

# **±15kV ESD-Protected, ±80V Fault-Protected, Fail-Safe RS-485/J1708 Transceivers**

## **General Description**

The MAX13442E/MAX13444E are fault-protected RS-485 and J1708 transceivers that feature ±80V protection from signal faults on communication bus lines. The MAX13442E/MAX13444E feature a reduced slew-rate driver that minimizes EMI and reflections, allowing error-free transmission up to 250kbps. The MAX13443E driver can transmit up to 10Mbps. The high-speed MAX13443E RS-485 transceiver features ±60V protection from signal faults on communication bus lines. These transceivers feature foldback current limit. Each device contains one differential line driver with three-state output and one differential line receiver with three-state input. The 1/4-unit-load receiver input impedance allows up to 128 transceivers on a single bus. The devices operate from a 5V supply. True fail-safe inputs guarantee a logic-high receiver output when the receiver inputs are open, shorted, or connected to an idle data line.

Hot-swap circuitry eliminates false transitions on the data bus during circuit initialization or connection to a live backplane. Short-circuit current-limiting and thermal-shutdown circuitry protect the driver against excessive power dissipation, and on-chip ±15kV ESD protection eliminates costly external protection devices.

The MAX13442E/MAX13443E/MAX13444E are available in an 8-pin SO package and are specified over the automotive temperature range.

## **Applications**

RS-422/RS-485 Communications	Telecommunications Systems
Truck and Trailer Applications	Automotive Applications
Industrial Networks	HVAC Controls

## **Features**

- ◆ ±15kV ESD Protection
- ◆ ±80V Fault Protection (±60V MAX13443E)
- ◆ Guaranteed 10Mbps Data Rate (MAX13443E)
- ◆ Hot-Swappable for Telecom Applications
- ◆ True Fail-Safe Receiver Inputs
- ◆ Enhanced Slew-Rate-Limiting Facilitates Error-Free Data Transmission (MAX13442E/MAX13444E)
- ◆ Allow Up to 128 Transceivers on the Bus
- ◆ -7V to +12V Common-Mode Input Range
- ◆ ±6mA FoldBack Current Limit
- ◆ Industry-Standard Pinout

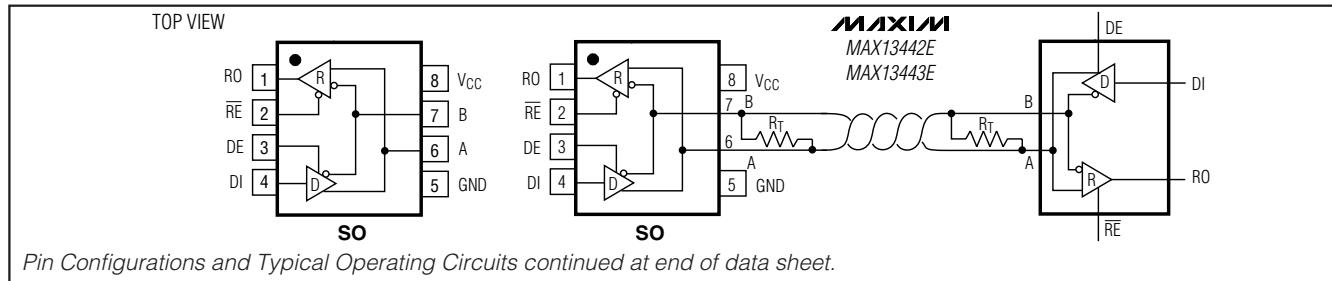

## **Ordering Information**

PART	TEMP RANGE	PIN-PACKAGE	PKG CODE
MAX13442EASA	-40°C to +125°C	8 SO	S8-4
MAX13443EASA	-40°C to +125°C	8 SO	S8-4
MAX13444EASA	-40°C to +125°C	8 SO	S8-4

## **Selector Guide**

PART	TYPE	DATA RATE (Mbps)	FAULT PROTECTION (V)	LOW-POWER SHUTDOWN	RECEIVER/DRIVER ENABLE	TRANSCEIVERS ON BUS	HOT SWAP
MAX13442E	RS-485	0.25	±80	Yes	Yes	128	Yes
MAX13443E	RS-485	10	±60	Yes	Yes	128	Yes
MAX13444E	J1708	0.25	±80	Yes	Yes	128	Yes (only $\bar{RE}$ )

## **Pin Configurations and Typical Operating Circuits**

Pin Configurations and Typical Operating Circuits continued at end of data sheet.

