Precision
LOGARITHMIC AND LOG RATIO AMPLIFIER

FEATURES

● **EASY-TO-USE COMPLETE CORE FUNCTION**
● **HIGH ACCURACY: 0.01% FSO Over 5 Decades**
● **WIDE INPUT DYNAMIC RANGE:**
  7.5 Decades, 100pA to 3.5mA
● **LOW QUIESCENT CURRENT: 1mA**
● **WIDE SUPPLY RANGE: ±4.5V to ±18V**

APPLICATIONS

● **LOG, LOG RATIO COMPUTATION:**
  Communication, Analytical, Medical, Industrial,
  Test, General Instrumentation
● **PHOTODIODE SIGNAL COMPRESSION AMP**
● **ANALOG SIGNAL COMPRESSION IN FRONT**
  OF ANALOG-TO-DIGITAL(A/D) CONVERTER
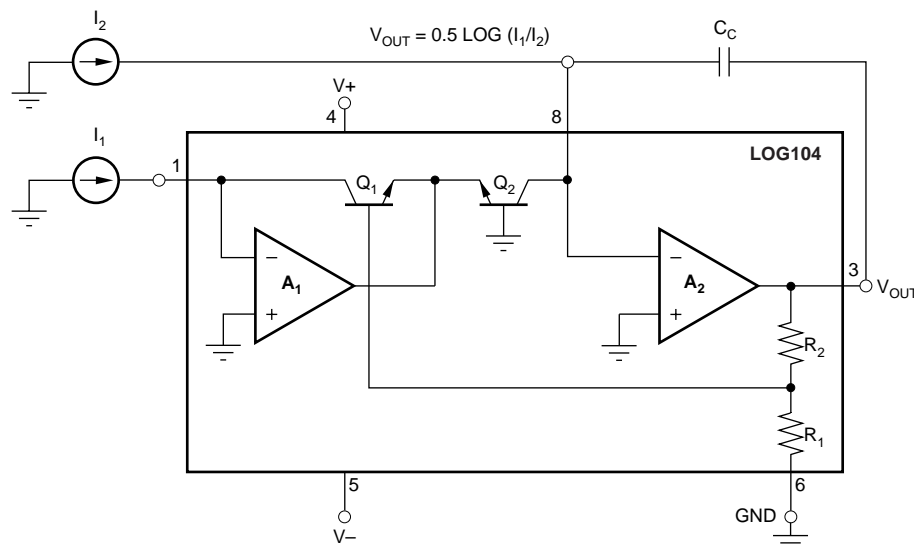

DESCRIPTION

The LOG104 is a versatile integrated circuit that computes the logarithm or log ratio of an input current relative to a reference current.

The LOG104 is tested over a wide dynamic range of input signals. In log ratio applications, a signal current can come from a photodiode, and a reference current from a resistor in series with a precision external reference.

The output signal at V_{OUT} is trimmed to 0.5V per decade of input current, allowing seven decades of input current, dynamic range.

Low DC offset voltage and temperature drift allow accurate measurement of low-level signals over a wide environmental temperature range. The LOG104 is specified over the temperature range –5°C to +75°C, with operation over –40°C to +85°C.

Note: Protected under US Patent #6,667,650; other patents pending.

$$V_{OUT} = 0.5 \, LOG \, (I_1/I_2)$$

TEXAS INSTRUMENTS

ABSOLUTE MAXIMUM RATINGS[(1)]

Supply Voltage, V+ to V–	36V
Input Voltage	V– (–0.5) to V+ (+0.5V)
Input Current	±10mA
Output Short-Circuit[(2)]	Continuous
Operating Temperature	–40°C to +85°C
Storage Temperature	–55°C to +125°C
Junction Temperature	+150°C
Lead Temperature (soldering, 10s)	+300°C

NOTES: (1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. (2) Short-circuit to ground.
⚠ ELECTROSTATIC DISCHARGE SENSITIVITY

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

LOG CONFORMITY vs INPUT CURRENT

LOG CONFORMITY vs TEMPERATURE

APPLICATION INFORMATION

The LOG104 is a true logarithmic amplifier that uses the base-emitter voltage relationship of bipolar transistors to compute the logarithm, or logarithmic ratio of a current ratio.

