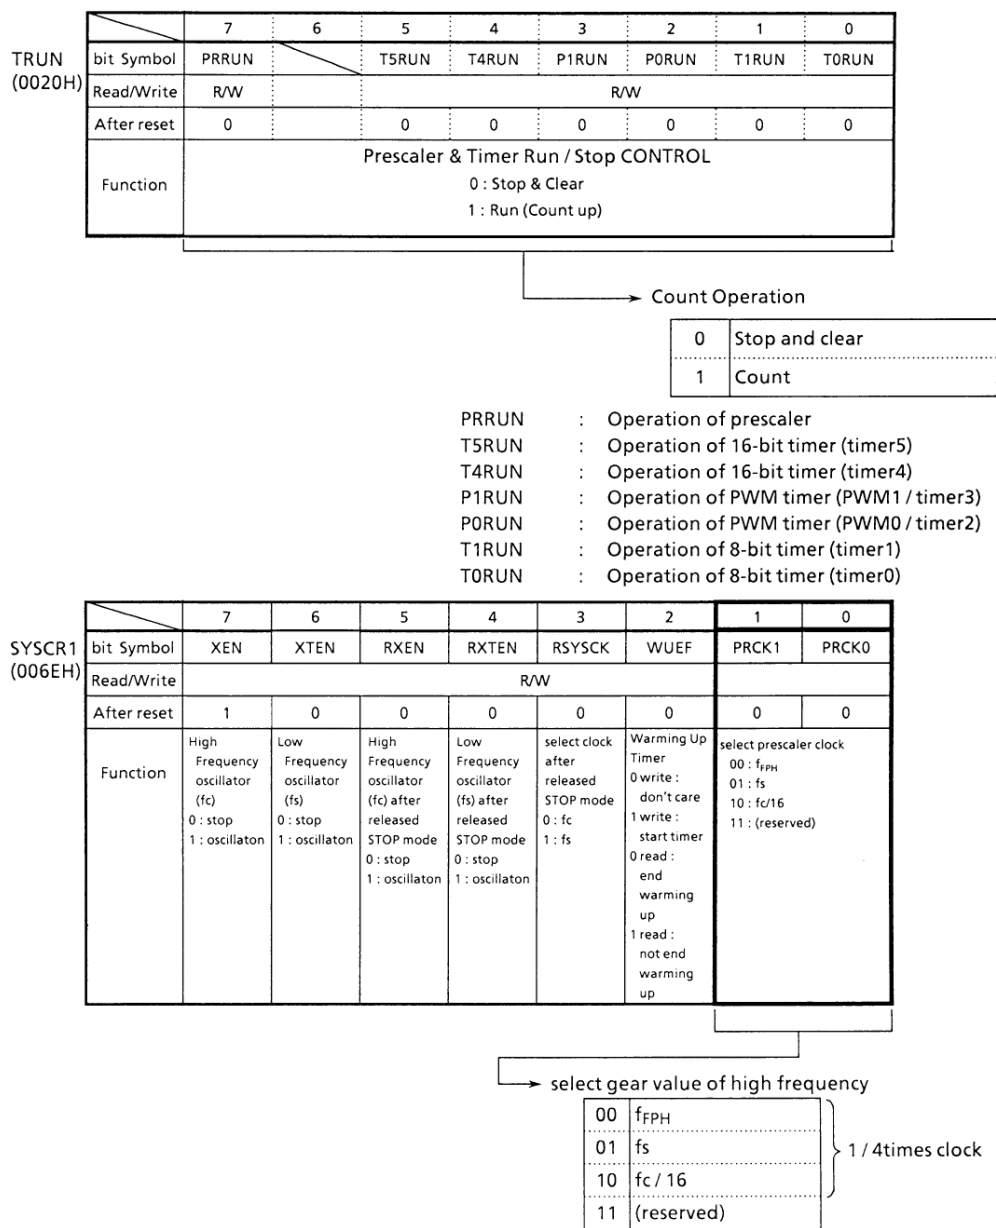

Figure 3.7 (4). Timer Operation Control Register/System Clock Control Register

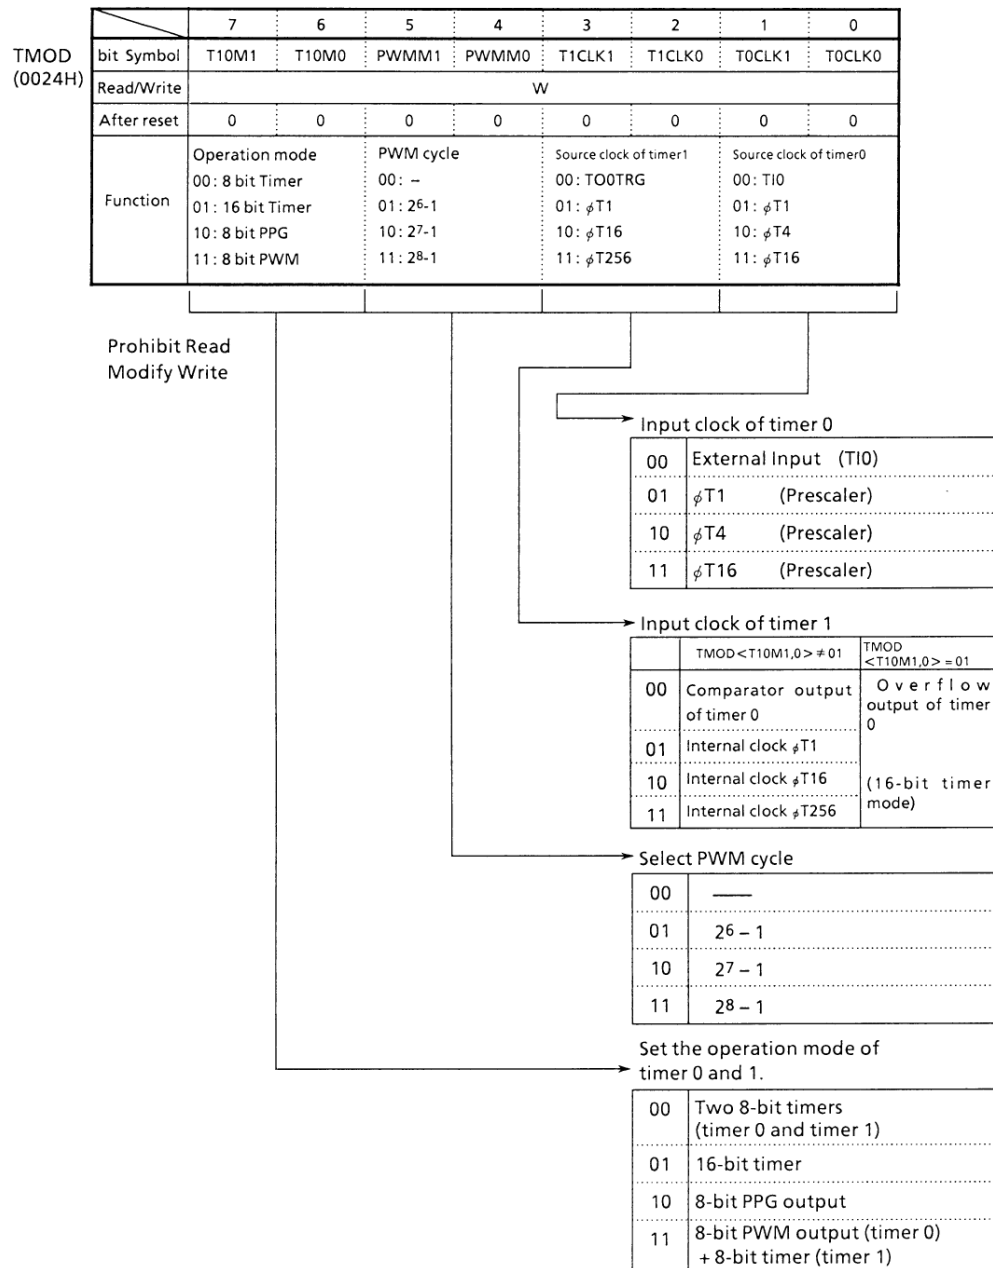

Figure 3.7 (5). Timer Mode Control Register (TMOD)

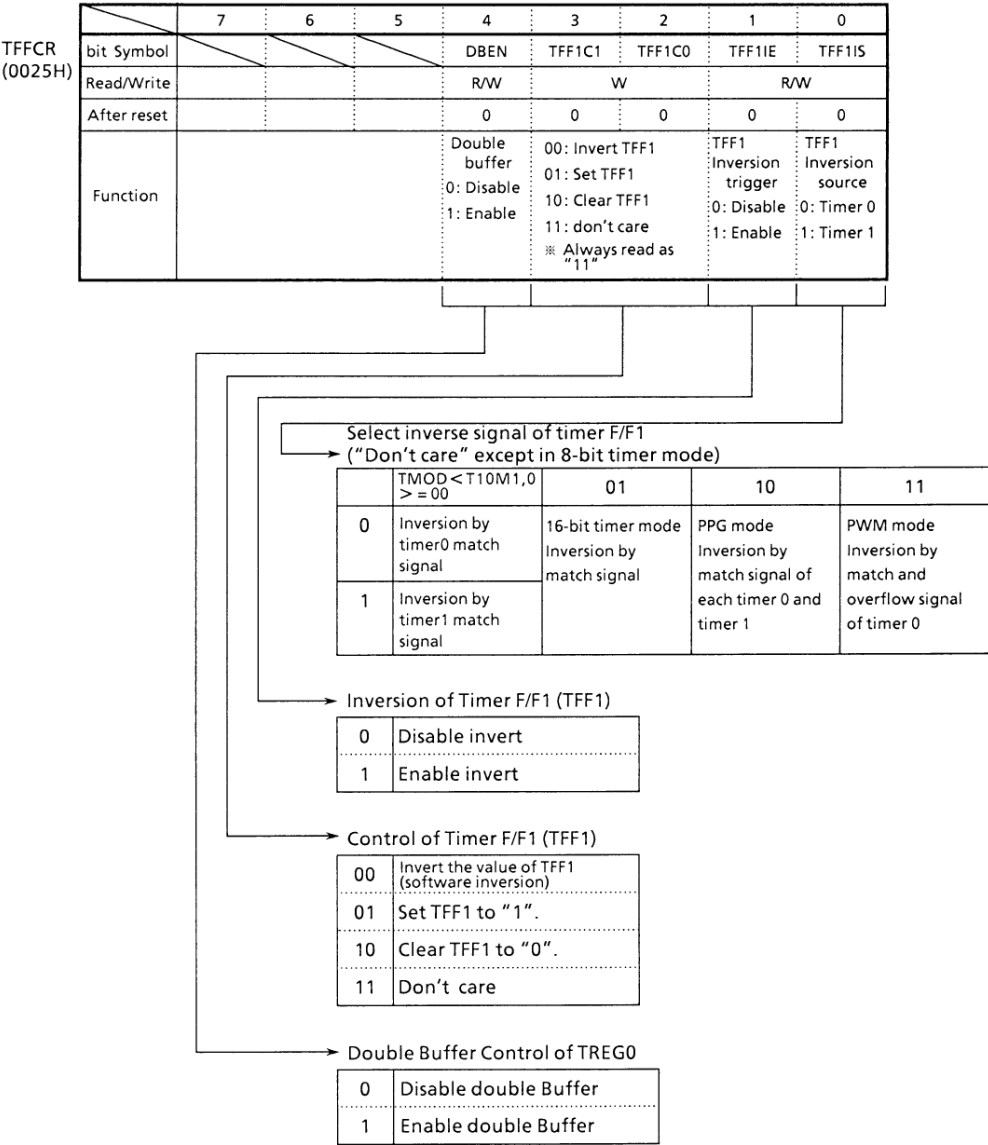

Figure 3.7 (6). Timer Flip-Flop Control Register (TFFCR)

The operation of 8-bit timers will be described below:

(1) 8-bit timer mode

Two interval timers 0, 1, can be used independently as 8-bit interval timer. All interval timers operate in the same manner, and thus only the operation of timer 1 will be explained below.

① Generating interrupts in a fixed cycle

To generate timer 1 interrupt at constant intervals using timer 1 (INTT1), first stop timer 1 then set the operation mode, input clock, and a cycle to TMOD and TREG1 register, respectively. Then, enable interrupt INTT1 and start the counting of timer 1.

Example: To generate timer 1 interrupt every 40 microseconds at  $f_c = 16$  MHz, set each register in the following manner.

※ Clock Condition

system clock : low frequency (fs)  
clock gear : xxx  
prescaler clock : low frequency (fs)

	MSB	LSB							
	7	6	5	4	3	2	1	0	
TRUN	←	-	X	-	-	-	0	-	Stop timer 1, and clear it to "0".
TMOD	←	0	0	X	X	0	1	-	Set the 8-bit timer mode, and select $\phi T16$ (4 ms at $f_s = 32$ kHz) as the input clock.
TREG1	←	1	1	1	1	0	1	0	Set the timer register $1s \div \phi T16 = 250 = FAH$
INTET10	←	1	1	0	1	-	-	-	Enable INTT1, and set it to "Level 5".
TRUN	←	1	X	-	-	-	1	-	Start timer 1 counting.

Note : X: don't care —; no change

Use the following table for selecting the input clock.

Table 3.7 (1) 8-Bit Timer Interrupt Cycle and Input Clock

Input Clock	Interrupt Cycle (at $f_c = 16\text{MHz}$ )	Resolution	Interrupt Cycle (at $f_c = 20\text{MHz}$ )	Resolution
$\phi T1$ (8/ $f_c$ )	0.5 $\mu\text{s}$ ~ 128 $\mu\text{s}$	0.5 $\mu\text{s}$	0.4 $\mu\text{s}$ ~ 102.4 $\mu\text{s}$	0.4 $\mu\text{s}$
$\phi T4$ (32/ $f_c$ )	2 $\mu\text{s}$ ~ 512 $\mu\text{s}$	2 $\mu\text{s}$	1.6 $\mu\text{s}$ ~ 409.6 $\mu\text{s}$	1.6 $\mu\text{s}$
$\phi T16$ (128/ $f_c$ )	8 $\mu\text{s}$ ~ 2.048ms	8 $\mu\text{s}$	6.4 $\mu\text{s}$ ~ 1.638ms	6.4 $\mu\text{s}$
$\phi T256$ (2048/ $f_c$ )	128 $\mu\text{s}$ ~ 32.708ms	128 $\mu\text{s}$	102.4 $\mu\text{s}$ ~ 2.621ms	128 $\mu\text{s}$

Note: The input clock of timer 0 and timer 1 are different from as follows:

Timer 0: T10 input,  $\phi T1$ ,  $\phi T4$ ,  $\phi T16$

Timer 1: Match Output of Timer 0,  $\phi T1$ ,  $\phi T16$ ,  $\phi T256$

② Generating a 50% duty square wave pulse

The timer flip-flop (TFF1) is inverted at constant intervals, and its status is output to timer output pin (TO1).

Example: To output a 3.0μs square wave pulse from TO1 pin at fc = 16MHz, set each register in the following procedures. Either timer 0 or timer 1 may be used, but this example uses timer 1.

- ※ Clock Condition
- system clock

clock gear

prescaler clock

:

:

:

High Frequency (fc)

1 (fc)

system clock (fsys)

7 6 5 4 3 2 1 0

TRUN ← - X - - - 0 -

TMOD ← 0 0 X X 0 1 - -

TREG1 ← 0 0 0 0 0 0 1 1

TFFCR ← - - - - 1 0 1 1

P7CR ← X X X X - - 1 -

P7FC ← X X X X - - 1 X

TRUN ← 1 X - - - - 1 -

Stop timer 1, and clear it to "0".

Set the 8-bit timer mode, and select φT1 (0.5 μs at fc = 16 MHz) as the input clock.

Set the timer register at  $3.0 \mu s \div \phi T1 \div 2 = 3$ .

Clear TFF1 to "0", and set to invert by the match detect signal from timer 1.

Select P71 as TO1 pin.

Start timer 1 counting.

Note : X ; don't care    - ; no change

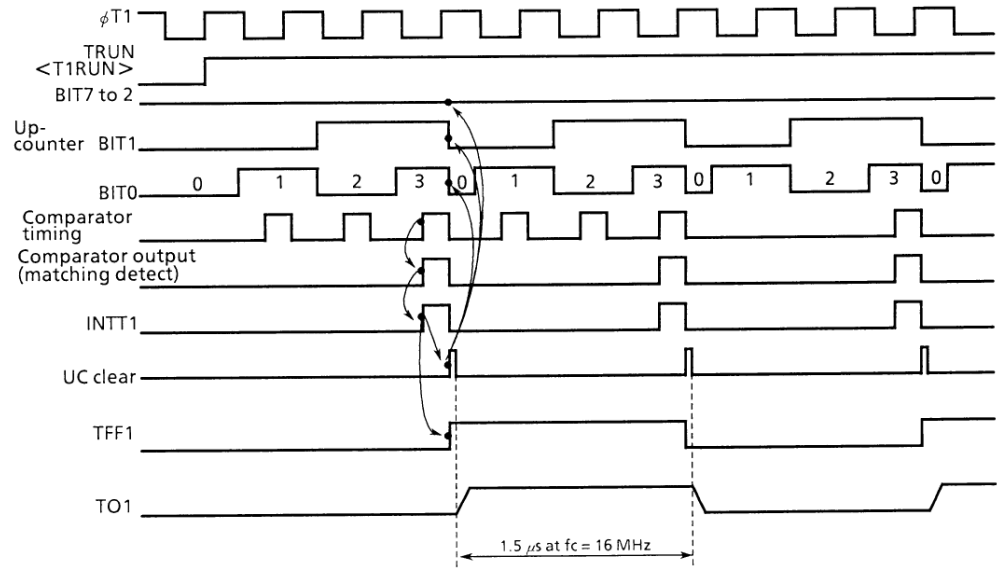

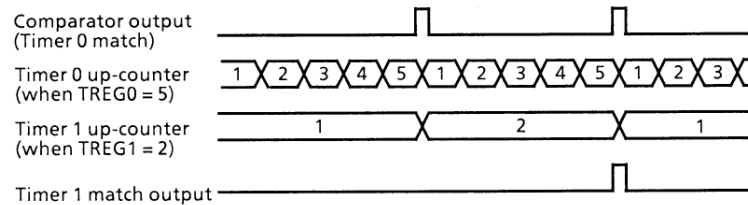

Figure 3.7 (7). Square Wave (50% Duty) Output Timing Chart

- ③ Making timer 1 count up by match signal from timer 0 comparator

Set the 8-bit timer mode, and set the comparator output of timer 0 as the input clock to timer 1.

**Figure 3.7 (8). Timer 1 Count Up by Timer 0**

- ④ Output inversion with software

- (2) 16-bit timer mode

The value of timer flip-flop (TFF1) can be inverted, independent of timer operation.

Writing "00" into TFFCR <TFF1C1, 0> (memory address: 000025h of bit 3 and bit 2) inverts the value of TFF1.

- ⑤ Initial setting of timer flip-flop (TFF1)

The value of TFF1 can be initialized to "0" or "1", independent of timer operation.

For example, write "10" in TFFCR <TFF1C1, 0> to clear TFF1 to "0", while write "01" in TFFCR <TFF1C1, 0> to set TFF1 to "1".

Note: The value of timer register cannot be read.

A 16-bit interval timer is configured by using the pair of timer 0 and timer 1.

To make a 16-bit interval timer by cascade connecting timer 0 and timer 1, set timer 0/timer 1 mode register TMOD <T10M1, 0> to "0, 1".

When set in 16-bit timer mode, the overflow output of timer 0 will become the input clock of timer 1, regardless of the set value of TMOD <T1CLK1, 0>. Table 3.7 (2) shows the relation between the cycle of timer (interrupt) and the selection of input clock.

Table 3.7 (2)

Input Clock	Interrupt Cycle (at fc = 16MHz)	Resolution	Interrupt Cycle (at fc = 20MHz)	Resolution
φT1 (8/fc)	0.5μs ~ 32.786ms	0.5μs	0.4μs ~ 26.214ms	0.4μs
φT4 (32/fc)	2μs ~ 131.072ms	2μs	1.6μs ~ 104.857ms	1.6μs
φT16 (128/fc)	8μs ~ 524.288ms	8μs	6.4μs ~ 419.430ms	6.4μs

The lower 8 bits of the timer (interrupt) cycle are set by the timer register TREG0, and the upper 8 bits are set by TREG1. Note that TREG0 always must be set first. (Writing data into TREG0 disables the comparator temporarily, and the comparator is restarted by writing data into TREG1.)

Setting example: To generate an interrupt INTT1 every 0.5 seconds at fc = 16MHz, set the following values for timer registers TREG0 and TREG1.

※ Clock Condition

system clock	:	High Frequency (fc)
clock gear	:	1 (fc)
prescaler clock	:	system clock (fsys)

When counting with input clock of φT16 (8μs @ 16MHz)

$0.5 \text{ sec} \div 8\mu\text{s} = 62500 = \text{F424H}$

Therefore, set TREG1 = F4H and TREG0 = 24H, respectively.

The comparator match signal is output from timer 0 each time the up-counter UC0 matches TREG0, where the up-counter UC0 is not to be cleared.

With the timer 1 comparator, the match detect signal

is output at each comparator timing when up-counter UC1 and TREG1 values match. When the match detect signal is output simultaneously from both comparators of timer 0 and timer 1, the up-counters UC0 and UC1 are cleared to “0”, and the interrupt INTT1 is generated. If inversion is enabled, the value of the timer flip-flop TFF1 is inverted.

Example: When TREG1 = 04H and TREG0 = 80H

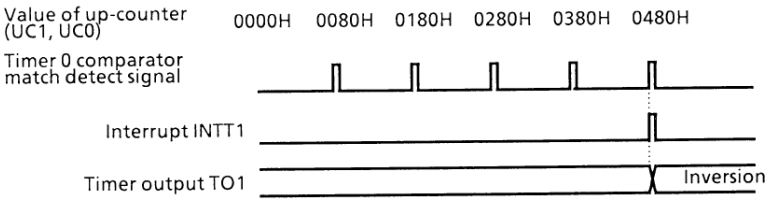

Figure 3.7 (9). Output Timer by 16-Bit Timer Mode

(3) 8-bit PPG (Programmable Pulse Generation) Output mode

Square wave pulse can be generated at any frequency and duty by timer 0 and timer 1. The output pulse may be either low-active or high-active. In this mode, timer 1 cannot be used.

Timer 0 outputs pulse to TO1 pin (also used as P70). In this mode, a programmable square wave is generated by inverting timer output each time the 8-bit up-

counter (UC0) matches the timer registers TREG0 and TREG1.

However, it is required that the set value of TREG0 is smaller than that of TREG1.

Though the up-counter (UC1) of timer 1 is not used in this mode, UC1 should be set for counting by setting TRUN <T1RUN> to 1.

Figure 3.7 (11) shows the block diagram for this mode.

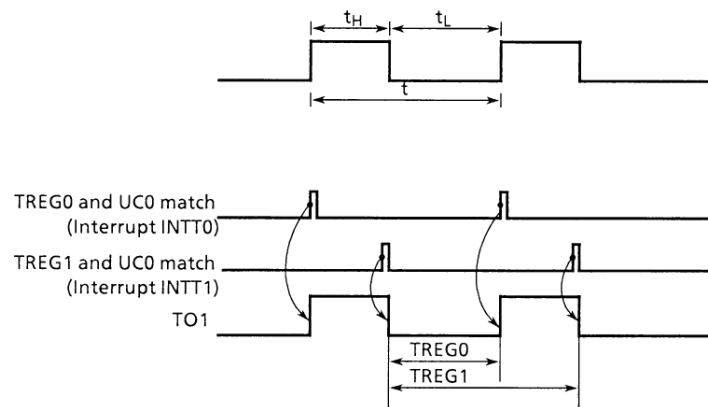

Figure 3.7 (10). 8-Bit PPG Output Waveforms

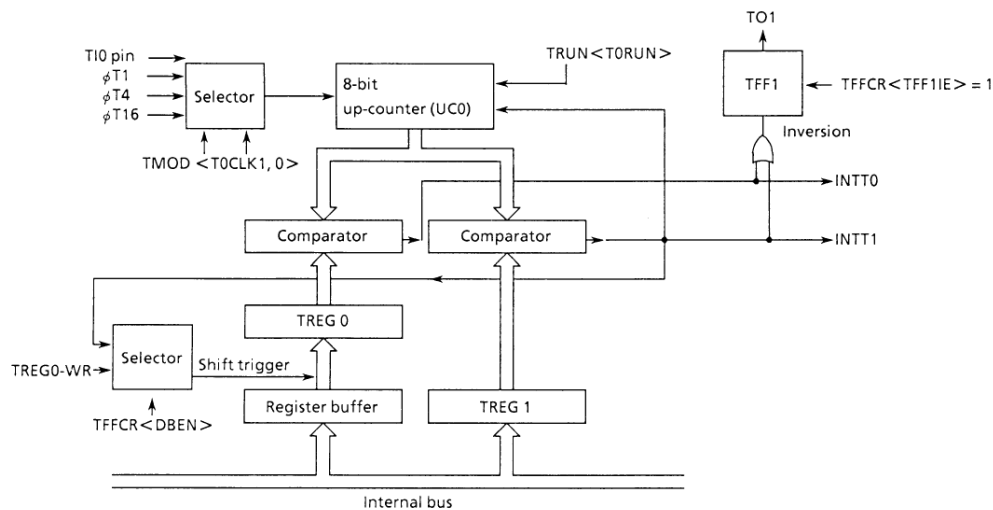

Figure 3.7 (11). Block Diagram of 8-Bit PPG Output Mode

When the double buffer of TREG0 is enabled in this mode, the value of register buffer will be shifted in TREG0 each time TREG1 matches UC0.

Use of the double buffer makes easy handling of low duty waves (when duty is varied).

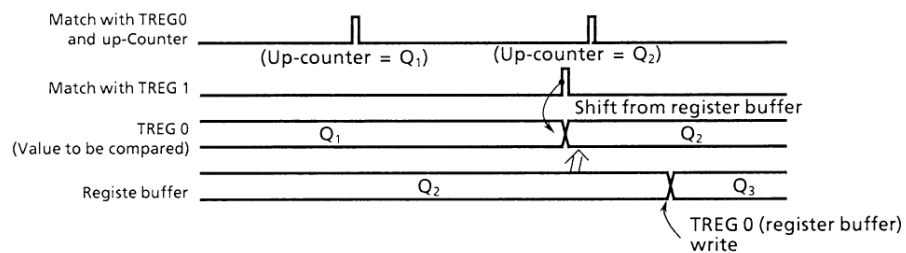

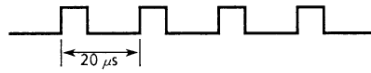

Figure 3.7 (12). Operation of Register Buffer

Example: Generating 1/4 duty 50kHz pulse (at  $f_c = 16\text{MHz}$ )

※ Clock Condition

system clock	:	High Frequency ( $f_c$ )
clock gear	:	1 ( $f_c$ )
prescaler clock	:	system clock ( $f_{sys}$ )

- Calculate the value to be set for timer register.  
To obtain the frequency 50kHz, the pulse cycle  $t$  should be:  $t = 1/50\text{kHz} = 20\mu\text{s}$ .  
Given  $\phi T1 = 0.5\mu\text{s}$  at 16MHz),  
 $20\mu\text{s} \div 0.5\mu\text{s} = 40$   
Consequently, to set the timer register 1 (TREG1) to

$TREG1 = 40 = 28\text{H}$  and then duty to 1/4,  $t \times 1/4 = 20\mu\text{s} \times 1/4 = 5\mu\text{s}$

$$5\mu\text{s} \div 0.5\mu\text{s} = 10$$

Therefore, set timer register 0 (TREG0) to  $TREG0 = 10 = 0\text{AH}$ .

	7	6	5	4	3	2	1	0	
TRUN	←	–	X	–	–	–	0	0	Stop timer 0, and clear it to "0".
TMOD	←	1	0	X	X	X	0	1	Set the 8-bit PPG mode, and select $\phi T1$ as input clock.
TREG0	←	0	0	0	0	1	0	1	Write "0AH".
TREG1	←	0	0	1	0	1	0	0	Write "28H".
TFFCR	←	–	–	–	1	0	1	X	Sets TFF1 and enable the inversion and double buffer enable.
									Writing "10" provides negative logic pulse.
P7CR	←	X	X	X	X	–	1	–	Set P71 as the TO1 pin.
P7FC	←	X	X	X	X	–	1	X	
TRUN	←	1	X	–	–	–	1	1	Start timer 0 and timer 1 counting.

Note : X ; don't care    – ; no change

(4) 8-bit PWM Output mode

This mode is valid only for timer 0. In this mode, maximum 8-bit resolution of PWM pulse can be output.

PWM pulse is output to TO1 pin (also used as P71) when using timer 0. Timer 1 can also be used as 8-bit timer.