# **±15kV ESD-Protected, ±80V Fault-Protected, Fail-Safe RS-485/J1708 Transceivers**

## **ABSOLUTE MAXIMUM RATINGS**

(Voltages referenced to GND.)

V <sub>CC</sub> .....	+7V
R <sub>E</sub> , D <sub>E</sub> , D <sub>I</sub> , T <sub>XD</sub> .....	-0.3V to (V <sub>CC</sub> + 0.3V)
A, B (Note 1) (MAX13442E/MAX13444E) .....	±80V
A, B (Note 1) (MAX13443E) .....	±60V
R <sub>O</sub> .....	-0.3V to (V <sub>CC</sub> + 0.3V)
Short-Circuit Duration (R <sub>O</sub> , A, B) .....	Continuous

Continuous Power Dissipation (T<sub>A</sub> = +70°C)

8-Pin SO (derate 5.9mW/°C above +70°C) .....	471mW
Operating Temperature Range .....	-40°C to +125°C
Storage Temperature Range .....	-65°C to +150°C
Junction Temperature .....	+150°C
Lead Temperature (soldering, 10s) .....	+300°C

**Note 1:** During normal operation, a termination resistor must be connected between A and B in order to guarantee overvoltage protection up to the absolute maximum rating of this device. When not in operation, these devices can withstand fault voltages up to the maximum rating without a termination resistor and will not be damaged.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## **DC ELECTRICAL CHARACTERISTICS**

(V<sub>CC</sub> = +4.75V to +5.25V, T<sub>A</sub> = T<sub>MIN</sub> to T<sub>MAX</sub>, unless otherwise noted. Typical values are at V<sub>CC</sub> = +5V and T<sub>A</sub> = +25°C.)

## **Detailed Description**

The MAX13442E/MAX13443E/MAX13444E fault-protected transceivers for RS-485/RS-422 and J1708 communication contain one driver and one receiver. These devices feature fail-safe circuitry, which guarantees a logic-high receiver output when the receiver inputs are open or shorted, or when they are connected to a terminated transmission line with all drivers disabled (see the *True Fail-Safe* section). All devices have a hot-swap input structure that prevents disturbances on the differential signal lines when a circuit board is plugged into a hot backplane (see the *Hot-Swap Capability* section). The MAX13442E/MAX13444E feature a reduced slew-rate driver that minimizes EMI and reduces reflections caused by improperly terminated cables, allowing error-free data transmission up to 250kbps (see the *Reduced EMI and Reflections* section). The MAX13443E driver is not slew-rate limited, allowing transmit speeds up to 10Mbps.

### **Driver**

The driver accepts a single-ended, logic-level input (DI) and transfers it to a differential, RS-485/RS-422 level output (A and B). Deasserting the driver enable places the driver outputs (A and B) into a high-impedance state.

### **Receiver**

The receiver accepts a differential, RS-485/RS-422 level input (A and B), and transfers it to a single-ended, logic-level output (RO). Deasserting the receiver enable places the receiver inputs (A and B) into a high-impedance state (see Tables 1–4).

### **Low-Power Shutdown**

The MAX13442E/MAX13443E/MAX13444E offer a low-power shutdown mode. Force DE low and  $\overline{\text{RE}}$  high to shut down the MAX13442E/MAX13443E. Force  $\overline{\text{DE}}$  and  $\overline{\text{RE}}$  high to shut down the MAX13444E. A time delay of 50ns prevents the device from accidentally entering shutdown due to logic skews when switching between transmit and receive modes. Holding DE low and  $\overline{\text{RE}}$  high for at least 800ns guarantees that the MAX13442E/MAX13443E enter shutdown. In shutdown, the devices consume a maximum 20 $\mu\text{A}$  supply current.