Figure 1 shows the basic connections required for operation of the LOG104. In order to reduce the influence of lead inductance of power-supply lines, it is recommended that each supply be bypassed with a 10μF tantalum capacitor in parallel with a 1000pF ceramic capacitor, as shown in Figure 1. Connecting the capacitors as close to the LOG104 as possible will contribute to noise reduction as well.

INPUT CURRENT RANGE

To maintain specified accuracy, the input current range of the LOG104 should be limited from 100pA to 3.5mA. Input currents outside of this range may compromise LOG104 performance. Input currents larger than 3.5mA result in increased nonlinearity. An absolute maximum input current rating of ±10mA is included to prevent excessive power dissipation that may damage the logging transistor.

On ±5V supplies, the total input current ($I_1 + I_2$) is limited to 4.5mA. Due to compliance issues internal to the LOG104, to accommodate larger total input currents, supplies should be increased.

Currents smaller than 100pA will result in increased errors due the input bias currents of op amps A_1 and A_2 (typically 5pA). The input bias currents may be compensated for, as shown in Figure 2. The input stages of the amplifiers have FET inputs, with input bias current doubling every 10°C, which makes the nulling technique shown practical only where the temperature is fairly stable.

FIGURE 1. Basic Connections of the LOG104.

FIGURE 2. Bias Current Nulling.

SETTING THE REFERENCE CURRENT

When the LOG104 is used to compute logarithms, either I_1 or I_2 can be held constant and becomes the reference current to which the other is compared.

V_{OUT} is expressed as:

$$V_{OUT} = (0.5V) \bullet \log (I_1/I_2) \qquad (1)$$

I_{REF} can be derived from an external current source (such as shown in Figure 3), or it may be derived from a voltage source with one or more resistors. When a single resistor is used, the value may be large depending on I_{REF}. If I_{REF} is 10nA and +2.5V is used:

$$R_{REF} = 2.5V/10nA = 250M \qquad (2)$$
FIGURE 3. Temperature Compensated Current Source.

A voltage divider may be used to reduce the value of the resistor (as shown in Figure 4). When using this method, one must consider the possible errors caused by the amplifier's input offset voltage. The input offset voltage of amplifier A_1 has a maximum value of 1.5mV, making V_{REF} a suggested value of 100mV.
FIGURE 4. T Network for Reference Current.

Figure 5 shows a low-level current source using a series resistor. The low offset op-amp reduces the effect of the LOG104's input offset voltage.

FREQUENCY RESPONSE

The frequency response curves seen in the Typical Characteristics Curves are shown for constant DC I_1 and I_2 with a small-signal AC current on one input.

The 3dB frequency response of the LOG104 is a function of the magnitude of the input current levels and of the value of the frequency compensation capacitor. See Typical Characteristic Curve, *3dB Frequency Response* for details.

The transient response of the LOG104 is different for increasing and decreasing signals. This is due to the fact that a log amp is a nonlinear gain element and has different gains

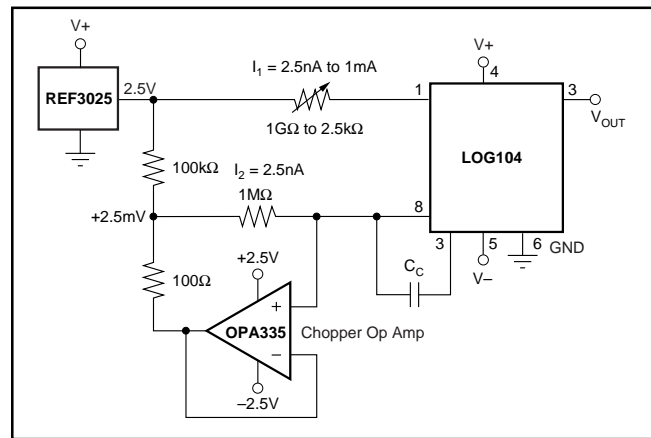

FIGURE 5. Current Source with Offset Compensation.

at different levels of input signals. Smaller input currents require greater gain to maintain full dynamic range, and will slow the frequency response of the LOG104.