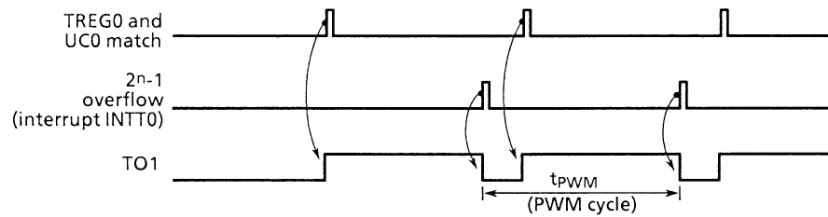

Timer output is inverted when up-counter (UC0) matches the set value of timer register TREG0 or when  $2^n - 1$  ( $n = 6, 7, \text{ or } 8$ ; specified by T01MOD <PWM01,

0>) counter overflow occurs. Up-counter UC0 is cleared when  $2^n - 1$  counter overflow occurs. For example, when  $n = 6$ , 6-bit PWM will be output, while when  $n = 7$ , 7-bit PWM will be output.

To use this PWM mode, the following conditions must be satisfied.

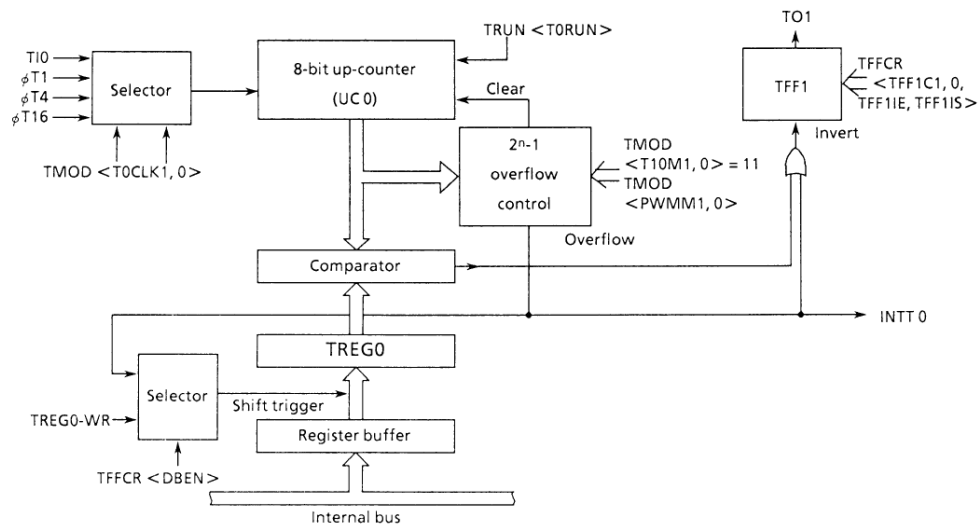

(Set value of timer register) < (Set value of  $2^n - 1$  counter overflow)

(Set value of timer register  $\neq 0$ )

**Figure 3.7 (13). 8-Bit PWM Waveforms**

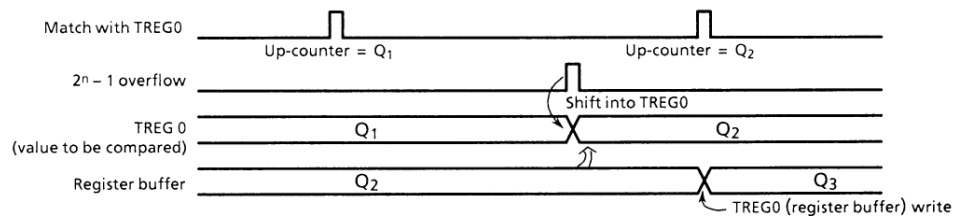

Figure 3.7 (14) shows the block diagram of this mode.

**Figure 3.7 (14). Block Diagram of 8-Bit PWM Mode**

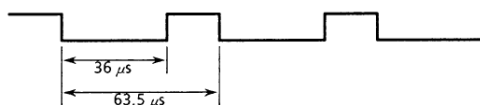

In this mode, the value of register buffer will be shifted in TREG0 if  $2^n - 1$  overflow is detected when the double buffer of TREG0 is enabled.

Use of the double buffer makes easy the handling of small duty waves.

**Figure 3.7 (15). Operation of Register Buffer**

Example: To output the following PWM waves to TO1 pin at  $f_c = 16\text{MHz}$ .

※ Clock Condition

system clock	: High Frequency ( $f_c$ )
clock gear	: 1 ( $f_c$ )
prescaler clock	: system clock ( $f_{sys}$ )

To realize  $63.5\mu\text{s}$  of PWM cycle by  $\phi T1 = 0.5\mu\text{s}$  (@  $f_c = 16\text{MHz}$ ),

$$63.5\mu\text{s} \div 0.5\mu\text{s} = 127 = 2^7 - 1$$

Consequently,  $n$  should be set to 7.

As the period of low level is  $36\mu\text{s}$ , for  $\phi T1 = 0.5\mu\text{s}$ , set the following value for TREG0:

$$36\mu\text{s} \div 0.5\mu\text{s} = 72 = 48H$$

	MSB		LSB	
	7	6	5	4 3 2 1 0
TRUN	←	–	X	– – – – 0
TMOD	←	1	1 1 0	– – 0 1
TREG0	←	0	1 0 0 1 0 0 0	
TFFCR	←	X	X X X 1 0 1 X	
				Stop timer 0, and clear it to “0”.
				Set 8-bit PWM mode (cycle: 2 <sup>7</sup> – 1) and select $\phi$ T1 as the input clock.
				Writes “48H”.
				Clears TFF1, enable the inversion and double buffer.
P7CR	←	X	X X X – – 1 –	} Set P71 as the TO1 pin.
P7FC	←	X	X X X – – 1 X	
TRUN	←	1	X – – – – 1	Start timer 0 counting.
Note	:	X	;	don't care – ; no change

### 3.8 8-Bit PWM Timer

The TMP93CM40/TMP93CM41 has two built-in 8-bit PWM timers (timers 2 and 3).

They have two operating modes.

- 8-bit PWM (pulse width modulation: variable duty at fixed interval) output mode
- 8-bit interval timer mode

Figure 3.8 (1), (2) are block diagrams of the 8-bit PWM timer (timers 2 and 3).

PWM timers consist of an 8-bit up-counter, 8-bit comparator, and 8-bit timer register. Two timer flip-flops (TFF2 for timer 2 and TFF3 for timer 3) are provided.

Input clocks  $\phi P1$ ,  $\phi P4$ , and  $\phi P16$  for the PWM timers can be obtained using the built-in prescaler.

PWM timer operating mode and timer flip-flops are controlled by four control registers (P0MOD, P1MOD, PFFCR, and TRUN).

PWM timer 0 and 1 can be used independently.

All PWM timers operate in the same manner, thus, only the operation of PWM timer 0 will be explained below.

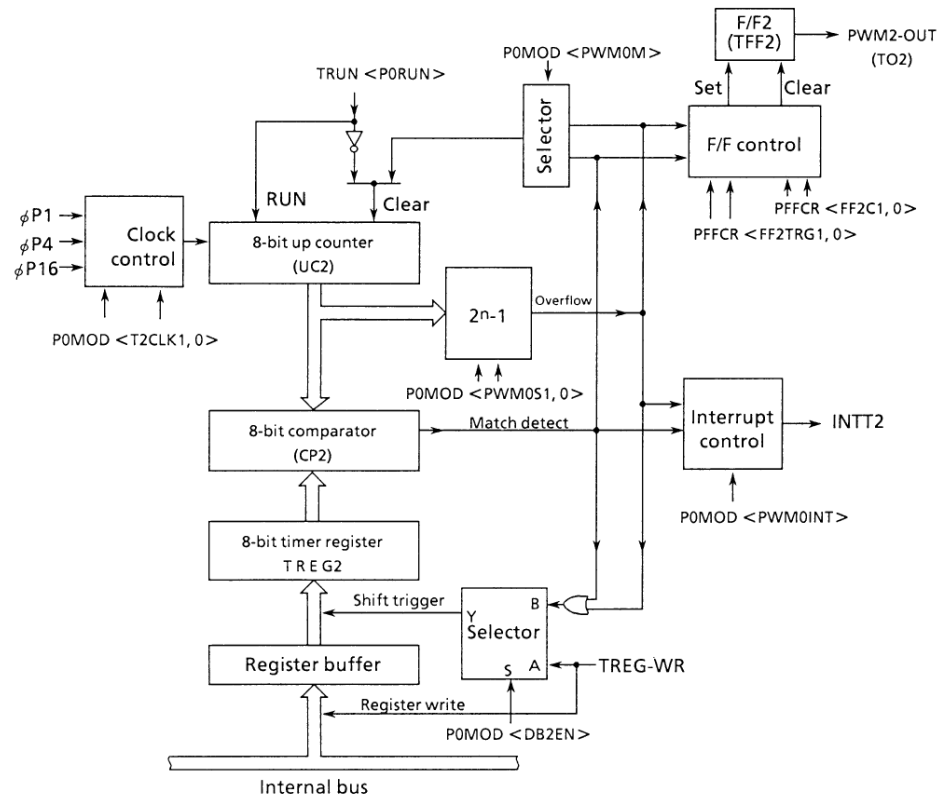

Figure 3.8 (1). Block Diagram of 8-Bit PWM Timer 0 (Timer 2)

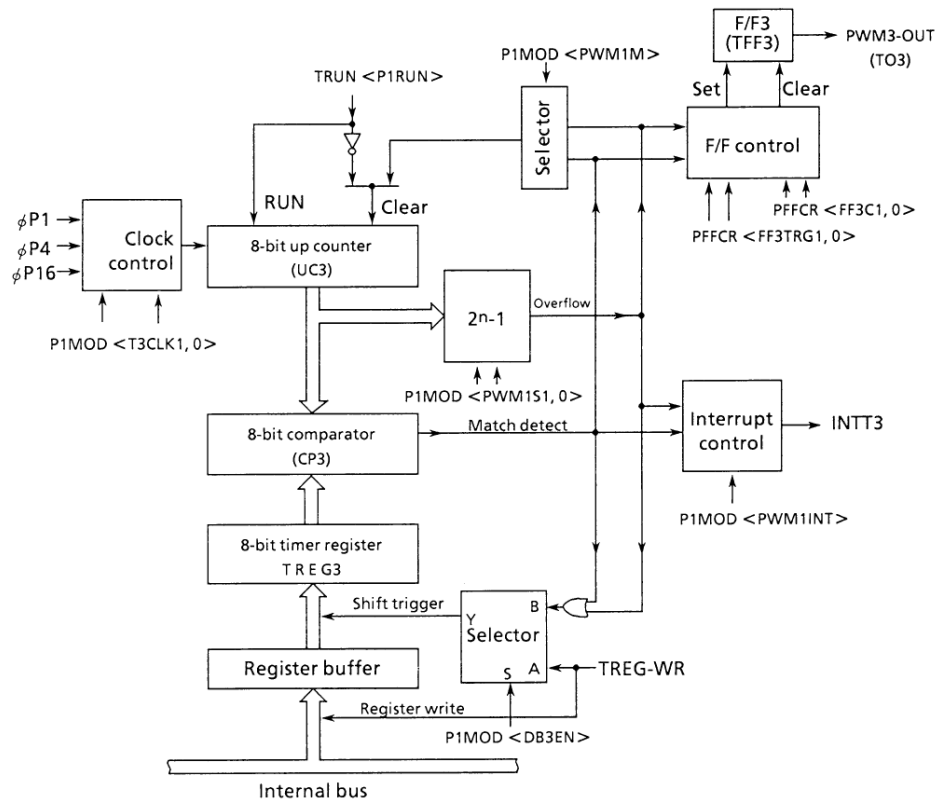

Figure 3.8 (2). Block Diagram of 8-Bit PWM Timer 1 (Timer 3)

① Prescaler

There are 5 bit prescaler and prescaler clock selection register to generate input clock for 8 bit PWM Timer 0, 1.

Figure 3.8 (3) shows the block diagram. Table 3.8 (1) shows prescaler clock resolution to 8 bit PWM Timer 0, 1.

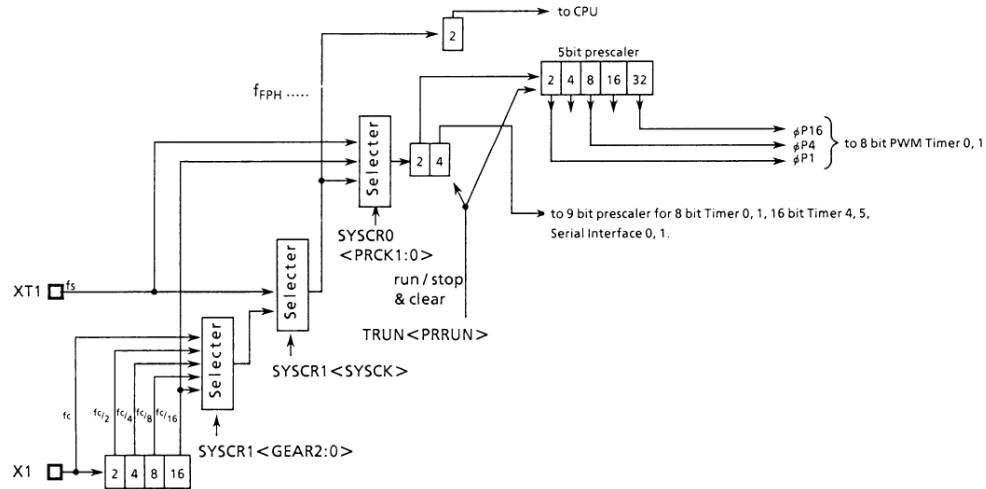

Figure 3.8 (3). Prescaler Block Diagram]

XXX : don't care

(Note) The  $f_c/16$  clock as a prescaler clock can not be used when the  $f_s$  is used as a system clock.

The 1/2 times clock selected among  $f_{FPH}$  clock,  $f_c/16$  clock, and  $f_s$  clock is input to this prescaler. This is selected by prescaler clock selection register SYSCRO <PRCK1 : 0>.

Resetting sets <PRCK1 : 0> to "00", therefore,  $f_{FPH}/2$  clock is input. The register TRUN <PRRUN> which controls this prescaler is also used at 9 bit prescaler. So, this prescaler cannot be operated independently.

The 8 bit Timer 0, 1 uses 3 types of clock:  $\phi P1$ ,  $\phi P4$ , and  $\phi P16$  among the prescaler outputs.

The prescaler can be run or stopped by TRUN <PRRUN> described of the 8 bit Timer.

Counting starts when <PRRUN> is set to "1", while the prescaler is cleared to zero and stops operation when <PRRUN> is set to "0".

When the IDLE1 mode (operates only oscillator) is used, set TRUN <PRRUN> to "0" to stop this prescaler before "HALT" instruction is executed.

## ② Up-counter

An 8-bit binary counter which counts up using the input clock specified by PWM mode register P0MOD <T2CLK1:0>.

The input clock for the PWM0 is selected from the internal clocks  $\phi P1$ ,  $\phi P4$ , and  $\phi P16$  (PWM dedicated prescaler output) depending on the <T2CLK1:0>.

Operating mode is also set by P0MOD <PWM0M>. At reset, they are initialized to "0", thus, the up-counter is

in PWM mode. In PWM mode, the up-counter is cleared when a  $2^n - 1$  overflow occurs; in timer mode, the up-counter is cleared at compare and match.

Count/stop and clear of the up-counter can be controlled for each PWM timer using the timer operation control register TRUN. Resetting clears all up-counters and stops timers.

## ③ Timer registers

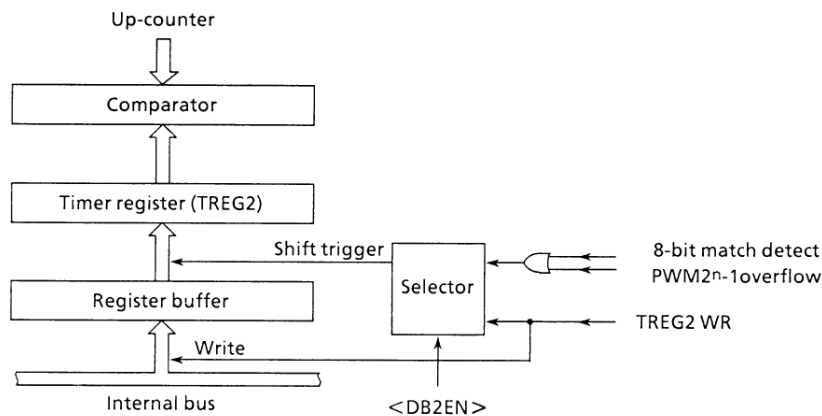

The 8-bit register is used for setting an interval time. When the value set in the timer register (TREG 2) matches the value in the up-counter, the match detect signal of the comparator becomes active.

Timer register TREG2 is paired with register buffer to make a double buffer structure.

TREG2 is a double buffer enable/disable controlled by P0MOD <DB2EN> : disabled when <DB2EN> = 0, enabled when <DB2EN> = 1.

Data is transferred from register buffer to timer when a  $2^n - 1$  overflow occurs in the PWM mode, or when compare and match occurs in 8-bit timer mode. That is, with a PWM timer, the timer mode can be operated in double buffer enable state, unlike timer mode for timers 0 and 1.

At reset, <DB2EN> is initialized to 0 to disable double buffer. To use double buffer, write the data in the timer register at first, then set <DB2EN> to 1, and write the following data in the register buffer.

**Figure 3.8 (4). Structure of Timer Registers 2**

Note: The timer register and register buffer are allocated to the same memory address. When <DB2EN> = 0, the same value is written to both register buffer and timer register. When <DB2EN> = 1, the value is written to the register buffer only.

Memory addresses of the timer registers are as follows:

TREG2 : 000026H

TREG3 : 000027H

Both timer registers are write only; however, register buffer values can be read when reading the above addresses.

#### ④ Comparator

Compares the value in the up-counter with the value in the timer register (TREG2). When they match, the

comparator outputs the match detect signal. A timer interrupt (INTT2) is generated at compare and match if the interrupt select bit <PWM0INT> of the mode register (P0MOD) is set to 1. In timer mode, the comparator clears the up-counter to 0 at compare and match. It also inverts the value of the timer flip-flop if timer flip-flop invert is enabled.

#### ⑤ Timer flip-flop

The value of the timer flip-flop is inverted by the match detect signal (comparator output) of each interval timer or  $2^n - 1$  overflow. The value can be output to the timer output pin TO2 (also used as P72).