### **$\pm 80\text{V}$ Fault Protection**

The driver outputs/receiver inputs of RS-485 devices in industrial network applications often experience voltage faults resulting from shorts to the power grid that exceed the -7V to +12V range specified in the EIA/TIA-485 standard. In these applications, ordinary RS-485 devices (typical absolute maximum -8V to +12.5V) require costly external protection devices. To reduce system complexity and eliminate this need for external protection, the dri-

ver outputs/receiver inputs of the MAX13442E/MAX13444E withstand voltage faults up to  $\pm 80\text{V}$  ( $\pm 60\text{V}$  for the MAX13443E) with respect to ground without damage. Protection is guaranteed regardless whether the device is active, shut down, or without power.

### **True Fail-Safe**

The MAX13442E/MAX13443E/MAX13444E use a -50mV to -200mV differential input threshold to ensure true fail-safe receiver inputs. This threshold guarantees the receiver outputs a logic high for shorted, open, or idle data lines. The -50mV to -200mV threshold complies with the  $\pm 200\text{mV}$  threshold EIA/TIA-485 standard.

### **$\pm 15\text{kV}$ ESD Protection**

As with all Maxim devices, ESD-protection structures are incorporated on all pins to protect against ESD encountered during handling and assembly. The MAX13442E/MAX13443E/MAX13444E receiver inputs/driver outputs (A, B) have extra protection against static electricity found in normal operation. Maxim's engineers have developed state-of-the-art structures to protect these pins against  $\pm 15\text{kV}$  ESD without damage. After an ESD event, the MAX13442E/MAX13443E/MAX13444E continue working without latchup.

ESD protection can be tested in several ways. The receiver inputs are characterized for protection to  $\pm 15\text{kV}$  using the Human Body Model.

### **ESD Test Conditions**

ESD performance depends on a number of conditions. Contact Maxim for a reliability report that documents test setup, methodology, and results.

### **Human Body Model**

Figure 9a shows the Human Body Model, and Figure 9b shows the current waveform it generates when discharged into a low impedance. This model consists of a 100pF capacitor charged to the ESD voltage of interest, which is then discharged into the device through a 1.5k $\Omega$  resistor.

### **Driver Output Protection**

Two mechanisms prevent excessive output current and power dissipation caused by faults or bus contention. The first, a foldback current limit on the driver output stage, provides immediate protection against short circuits over the whole common-mode voltage range. The second, a thermal shutdown circuit, forces the driver outputs into a high-impedance state if the die temperature exceeds +160°C. Normal operation resumes when the die temperature cools to +140°C, resulting in a pulsed output during continuous short-circuit conditions.

## **Hot-Swap Capability**

### **Hot-Swap Inputs**

Inserting circuit boards into a hot, or powered, backplane may cause voltage transients on DE,  $\overline{RE}$ , and receiver inputs A and B that can lead to data errors. For example, upon initial circuit board insertion, the processor undergoes a power-up sequence. During this period, the high-impedance state of the output drivers makes them unable to drive the MAX13442E/MAX13443E/MAX13444E enable inputs to a defined logic level. Meanwhile, leakage currents of up to  $10\mu A$  from the high-impedance output, or capacitively coupled noise from  $V_{CC}$  or GND, could cause an input to drift to an incorrect logic state. To prevent such a condition from occurring, the MAX13442E/MAX13443E/MAX13444E feature hot-swap input circuitry on DE, and  $\overline{RE}$  to guard against unwanted driver activation during hot-swap situations. The MAX13444E has hot-swap input circuitry only on  $\overline{RE}$ . When  $V_{CC}$  rises, an internal pulldown (or pullup for  $\overline{RE}$ ) circuit holds DE low for at least  $10\mu s$ , and until the current into DE exceeds  $200\mu A$ . After the initial power-up sequence, the pulldown circuit becomes transparent, resetting the hot-swap tolerable input.