FREQUENCY COMPENSATION

Frequency compensation for the LOG104 is obtained by connecting a capacitor between pins 3 and 8. The size of the capacitor is a function of the input currents, as shown in the Typical Characteristic Curves (*Minimum Value of Compensation Capacitor*). For any given application, the smallest value of the capacitor which may be used is determined by the maximum value of I_2 and the minimum value of I_1. Larger values of C_C will make the LOG104 more stable, but will reduce the frequency response.

In an application, highest overall bandwidth can be achieved by detecting the signal level at V_{OUT}, then switching in appropriate values of compensation capacitors.

NEGATIVE INPUT CURRENTS

The LOG104 will function only with positive input currents (conventional current flows into pins 1 and 8). In situations where negative input currents are needed, the circuits in Figures 6, 7, and 8 may be used.

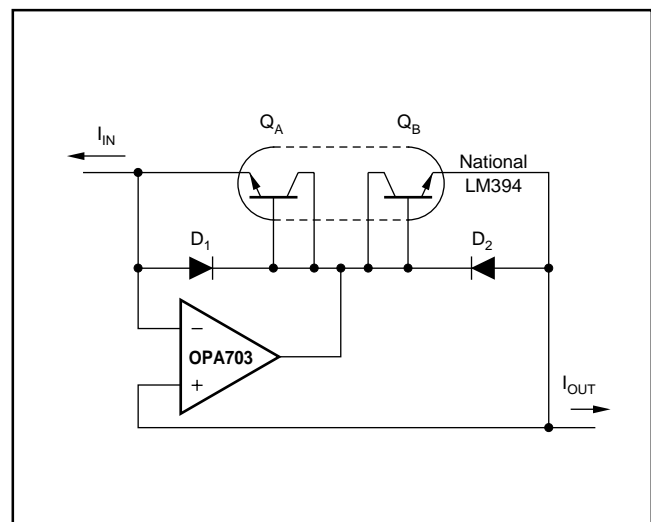

FIGURE 6. Current Inverter/Current Source.

LOG104

SBOS243C

VOLTAGE INPUTS

The LOG104 gives the best performance with current inputs. Voltage inputs may be handled directly with series resistors, but the dynamic input range is limited to approximately three decades of input voltage by voltage noise and offsets. The transfer function of Equation (13) applies to this configuration.

FIGURE 7. Precision Current Inverter/Current Source.

APPLICATION CIRCUITS

LOG RATIO

One of the more common uses of log ratio amplifiers is to measure absorbance. A typical application is shown in Figure 9.

$$\text{Absorbance of the sample is } A = \log\lambda_1{}'/\lambda_1 \qquad (3)$$

$$\text{If } D_1 \text{ and } D_2 \text{ are matched } A \propto (0.5V) \log I_1/I_2 \qquad (4)$$

DATA COMPRESSION

In many applications the compressive effects of the logarithmic transfer function are useful. For example, a LOG104 preceding a 12-bit A/D converter can produce the dynamic range equivalent to a 20-bit converter.
FIGURE 9. Absorbance Measurement.

OPERATION ON SINGLE SUPPLY

Many applications do not have the dual supplies required to operate the LOG104. Figure 10 shows the LOG104 configured for operation with a single +5V supply.