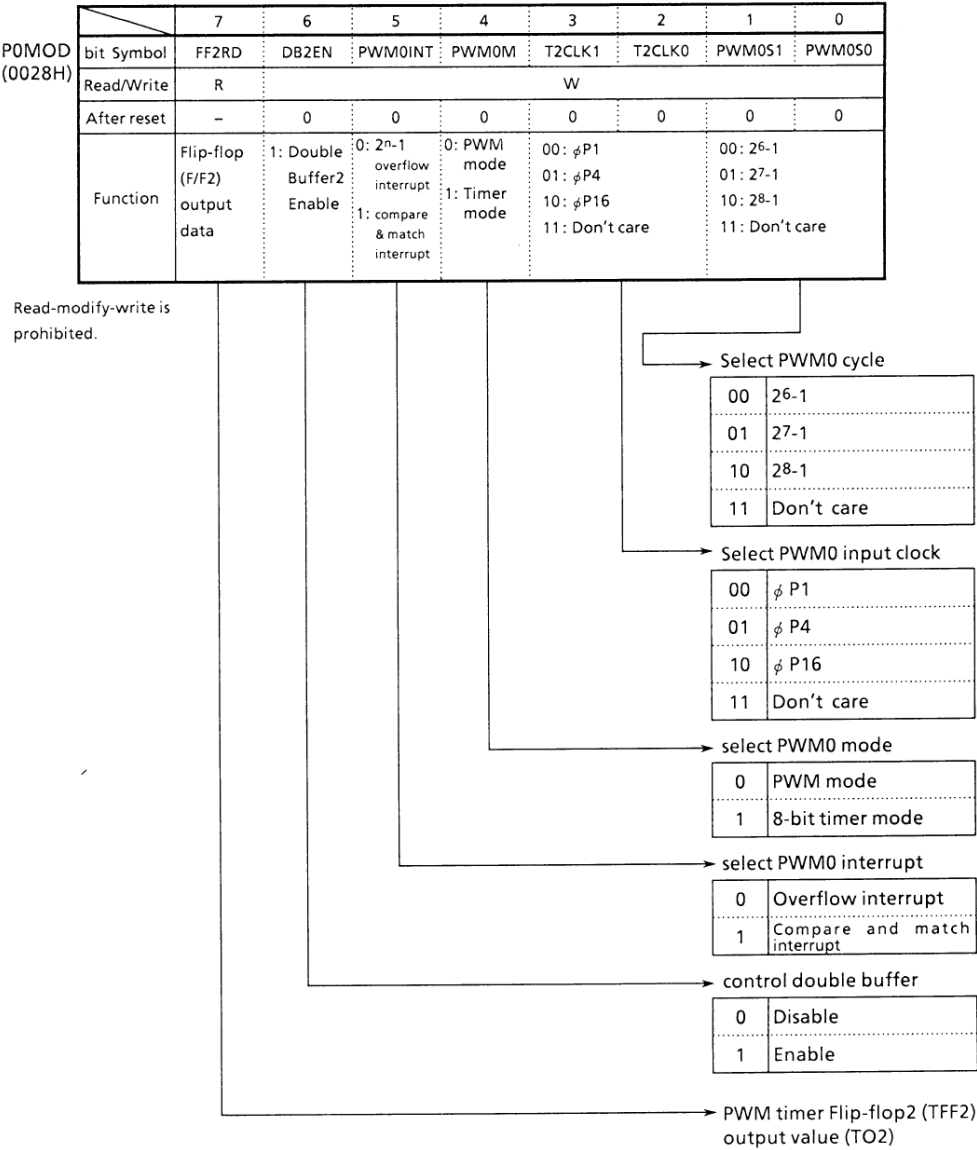

Figure 3.8 (5). 8-Bit PWM0 Mode Control Register

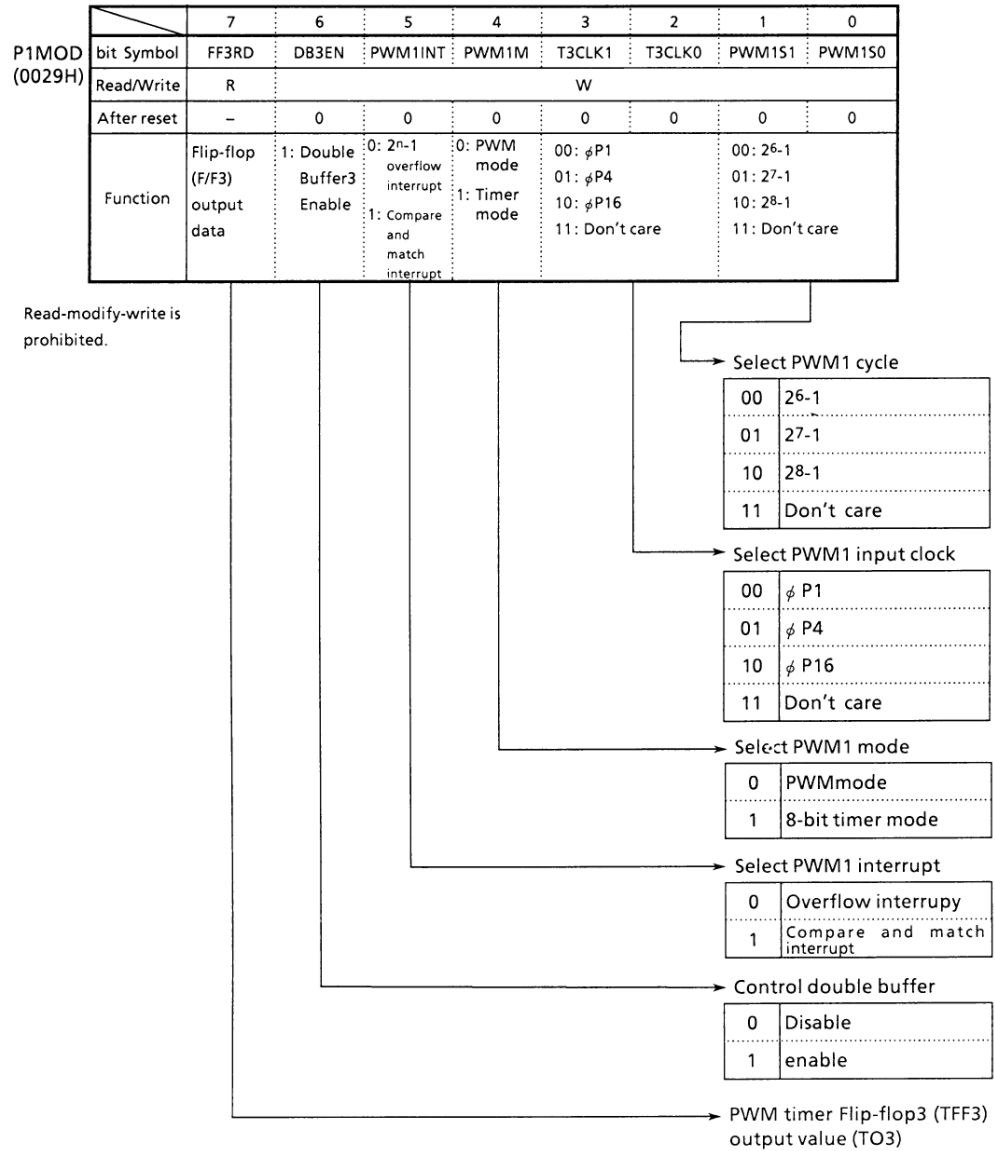

Figure 3.8 (6). 8-Bit PWM1 Mode Control Register

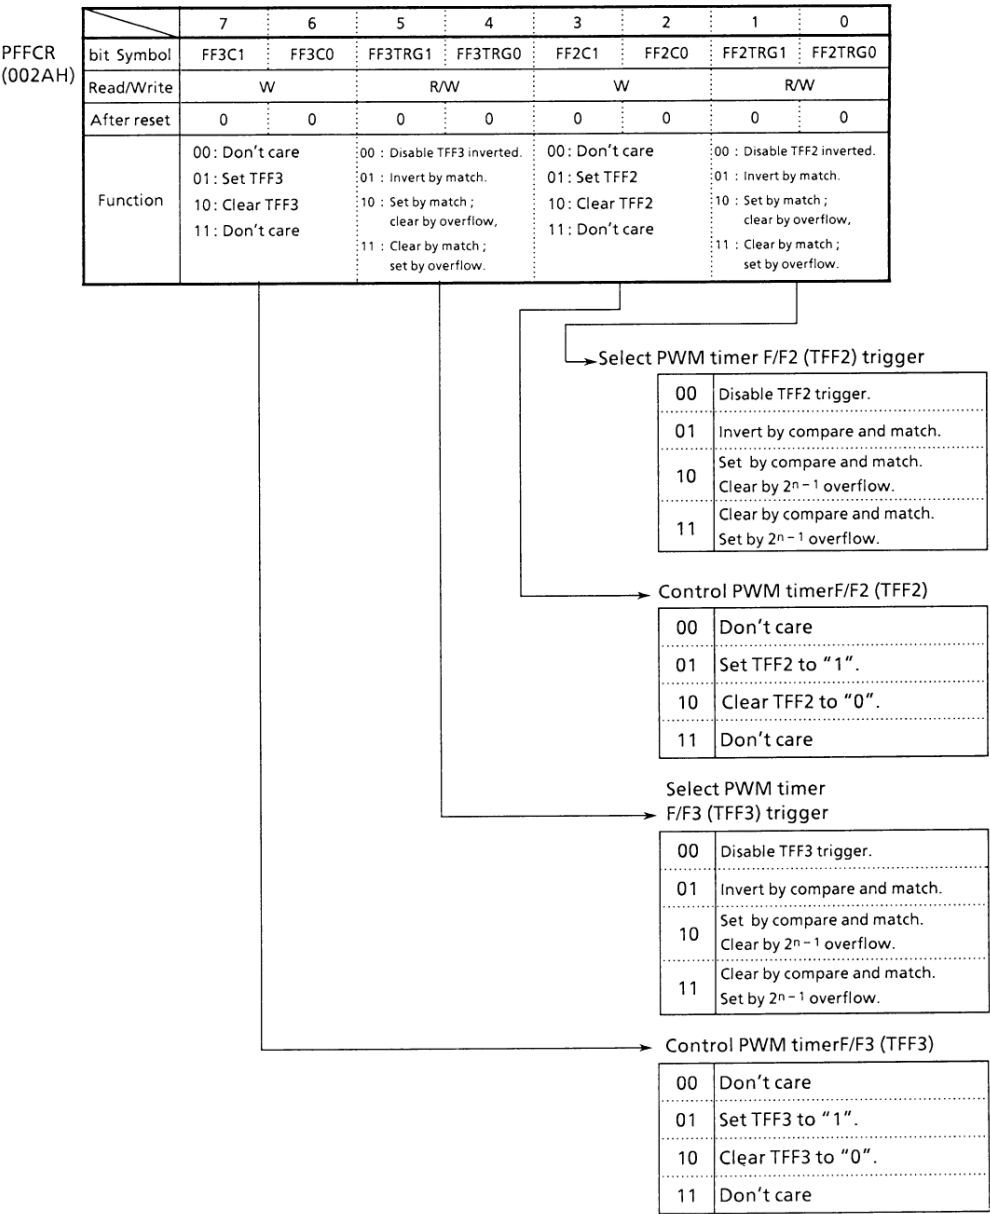

Figure 3.8 (7). 8-Bit PWM F/F Control Register

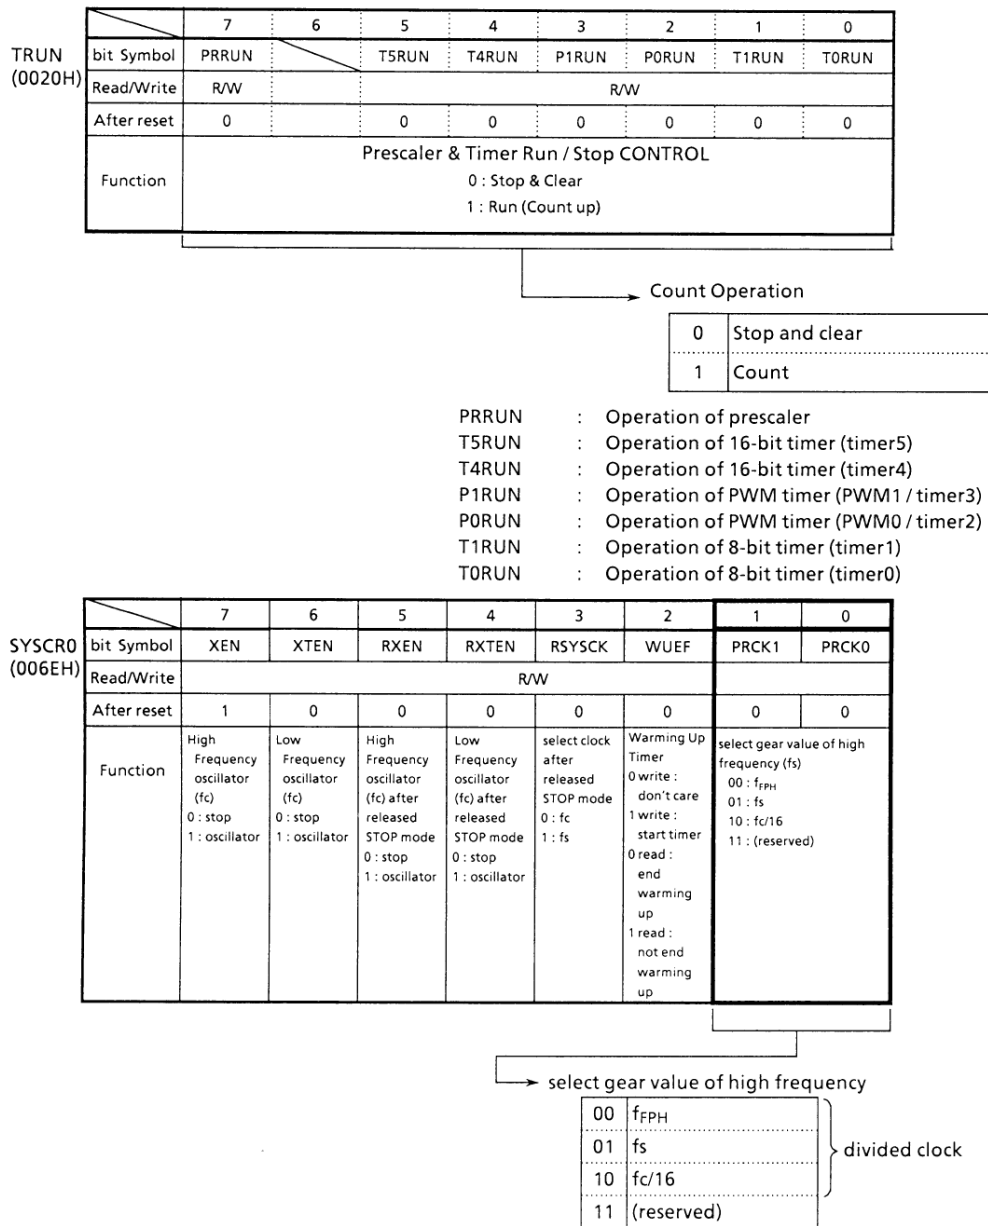

Figure 3.8 (8). Timer Operation Control Register/System Clock Control Register

The following explains PWM timer operations.

(1) PWM timer mode

PWM output changes under the following two conditions.

Condition 1:

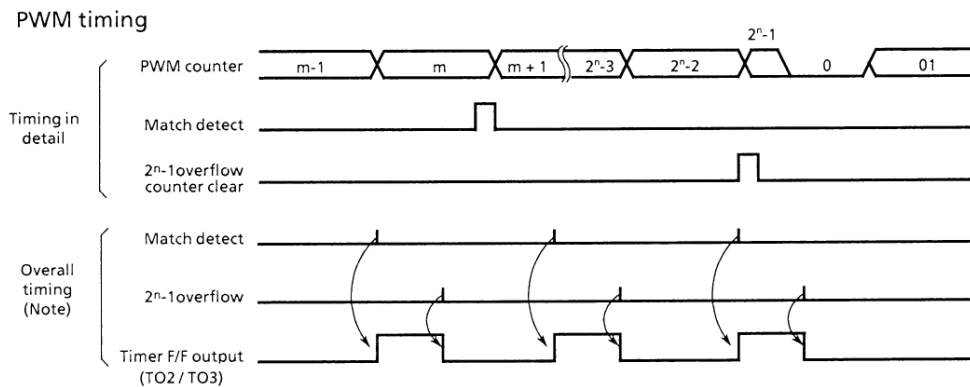

- TFF2 is cleared to 0 when the value in the up-counter (UC2) and the value set in the TREG2 match.
- TFF2 is set to 1 when a  $2^n - 1$  counter overflow ( $n = 6, 7, \text{ or } 8$ ) occurs.

Condition 2:

- TFF2 is set to 1 when the value in the up-counter (UC2) and the value set in TREG2 match.
- TFF2 is cleared to 0 when a  $2^n - 1$  counter overflow ( $n = 6, 7, \text{ or } 8$ ) occurs.

The up-counter (UC2) is cleared by a  $2^n - 1$  counter overflow.

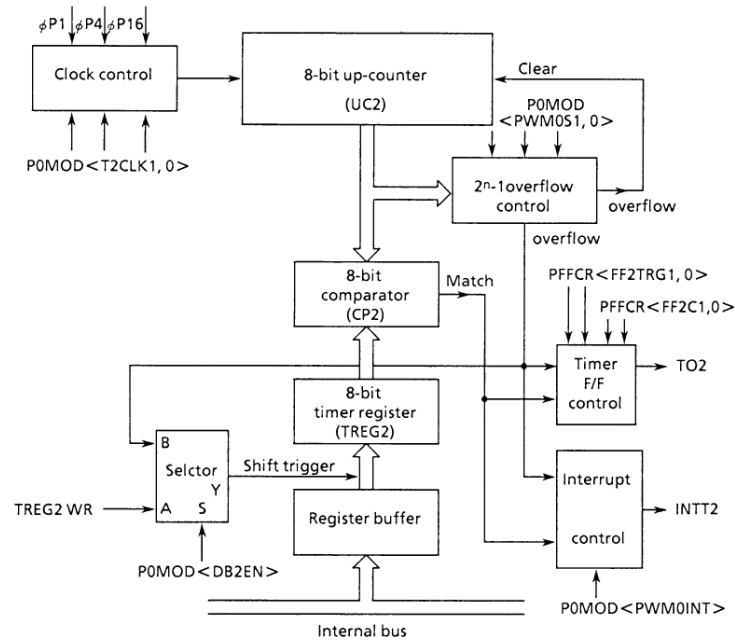

The PWM timer can output 0% to 100% duty pulses because a  $2^n - 1$  counter overflow has a higher priority. That is, to obtain 0% output (always low), the mode used to set TFF2 to 0 due to overflow (PFFCR <FF2TRG1, 0> = 1, 0) must be set and  $2^n - 1$  (value for overflow) must be set in TREG2. To obtain 100% output (always high), the mode must be changed: PFFCR <FF2TRG1, 0> = 1, 1 then the same operation is required.

**Figure 3.8 (9). Output Waves in PWM Timer Mode**

Note: The above waves are obtained in a mode where the F/F is set by a match with the timer register (TREG) and reset by an overflow.

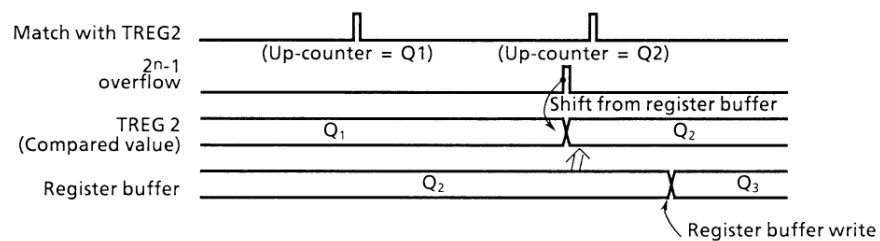

Figure 3.8 (10) is a block diagram of this mode.

**Figure 3.8 (10). Block Diagram of PWM Timer Mode (PWM0)**

In this mode, enabling double buffer is very useful. The register buffer value shifts into TREG2 when a  $2^n - 1$  overflow is detected, when double buffer is enabled.

Using double buffer makes handling small duty waves easy.

**Figure 3.8 (11). Register Buffer Operation**

Example: To output the following PWM waves to TO2 pin using PWM0 at  $f_c = 16\text{MHz}$ .

To implement  $31.75\mu\text{s}$  PWM cycle by  $\phi P1 = 0.25\mu\text{s}$  (@  $f_c = 16\text{MHz}$ )

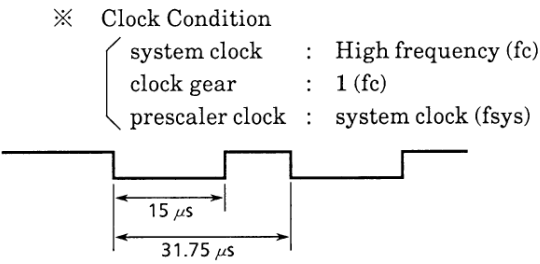

$$31.75\mu\text{s} \div 0.25\mu\text{s} = 127 = 2^7 - 1.$$

Consequently, set n to 7.

Since the low level cycle =  $15\mu\text{s}$ ; for  $\phi P1 = 0.25\mu\text{s}$

$$15\mu\text{s} \div 0.25 = 60 = 3\text{CH}$$

set the 3CH in TREG2.

	7	6	5	4	3	2	1	0	
TRUN	←	-	X	-	-	-	0	-	Stops PWM0 and clears it to 0.
P0MOD	←	-	0	0	0	0	0	1	Sets PWM (27-1) mode, input clock $\phi P1$ , overflow interrupt, and disables double buffer.
TREG2	←	0	0	1	1	1	1	0	Writes 3CH.
P0MOD	←	-	1	0	0	0	0	1	Enables double buffer.
PFFCR	←	-	-	-	-	0	1	1	Sets TFF2 and a mode where TFF2 is set by compare and match, and cleared by overflow.
P7CR	←	X	X	X	X	-	1	-	} Sets P72 as TO2 pin
P7FC	←	X	X	X	X	-	1	-	
TRUN	←	1	X	-	-	-	1	-	Starts PWM0 counting.

Note: X; don't care    -; no change

XXX : don't care

## (2) 8-bit timer mode

Both PWM timers can be used independently as 8-bit interval timers. Since both timers operate in exactly the same way, PWM0 (timer 2) is used for the purposes of explanation.

## ① Generating interrupts at a fixed interval

using PWM0 timer, first stop PWM0, then set the operating mode, input clock, and interval in the P0MOD and TREG2 registers. Next, enable INTT2 and start counting PWM0.

Example: To generate a timer 2 interrupt every 40 $\mu s$  at  $f_c = 16 \text{ MHz}$ , set registers as follows:

To generate timer 2 interrupt (INTT2) at a fixed interval

## ※ Clock Condition

system clock : High frequency ( $f_c$ )  
 clock gear : 1 ( $f_c$ )  
 prescaler clock : system clock ( $f_{sys}$ )

7 6 5 4 3 2 1 0

TRUN ← - X - - - 0 - -

P0MOD ← X 0 1 1 0 0 X X

TREG2 ← 1 0 1 0 0 0 0 0

INTEPW10 ← - - - - 1 1 0 0

TRUN ← 1 X - - - 1 - -

Note: X; don't care -; no change

Stops PWM0 and clears it to 0.

Sets 8-bit timer mode and selects  $\phi P1$  (0.25  $\mu s$ ) and compare interrupt.Sets 40  $\mu s$  / 0.25  $\mu s = A0H$  in timer register.

Enables INTT2 and sets interrupt level 4.

Starts counting PWM0.

Select an input clock using Table 3.8 (1).

Note: To generate interrupts in 8-bit timer mode, bit 5 (interrupt control bit <PWM0INT> must be set to 1.

② Generating a 50% square wave

Example: To output a 3.0μs square wave at fc = 16MHz from TO2 pin, set register as follows:

To generate a 50% square wave, invert the timer flip-flop at a fixed interval and output the timer flip-flop value to the timer output pin (TO2).

※ Clock Condition	
system clock	: High frequency (fc)
clock gear	: 1 (fc)
prescaler clock	: system clock (fsys)
7 6 5 4 3 2 1 0	
TRUN ← - X - - - 0 - -	Stops PWM0 and clears it to 0.
POMOD ← X 0 1 1 0 0 X X	Sets 8-bit timer mode and selects φP1 (0.25 μs) as the input clock.
TREG2 ← 0 0 0 0 0 1 1 0	Sets 3.0 μs / 0.25 μs / 2 = 6 in the timer register.
PFFCR ← - - - - 1 0 0 1	Clears TFF2 to 0 and inverts using comparator output.
P7CR ← X X X X - 1 - -	Sets P72 as TO2 pin.
P7FC ← X X X X - 1 - X	
TRUN ← 1 X - - - 1 - -	Starts counting PWM0.
Note: X; don't care    -; no change	

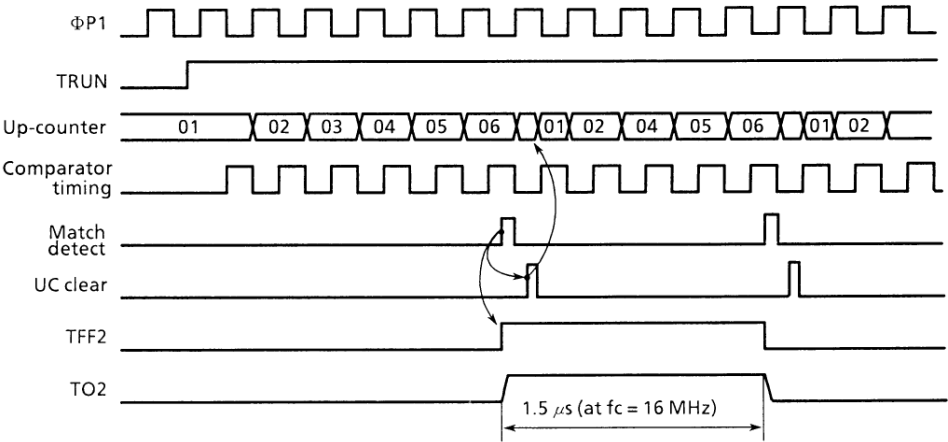

Figure 3.8 (12). Square Wave (50% Duty) Output Timing Chart

This mode is as shown in Figure 3.8 (13) below.

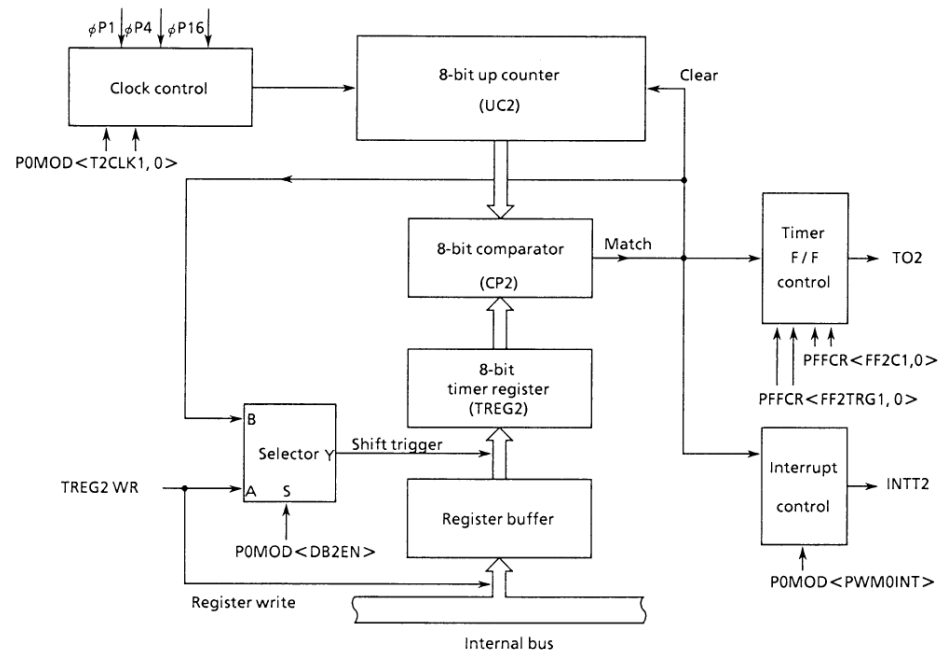

Figure 3.8 (13). Block Diagram of 8-Bit Timer Mode

3.9 16-Bit Timer

TMP93CM40/TMP93CM41 contains two (timer 4 and timer 5) multifunctional 16-bit timer/event counter with the following operation modes.

- 16-bit interval timer mode
- 16-bit event counter mode
- 16-bit programmable pulse generation (PPG) mode
- Frequency measurement mode
- Pulse width measurement mode
- Time differential measurement mode

Timer/event counter consists of 16-bit up-counter, two 16-bit timer registers, two 16-bit capture registers (one of them applies double-buffer), two comparators, capture input controller, and timer flip-flop and the control circuit.

Timer/event counter is controlled by four control registers: T4MOD/T5MOD, T4FFCR/T5FFCR, TRUN and T45CR.

Figure 3.9 (1), (2) show the block diagram of 16-bit timer/event counter (timer 4 and timer 5).

Timer 4 and 5 can be used independently.

All timers operate in the same manner except the following points, thus, only Timer 4 operation will be explained below.

Different Points Between Timer 4 and 5

	Timer 4	Timer 5
Timer Out Pin (for upper timer register)	T05 pin (TFF5)	—
Different Phased Pulse Output Mode	Exist	Does not exist (not T07 pin)

XXX : don't care						
The $f_c/16$ clock as a prescaler clock can not be used when the $f_s$ is used as a system clock.			16 bit Timer			
			8 bit Timer			

The 1/4 times clock selected among 2 times system clock, fc/16 clock, and fs clock is input to this prescaler. This is selected by prescaler clock selection register SYSCR0 <PRCK1 : 0>.

Resetting sets <PRCK1 : 0> to "00", therefore, 2 times system clock is input.

The 16 bit Timer 4, 5 uses 3 types of clock:  $\phi$ T1,  $\phi$ T4, and  $\phi$ T16 among the prescaler outputs.

The prescaler can be run or stopped by the timer operation control register TRUN <PRRUN>. Counting starts when <PRRUN> is set to "1", while the prescaler is cleared to zero and stops operation when <PRRUN> is set to "0".

When the IDLE1 mode (operates only oscillator) is used, set TRUN <PRRUN> to "0" to stop this prescaler before "HALT" instruction is executed.

## ② Up-counter

UC4 is a 16-bit binary counter which counts up according to the input clock specified by T4MOD <T4CLK1, 0> or T5MOD <T5CLK1, 0> register.

As the input clock, one of the internal clocks  $\phi$  T1,  $\phi$  T4, and  $\phi$  T16 from 9-bit prescaler (also used for 8-bit

timer), and external clock from T14 pin (also used as P80/INT4 pin) can be selected. When reset, it will be initialized to <T4CLK1, 0> = 00 to select T14 input mode. Counting or stop and clear of the counter is controlled by timer operation control register TRUN <T4RUN>.

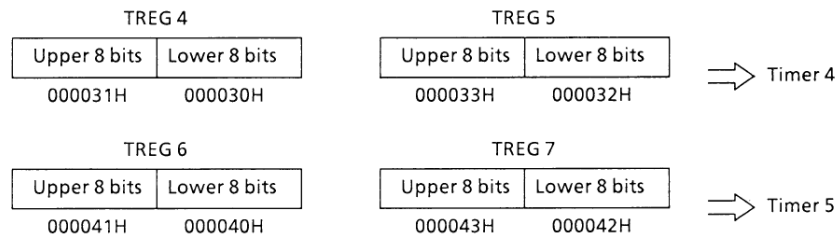

When clearing is enabled, up-counter UC4/UC5 will be cleared to zero each time it coincides matches the timer register TREG5, TREG7. The "clear enable/disable" is set by T4MOD <CLE>.

If clearing is disabled, the counter operates as a free-running counter.

## ③ Timer Registers

These two 16-bit registers are used to set the interval time. When the value of up-counter UC4 matches the set value of this timer register, the comparator match detect signal will be active.

Setting data for timer register (TREG4 and TREG5) is executed using 2 byte data transfer instruction or using 1 byte data transfer instruction twice for lower 8 bits and upper 1 bits in order.

TREG4 timer register is of double buffer structure, which is paired with register buffer. The timer control register T45CR <DB4EN> controls whether the double buffer structure should be enabled or disabled. : disabled when <DB4EN> = 0, while enabled when <DB4EN> = 1.

When the double buffer is enabled, the timing to transfer data from the register buffer to the timer register is at the match between the up-counter (UC4) and timer register TREG5.

When reset, it will be initialized to <DB4EN> = 0, whereby the double buffer is disabled. To use the double buffer, write data in the timer register, set <DB4EN> = 1, and then write the following data in the register buffer.

TREG4, TREG6 and register buffer are allocated to the

same memory addresses 000030H/000031H. When <DB4EN> = 0, same value will be written in both the timer register and register buffer. When <DB4EN> = 1, the value is written into only the register buffer.

## ④ Capture Register

These 16-bit registers are used to hold the values of the up-counter.

Data in the capture registers should be read by a 2-byte data load instruction or two 1-byte data load instruction, from the lower 8 bits followed by the upper 8 bits.

CAP 1		CAP 2	
Upper 8 bits	Lower 8 bits	Upper 8 bits	Lower 8 bits
000035H	000034H	000037H	000036H

CAP 3		CAP 4	
Upper 8 bits	Lower 8 bits	Upper 8 bits	Lower 8 bits
000045H	000044H	000047H	000046H

## ⑤ Capture Input Control

This circuit controls the timing to latch the value of up-counter UC4 into (CAP1, CAP2). The latch timing of capture register is controlled by register T4MOD <CAP12M1, 0>.

- When T4MOD <CAP12M1, 0> = 00

Capture function is disabled. Disable is the default on reset.

- When T4MOD <CAP12M1, 0> = 01

Data is loaded to CAP1 at the rise edge of TI4 pin (also used as P80/INT4) input, while data is loaded to CAP2 at the rise edge of TI5 pin (also used as P81/INT5) input. (Time difference measurement)

- When T4MOD <CAP12M1, 0> = 10

Data is loaded to CAP1 at the rise edge of TI4 pin input, while to CAP2 at the fall edge. Only in this setting, interrupt INT4 occurs at fall edge. (Pulse width measurement)

- When T4MOD <CAP12M1, 0> = 11

Data is loaded to CAP1 at the rise edge of timer flip-flop TFF1, while to CAP2 at the fall edge.

Besides, the value of up-counter can be loaded to capture registers by software. Whenever "0" is written in T4MOD <CAPIN>, the current value of up-counter will be loaded to capture register CAP1. It is necessary to keep the prescaler in RUN mode (TRUN <PRRUN> to be "1").

## ⑥ Comparator

These are 16-bit comparators which compare the up-counter UC4 value with the set value of (TREG4, TREG5) to detect the match. When a match is detected, the comparators generate an interrupt (INTT4, INTT5), respectively. The up-counter UC4 is cleared only when UC4 matches TREG5. (The clearing of up-counter UC4 can be disabled by setting T4MOD <CLE> = 0.)

### ⑦ Timer Flip-Flop (TFF4)

This flip-flop is inverted by the match detect signal from the comparators and the latch signals to the capture registers. Disable/enable of inversion can be set for each element by T4FFCR <CAP2T4, CAP1T4, EQ5T4, EQ4T4>. TFF4 will be inverted when "00" is written in T4FFCR <TFF4C1, 0>. Also it is set to "1" when "10" is written, and cleared to "0" when "10" is written. The value of TFF4 can be output to the timer output pin TO4 (also used as P82).

### ⑧ Timer Flip-Flop (TFF5)

This flip-flop is inverted by the match detect signal from the comparator and the latch signal to the capture register CAP2. TFF5 will be inverted when "00" is written in T4FFCR <TFF5C1, 0>. Also it is set to "1" when "10" is written, and cleared to "0" when "10" is written. The value of TFF5 can be output to the timer output pin TO5 (also used as P82).

Note: This flip-flop (TFF5) is contained only in the 16-bit timer 4.

(1) 16-bit Timer Mode

In this example, the interval time is set in the timer register TREG5 to generate the interrupt INTTR5.

Generating interrupts at fixed intervals:

	7	6	5	4	3	2	1	0	
TRUN	←	-	X	-	-	-	-	-	Stop timer 4.
INTET54	←	1	1	0	0	1	0	0	Enable INTTR5 and sets interrupt level 4. Disable INTTR4.
T4FFCR	←	1	1	0	0	0	1	1	Disable trigger.
T4MOD	←	0	0	1	0	0	1	*	Select internal clock for input and disable the capture function.
									(** = 01, 10, 11)
TREG5	←	*	*	*	*	*	*	*	Set the interval time (16 bits).
TRUN	←	1	X	-	1	-	-	-	Start timer 4.

Note : X ; don't care    - ; no change

(2) 16-bit Event Counter Mode

In 16-bit timer mode as described in above, the timer can be used as an event counter by selecting the external clock (TI4 pin input) as the input clock. To read the value of the counter, first perform “software cap-

ture” once and read the captured value. The counter counts at the rise edge of TI4 pin input. TI4 pin can also be used as P80/INT4. Since both timers operate in exactly the same way, timer 4 is used for the purposes of explanation.

	7	6	5	4	3	2	1	0	
TRUN	←	-	X	-	-	-	-	-	Stop timer 4.
P8CR	←	-	-	-	-	-	-	0	Set P80 to input mode
INTET54	←	1	1	0	0	1	0	0	Enable INTTR5 and sets interrupt level 4, while disables INTTR4.
T4FFCR	←	1	1	0	0	0	1	1	Disable trigger.
T4MOD	←	0	0	1	0	0	1	0	Select TI4 as the input clock.
TREG5	←	*	*	*	*	*	*	*	Set the number of counts (16 bits).
TRUN	←	1	X	-	1	-	-	-	Start timer 4.

Note : When used as an event counter, set the prescaler in RUN mode.

(3) 16-bit Programmable Pulse Generation (PPG) Output Mode

Since both timers operate in exactly the same way, timer 4 is used for the purposes of explanation.  
The PPG mode is obtained by inversion of the timer

flip-flop TFF4 that is to be enabled by the match of the up-counter UC4 with the timer register TREG4 or 5 and to be output to TO4 (also used as P82). In this mode, the following conditions must be satisfied.

(Set value of TREG4) < (Set value of TREG5)

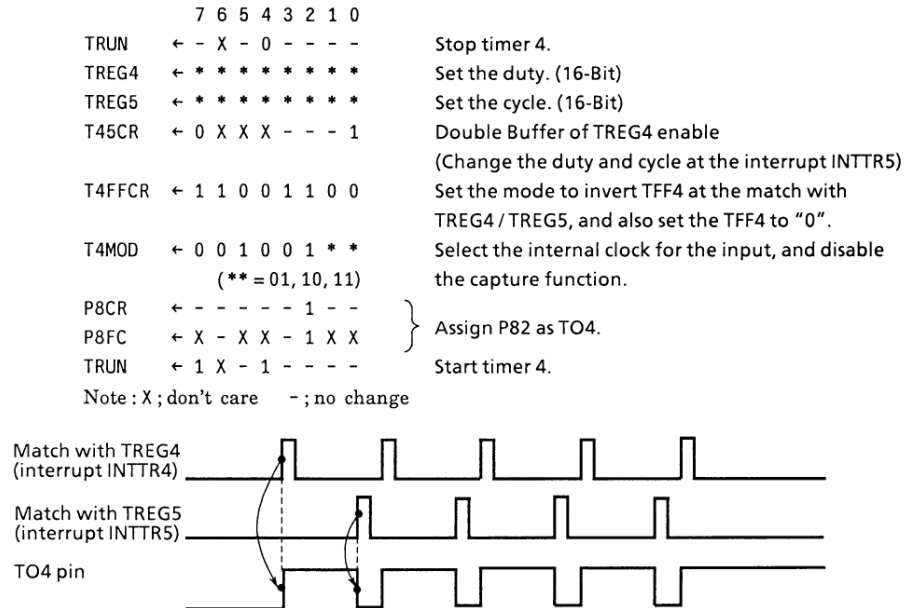

Figure 3.9 (11). Programmable Pulse Generation (PPG) Output Waveforms

When the double buffer of TREG4 is enabled in this mode, the value of register buffer 4 will be shifted in TREG4

at match with TREG5. This feature makes easy the handling of low duty waves.