### **Hot-Swap Input Circuitry**

At the driver-enable input (DE), there are two NMOS devices, M1 and M2 (Figure 10). When  $V_{CC}$  ramps from zero, an internal  $15\mu s$  timer turns on M2 and sets the SR latch, which also turns on M1. Transistors M2, a  $2mA$  current sink, and M1, a  $100\mu A$  current sink, pull DE to GND through a  $5.6k\Omega$  resistor. M2 pulls DE to the disabled state against an external parasitic capacitance up to  $100pF$  that may drive DE high. After  $15\mu s$ , the timer deactivates M2 while M1 remains on, holding DE low against tri-state leakage currents that may drive DE high. M1 remains on until an external current source overcomes the required input current. At this time, the SR latch resets M1 and turns off. When M1 turns off, DE reverts to a standard, high-impedance CMOS input. Whenever  $V_{CC}$  drops below  $1V$ , the input is reset.

A complementary circuit for  $\overline{RE}$  uses two PMOS devices to pull  $\overline{RE}$  to  $V_{CC}$ .

## **Applications Information**

### **128 Transceivers on the Bus**

The MAX13442E/MAX13443E/MAX13444E transceivers 1/4-unit-load receiver input impedance ( $48\text{k}\Omega$ ) allows up to 128 transceivers connected in parallel on one communication line. Connect any combination of these devices, and/or other RS-485 devices, for a maximum of 32-unit loads to the line.

### **Reduced EMI and Reflections**

The MAX13442E/MAX13444E are slew-rate limited, minimizing EMI and reducing reflections caused by improperly terminated cables. Figure 11 shows the driver output waveform and its Fourier analysis of a 125kHz signal transmitted by a MAX13443E. High-frequency harmonic components with large amplitudes are evident.

Figure 12 shows the same signal displayed for the MAX13442E transmitting under the same conditions. Figure 12's high-frequency harmonic components are much lower in amplitude, compared with Figure 11's, and the potential for EMI is significantly reduced.

In general, a transmitter's rise time relates directly to the length of an unterminated stub, which can be driven with only minor waveform reflections. The following equation expresses this relationship conservatively:

$$\text{length} = \text{tRISE} / (10 \times 1.5\text{ns/ft})$$

where tRISE is the transmitter's rise time.

For example, the MAX13442E's rise time is typically 800ns, which results in excellent waveforms with a stub length up to 53ft. A system can work well with longer unterminated stubs, even with severe reflections, if the waveform settles out before the UART samples them.

### **RS-485 Applications**

The MAX13442E/MAX13443E/MAX13444E transceivers provide bidirectional data communications on multi-point bus transmission lines. Figure 13 shows a typical network application circuit. The RS-485 standard covers line lengths up to 4000ft. To minimize reflections and reduce data errors, terminate the signal line at both ends in its characteristic impedance, and keep stub lengths off the main line as short as possible.

## **J1708 Applications**

The MAX13444E is designed for J1708 applications. To configure the MAX13444E, connect  $\overline{DE}$  and  $\overline{RE}$  to GND. Connect the signal to be transmitted to TXD. Terminate the bus with the load circuit as shown in Figure 14. The drivers used by SAE J1708 are used in a dominant-mode application.  $\overline{DE}$  is active low; a high input on  $\overline{DE}$  places the outputs in high impedance. When the driver is disabled (TXD high or  $\overline{DE}$  high), the bus is pulled high by external bias resistors R1 and R2. Therefore, a logic-level high is encoded as recessive. When all transceivers are

idle in this configuration, all receivers output logic high because of the pullup resistor on A and pulldown resistor on B. R1 and R2 provide the bias for the recessive state. C1 and C2 combine to form a lowpass filter, effective for reducing FM interference. R2, C1, R4, and C2 combine to form a 1.6MHz lowpass filter, effective for reducing AM interference. Because the bus is unterminated, at high frequencies, R3 and R4 perform a pseudoterminalization. This makes the implementation more flexible, as no specific termination nodes are required at the ends of the bus.