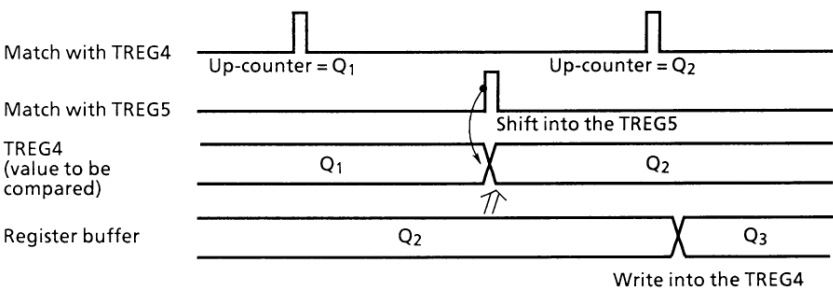

Figure 3.9 (12). Operation of Register Buffer

Shows the block diagram of this mode.

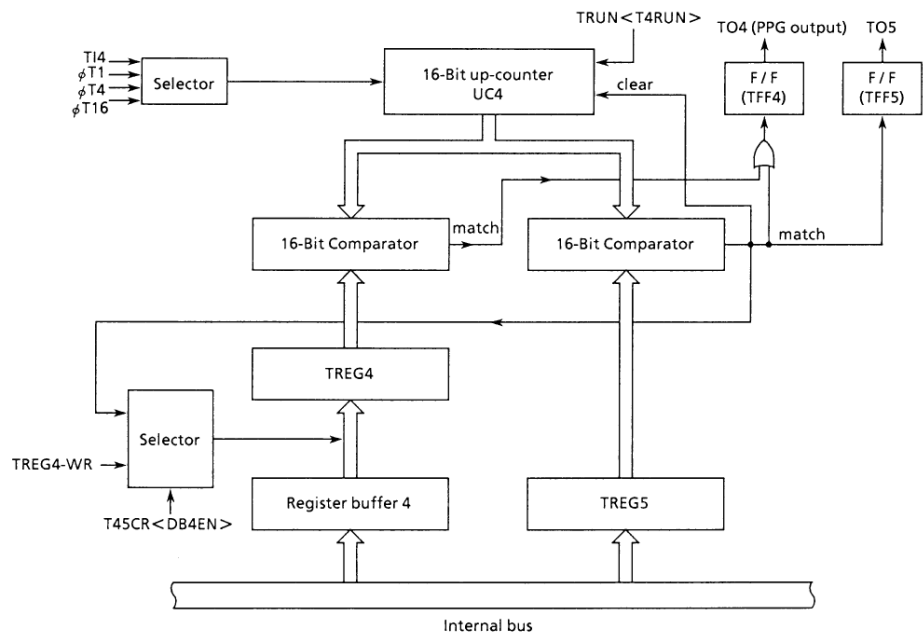

Figure 3.9 (13). Block Diagram of 16-Bit PPG Mode

(4) Application Examples of Capture Function

The loading of up-counter (UC4) values into the capture registers CAP1 and CAP2, the timer flip-flop TFF4 inversion due to the match detection by comparators CP4 and CP5, and the output of TFF4 status to TO4 pin can be enabled or disabled. Combined with inter-

rupt function, they can be applied in many ways, for example:

- ① One-shot pulse output from external trigger pulse
- ② Frequency measurement
- ③ Pulse width measurement
- ④ Time difference measurement

① One-Shot Pulse Output from External Trigger Pulse

Set the up-counter UC4 in free-running mode with the internal input clock, input the external trigger pulse from TI4 pin, and load the value of up-counter into capture register CAP1 at the rise edge of the TI4 pin. Then set to T4MOD <CAP12M1, 0> = 01.

When the interrupt INT4 is generated at the rise edge

of TI4 input, set the CAP1 value (c) plus a delay time (d) to TREG4 (= c + d), and set the above set value (c + d) plus a one-shot pulse width (p) to TREG5 (= c + d + p). When the interrupt INT4 occurs the T4FFCR <EQ5T4, EQ4T4> register should be set that the TFF4 inversion is enabled only when the up-counter value matches TREG4 or TREG5. When interrupt INTTR5 occurs, this inversion will be disabled.

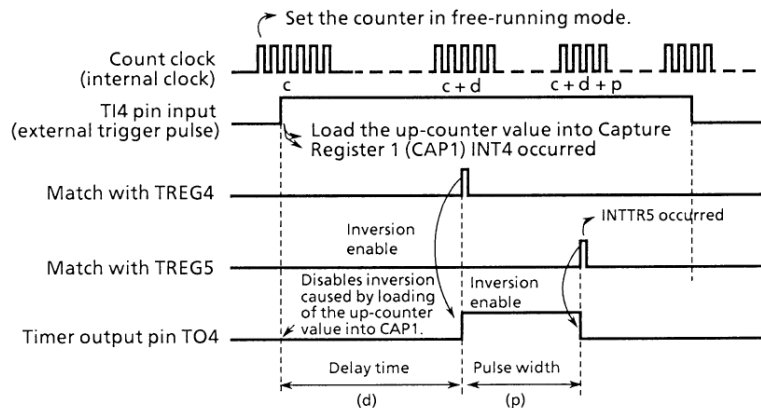

Figure 3.9 (14). One-Shot Pulse Output (with Delay)

Setting Example: To output 2ms one-shot pulse with 3ms delay to the external trigger pulse to TI4 pin.

※ Clock Condition

system clock	:	High frequency (fc)
clock gear	:	1 (fc)
prescaler clock	:	system clock (fsys)

Main setting

T4MOD	←	- - 1 0 1 0 0 1	Keep counting (Free-runing) Count with $\phi T1$ .
T4FFCR	←	1 1 0 0 0 0 1 0	Load the up-counter value into CAP1 at the rise edge of TI4 pin input. Clear TFF4 to zero. Disable TFF4 inversion.
P8CR	←	- - - - - 1 - -	} Select P82 as the TO4 pin.
P8FC	←	X - X X - 1 X X	
INTE45	←	- - - - 1 1 0 0	Enable INT4, and disable INTTR4 and INTTR5.
INTET54	←	1 0 0 0 1 0 0 0	
TRUN	←	1 X - 1 - - - -	Start timer 4.

Setting of INT4

TREG4	←	CAP1+3ms/ $\phi T1$	
TREG5	←	TREG4+2ms/ $\phi T1$	
T4FFCR	←	- - - - 1 1 - -	Enable TFF4 inversion when the up-counter value matches TREG4 or 5.
INTET54	←	1 1 0 0 - - - -	Enable INTTR5.

Setting of INT5

T4FFCR	←	- - - - 0 0 - -	Disable TFF4 inversion when the up-counter value matches TREG4 or 5.
INTET54	←	1 0 0 0 - - - -	Disable INTTR5.

Note: X; don't care -; no change

When delay time is unnecessary, invert timer flip-flop TFF4 when the up-counter value is loaded into capture register 1 (CAP1), and set the CAP1 value (c) plus the one-shot pulse width (p) to TREG5 when the interrupt

INT4 occurs. The TFF4 inversion should be enabled when the up-counter (UC4) value matches TREG5, and disabled when generating the interrupt INTTR5.

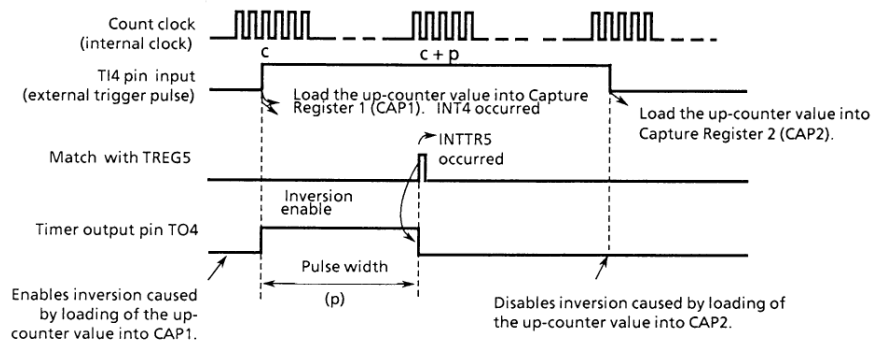

Figure 3.9 (15). One-Shot Pulse Output (without Delay)

## ② Frequency Measurement

The frequency of the external clock can be measured in this mode. The clock is input through the TI4 pin, and its frequency is measured by the 8-bit timers (Timer 0 and Timer 1) and the 16-bit timer/event counter (Timer 4).

The TI4 pin input should be selected for the input clock of Timer 4. The value of the up-counter is loaded into the capture register CAP1 at the rise edge of the timer flip-flop TFF1 of 8-bit timers (Timer 0 and Timer 1), and into CAP2 at its fall edge.

The frequency is calculated by the difference between the loaded values in CAP1 and CAP2 when the interrupt (INTT0 or INTT1) is generated by either 8-bit timer.

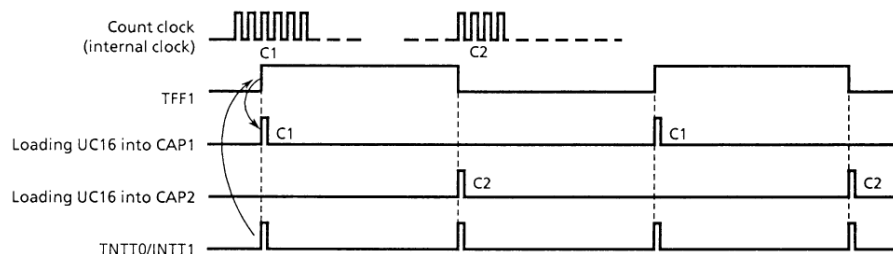

Figure 3.9 (16). Frequency Measurement

For example, if the value for the level "1" width of TFF1 of the 8-bit timer is set to 0.5 sec. and the difference

between CAP1 and CAP2 is 100, the frequency will be  $100/0.5 \text{ [sec.]} = 200 \text{ [Hz]}$ .

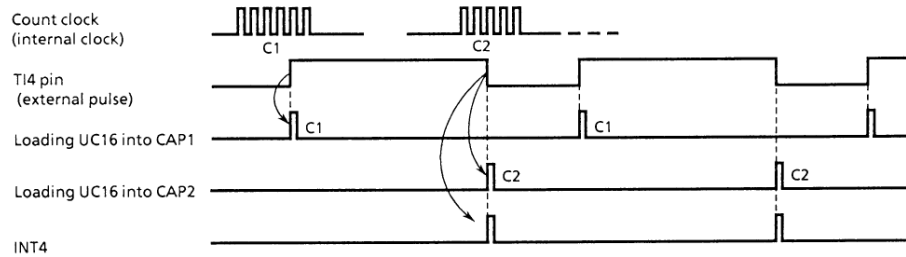

### ③ Pulse Width Measurement

This mode allows measuring the “H” level width of an external pulse. While keeping the 16-bit timer/event counter counting (free-running) with the internal clock input, the external pulse is input through the TI4 pin. Then the capture function is used to load the UC4 values into CAP1 and CAP2 at the rising edge and falling

edge of the external trigger pulse respectively. The interrupt INT4 occurs at the falling edge of TI4.

The pulse width is obtained from the difference between the values of CAP1 and CAP2 and the internal clock cycle.

For example, if the internal clock is 0.8 microseconds and the difference between CAP1 and CAP2 is 100, the pulse width will be  $100 \times 0.8\mu\text{s} = 80\mu\text{s}$ .

**Figure 3.9 (17). Pulse Width Measurement**

Note: Only in this pulse width measuring mode ( $T4MOD < CAP12M1, 0 > = 10$ ), external interrupt INT4 occurs at the falling edge of TI4 pin input. In other modes, it occurs at the rising edge.

The width of “L” level can be measured from the difference between the first C2 and the second C1 at the second INT4 interrupt.

### ④ Time Difference Measurement

This mode is used to measure the difference in time between the rising edges of external pulses input through TI4 and TI5.

Keep the 16-bit timer/event counter (Timer 4) counting

(free-running) with the internal clock, and load the UC4 value into CAP1 at the rising edge of the input pulse to TI4. Then the interrupt INT4 is generated.

Similarly, the UC4 value is loaded into CAP2 at the rising edge of the input pulse to TI5, generating the interrupt INT5.

The time difference between these pulses can be obtained from the difference between the time counts at which loading the up-counter value into CAP1 and CAP2 has been done.

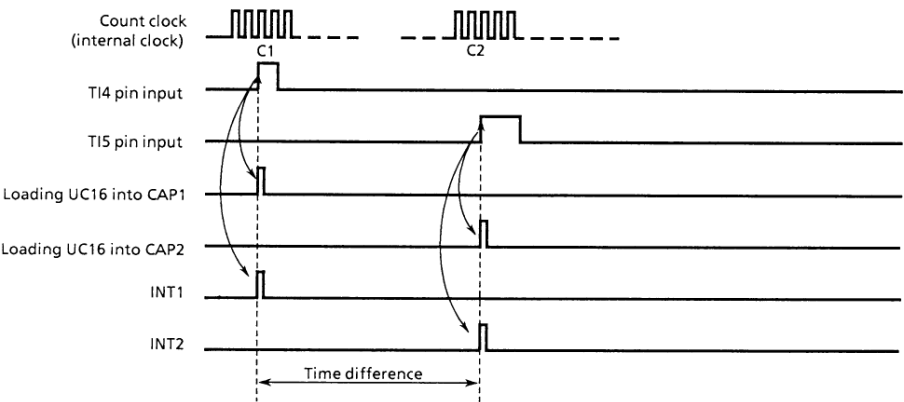

Figure 3.9 (18). Time Difference Measurement

- (5) Different Phased Pulses Output Mode (This mode can only be used in Timer 4)

When the value in up-counter UC4 and the value in TREG4 (TREG5) match, the value in TFF4 (TFF5) is inverted and output to TO4 (TO5). This mode can only be used by 16-bit timer 4.

In this mode, signals with any different phase can be output by free-running up-counter UC4.

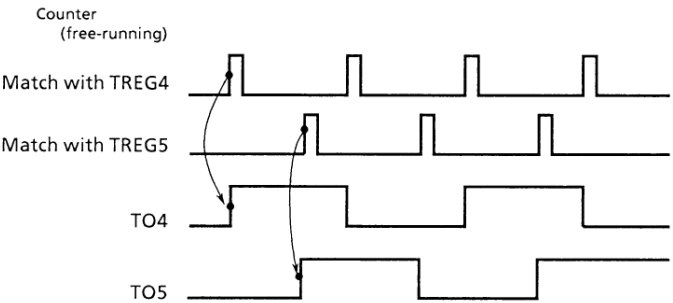

Figure 3.9 (19). Phase Output

Cycles (counter overflow time) of the above output waves are listed below.

**Table 3.9 (2) Timer Output Cycle on the Different Phased Pulse Output Mode**

at  $f_c = 16 \text{ MHz}$ ,  $f_s = 32 \text{ kHz}$

select system clock <SYSCK>	select prescaler clock <PRCK1, 0>	Gear value <GEAR2 : 0>	Counter Overflow Time

3.10 Stepping Motor Control/Pattern Generation Port

TMP93CM40/M41 has two channels (PG0 and PG1) of 4-bit hardware stepping motor control/pattern generation (herein after called PG) which actuate in synchronization with the (8-bit/16-bit) timers. The PG (PG0 and PG1) are shared in 8-bit I/O ports P6.

Channel 0 (PG0) is synchronous with 8-bit timer 0 or timer 1, 16-bit timer 5, to update the output.

The PG ports are controlled by control registers (PG01CR) and can select either stepping motor control mode or pattern generation mode. Each bit of the P6 can be used as

the PG port.  
PG0 and PG1 can be used independently.  
All PG operate in the same manner except the following points, and thus only the operation of PG0 will be explained below.

Different Points Between PG0 and PG1

	PG0	PG1
Trigger Signal	from Timer 4	from Timer 5

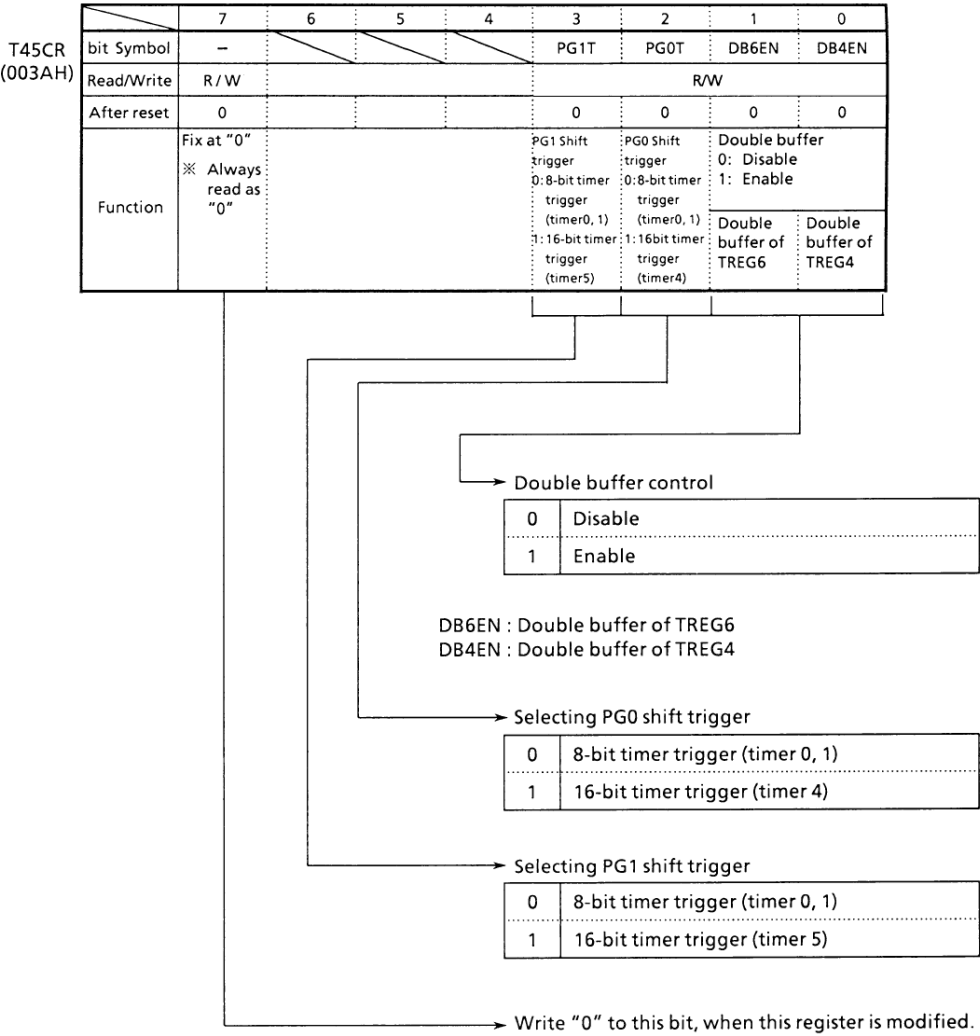

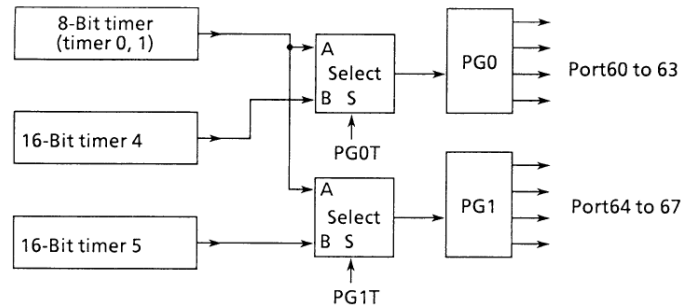

Figure 3.10 (5). 16-bit Timer Trigger Control Register (T45CR)

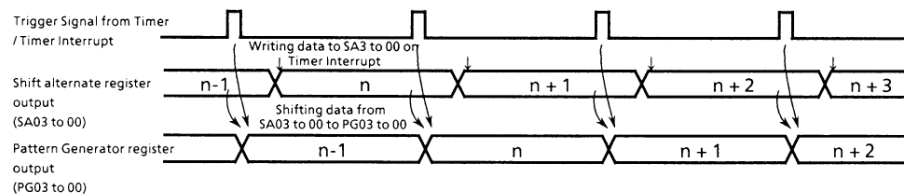

**Figure 3.10 (6). Connection of Timer and Pattern Generator**

(1) Pattern Generation Mode

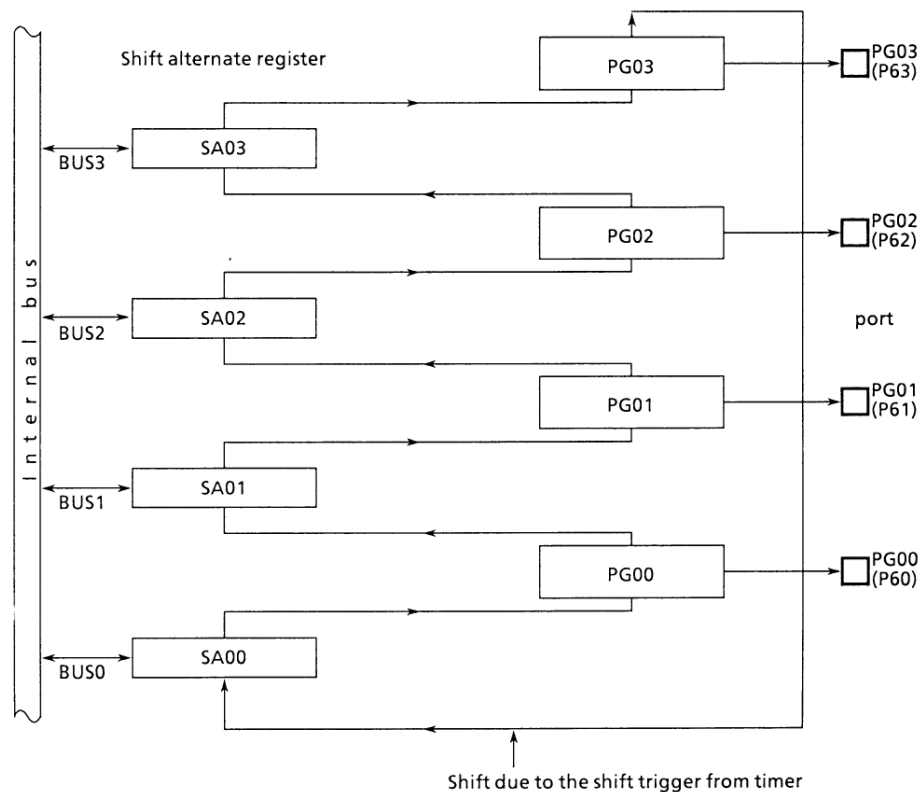

PG functions as a pattern generation according to the setting of PG01CR <PAT1>. In this mode, writing from CPU is executed only on the shifter alternate register. Writing a new data should be done during the interrupt operation of the timer for shift trigger, and a pattern can be output synchronous with the timer.

In this mode, set PG01CR <PG0M> to 1, and PG01CR <CCW0> to 0.

The output of this pattern generator is output to port 6; since port and functions can be switched on a bit basis using port function control register P6FC, any port pin can be assigned to pattern generator output. Figure 3.10 (7) shows the block diagram of this mode.

Example of pattern generation mode

**Figure 3.10 (7). Pattern Generation Mode Block Diagram (PG0)**

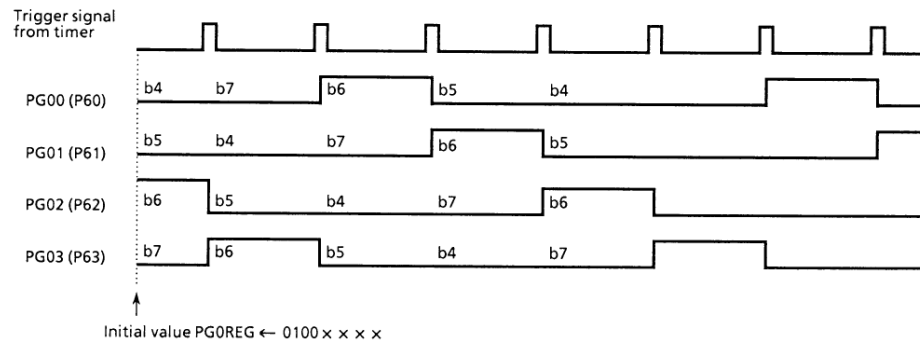

In this pattern generation mode, only writing the output latch is disabled by hardware, but other functions do the same operation as 1-2 excitation in stepping motor control port

mode. Accordingly, the data shifted by trigger signal from a timer must be written before the next trigger signal is output.

## (2) Stepping Motor Control Mode

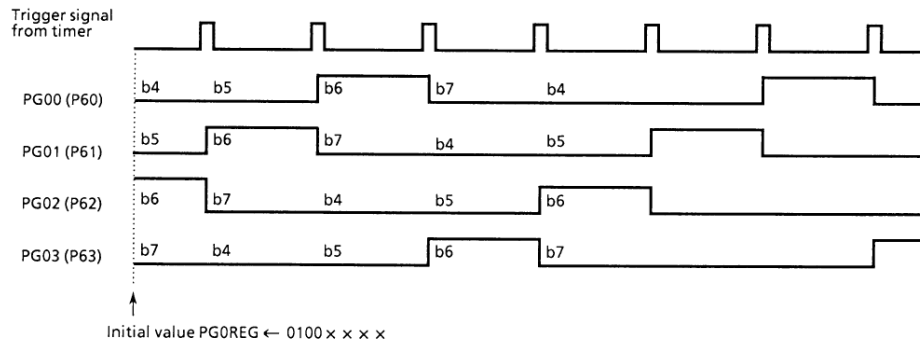

### ① 4-phase 1-Step/2-Step Excitation

Figure 3.10 (8) and Figure 3.10 (9) show the output waveforms of 4-phase 1 excitation and 4-phase 2 excitation, respectively when channel 0 (PG0) is selected.

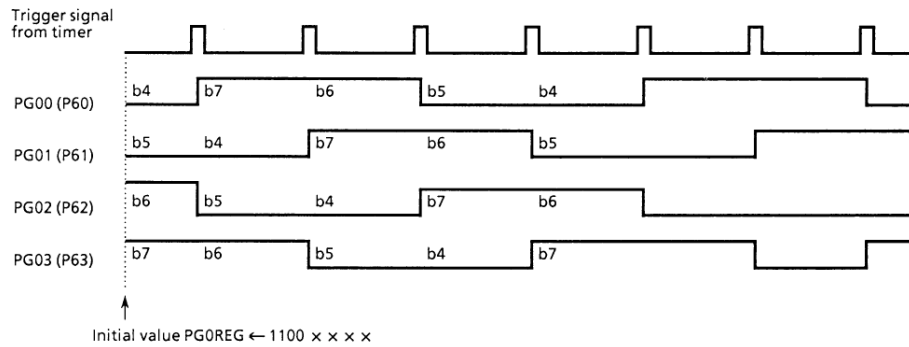

Note : bn indicates the initial value of PG0REG ← b7 b6 b5 b4 x x x x

#### ① Normal Rotation

#### ② Reverse Rotation

Figure 3.10 (8). Output Waveforms of 4-Phase 1-Step Excitation (Normal Rotation and Reverse Rotation)

**Figure 3.10 (9). Output Waveforms of 4-Phase 2-Step Excitation (Normal Rotation)**

The operation when channel 0 is selected is explained below.

The output latch of PG0 (also used as P6) is shifted at the rising edge of the trigger signal from the timer to be output to the port.

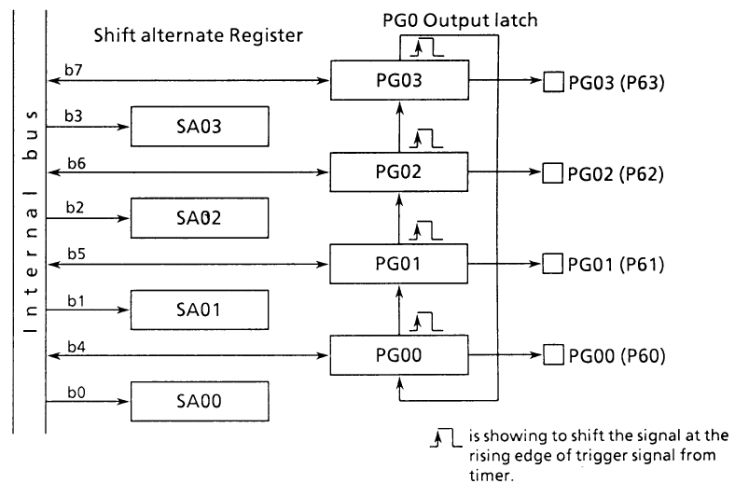

The direction of shift is specified by PG01CR

<CCW0>: Normal rotation (PG00 → PG01 → PG02 → PG03) when <CCW0> is set to "0"; reverse rotation (PG00 ← PG01 ← PG02 ← PG03) when "1". Four-

phase 1-step excitation will be selected when only one bit is set to "1" during the initialization of PG, while 4-phase 2-step excitation will be selected when two consecutive bits are set to "1".

The value in the shift alternate registers are ignored when the 4-phase 1-step/2-step excitation mode is selected.

Figure 3.10 (10) shows the block diagram.

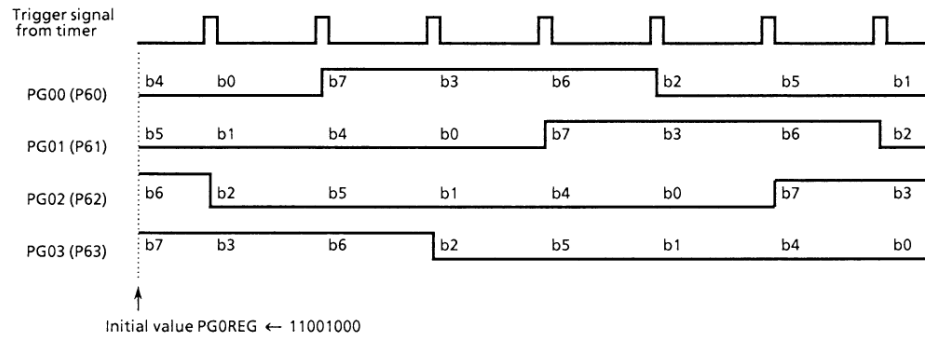

**Figure 3.10 (10). Block Diagram of 4-Phase 1-Step Excitation/2-Step Excitation (Normal Rotation)**

② 4-Phase 1-2 Step Excitation

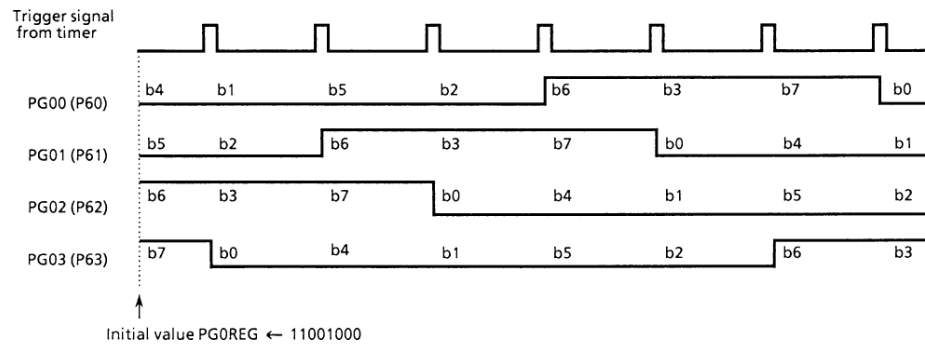

phase 1 -2 step excitation when channel 0 is selected.

Figure 3.10 (11) shows the output waveforms of 4-

Note : bn denotes the initial value PG0REG ← b7 b6 b5 b4 b3 b2 b1 b0

① Normal Rotation

② Reverse Rotation

Figure 3.10 (11). Output Waveforms of 4-Phase 1-2 Step Excitation (Normal Rotation and Reverse Rotation)

The initialization for 4-phase 1-2 step excitation is as follows:

By rearranging the initial value “b7 b6 b5 b4 b3 b2 b1 b0” to “b7 b3 b6 b2 b5 b1 b4 b0”, the consecutive 3 bits are set to “1” and other bits are set to “0” (positive logic).

For example, if b7, b3, and b6 are set to “1”, the initial value becomes “11001000”, obtaining the output waveforms as shown in Figure 3.10 (11).

To get an output waveform of negative logic, set values 1s and 0's of the initial value should be inverted. For

example, to change the output waveform shown in Figure 3.10 (11) into negative logic, change the initial value to “00110111”.

The operation will be explained below for channel 0.

The output latch of PG0 (shared by P6) and the shifter alternate register (SA0) for Pattern Generation are shifted at the rising edge of trigger signal from the timer to be output to the port. The direction of shift is set by PG01CR <CCW0>.

Figure 3.10 (12) shows the block diagram.

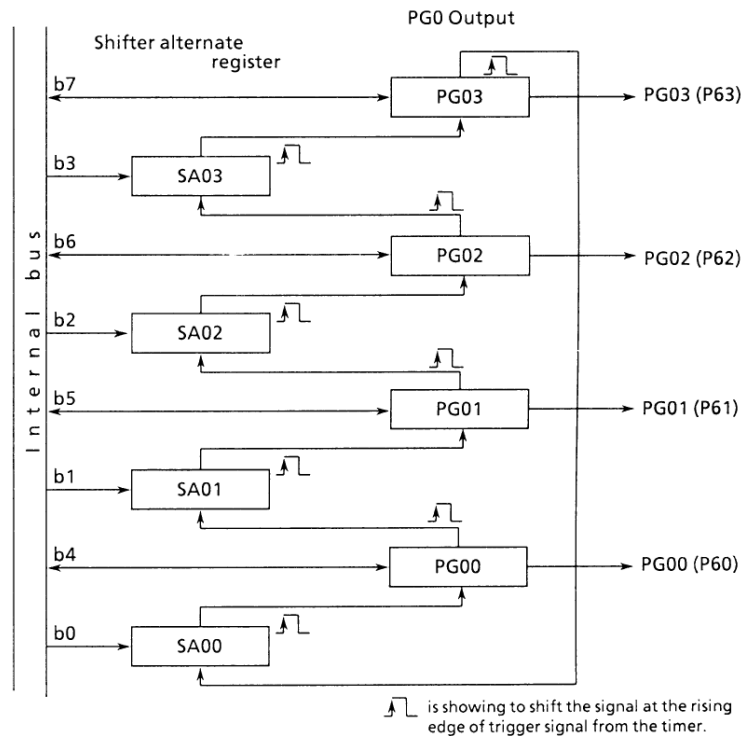

Figure 3.10 (12). Block Diagram of 4-Phase 1-2 Step Excitation (Normal Rotation)

Setting example: To drive channel 0 (PG0) by 4-phase 1-2 step excitation (normal rotation) when

timer 0 is selected, set each register as follows:

	7	6	5	4	3	2	1	0		
TRUN	←	-	X	-	-	-	-	0	Stop timer 0, and clear it to zero.	
TMOD	←	0	0	X	X	-	0	1	Set 8-bit timer mode and select $\phi$ T1 as the input clock of timer 0.	
TFFCR	←	X	X	X	0	1	0	1	0	Clear TFF1 to zero and enable the inversion trigger by timer 0.
TREG0	←	*	*	*	*	*	*	*	*	Set the cycle in timer register.
P6CR	←	-	-	-	-	1	1	1	1	Set P60 to P63 bits to the output mode.
P6FC	←	-	-	-	-	1	1	1	1	Set P60 to P63 bits to the PG output.
PG01CR	←	-	-	-	-	0	0	1	1	Select PG0 4-phase 1-2 step excitation mode and normal rotation .
PG0REG	←	1	1	0	0	1	0	0	0	Set an initial value.
TRUN	←	1	X	-	-	-	-	1		Start timer 0.

Note: X; don't care -; no change

### (3) Trigger Signal From Timer

The trigger signal from the timer which is used by PG is

not equal to the trigger signal of timer flip-flop (TFF1, TFF4, TFF5, and TFF6) and differs as shown in Table 3.10 (1) depending on the operation mode of the timer.

**Table 3.10 (1) Select of Trigger Signal**

	TFF1 Inversion	PG Shift
8-bit timer mode	Selected by TFFCR <TFF1IS> when the up-counter value matches TREG0 or TREG1 value.	←
16-bit timer mode	When the up-counter value matches with both TREG0 and TREG1 values. (The value of up-counter = $TREG1 \times 2^8 + TREG0$ )	←
PPG output mode	When the up-counter value matches with both TREG0 and TREG1.	When the up-counter value matches TREG1 value (PPG cycle).
PWM output mode	When the up-counter value matches TREG0 value and PWM cycle.	Trigger signal for PG is not generated.

Note: To shift PG, TFFCR <TFF1IE> must be set to "1" to enable TFF1 inversion.

Channel 1 of PG can be synchronized with the 16-bit timer Timer 4/Timer 5. In this case, the PG shift trigger signal from the 16-bit timer is output only when the up-counter UC4/UC5 value matches TREG5/TREG7.

When using a trigger signal from Timer 4, set either T4FFCR <EQ5T4> or T4MOD <EQ5T5> to "1" and a

trigger is generated when the value in UC4 and the value in TREG5 match. When using a trigger signal from Timer 5, set T5FFCR <EQ7T6> to 1. Generates a trigger when the value in UC5 and the value in TREG7 match.

(4) Application of PG and Timer Output

As explained in “Trigger signal from timer”, the timing to shift PG and invert TFF differs depending on the mode of timer. An application to operate PG while operating an 8-bit timer in PPG mode will be explained below.

To drive a stepping motor, in addition to the value of each phase (PG output), synchronizing signal is often required at the timing when excitation is changed over. In this application, port 6 is used as a stepping motor control port to output a synchronizing signal to the TO1 pin (shared by P71).

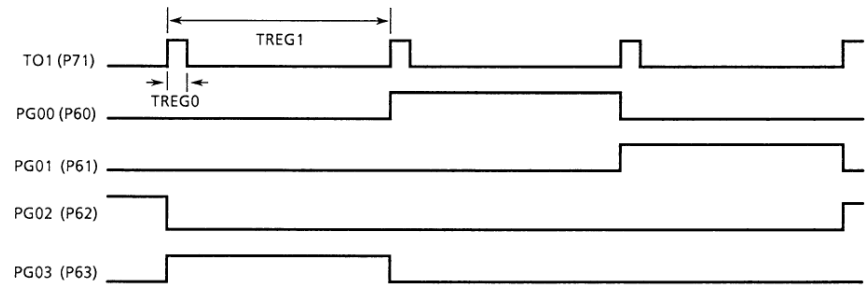

Figure 3.10 (13). Output Waveforms of 4-Phase 1-Step Excitation

Setting example:

	7	6	5	4	3	2	1	0		
TRUN	←	-	X	-	-	-	0	0	Stop timer 0, and clear it to zero.	
TMOD	←	1	0	X	X	X	X	0	1	Set timer 0 and timer 1 in PPG output mode and select $\phi$ T1 as the input clock.
TFFCR	←	X	X	X	0	0	1	1	X	Enable TFF1 inversion and set TFF1 to "1".
TREG0	←	*	*	*	*	*	*	*	*	Set the duty of TO1 to TREG0.
TREG1	←	*	*	*	*	*	*	*	*	Set the cycle of TO1 to TREG1.
P7CR	←	X	X	X	X	-	-	1	-	} Assign P71 as TO1.
P7FC	←	X	X	X	X	-	-	1	X	
P6CR	←	-	-	-	-	1	1	1	1	} Assign P60 to 63 as PG0.
P6FC	←	-	-	-	-	1	1	1	1	
PG01CR	←	-	-	-	-	0	0	0	1	Set PG0 in 4-phase 1-step excitation mode.
PGOREG	←	*	*	*	*	*	*	*	*	Set an initial value.
TRUN	←	1	X	-	-	-	1	1		Start timer 0 and timer 1.

Note: X;don't care    -;no change

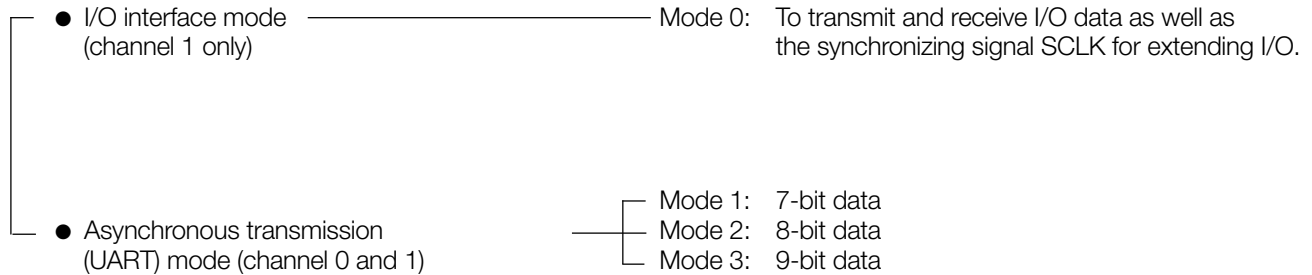

Note: X; don't care    -; no change

### 3.11 Serial Channel

TMP93CM40/TMP93CM41 contains two serial I/O channels for full duplex asynchronous transmission (UART) as well as for

I/O extension.

The serial channel has the following operation modes:

In mode 1 and mode 2, a parity bit can be added. Mode 3 has wake-up function for making the master controller start slave controllers in serial link (multi-controller system).

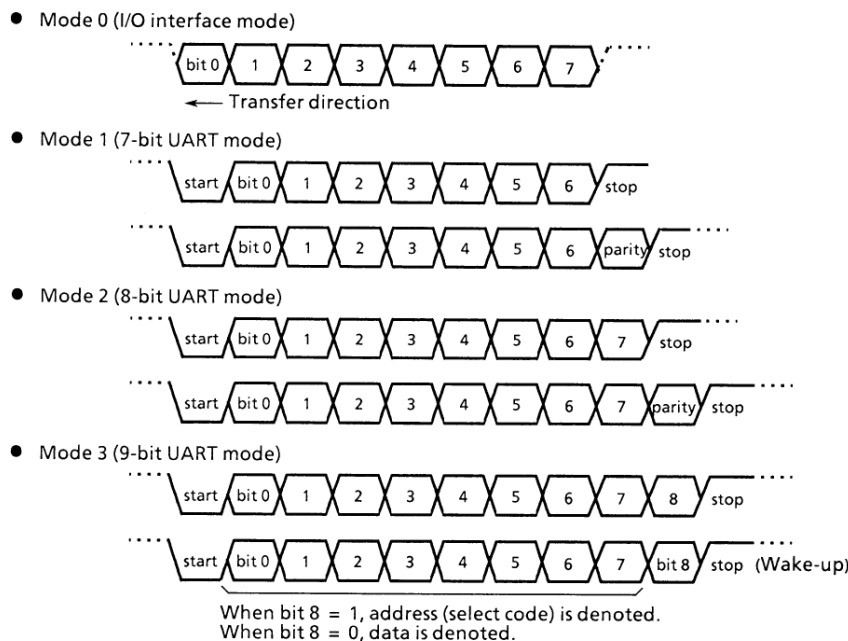

Figure 3.11 (1) shows the data format (for one frame) in each mode.

Serial Channel 0 and 1 can be used independently.

All channels operate in the same manner except the following points, thus, only the channel 0 will be explained below.

#### Different Points Between Channel 0 and Channel 1

	Channel 0	Channel 1
Pin Name	TXD0 (P90), RXD0 (P91), $\overline{\text{CTS0}}$ /SCLK0 (P92)	TXD01 (P93), RXD1 (P94), SCLK1 (P95)
Handshake Function	Exist	Does Not Exist (Not for $\overline{\text{CTS}}$ pin)

**Figure 3.11 (1). Data Formats**

The serial channel has a buffer register for transmitting and receiving operations, in order to temporarily store transmitted or received data, so that transmitting and receiving operations can be done independently (full duplex).

However, in I/O interface mode, SCLK (serial clock) pin is used for both transmission and receiving, the channel becomes half-duplex.

The receiving data register is of a double buffer structure to prevent the occurrence of overrun error and provides one frame of margin before CPU reads the received data. The receiving data register stores the already received data while the buffer register receives the next frame data.

By using CTS and RTS (there is no RTS pin, so any one port must be controlled by software), it is possible to halt data send until CPU finishes reading receive data every time a frame is received (Handshake function).

In the UART mode, a check function is added not to start

the receiving operation by error start bits due to noise. The channel starts receiving data only when the start bit is detected to be normal at least twice in three samplings.

When the transmission buffer becomes empty and requests the CPU to send the next transmission data, or when data is stored in the receiving data register and the CPU is requested to read the data, INTTX or INTRX interrupt occurs. Besides, if an overrun error, parity error, or framing error occurs during receiving operation, flag SC0CR/SC1CR <OERR, PERR, FERR> will be set.

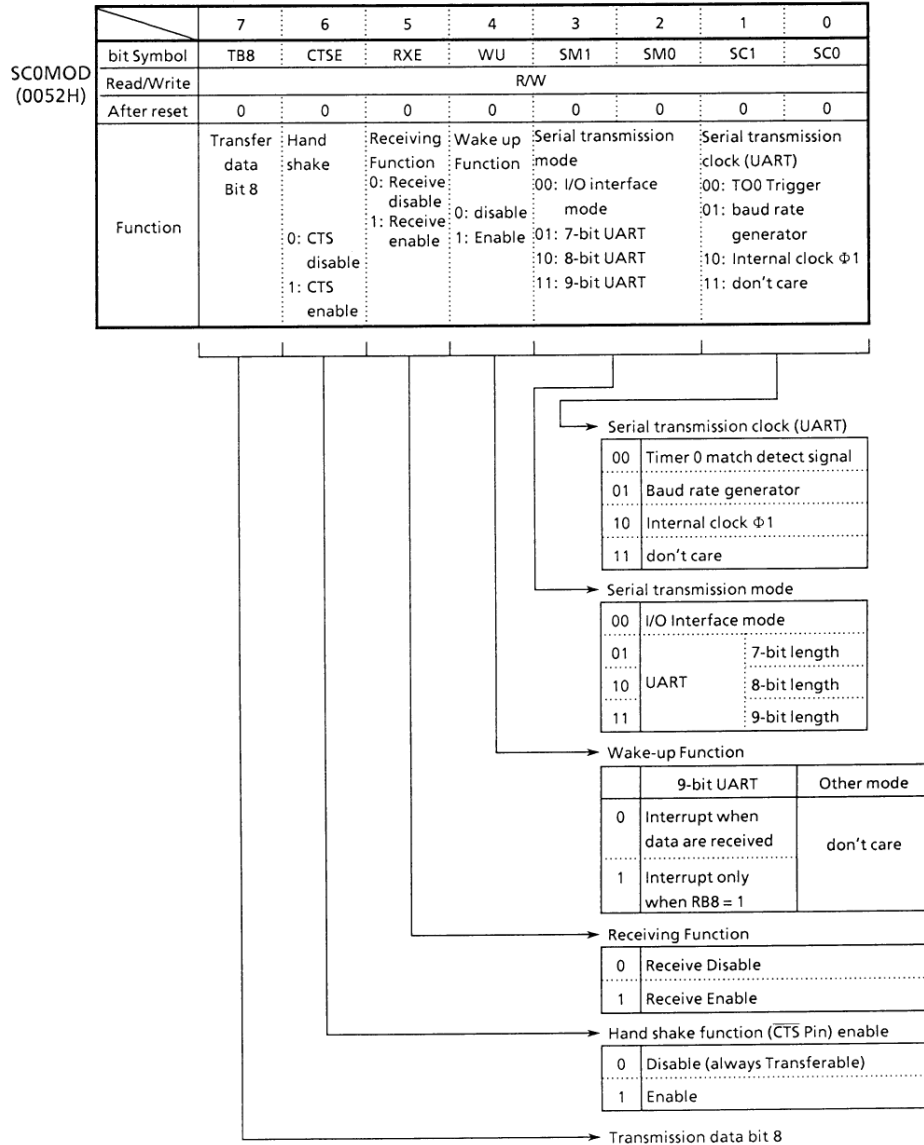

The serial channel 0/1 includes a special baud rate generator, which can set any baud rate by dividing the frequency of four clocks ( $\phi T0$ ,  $\phi T2$ ,  $\phi T8$ , and  $\phi T32$ ) from the internal prescaler (shared by 8-bit/16-bit timer) by the value 2 to 16.

In I/O interface mode, it is possible to input synchronous signals as well as to transmit or receive data by external clock.

### 3.11.1 Control Registers

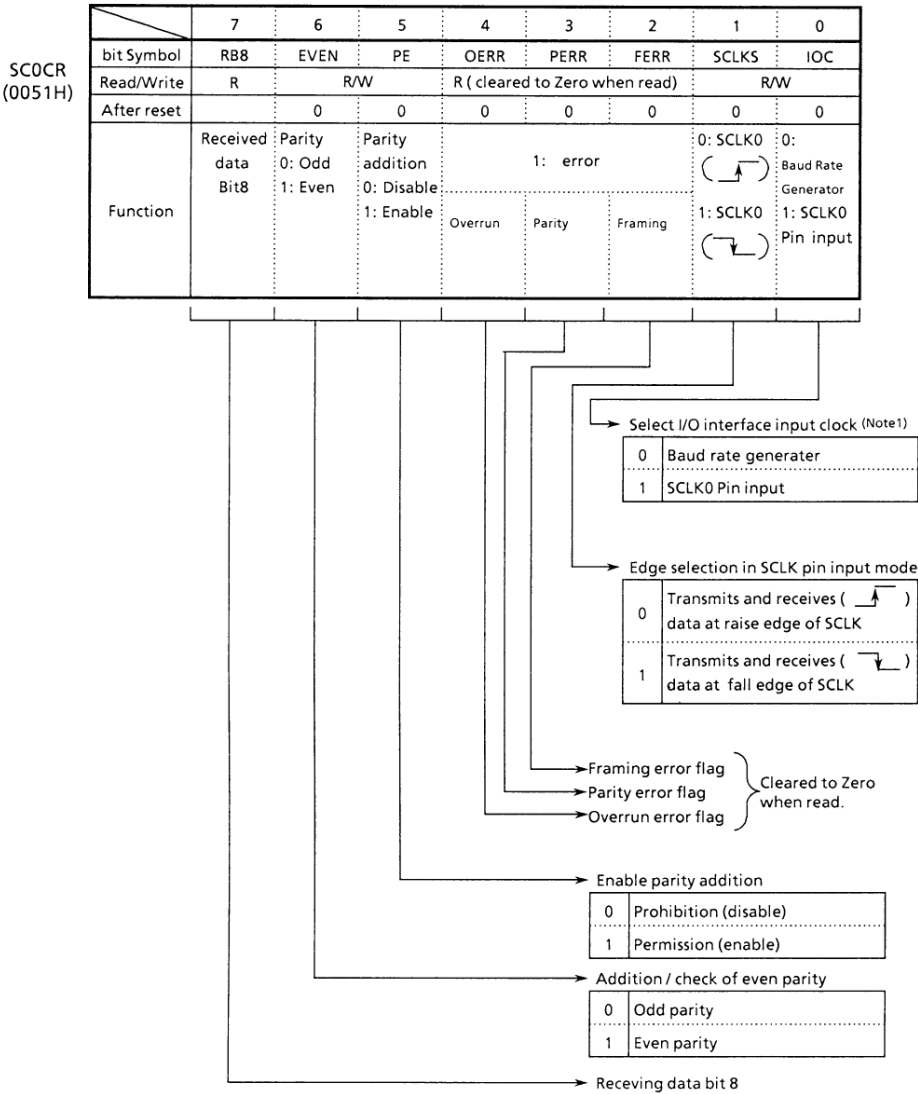

The serial channel is controlled by three control registers

SC0CR, SC0MOD, and BR0CR. Transmitted and received data is stored in register SC0BUF.

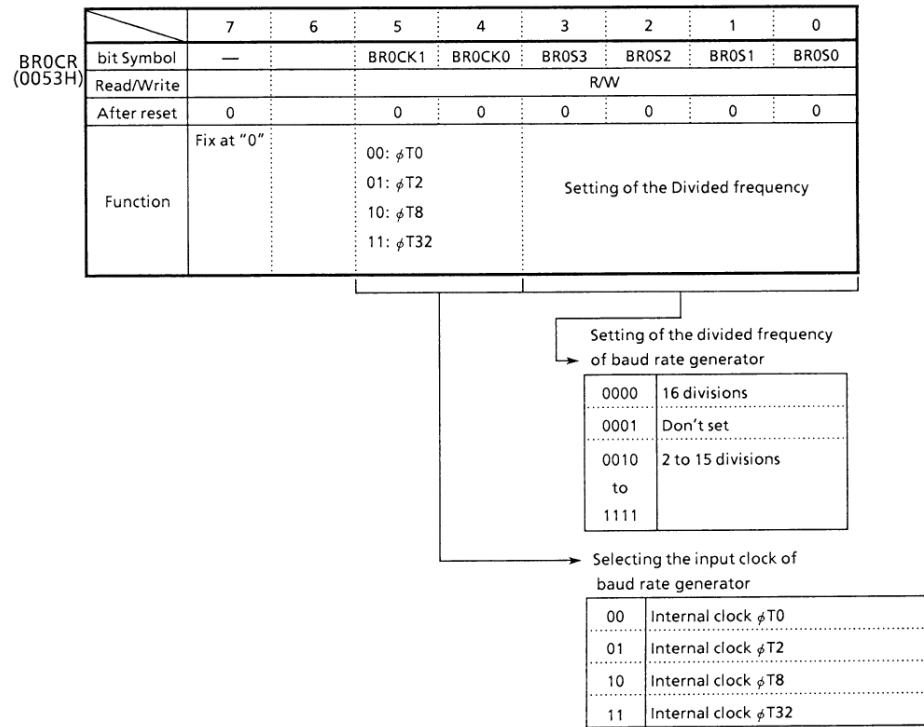

Note : There is SC1MOD (56H) in Channel1

Figure 3.11 (2). Serial Mode Control Register (Channel 0, SC0MOD)

Note : Serial control register for channel 1 is SC1CR (55H).  
Note : As all error flags are cleared after reading do not test only a single bit with a bit-testing instruction.

XXX	10 (fc/16 clock)	XXX	—	fc/2 <sup>8</sup>	fc/2 <sup>10</sup>	fc/2 <sup>12</sup>

XXX : don't care    — : can not use

(Note) The  $f_c/16$  clock as a prescaler prescaler clock can not be used when the  $f_s$  is used as a system clock.

The 1/4 times clock selected among  $f_{\text{FPH}}$  clock,  $f_c/16$  clock, and  $f_s$  clock is input to this prescaler. This is selected by prescaler clock selection register SYSCRO <PRCK1 : 0>.

Resetting sets <PRCK1 : 0> to "00", therefore,  $f_{\text{FPH}}/4$  clock is input.

The Baud Rate Generator uses 4 types of clock:  $\phi T_0$ ,  $\phi T_2$ ,  $\phi T_8$ , and  $\phi T_{32}$  among the prescaler output.

The prescaler can be run or stopped by the timer control register TRUN <PRRUN>. Counting starts when <PRRUN> is set to "1", while the prescaler is cleared to zero and stops operation when <PRRUN> is set to "0".

When the IDLE1 mode (operates only oscillator) is used, set TRUN <PRRUN> to "0" to stop this prescaler before "HALT" instruction is executed.

## ② Baud Rate Generator

Baud rate generator comprises a circuit that generates transmission and receiving clocks to determine the transfer rate of the serial channel.

The input clock to the baud rate generator,  $\phi T_0$ ,  $\phi T_2$ ,  $\phi T_8$ , or  $\phi T_{32}$  is generated by the 9-bit prescaler which is shared by the timers. One of these input clocks is selected by the baud rate generator control register BR0CR <BR0CK1, 0>.

The baud rate generator includes a 4-bit frequency divider, which divides frequency by 2 to 16 values to determine the transfer rate.

How to calculate a transfer rate when the baud rate generator is used is explained below.

### ● UART mode

$$\text{Transfer rate} = \frac{\text{Input clock of baud rate generator}}{\text{Frequency divisor of baud rate generator}} \div 16$$

### ● I/O interface mode

$$\text{Transfer rate} = \frac{\text{Input clock of baud rate generator}}{\text{Frequency divisor of baud rate generator}} \div 2$$

Accordingly, when source clock  $f_c$  is 12.288 MHz, input clock is  $\phi T_2$  ( $f_c/16$ ), and frequency divisor is 5, the transfer rate in UART mode becomes as follows:

$$\begin{aligned} \text{Transfer rate} &= \frac{f_c/16}{5} \div 16 \\ &= 12.288 \times 10^6 / 16 / 5 / 16 = 9600 \text{ (bps)} \end{aligned}$$

Table 3.11 (2) shows an example of the transfer rate in UART mode.

Also with 8-bit timer 0, the serial channel can get a transfer rate. Table 3.9 (3) shows an example of baud rate using timer 0.

**Table 3.11 (2) Selection of Transfer Rate (1) (When Baud Rate Generator is Used)**

Unit (kbps)

<b>fc [Mhz]</b>	<b>Input Clock Frequency Divisor</b>	<b><math>\phi T0</math> (fc/4)</b>	<b><math>\phi T2</math> (fc/16)</b>	<b><math>\phi T8</math> (fc/64)</b>	<b><math>\phi T32</math> (fc/256)</b>
9.830400	2	76.800	19.200	4.800	1.200

4H		24		19.2		12
5H		19.2				9.6
8H		12		9.6		6
AH		9.6				4.8
10H		6		4.8		3
14H		4.8				2.4

How to calculate the transfer rate (when timer 0 is used):

$$\text{Transfer rate} = \frac{\text{fc}}{\text{TREG0} \times 8 \times 16}$$

↑  
(When Timer 0 (input clock  $\phi T1$ ) is used)

Note 1: Timer 0 match detect signal cannot be used as the transfer clock in I/O interface mode.

Note 2: This table is calculated when fc is selected as a system clock, 1 as a clock gear, and system clock as a prescaler clock.

### ③ Serial Clock Generation Circuit

This circuit generates the basic clock for transmitting and receiving data.

#### 1) I/O interface mode (channel 1 only)

When in SCLK output mode with the setting of SC1CR <IOC> = "0", the basic clock will be generated by dividing by 2 the output of the baud rate generator as described before. When in SCLK input mode with the setting of SC1CR <IOC> = "1", the rising edge or falling edge will be detected according to the setting of SC1CR <SCLKS> register to generate the basic clock.

#### 2) Asynchronous Communication (UART) mode

According to the setting of SC0CR <SC1, 0>, the above baud rate generator clock, internal clock  $\phi 1$  (500 Kbps @  $f_c = 16$  MHz), or the match detect signal from timer 0 will be selected to generate the basic clock SIOCLK.

### ④ Receiving Counter

The receiving counter is a 4-bit binary counter used in asynchronous communication (UART) mode and counts up by SIOCLK clock. Sixteen pulses of SIOCLK are used for receiving one bit of data, and the data bit is sampled three times at 7th, 8th and 9th clock.

With the three samples, the received data is evaluated by the rule of majority.

For example, if the sampled data bit is "1", "0" and "1" at 7th, 8th and 9th clock respectively, the received data is evaluated as "1". The sampled data "0", "0" and "1" is evaluated that the received data is "0".

### ⑤ Receiving Control

#### 1) I/O interface mode (channel 1 only)

When in SCLK0 output mode with the setting of SC0CR <IOC> = "0", RxD0 signal will be sampled at the rising edge of shift clock which is output to SCLK0 pin.

When in SCLK0 input mode with the setting SC0CR

<IOC> = "1", RxD0 signal will be sampled at the rising edge or falling edge of SCLK0 input according to the setting of SC0CR <SCLKS> register.

#### 2) Asynchronous Communication (UART) mode

The receiving control has a circuit for detecting the start bit by the rule of majority. When two or more "0" are detected during three samples, it is recognized as start bit and the receiving operation is started.

Data being received is also evaluated by the rule of majority.

### ⑥ Receiving Buffer

To prevent overrun error, the receiving buffer has a double buffer structure.

Received data is stored one bit by one bit in the receiving buffer 1 (shift register type). When 7 bits or 8 bits of data are stored in the receiving buffer 1, the stored data is transferred to another receiving buffer 2 (SC0BUF), generating an interrupt INTRX0/INTRX1.

The CPU reads only receiving buffer 2 (SC0BUF). Even before the CPU reads the receiving buffer 2 (SC0BUF), the received data can be stored in the receiving buffer 1. However, unless the receiving buffer 2 (SC0BUF) is read before all bits of the next data are received by the receiving buffer 1, an overrun error occurs. If an overrun error occurs, the contents of the receiving buffer 1 will be lost, although the contents of the receiving buffer 2 and SC0CR <RB8> are still preserved.

The parity bit added in 8-bit UART mode and the most significant bit (MSB) in 9-bit UART mode are stored in SC0CR <RB8>.

When in 9-bit UART mode, the wake-up function of the slave controllers is enabled by setting SC0MOD <WU> to "1", and interrupt INTRX0 occurs only when SC0CR <RB8> is set to "1".

### ⑦ Transmission Counter

Transmission counter is a 4-bit binary counter which is used in asynchronous communication (UART) mode and, like a receiving counter, counts by SIOCLK clock, generating TxCLK every 16 clock pulses.

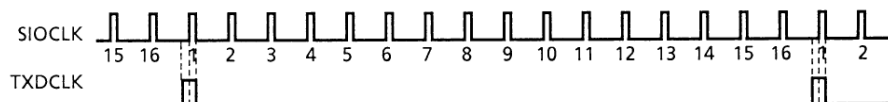

Figure 3.11 (15). Generation of Transmission Clock

## ⑧ Transmission Controller

### 1) I/O interface mode

In SCLK0 output mode with the setting of SC0CR <IOC> = "0", the data in the transmission buffer are output bit by bit to TxD0 pin at the rising edge of shift clock which is output from SCLK0 pin.

In SCLK0 input mode with the setting SC0CR <IOC> = "1", the data in the transmission buffer are output bit by bit to TxD0 pin at the rising edge or falling edge of SCLK0 input according to the setting of SC0CR <SCLKS> register.

### 2) Asynchronous Communication (UART) mode

When transmission data is written in the transmission buffer sent from the CPU, transmission starts at the rising edge of the next TxDCLK, generating a transmission shift clock TxDSFT.

## Handshake function

Serial channel 0 has a  $\overline{\text{CTS0}}$  pin. Using this pin, data can be sent in units of one frame; thus, overrun errors can be avoided. The handshake function is enabled/disabled by SC0MOD <CTSE>.

When the  $\overline{\text{CTS0}}$  pin goes high, after completion of the current data send, data send is halted until the  $\overline{\text{CTS0}}$  pin goes low again. The INTTX0 Interrupts are generated, requests the next send data to the CPU.

Though there is no  $\overline{\text{RTS}}$  pin, a handshake function can be easily configured by setting any port assigned to the  $\overline{\text{RTS}}$  function. The  $\overline{\text{RTS}}$  should be output "High" to request data send halt after data receive is completed by a software in the RXD interrupt routine.

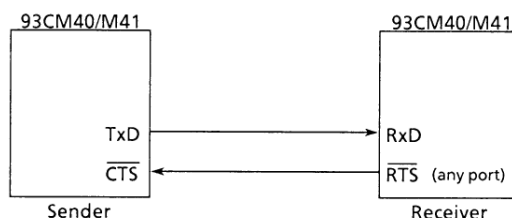

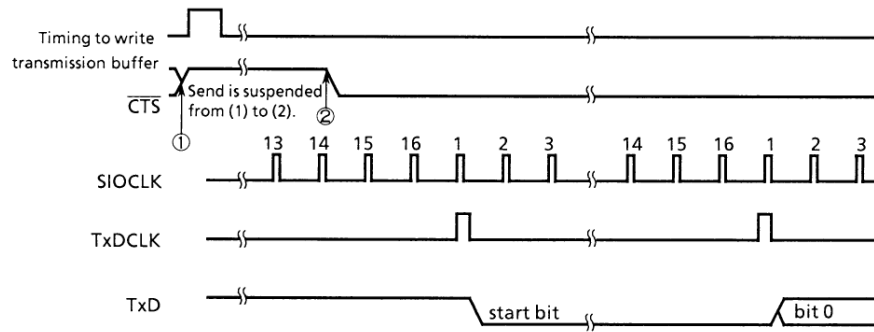

Figure 3.11 (16). Handshake Function

Note 1: If the  $\overline{\text{CTS}}$  signal rises during transmission, the next data is not sent after the completion of the current transmission.

Note 2: Transmission starts at the first TxDCLK clock fall after the  $\overline{\text{CTS}}$  signal falls.

Figure 3.11 (17). Timing of  $\overline{\text{CTS}}$  (Clear to Send)

#### ⑨ Transmission Buffer

Transmission buffer (SC0BUF) shifts to and sends the transmission data written from the CPU from the least significant bit (LSB) in order, using transmission shift clock TxDSFT which is generated by the transmission control. When all bits are shifted out, the transmission buffer becomes empty and generates INTTX0 interrupt.

#### ⑩ Parity Control Circuit

When serial channel control register SC0CR <PE> is set to "1", it is possible to transmit and receive data with parity. However, parity can be added only in 7-bit UART or 8-bit UART mode. With SC0CR <EVEN> register, even (odd) parity can be selected.

For transmission, parity is automatically generated according to the data written in the transmission buffer SCBUF, and data are transmitted after being stored in SC0BUF <TB7> when in 7-bit UART mode while in SC0MOD <TB8> when in 8-bit UART mode. <PE> and <EVEN> must be set before transmission data are written in the transmission buffer.

For receiving, data is shifted in the receiving buffer 1, and parity is added after the data is transferred in the receiving buffer 2 (SC0BUF/SC1BUF), and then compared with SC0BUF <RB7> when in 7-bit UART mode

and with SC0MOD <RB8> when in 8-bit UART mode. If they are not equal, a parity error occurs, and SC0CR <PERR> flag is set

#### ⑪ Error Flag

Three error flags are provided to increase the reliability of receiving data.

##### 1. Overrun error <OERR>

If all bits of the next data are received in receiving buffer 1 while valid data is stored in receiving buffer 2 (SCBUF0), an overrun error will occur.

##### 2. Parity error <PERR>

The parity generated for the data shifted in receiving buffer 2 (SCBUF) is compared with the parity bit received from RxD pin. If they are not equal, a parity error occurs.

##### 3. Framing error <FERR>

The stop bit of received data is sampled three times around the center. If the majority is "0", a framing error occurs.

⑫ Generating Timing

1) UART mode

**Receiving**

<b>Mode</b>	<b>9 Bit</b>	<b>8 Bit + Parity</b>	<b>8 Bit, 7 Bit + Parity, 7 Bit</b>
Interrupt timing	Center of last bit (Bit 8)	Center of last bit (parity bit)	Center of stop bit
Framing error timing	Center of stop bit	Center of stop bit	Center of stop bit
Parity error timing	Center of last bit (Bit 8)	Center of last bit (parity bit)	Center of stop bit
Overrun error timing	Center of last bit (Bit 8)	Center of last bit (parity bit)	Center of stop bit

Note: Framing error occurs after an interrupt has occurred. Therefore, to check for framing error during interrupt operation, it is necessary to wait for 1 bit period of transfer rate.

**Transmitting**

<b>Mode</b>	<b>9 Bit</b>	<b>8 Bit + Parity</b>	<b>8 Bit, 7 Bit + Parity, 7 Bit</b>
Interrupt timing	Just before last bit is transmitted.	←	←

2) I/O Interface mode

Transmission interrupt timing	SCLK output mode	Immediately after rise of last SCLK signal. (See Figure 3.11 (20))
	SCLK input mode	Immediately after rise of last SCLK signal (rising mode), or immediately after fall in falling mode. (See Figure 3.11 (21))
Receiving interrupt timing	SCLK output mode	Timing used to transfer received data to data receive buffer 2 (SC1BUF); that is, immediately after last SCLK. (See Figure 3.11 (22))
	SCLK input mode	Timing used to transfer received data to data receive buffer 2 (SC1BUF); that is, immediately after SCLK. (See Figure 3.11 (23))

### 3.11.3 Operational Description

(1) Mode 0 (I/O interface mode)

This mode is used to increase the number of I/O pins

for transmitting or receiving data to or from the external shifter register.

This mode includes SCLK output mode to output synchronous clock SCLK and SCLK input mode to input external synchronous clock SCLK.

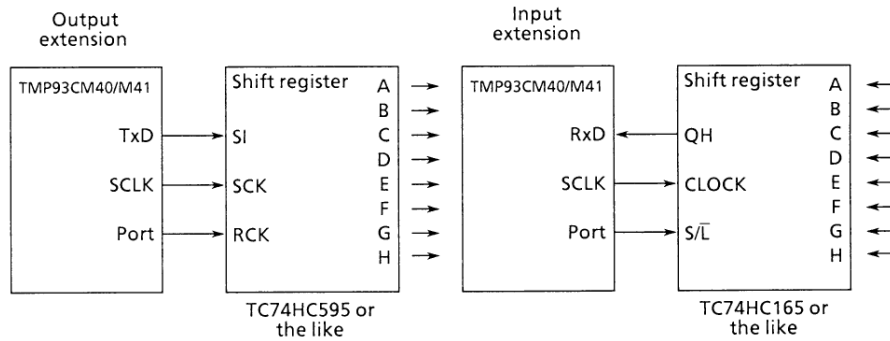

Figure 3.11 (18). Example of SCLK Output Mode Connection

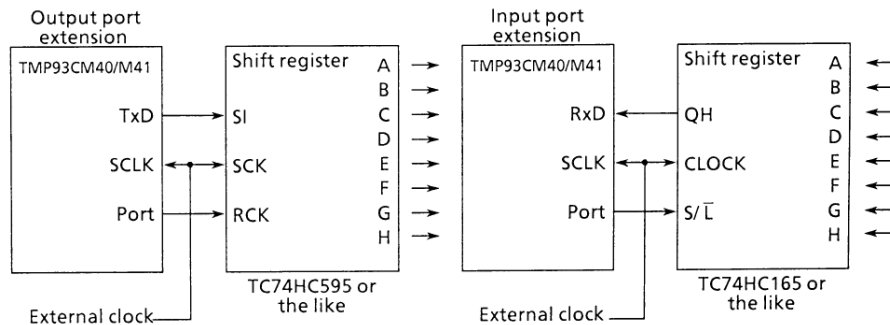

Figure 3.11 (19). Example of SCLK Input Mode Connection

① Transmission

In SCLK output mode, 8-bit data and synchronous clock are output from TxD0 pin and SCLK0 pin, respectively,

each time the CPU writes data in the transmission buffer. When all data is output, INTES0 <ITX0C0> will be set to generate INTTX0 interrupt.

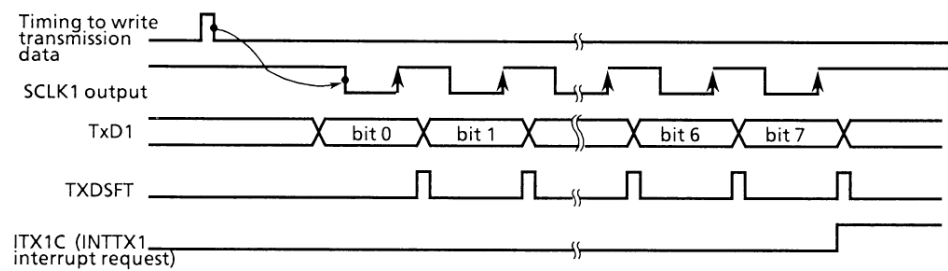

Figure 3.11 (20) Transmitting Operation in I/O Interface Mode (SCLK Output Mode) (Channel 1)

In SCLK input mode, 8-bit data are output from TxD0 pin when SCLK0 input becomes active while data are written in the transmission buffer by CPU.

When all data are output, INTES0 <ITX0C> will be set to generate INTTX0 interrupt.

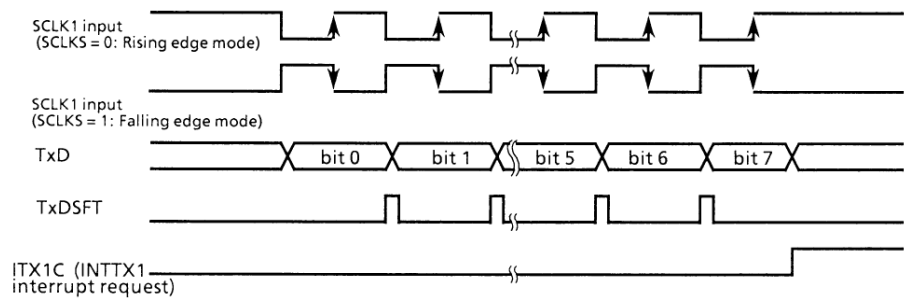

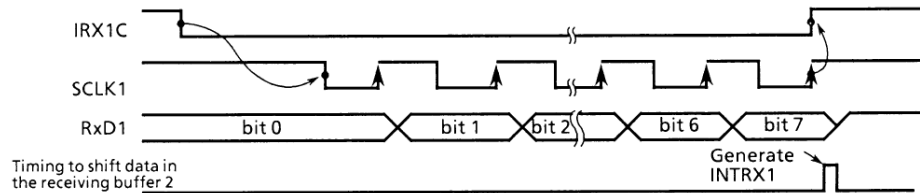

Figure 3.11 (21). Transmitting Operation in I/O Interface Mode (SCLK Input Mode) (Channel 1)

## ② Receiving

In SCLK output mode, synchronous clock is output from SCLK0 pin and the data is shifted in the receiving buffer 1 whenever the receive interrupt flag INTES0

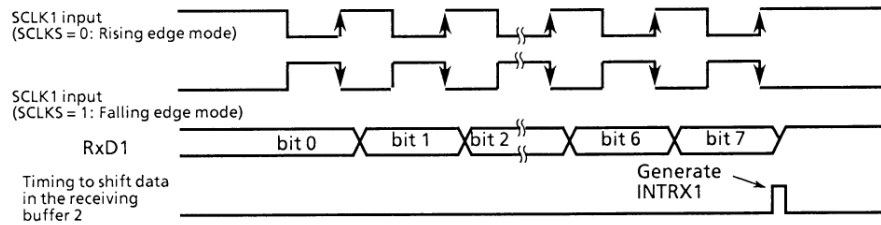

<IRX0C> is cleared by reading the received data. When 8-bit data are received, the data will be transferred in the receiving buffer 2 (SC0BUF) at the timing shown below, and INTES0 <IRX0C> will be set again to generate INTRX0 interrupt.

**Figure 3.11 (22). Receiving Operation in I/O Interface Mode (SCLK1 Output Mode) (Channel 1)**

In SCLK input mode, the data is shifted in the receiving buffer 1 when SCLK input becomes active, while the receive interrupt flag INTES0 <IRX0C> is cleared by reading the received data. When 8-bit data is received, the

data will be shifted in the receiving buffer 2 (SC0BUF) at the timing shown below, and INTES0 <IRX0C> will be set again to generate INTRX0 interrupt.

**Figure 3.11 (23). Receiving Operation in I/O Interface Mode (SCLK Input Mode) (Channel 1)**

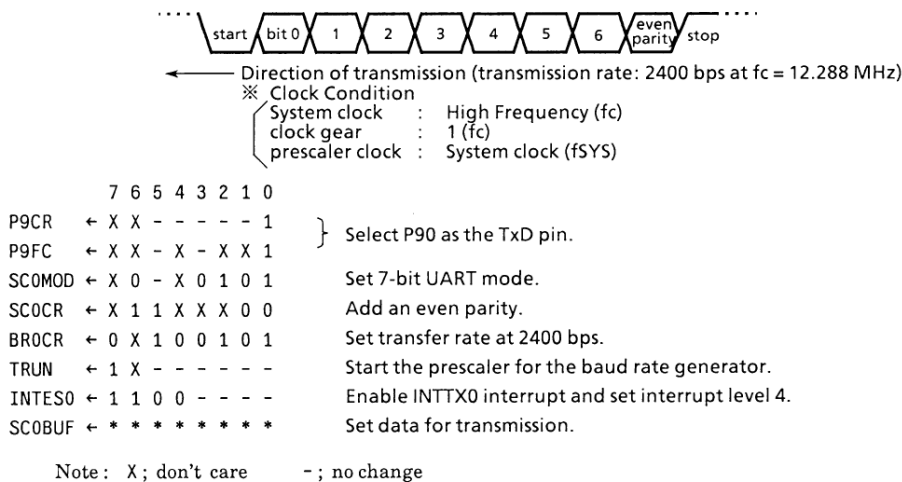

Note: For data receiving, the system must be placed in the receive enable state (SC0MOD <RXE> = "1")

(2) Mode 1 (7-bit UART Mode)

or odd parity is selected by SC0CR <EVEN> when <PE> is set to “1” (enable).

Setting example: When transmitting data with the following format, the control registers should be set as described below. Channel 0 is explained here.

The 7-bit mode can be set by setting serial channel mode register SC0MOD <SM1, 0> to “01”. In this mode, a parity bit can be added, and the addition of a parity bit can be enabled or disabled by serial channel control register SC0CR <PE>, and even parity

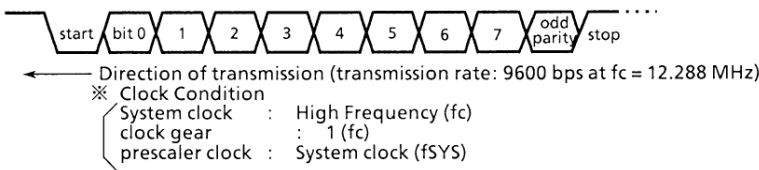

(3) Mode 2 (8-bit UART Mode)

ity is selected by SC0CR <EVEN> when <PE> is set to “1” (enable).

Setting example: When receiving data with the following format, the control register should be set as described below.

The 8-bit UART mode can be specified by setting SC0MOD <SM1, 0> to “10”. In this mode, parity bit can be added, the addition of a parity bit is enabled or disabled by SC0CR <PE>, and even parity or odd par-

Main setting

	7	6	5	4	3	2	1	0		
P9CR	←	X	X	-	-	-	0	-	Select P91 (RxD) as the input pin.	
SC0MOD	←	-	0	1	X	1	0	0	1	Enable receiving in 8-bit UART mode.
SC0CR	←	X	0	1	X	X	X	0	0	Add an odd parity.
BR0CR	←	0	X	0	1	0	1	0	1	Set transfer rate at 9600 bps.
TRUN	←	1	X	-	-	-	-	-	-	Start the prescaler for the baud rate generator.
INTES0	←	-	-	-	-	1	1	0	0	Enable INTTX0 interrupt and set interrupt level 4.

Interrupt processing

```

Acc ← SC0CR AND 00011100    } Check for error.
if Acc ≠ 0 then ERROR
Acc ← SC0BUF                  } Read the received data.
Note: X; don't care  -; no change

```

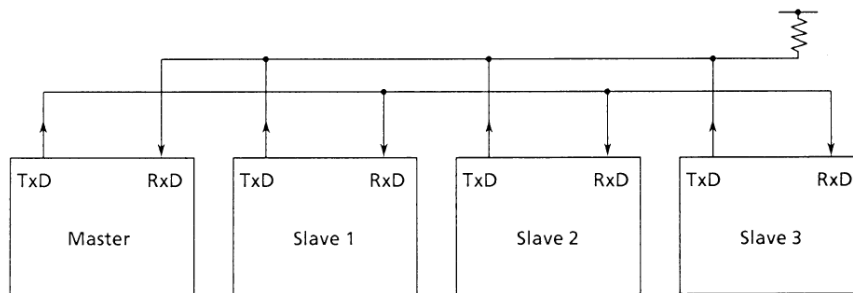

(4) Mode 3 (9-bit UART Mode)

The 9-bit UART mode can be specified by setting SC0MOD <SM1, 0> to "11". In this mode, parity bit cannot be added

For transmission, the MSB (9th bit) is written in SC0MOD <TB8>, while in receiving it is stored in SCCR <RB8>. For writing and reading the buffer, the MSB is read or written first, then SC0BUF.

Wake-up function

In 9-bit UART mode, the wake-up function of slave controllers is enabled by setting SC0MOD <WU> to "1". The interrupt INTRX0 occurs only when <RB8> = 1.

Note: TxD pin of the slave controllers must be in open drain output mode.

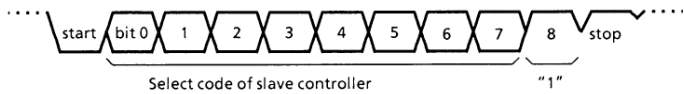

**Figure 3.11 (24). Serial Link Using Wake-Up Function**

Protocol

- ① Select the 9-bit UART mode for master and slave controllers.
- ② Set SC0MOD <WU> bit of each slave controller to “1”

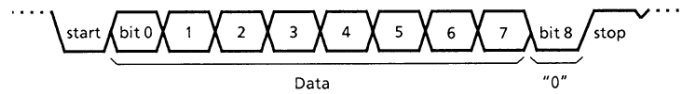

to enable data receiving.

- ③ The master controller transmits one-frame data including the 8-bit select code for the slave controllers. The MSB (bit 8) <TB8> is set to “1”.

- ④ Each slave controller receives the above frame, and clears WU bit to “0” if the above select code matches its own select code.

- ⑤ The master controller transmits data to the specified slave controller whose SC0MOD <WU> bit is cleared to “0.” The MSB (bit 8) <TB8> is cleared to “0”.

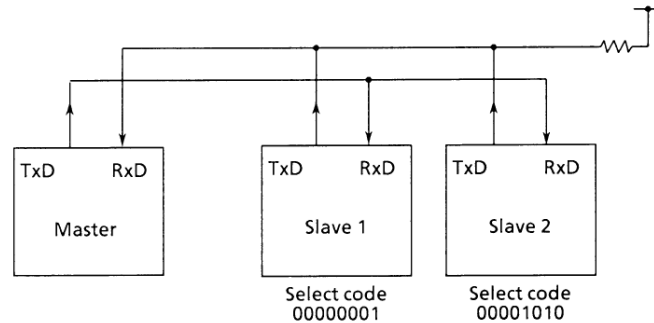

- ⑥ The other slave controllers (with the <WU> bit remaining at “1”) ignore the receiving data because their MSBs (bit 8 or <RB8>) are set to “0” to disable the interrupt INTRX0. The slave controllers (WU = 0) can

transmit data to the master controller, and it is possible to indicate the end of data receiving to the master controller by this transmission.

Setting Example: To link two slave controllers serially with the master controller, and use

the internal clock  $\phi 1$  ( $f_c/2$ ) as the transfer clock.

Since serial channels 0 and 1 operate in exactly the

same way, channel 0 is used for the purposes of explanation.

- Setting the master controller

```

Main
P9CR  ← X X - - - 0 1
P9FC  ← X X - X - X X 1
INTES0 ← 1 1 0 0 1 1 0 1
SC0MOD ← 1 0 1 0 1 1 1 0
SC0BUF ← 0 0 0 0 0 0 0 1

INTTX0 interrupt
SC0MOD ← 0 - - - - -
SC0BUF ← * * * * *
  
```

} Select P90 as TxD0 pin and P91 as RxD0 pin.  
 Enable INTTX0 and set the interrupt level 4.  
 Enable INTTX0 and set the interrupt level 5.  
 Set  $\phi 1$  as the transmission clock in 9-bit UART mode.  
 Set the select code for slave controller 1.  
 Sets TB8 to "0".  
 Set data for transmission.

- Setting the slave controller 2

```

Main
P9CR  ← X X - - - 0 1
P9FC  ← X X - X - X X 1
ODE   ← X X X X X X - 1
INTES0 ← 1 1 0 1 1 1 1 0
SC0MOD ← 0 0 1 1 1 1 1 0

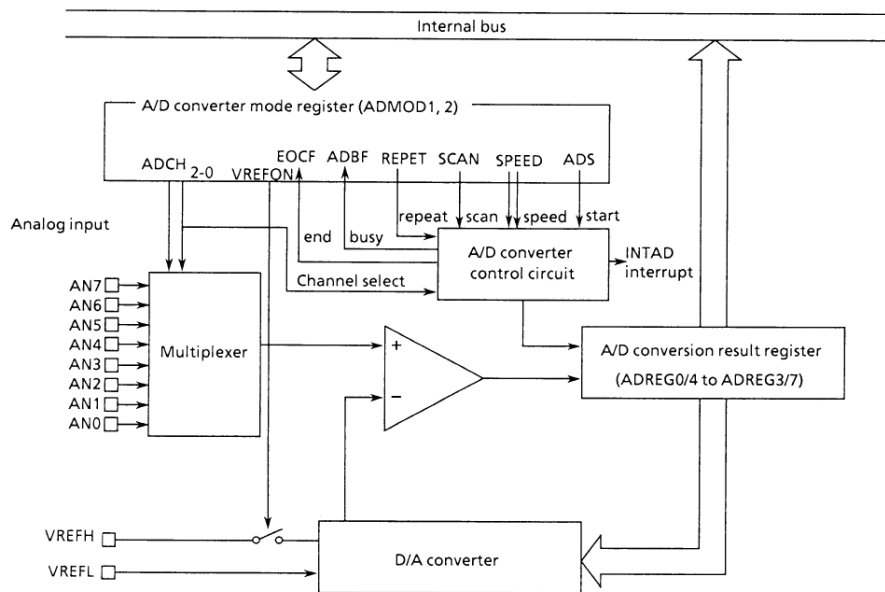

INTRX0 interrupt
Acc ← SC0BUF
if Acc = Select code
Then SC0MOD ← - - - 0 - - - - Clear <WU> to "0".
  
```

} Select P91 as RxD0 pin and P90 as TxD0 pin (open drain output).  
 Enable INTRX0 and INTTX0.  
 Set <WU> to "1" in the 9-bit UART transmission mode with transfer clock  $\phi 1$ .

### 3.12 Analog/Digital Converter

TMP93CM40/M41 contains a high-speed analog/digital converter (A/D converter) with 8-channel analog input that features 10-bit successive approximation.

Figure 3.12 (1) shows the block diagram of the A/D converter. The 8-channel analog input pins (AN7 to AN0) are shared by input-only P5 and so can be used as input port.

**Figure 3.12 (1). Block Diagram of A/D Converter**

Note: This A/D converter does not have a built-in sample and hold circuit. Therefore, when A/D converting high-frequency signals, connect a sample and hold circuit externally.

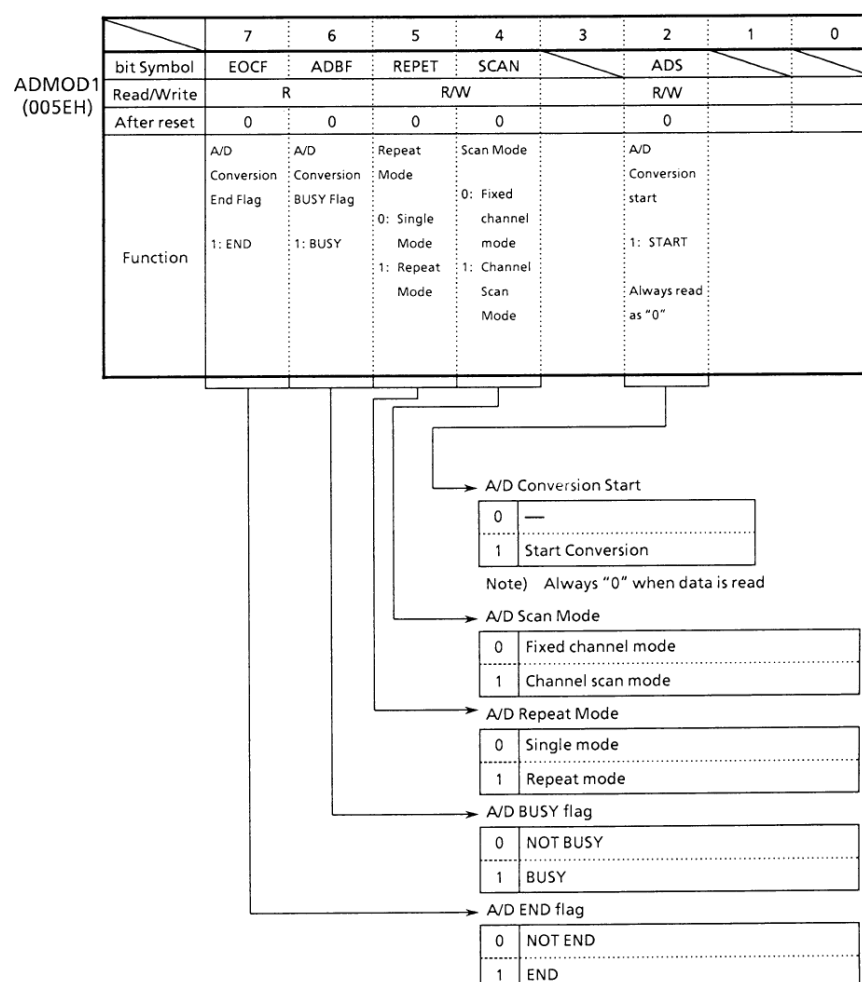

Figure 3.12 (2-1). A/D Control Register

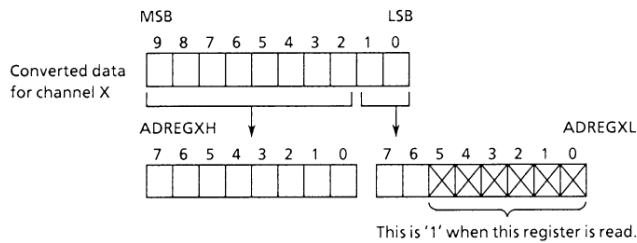

Figure 3.12 (3-2). A/D Conversion Result Register (ADREG04, 15)

### 3.12.1 Operation

#### (1) Analog Reference Voltage

High analog reference voltage is applied to the VREFH pin, and low analog reference voltage is applied to VREFL pin.

The reference voltage between VREFH and VREFL is divided by 1024 using ladder resistance, and compared with the analog input voltage for A/D conversion. The switch between VREFH and VREFL can be cut (OFF) by writing "0" to <VREFON>.

When the conversion will be started at the <VREFON> = "0", write "1" to <VEFRON> before writing "1" to <ADS>.

#### (2) Analog Input Channels

Analog input channel is selected by ADMOD <ADCH2:0>. However, which channel to select depends on the operation mode of the A/D converter. In fixed analog input mode, one channel is selected by ADMOD <ADCH2:0> among four pins: AN0 to AN7.

In analog input channel scan mode, the number of channels to be scanned from AN0 or AN4 is specified by <ADCH2:0>, such as AN0 → AN1, AN0 → AN1 → AN2, AN0 → AN1 → AN2 → AN3, AN4 → AN5, AN4 → AN5 → AN6, and AN4 → AN5 → AN6 → AN7.

When reset, A/D conversion channel register will be initialized to ADMOD <ADCH2:0> = 00, so that AN0 pin will be selected.

The pins which are not used as analog input channel can be used as ordinary input port P5.

#### (3) Starting A/D Conversion

A/D conversion starts when A/D conversion register ADMOD1 <ADS> is written "1". When A/D conversion starts, A/D conversion busy flag ADMOD1 <ADBF> which indicates "conversion is in progress" will be set to "1".

#### (4) A/D Conversion Mode

Both fixed A/D conversion channel mode and A/D conversion channel scan mode have two conversion modes, i.e., single and repeat conversion modes.

In fixed channel repeat mode, conversion of specified one channel is executed repeatedly.

In scan repeat mode, scanning from AN0, ... → AN3 is executed repeatedly.

A/D conversion mode is selected by ADMOD1 <REPET, SCAN>.

#### (5) A/D Conversion Speed Selection

There are four A/D conversion speed modes. The selection is executed by ADMOD2 <SPEED1:0> register.

When reset, ADMOD <SPEED1:0> will be initialized to "00", so that high speed conversion mode will be selected.

#### (6) A/D Conversion End and Interrupt

##### • A/D conversion single mode

ADMOD1 <EOCF> for A/D conversion end will be set to "1," ADMOD1 <ADBF> flag will be reset to "0," and INTAD interrupt will be enabled when A/D conversion of specified channel ends in fixed conversion channel mode or when A/D conversion of the last channel ends in channel scan mode.

##### • A/D conversion repeat mode

For both fixed conversion channel mode and conversion channel scan mode, INTAD should be disabled when in repeat mode. Always set the INTE0AD at "000", so that it disables the interrupt request.

Write "0" to ADMOD2 <REPET> to end the repeat mode. Then, the repeat mode will be exited as soon as the conversion in progress is completed.

#### (7) Storing the A/D Conversion Result

The results of A/D conversion are stored in ADREG04 to ADREG37 registers for each channel.

The result registers are used both as AN0 and AN4, AN1 and AN5, AN2 and AN6, AN3 and AN7.

However, the current conversion data cannot be known which channels.

In repeat mode, the registers are updated whenever conversion ends.

ADREG04 to ADREG37 are read-only registers.

#### (8) Reading the A/D Conversion Result

The results of A/D conversion are stored in ADREG04 to ADREG37 registers.

When the contents of one of ADREG04L, ADREG15L, ADREG26L, and ADREG37L registers are read, ADMOD1 <EOCF> will be cleared to "0".

<EOCF> is not cleared to "0" when the contents of one ADREG04L, ADREG15L, ADREG26L, and ADREG37L for lower 2-bits is read.

Setting example: ① When the analog input voltage of the AN3 pin is A/D converted by 160 states speed and the result is transfered in the memory address 100H by A/D interrupt INTAD routine

Main setting		
INTE0AD	← 1 1 0 0 - - - -	Enable INTAD and set interrupt level 4.
ADMOD2	← 1 X 0 0 X 0 1 1	Specify AN3 pin as an analog input channel and starts A/D conversion in 160 states speed mode.
ADMOD1	← X X 0 0 X 1 X X	
INTAD routine		
WA	← ADREG37	Read ADREG37L and ADREG37H values and write to WA (16 bit)
WA	>> 6	Right-shifts WA six times and writes 0 in upper bits.
(000100H)←	WA	Writes contents of WA in memory at 100H

② When the analog input voltage of the AN4 to AN7 pins (4 pins) are A/D converted by 320 states speed and set the channel scan & repeat mode.

Main setting		
INTE0AD	← 1 0 0 0 - - - -	INTAD disable.
ADMOD2	← 1 X 0 1 0 1 1 1	Specify AN4 to AN7 pins as input channel and scan & repeat mode and starts A/D conversion in 320 states speed mode .
ADMOD1	← X X 1 1 X 1 0 0	

Note) X: don't care  
-: no change

TMP93CM40/M41 contain watchdog timer of Runaway detecting.

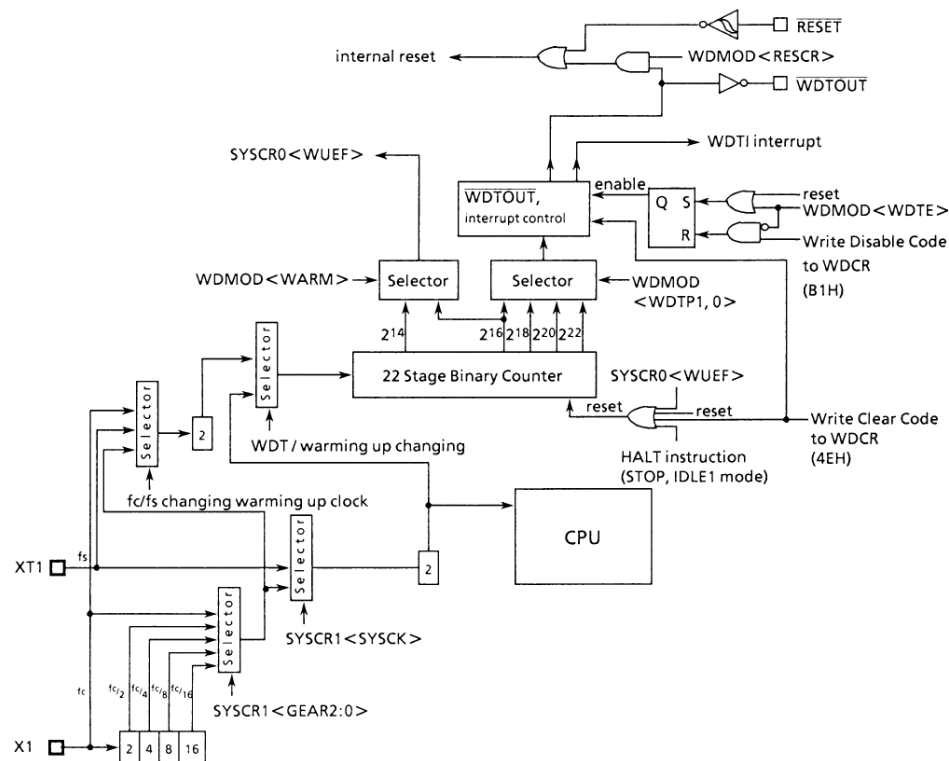

The watchdog timer (WDT) is used to return the CPU to the normal state when it detects that the CPU has started to malfunction (runaway) due to causes such as noise. When the watchdog timer detects a malfunction, it generates a non-maskable interrupt to notify the CPU of the malfunction, and outputs “0” externally from watchdog timer out pin WDTOUT to notify the peripheral devices of the malfunction.

Connecting the watchdog timer output to the reset pin internally forces a reset.

This binary counter is also used as a warming up timer for the internal oscillator stabilization. This is used when the STOP releasing and before changing system clock.

### 3.13.1 Configuration

Figure 3.13 (1) shows the block diagram of the watchdog timer (WDT).

**Figure 3.13 (1). Block Diagram of Watchdog Timer/Warming Up Timer**

The watchdog timer is a 22-stage binary counter which uses  $\phi$  (fc/2) as the input clock. There are four outputs from the binary counter:  $2^{16}/\text{fc}$ ,  $2^{18}/\text{fc}$ ,  $2^{20}/\text{fc}$ , and  $2^{22}/\text{fc}$ . Selecting one of the outputs with the WDMOD register generates a watchdog interrupt, and outputs watchdog timer out when an overflow occurs.

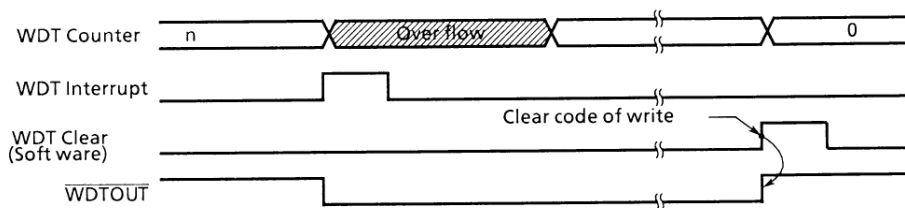

Since the watchdog timer out pin ( $\overline{\text{WDTOUT}}$ ) outputs "0" due to a watchdog timer overflow, the peripheral devices can be reset. The watchdog timer out pin is set to "1" after disabling WDT and clearing the watchdog timer (by writing a clear code 4EH in the WDCR register).

(Example)

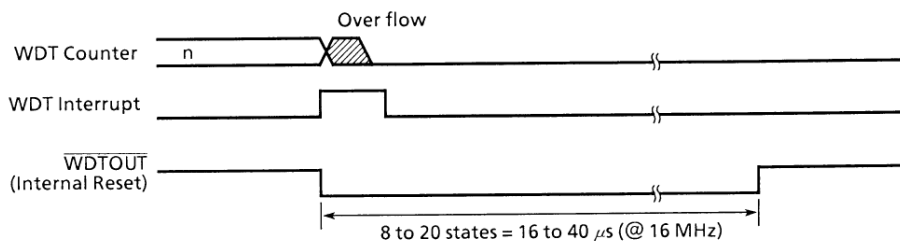

LDW	(WDMOD), B100H	;	disable
LD	(WDCR), 4EH	;	write clear code
SET	7, (WDMOD)	;	enable again

In other words, the  $\overline{\text{WDTOUT}}$  keeps outputting "0" until the clear code is written.

The watchdog timer out pin can also be connected to the reset pin internally. The watchdog timer out pin ( $\overline{\text{WDTOUT}}$ ) outputs 0 to 8 to 20 states (16 to 40  $\mu\text{s}$  @  $\text{fc} = 16\text{MHz}$ ) and resets itself.

**Figure 3.13 (2). Normal Mode**

**Figure 3.13 (3). Reset Mode**

### 3.13.2 Control Registers

Watchdog timer WDT is controlled by two control registers WDMOD and WDCR.

#### (1) Watchdog Timer Mode Register (WDMOD)

- ① Setting the detecting time of watchdog timer <WDTP>

This 2-bit register is used to set the watchdog timer interrupt time for detecting the runaway. This register is initialized to WDMOD <WDTP1, 0> = 00 when reset, and therefore  $2^{16}/f_c$  is set. (The number of states is approximately 32,768).

The detecting time of WDT is shown in Figure 3.13 (6).

- ② Watchdog timer enable/disable control register <WDTE>

When reset, WDMOD <WDTE> is initialized to "1"

- Disable control

WDMOD	← 0 - - - - X X
WDCR	← 1 0 1 1 0 0 0 1

Clear WDMOD<WDTE> to "0".  
Write the disable code (B1H).

- Enable control  
Set WDMOD <WDTE> to "1".

enable the watchdog timer.

To disable, it is necessary to clear this bit to "0" and write the disable code (B1H) in the watchdog timer control register WDCR. This makes it difficult for the watchdog timer to be disabled by runaway.

However, it is possible to return from the disable state to enable state by merely setting <WDTE> to "1".

- ③ Watchdog timer out reset connection <RESCR>

This register is used to connect the output of the watchdog timer with RESET terminal, internally. Since WDMOD <RESCR> is initialized to 0 at reset, a reset by the watchdog timer will not be performed.

#### (2) Watchdog Timer Control Register (WDCR)

This register is used to disable and clear the binary counter of the watchdog timer function.

- Watchdog timer clear control  
The binary counter can be cleared and resume counting by writing clear code (4EH) into the WDCR register.

WDCR ← 0 1 0 0 1 1 1 0

Write the clear code (4EH).

XXX : don't care

Figure 3.13 (6). Watchdog Detecting Time

### 3.13.3 Operation

The watchdog timer generates interrupt INTWD after the detecting time set in the WDMOD <WDTP1, 0> register and outputs a low level signal. The watchdog timer must be zero-cleared by software before an INTWD interrupt is generated. If the CPU malfunctions (runaway) due to causes such as noise, but does not execute the instruction used to clear the binary counter, the binary counter overflows and an INTWD interrupt is generated. The CPU detects malfunction (runaway) due to the INTWD Interrupt and it is possible to return to normal operation by an anti-malfunction program. By connecting the

watchdog timer out pin to peripheral devices' resets, a CPU malfunction can also be acknowledged to other devices.

The watchdog timer restarts operation immediately after resetting is released.

The watchdog timer stops its operation in the IDLE1 and STOP modes. In the RUN mode, the watchdog timer is enabled. When the bus is released ( $\overline{\text{BUSA}} = \text{"L"}\text{"}$ ), WDT continues counting up.

However, the function can be disabled when entering the RUN, IDLE2 modes.

Example : ① Clear the binary counter

WDCR ← 0 1 0 0 1 1 1 0      Write clear code (4EH).

② Set the watchdog timer detecting time to  $2^{18} / f_{\text{SYS}}$

WDMOD ← 1 0 1 - - - X X

③ Disable the watchdog timer.

WDMOD ← 0 - - - - X X      Clear WDTE to "0".  
WDCR ← 1 0 1 1 0 0 0 1      Write disable code (B1H).

④ Set IDLE1 mode.

WDMOD ← 0 - - - 1 0 X X      Disables WDT and sets IDLE1 mode.  
WDCR ← 1 0 1 1 0 0 0 1  
Executes HALT command      Set the standby mode

⑤ Set the STOP mode (warming up time:  $2^{16} / f_{\text{SYS}}$ )

WDMOD ← - - - 1 0 1 X X      Set the STOP mode.  
Executes HALT command.      Execute HALT instruction. Set the standby mode.

## 4. Electrical Characteristics

### 4.1 Absolute Maximum (TMP93CM40F/TMP93CM41F)

Symbol	Parameter	Rating	Unit
$V_{CC}$	Power Supply Voltage	-0.5 to 6.5	V
$V_{IN}$	Input Voltage	$-0.5 - V_{CC} + 0.5$	V
$\Sigma I_{OL}$	Output Current (total)	120	mA
$\Sigma I_{OH}$	Output Current (total)	-80	mA
PD	Power Dissipation ( $T_a = 85^\circ\text{C}$ )	600	mW
T SOLDER	Soldering Temperature (10s)	260	$^\circ\text{C}$
T STG	Storage Temperature	-65 to 150	$^\circ\text{C}$
T OPR	Operating Temperature	-40 to 85	$^\circ\text{C}$

### 4.2 DC Characteristics (1/2)

Symbol	Parameter	Max	Typ. (Note 1)	Max	Unit	Test Condition
$V_{CC}$	Power Supply Voltage	4.5		5.5	V	$f_c = 4$ to 16MHz $f_s = 30$ to 34kHz ( $T_a = -40$ to $85^\circ\text{C}$ )
						$f_c = 4$ to 20MHz $f_s = 30$ to 34kHz ( $T_a = -20$ to $70^\circ\text{C}$ )
		2.7 (Note 2)				$f_c = 4$ to 10MHz $f_s = 30$ to 34kHz ( $T_a = -40$ to $85^\circ\text{C}$ )
$V_{IL}$	Low High Voltage (AD0 to 15)			0.8 0.6	V	$V_{CC} \geq 4.5\text{V}$ $V_{CC} < 4.5\text{V}$
$V_{IL1}$	Port 2 to A (except P87, P5)			$0.3 V_{CC}$		$V_{CC} = 2.7$ to $5.5\text{V}$
$V_{IL2}$	$\overline{\text{RESET}}$ , $\overline{\text{NMI}}$ , INTO			$0.25 V_{CC}$		
$V_{IL3}$	$\overline{\text{EA}}$ , AM8/ $\overline{\text{T6}}$			0.3		
$V_{IL4}$	X1, P5			$0.2 V_{CC}$		
$V_{IH}$	Low High Voltage (AD0 to 15)	2.2 2.0		$V_{CC} + 0.3$	V	$V_{CC} \geq 4.5\text{V}$ $V_{CC} < 4.5\text{V}$
$V_{IH1}$	Port 2 to A (except P87)	$0.7 V_{CC}$				$V_{CC} = 2.7$ to $5.5\text{V}$
$V_{IH2}$	$\overline{\text{RESET}}$ , $\overline{\text{NMI}}$ , INTO	$0.75 V_{CC}$				
$V_{IH3}$	$\overline{\text{EA}}$ , AM8/ $\overline{\text{T6}}$	$V_{CC} - 0.3$				
$V_{IH4}$	X1	$0.8 V_{CC}$				
$V_{OL}$	Output Low Voltage			0.45	V	$I_{OL} = 1.6\text{mA}$ ( $V_{CC} = 2.7$ to $5.5\text{V}$ )
$V_{OH}$	Output High Voltage	2.4			V	$I_{OH} = -400\mu\text{A}$ ( $V_{CC} = 2.7$ to $5.5\text{V}$ )
$V_{OH1}$		$0.75 V_{CC}$			V	$I_{OH} = -100\mu\text{A}$ ( $V_{CC} = 5\text{V} \pm 10\%$ )
$V_{OH2}$		$0.9 V_{CC}$			V	$I_{OH} = -20\mu\text{A}$ ( $V_{CC} = 5\text{V} \pm 10\%$ )
$I_{DAR}$ (note 3)	Darlington Drive Current (8 Output Pins max.)	-1.0		-3.5	mA	$V_{EXT} = 1.5\text{V}$ $R_{EXT} = 1.1\text{k}\Omega$ ( $V_{CC} = 5\text{V} \pm 10\%$ )
$I_{LI}$	Input Leakage Current		0.02 (Typ)	$\pm 5$	$\mu\text{A}$	$0.0 \leq V_{in} \leq V_{CC}$
$I_{LO}$	Output Leakage Current		0.05 (Typ)	$\pm 10$		$0.2 \leq V_{in} \leq V_{CC} - 0.2$

(note 1) Typical values are for  $T_a = 25^\circ\text{C}$  and  $V_{CC} = 5\text{V}$  unless otherwise.

(note 3) I-DAR is guaranteed for a total of up to 8 ports.

(note 2) The operation of A/D converter is guaranteed at  $V_{CC} = 5\text{V} \pm 10\%$ .

(note 4) The condition of measurement of  $I_{CC}$  (Normal/Slow).

Operates only CPU, output ports are open and input ports fixed.

## TMP93CM40/TMP93CM41

### 4.2 DC Characteristics (1/2/2)

Symbol	Parameter	Max	Typ. (Note 1)	Max	Unit	Test Condition
V STOP	Power Down Voltage (at STOP, RAM Back up)	2.0		6.0	V	$V_{IL2} = 0.2V_{CC}$ , $V_{IH2} = 0.8V_{CC}$
R RST	$\overline{\text{RESET}}$ Pull Up Register	50 80		150 200	K $\Omega$	$V_{CC} = 5V \pm 10\%$ $V_{CC} = 3V \pm 10\%$
C IO	Pin Capacitance			10	pF	tosc = 1MHz
V TH	Schmitt Width $\overline{\text{RESET}}$ , $\overline{\text{NMI}}$ , INTO (P87)	0.4	1.0		V	
R KL	Programmable Pull Down Register	10 30		80 150	K $\Omega$	$V_{CC} = 5V \pm 10\%$ $V_{CC} = 3V \pm 10\%$
R KH	Programmable Pull Up Register	50 100		150 300	K $\Omega$	$V_{CC} = 5V \pm 10\%$ $V_{CC} = 3V \pm 10\%$
I <sub>CC</sub>	Operating Current (NORMAL)		16	25	mA	$V_{CC} = 5V \pm 10\%$ fc = 20MHz
	RUN		14	25		
	IDLE2		8.0	15		
	IDLE1		1.0	5		
	Operating Current (NORMAL)		6.0	8	$\mu\text{A}$	$V_{CC} = 3V \pm 10\%$ fc = 10MHz (Typ.: $V_{CC} = 3.0V$ )
	RUN		5.0	7		
	IDLE2		3.0	4		
	IDLE1		0.4	1.1		
	Operating Current (SLOW)		30	35	$\mu\text{A}$	$V_{CC} = 3V \pm 10\%$ fs = 32.768kHz (Typ.: $V_{CC} = 3.0V$ )
	RUN		28	30		
	IDLE2		20	20		
	IDLE1		15	15		
	STOP		0.2	10	$\mu\text{A}$	$V_{CC} = 2.7$ to $5.5V$

(note 1) Typical values are for Ta = 25°C and V<sub>CC</sub> = 5V unless otherwise.

(note 3) I-DAR is guaranteed for a total of up to 8 ports.

(note 2) The operation of A/D converter is guaranteed at V<sub>CC</sub> = 5V±10%.

(note 4) The condition of measurement of ICC (Normal/Slow).

Operates only CPU, output ports are open and input ports fixed.

## 4.3 AC Electrical Characteristics

(1)  $V_{CC} = 5V \pm 10\%$ 

No.	Symbol	Parameter	Variable		16MHz		20MHz		Unit
			Min	Max	Min	Max	Min	Max	
1	$t_{OSC}$	Osc. Period (= x)	50	250	62.5		50		ns
2	$t_{CLK}$	CLK width	2x - 40		85		60		ns

High 0.8V<sub>CC</sub> /Low 0.2V<sub>CC</sub> (Except for AD0 ~ AD15)

## (1) Read Cycle

(2) Write Cycle

#### 4.4 A/D Conversion Characteristics

Symbol	Parameter	Min	Typ	Max	Unit
$V_{REF}$	Analog reference voltage	$V_{CC} - 0.2V$	$V_{CC}$	$V_{CC}$	V
$A_{GND}$	Analog reference voltage	$V_{SS}$	$V_{SS}$	$V_{SS} + 0.2V$	
$V_{AIN}$	Analog input voltage range	$V_{SS}$		$V_{CC}$	
$I_{REF}$ ( $V_{REFL} = 0V$ )	Analog current for analog reference voltage $V_{CC} = 5V \pm 10\%$ $\langle V_{REFON} \rangle = 1$		0.5	1.5	mA
	$V_{CC} = 5V \pm 10\%$ $\langle V_{REFON} \rangle = 0$				
Error	$V_{CC} = 5V \pm 10\%$		$\pm 3.0$	$\pm 6$	LSB

#### 4.5 Serial Channel Timing - I/O Interface Mode

##### (1) SCLK Input Mode

Symbol	Parameter	Variable		10MHz		20MHz		Unit
		Min	Max	Min	Max	Min	Max	
$t_{SCY}$	SCLK cycle	16x		1.6		0.8		$\mu s$
$t_{OSS}$	Output Data→rising edge of SCLK	$t_{SCY}/2 - 5x - 50$		250		100		ns
$t_{OHS}$	SCLK rising edge→output data hold	$5x - 100$		400		150		ns
$t_{HSR}$	SCLK rising edge→input data hold	0		0		0		ns
$t_{SRD}$	SCLK rising edge→effective data input		$t_{SCY} - 5x - 100$		1000		450	ns

##### (2) SCLK Output Mode

Symbol	Parameter	Variable		10MHz		20MHz		Unit
		Min	Max	Min	Max	Min	Max	
$t_{SCY}$	SCLK cycle (programmable)	16x	8192x	1.6	819.2	0.8	409.6	$\mu s$
$t_{OSS}$	Output Data→rising edge of SCLK	$t_{SCY} - 2x - 150$		1250		550		ns
$t_{OHS}$	SCLK rising edge→output data hold	$2x - 80$		120		20		ns
$t_{HSR}$	SCLK rising edge→input data hold	0		0		0		ns
$t_{SRD}$	SCLK rising edge→effective data input		$t_{SCY} - 2x - 150$		1250		550	ns

#### 4.6 Timer/Counter Input Clock (TI0, TI4, TI5, TI6, TI7)

Symbol	Parameter	Variable		10MHz		20MHz		Unit
		Min	Max	Min	Max	Min	Max	
$t_{VCK}$	Clock cycle	$8x + 100$		900		500		ns
$t_{VCKL}$	Low level clock pulse width	$4x + 40$		440		240		ns
$t_{VCKH}$	High level clock pulse width	$4x + 40$		440		240		ns

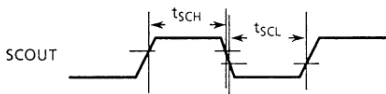

#### 4.7 Interrupt Operation

Symbol	Parameter	Variable		10MHz		20MHz		Unit
		Min	Max	Min	Max	Min	Max	
$t_{INTAL}$	$\overline{NMI}$ , INT0 Low level pulse width	4x		400		200		ns
$t_{INTAH}$	$\overline{NMI}$ , INT0 High level pulse width	4x		400		200		ns
$t_{INTBL}$	INT4 ~ INT7 Low level pulse width	$8x + 100$		900		500		ns
$t_{INTBH}$	INT4 ~ INT7 High level pulse width	$8x + 100$		900		500		ns

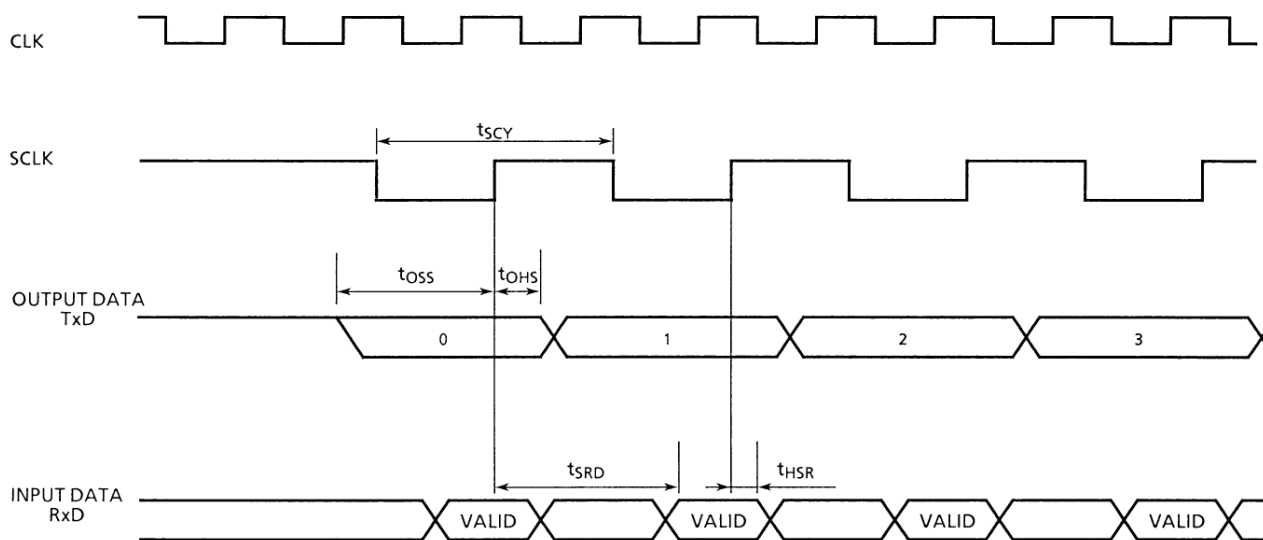

4.8 SCOUT Pin Characteristics

Symbol	Parameter	Variable		10MHz		20MHz		Unit
		Min	Max	Min	Max	Min	Max	
	High level pulse width	5x - 10		40		15		ns
	$V_{CC} = 5V \pm 10\%$							
	$\uparrow$	5x - 20		30		—	—	
	$V_{CC} = 3V \pm 10\%$							
	Low level pulse width	5x - 10		40		15		ns
	$V_{CC} = 5V \pm 10\%$							
	$\uparrow$	5x - 20		30		—	—	
	$V_{CC} = 3V \pm 10\%$							

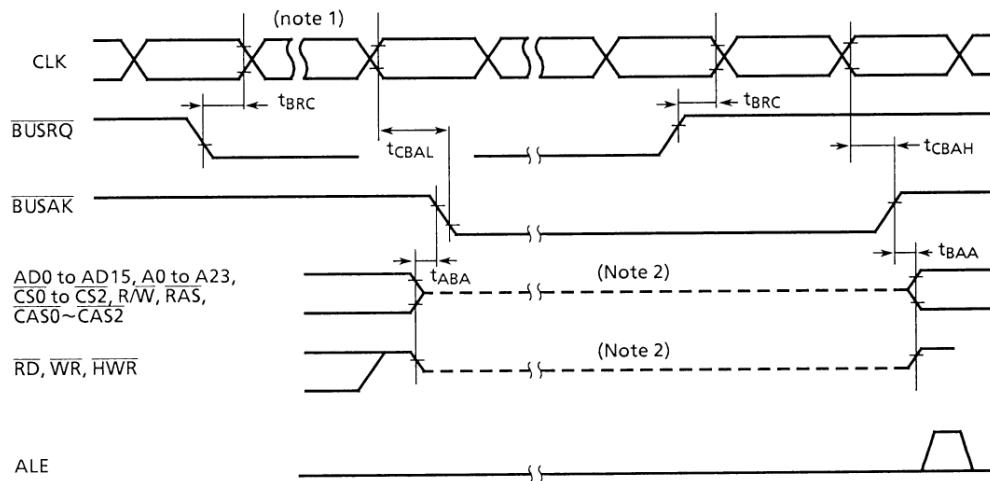

Measurement condition  
● Output level : High 2.2 V / Low 0.8 V, CL = 10 pF

# 4.9 Timing Chart for I/O Interface Mode

#### 4.10 Timing Chart for Bus Request ( $\overline{\text{BUSRQ}}$ )/BUS Acknowledge ( $\overline{\text{BUSAK}}$ )

Symbol	Parameter	Variable		10MHz		20MHz		Unit
		Min	Max	Min	Max	Min	Max	
$t_{\text{BRC}}$	$\overline{\text{BUSRQ}}$ setup time for CLK	120		120		120		ns
$t_{\text{CBAL}}$	CLK→ $\overline{\text{BUSAK}}$ falling edge		$1.5x + 120$		270		195	ns
$t_{\text{CBAH}}$	CLK→ $\overline{\text{BUSAK}}$ rising edge		$0.5x + 40$		90		65	ns
$t_{\text{ABA}}$	Output buffer is off to $\overline{\text{BUSAK}}$	0	80	0	80	0	80	ns
$t_{\text{BAA}}$	$\overline{\text{BUSAK}}$ output buffer is on.	0	80	0	80	0	80	ns

Note 1: The Bus will be released after the  $\overline{\text{WAIT}}$  request is inactive, when the  $\overline{\text{BUSRQ}}$  is set to "0" during "Wait" cycle.

Note 2: This line only shows the output buffer is off-states. They don't indicate the signal levels are fixed. After the bus is released, the signal level is kept dynamically before the bus is released by the external capacitance. Therefore, to fix the signal level by an external resistance under the bus is releasing, the design must be carefully because of the level-fix will be delayed. The internal programmable pull-up/pull-down resistance is switched active by the internal signal.

## 5. Table of Special Function Registers (SFRs)

### (SFR; Special Function Register)

The special function registers (SFRs) include the I/O ports and peripheral control registers allocated to the 128-byte addresses from 000000H to 00007FH.

- (1) I/O port
- (2) I/O port control
- (3) Timer control
- (4) Pattern Generator control
- (5) Watch Dog Timer control
- (6) Serial Channel control
- (7) A/D converter control
- (8) Interrupt control
- (9) Chip Select/Wait Control
- (10) Clock Control

Configuration of the table

Symbol	Name	Address	7	6		1	0	
								→ bit Symbol
								→ Read / Write
								→ Initial value aftrer reset
								→ Remarks

Note: "Prohibit "RMW" in table means that you cannot use RMW instructions to these registers.

(Example) Setting only the bit0 of register P0CR, do not use "Set 0, (0002H)".

Table 5 I/O Register Address Map

ADDRESS	NAME	ADDRESS	NAME	ADDRESS	NAME	ADDRESS	NAME
000000H	P0	20H	TRUN	40H	TREG6L	60H	ADREG04L
1H	P1	21H		41H	TREG6H	61H	ADREG04H

			R/W							
			Input mode							
			0	0	0	0	0	0	0	0
P3	PORT3	07H	P37	P36	P35	P34	P33	P32	P31	P30(note1)
			R/W							
			Input mode							
			Output mode							
P4	PORT4	0CH	1	1	1	1	1	1	1	1
			P42							
			P41							
			P40							
P5	PORT5	0DH	R/W							
			Input mode							
			0	1	1					
			P57	P56	P55	P54	P53	P52	P51	P50
P6	PORT6	12H	R							
			Input mode							
			P67	P66	P65	P64	P63	P62	P61	P60
			R/W							
P7	PORT7	13H	Input mode							
			1	1	1	1	1	1	1	1
			P73							
			P72							
P8	PORT8	18H	P71							
			P70							
			R/W							
			Input mode							
P9	PORT9 (note2)	19H	1							
			1							
			1							
			1							
PA	PORTA	1EH	P87	P86	P85	P84	P83	P82	P81	P80
			R/W							
			Input mode							
			1	1	1	1	1	1	1	1
P9	PORT9 (note2)	19H	P97	P96	P95	P94	P93	P92	P91	P90
			R/W	R/W	R/W					
			Output mode	Output mode	Input mode					
			1	1	1	1	1	1	1	1
PA	PORTA	1EH	PA7	PA6	PA5	PA4	PA3	PA2	PA1	PA0
			R/W							
			Input mode							
			1							

Note1 : When P30 pin is defined as  $\overline{RD}$  signal output mode (P30F = 1), clearing the output latch register P30 to "0" outputs the  $\overline{RD}$  strobe from P30 pin for PSRAM, even when the internal address is accessed. If the output latch register P30 remains "1", the  $\overline{RD}$  strobe is output only when the external address is accessed.

Note2 : Port96, 97 is also used as XT1, XT2. Therefore these pins are open drain output type.

Read / Write

R/W ; Either read or write is possible

R ; Only read is possible

W ; Only write is possible

Prohibit RMW ; Prohibit Read Modify Write. (Prohibit RES / SET / TSET / CHG / STCF / ANDCF / ORCF / XORCF Instruction)

## (2) I/O Port Control (1/2)

Symbol	Name	Address	7	6	5	4	3	2	1	0
P0CR	PORT0 Control (Prohibit RMW)	02H (Prohibit RMW)	P07C	P06C	P05C	P04C	P03C	P02C	P01C	P00C
			W							
			0	0	0	0	0	0	0	0
			0 : IN 1 : OUT (When external access, set as AD7-0 and cleared to "0".)							
P1CR	PORT1 Control (Prohibit RMW)	04H (Prohibit RMW)	P17C	P16C	P15C	P14C	P13C	P12C	P11C	P10C
			W							
			0	0	0	0	0	0	0	0
			<<Refer to the "P1FC" >>							
P1FC	PORT1 Function (Prohibit RMW)	05H (Prohibit RMW)	P17F	P16F	P15F	P14F	P13F	P12F	P11F	P10F
			W							
			0	0	0	0	0	0	0	0
			P1FC/P1CR = 00 : IN, 01 : OUT, 10 : AD15-8, 11 : A15-8							
P2CR	PORT2 Control (Prohibit RMW)	08H (Prohibit RMW)	P27C	P26C	P25C	P24C	P23C	P22C	P21C	P20C
			W							
			0	0	0	0	0	0	0	0
			<<Refer to the "P2FC" >>							
P2FC	PORT2 Function (Prohibit RMW)	09H (Prohibit RMW)	P27F	P26F	P25F	P24F	P23F	P22F	P21F	P20F
			W							
			0	0	0	0	0	0	0	0
			P2FC/P2CR = 00 : IN, 01 : OUT, 10 : A7-0, 11 : A23-16							
P3CR	PORT3 Control (Prohibit RMW)	0AH (Prohibit RMW)	P37C	P36C	P35C	P34C	P33C	P32C		
			W							
			0	0	0	0	0	0		
			0 : IN 1 : OUT							
P3FC	PORT3 Function (Prohibit RMW)	0BH (Prohibit RMW)	P37F	P36F	P35F	P34F		P32F	P31F	P30F
			W							
			0	0	0	0		0	0	0
			0 : PORT 1 : RA $\overline{S}$	0 : PORT 1 : R/W	0 : PORT 1 : BUSAK	0 : PORT 1 : BUSRQ		0 : PORT 1 : HWR	0 : PORT 1 : WR	0 : PORT 1 : RD
P4CR	PORT4 Control (Prohibit RMW)	0EH (Prohibit RMW)						P42C	P41C	P40C
			W							
								0	0	0
			0 : IN 1 : OUT							
P4FC	PORT4 Function (Prohibit RMW)	10H (Prohibit RMW)						P42F	P41F	P40F
			W							
								0	0	0
			0 : PORT 1 : CS/CAS							

Note : With the TMP93CM41, which requires an external ROM, PORT0 functions as AD0 to AD7; PORT1, AD8 to AD15 or A8 to A15; P30, the  $\overline{RD}$  signal; P31, the  $\overline{WR}$  signal, regardless of the values set in P0CR, P1CR, P1FC, P30F and P31F.

(2) I/O Port Control (2/2)

Symbol	Name	Address	7	6	5	4	3	2	1	0

Note 1 : After reset, only “Block 2” is set to enable.

## (10) Clock Control

Symbol	Name	Address	7	6	5	4	3	2	1	0
CKOCR	Clock Output Control Register	006DH					SCOSEL	SCOEN	ALEEN	CLKEN
							R/W			
							0	0	0/1 note1)	0/1 note1)
							SCOUT select 0 : $f_{SYS} \times 2$ clock 1 : $f_{SYS}$ clock	SCOUT Output control 0 : I/O port 1 : SCOUT output	ALE pin control 0 : HZ output 1 : ALE output	CLK pin control 0 : HZ output 1 : CLK output
SYSCR0	System Clock Control Register 0	006EH	XEN	XTEN	RXEN	RXTEN	RSYSCK	WUEF	PRCK1	PRCK0
			R/W							
			1	0	1	0	0	0	0	0
			High Frequency oscillator (fc) 0 : stop 1 : oscillation	Low Frequency oscillator (fs) 0 : stop 1 : oscillation	High Frequency oscillator (fc) after released STOP mode 0 : stop 1 : oscillation	Low Frequency oscillator (fs) after released STOP mode 0 : stop 1 : oscillation	select clock after released STOP mode 0 : fc 1 : fs	Warming Up Timer 0 write : don't care 1 write : start timer 0 read : end warming up 1 read : not end warming up	select prescaler clock 00 : $f_{FPH}$ 01 : fs 10 : fc/16 11 : (reserved)	
SYSCR1	System Clock Control Register 1	006FH					SYSCCK	GEAR2	GEAR1	GEAR0
							R/W			
							0	1	0	0
							select system clock 0 : fc 1 : fs note2)	select gear value of high frequency (fc) 000 : fc 001 : fc/2 010 : fc/4 011 : fc/8 100 : fc/16 101 : (reserved) 110 : (reserved) 111 : (reserved)		

(note 1) The value after reset of <CLKEN>, <ALEEN> is following :

TMP93CM40 : "0" (High impedance output)

TMP93CM41 : "1" (CLK or ALE output)

But during reset, CLK pin is pulled up internally regardless of the products.

(note2) The high frequency oscillator will be enabled regardless the value of SYSCR0<XEN> when SYSCR1<SYSCCK> is set to "0".

On the other hand, the low frequency oscillator will be enabled regardless the value of SYSCR0<XTEN> when SYSCR1<SYSCCK> is set to "1".

## 6. Port Section Equivalent Circuit Diagram

- Reading The Circuit Diagram

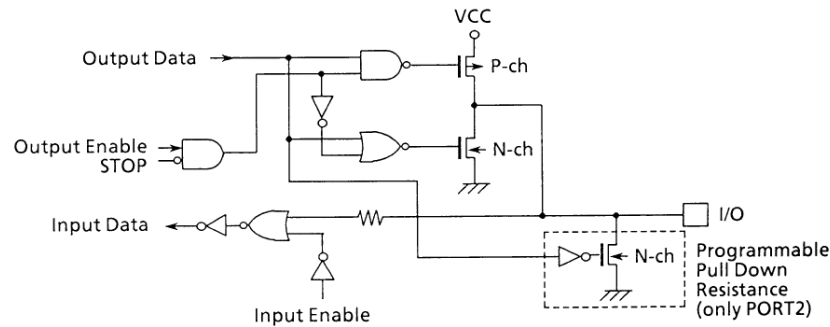

Basically, the gate singles written are the same as those used for the standard CMOS logic IC [74HCXX] series.

The dedicated signal is described below.

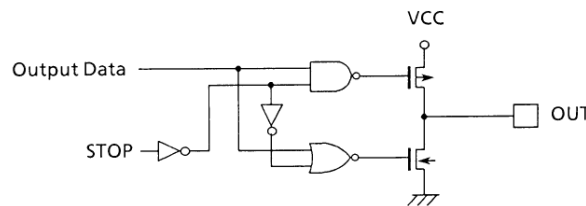

STOP: This signal becomes active "1" when the hold mode setting register is set to the STOP mode and the CPU executes the HALT instruction. When the drive enable bit [DRIVE] is set to "1", however, STP remains at "0".

- The input protection resistor ranges from several tens of ohms to several hundreds of ohms.

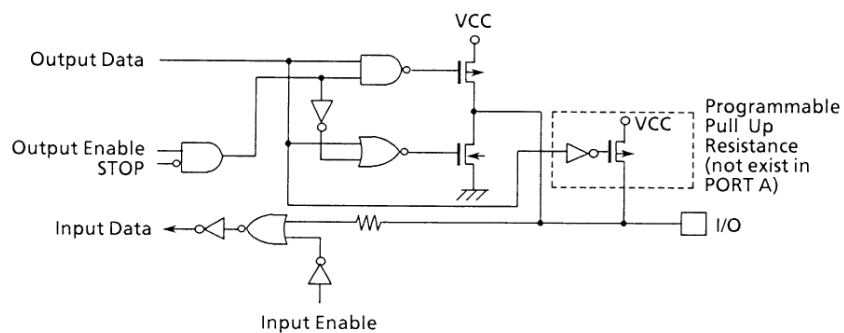

- PO (AD0 to AD7), P1 (AD8 to 15, A8 to 15), P2 (A16 to 23, A0 to 7)

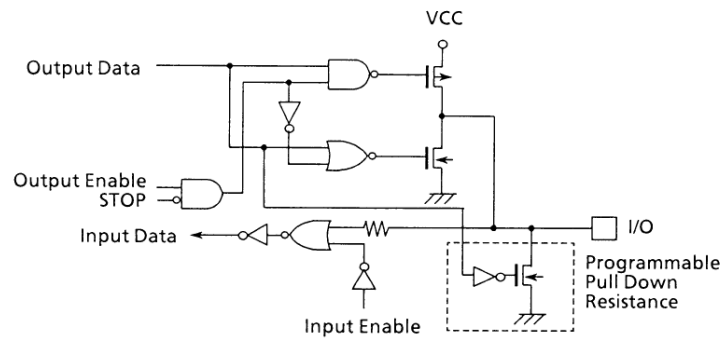

- P30 ( $\overline{\text{RD}}$ ), P31 ( $\overline{\text{WR}}$ )

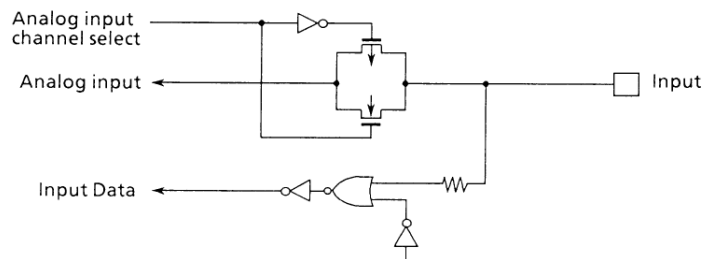

- P32 to 37, P40 to 41, P6, P7, P80 to 86, P91 to 92, P94 to 95, PA

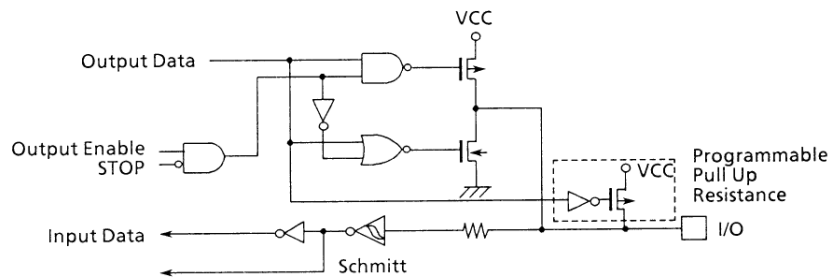

- P42 ( $\overline{\text{CS2}}$ ,  $\overline{\text{CAS2}}$ )

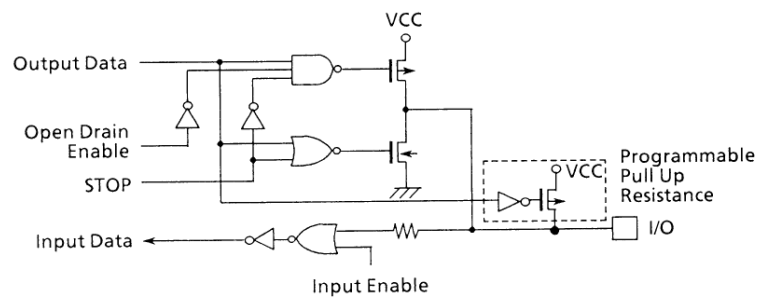

- P5 (AN0 to 7)

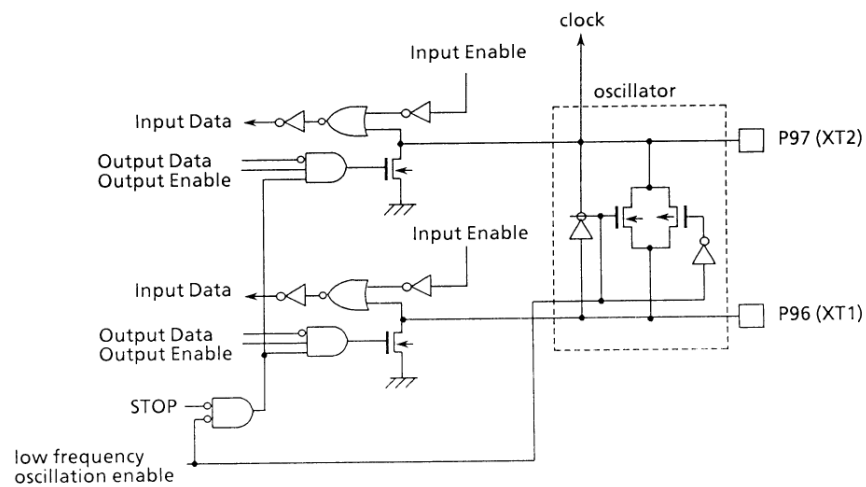

- P87 (INT0)

- P90 (TXD0), P93 (TXD1)

- P96 (XT1), P97 (XT2)

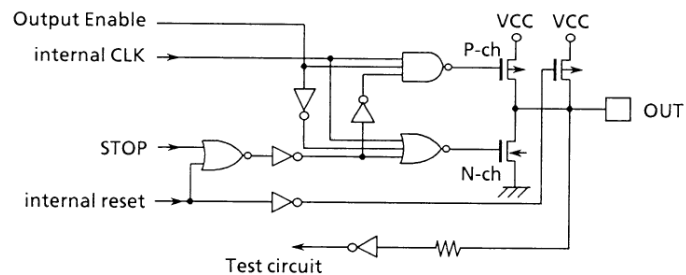

- $\overline{\text{NMI}}$

- $\overline{\text{WDTOUT}}$

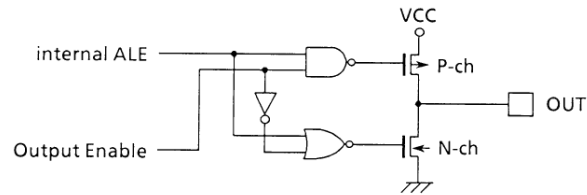

- CLK

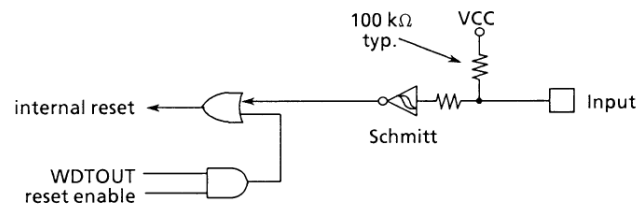

- $\overline{\text{EA}}$ , AM8/16

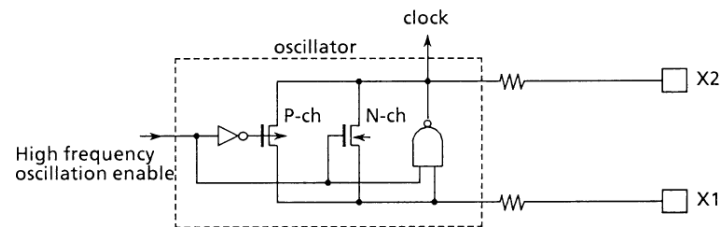

- ALE

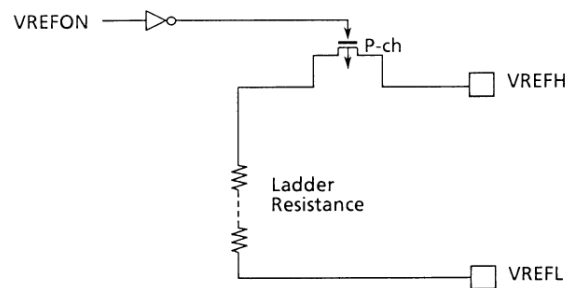

- $\overline{\text{RESET}}$

- X1, X2

- VREF, AGND

## 7. Care Points and Restriction

### (1) Special Expression

#### ① Explanation of a built-in I/O register: Register

Symbol <Bit Symbol>

ex) TRUN <TORUN> ... Bit TORUN of Register TRUN

#### ② Read, Modify and Write Instruction

An instruction which CPU executes following by one instruction.

1. CPU reads data of the memory.

2. CPU modifies the data.

3. CPU writes the data to the same memory.

ex1) SET 3, (TRUN) ... set bit3 of TRUN

ex2) INC1, (100H) increment the data of 100H

- The representative Read, Modify and Write Instruction in the TLCS-900

SET	imm, mem,	RES	imm, mem
CHG	imm, mem,	TSET	imm, mem
INC	imm, mem,	DEC	imm, mem
RLD	A, mem,	ADD	imm, reg

#### ③ 1 state

1 cycle clock divided by 2 oscillation frequency is called 1 state

ex) The case of oscillation frequency is 20MHz.

### (2) Care Points

#### ① $\overline{EA}$ , AM8/16 pin

Fix these pins VCC or GND unless changing voltage.

#### ② TEST2, TEST2 pin

Connect TEST1 pin with TEST2 pin.

#### ③ Reserved Area in Memory Space

The 256 byte memory area for FFFF00H to FFFFFFFH cannot be used because it is a reserved area.

#### ④ Standby Mode (IDLE1)

When IDLE1 mode (operates only as an oscillator) is used, set TRUN <PRRUN> to "0" to stop prescaler before "HALT" instruction is executed.

#### ⑤ Warming-up Counter

The warming-up counter operates when the STOP mode. is released even the system which is used an external oscillator. As a result, it takes warming up time from inputting the releasing request to outputting the system clock.

#### ⑥ High Speed $\mu$ DMA (DRAM refresh mode)

When the bus is released ( $\overline{BUSA\overline{K}}$  = "0") for waiting to accept the interrupt, DRAM refresh is not performed because of the high speed  $\mu$ DMA is generated by an interrupt.

#### ⑦ Programmable Pull Up/Down Resistance

The programmable pull up/down resistors can be selected ON/OFF by program when they are used as the input ports. The case of they are used as the output ports, they cannot be selected ON/OFF by program.

#### ⑧ Bus Releasing Function

Refer to the "Note about the Bus Release" in 3.5 Functions of Ports because the pin state when the bus is released is written.

#### ⑨ Watch Dog Timer

The watch dog timer starts operation immediately after the reset is released. When the watch dog timer is not used, set watch dog timer to disable.

#### ⑩ Watch Dog Timer

When the bus is released, both internal memory and internal I/O cannot be accessed. But internal I/O continues to operate. So, the watch dog timer continues to run. Therefore, be careful with the bus releasing time and set the detection timer of watch dog timer.

**⑪ A/D Converter**

The ladder resistor between CREFH and VREFL pins can be cut by program to reduce the power consumption. When the standby mode is used, cut by program before "HALT" instruction is used.

**⑫ CPU (High Speed $\mu$ DMA)**

Only the "LDC cr, r", "LDC r, cr" instruction can be used to access the control register like transfer source address register (DMASn) in the CPU.

## 8. TMP93XX40/41 Different Points

	93CM40F	93CM41F	93CM40AF	93CM41AF	93CS40F	93PS40F