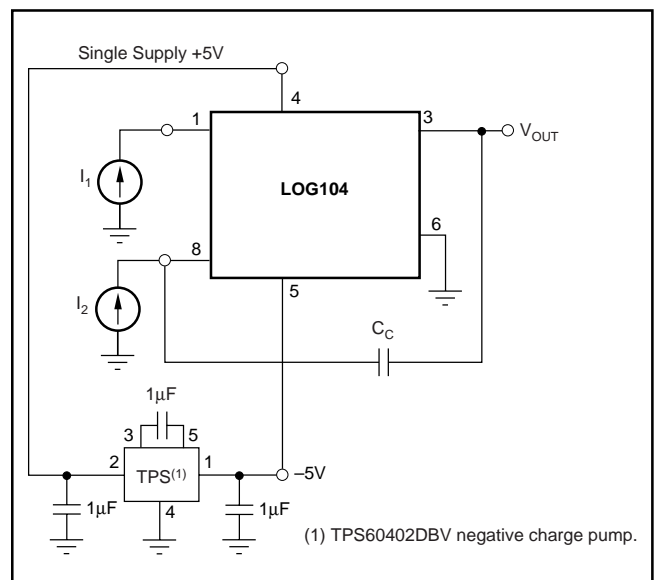

FIGURE 10. Single +5V Power-Supply Operation.

FIGURE 8. Precision Current Inverter/Current Source.

INSIDE THE LOG104

Using the base-emitter voltage relationship of matched bipolar transistors, the LOG104 establishes a logarithmic function of input current ratios. Beginning with the base-emitter voltage defined as:

$$V_{BE} = V_T \ln \frac{I_C}{I_S} \quad where: V_T = \frac{kT}{q} \qquad (1)$$

k = Boltzmann's constant = $1.381 \cdot 10^{-23}$

T = Absolute temperature in degrees Kelvin

q = Electron charge = $1.602 \cdot 10^{-19}$ Coulombs

I_C = Collector current

I_S = Reverse saturation current

From the circuit in Figure 11, we see that:

$$V_L = V_{BE_1} - V_{BE_2} \qquad (2)$$

Substituting (1) into (2) yields:

$$V_L = V_{T_1} \ln \frac{I_1}{I_{S_1}} - V_{T_2} \ln \frac{I_2}{I_{S_2}} \qquad (3)$$

If the transistors are matched and isothermal and $V_{TI} = V_{T2}$, then (3) becomes:

$$V_L = V_{T_1} \left[\ln \frac{I_1}{I_S} - \ln \frac{I_2}{I_S} \right] \qquad (4)$$

$$V_L = V_T \ln \frac{I_1}{I_2} \quad and \; since \qquad (5)$$

$$\ln x = 2.3 \log_{10} x \qquad (6)$$

$$V_L = n \, V_T \log \frac{I_1}{I_2} \qquad (7)$$

where n = 2.3 $\qquad (8)$

also

$$V_{OUT} = V_L \frac{R_1 + R_2}{R_1} \qquad (9)$$

$$V_{OUT} = \frac{R_1 + R_2}{R_1} n \, V_T \log \frac{I_1}{I_2} \qquad (10)$$

or $\qquad V_{OUT} = 0.5V \cdot \log \frac{I_1}{I_2} \qquad (11)$

FIGURE 11. Simplified Model of a Log Amplifier.

DEFINITION OF TERMS

TRANSFER FUNCTION

The ideal transfer function is:

$$V_{OUT} = 0.5V \cdot \log I_1/I_2 \qquad (5)$$

See Figure 12 for the graphical representation of the transfer over valid operating range for the LOG104.

ACCURACY

Accuracy considerations for a log ratio amplifier are somewhat more complicated than for other amplifiers. This is because the transfer function is nonlinear and has two inputs, each of which can vary over a wide dynamic range. The accuracy for any combination of inputs is determined from the total error specification.

FIGURE 13. Transfer Function with Varying I_2 and I_1.

TEXAS INSTRUMENTS
www.ti.com

LOG104

SBOS243C

TOTAL ERROR

The total error is the deviation (expressed in mV) of the actual output from the ideal output of $V_{OUT} = 0.5V \cdot \log(I_1/I_2)$.

Thus,

$$V_{OUT(ACTUAL)} = V_{OUT(IDEAL)} \pm \text{Total Error.} \qquad (6)$$

It represents the sum of all the individual components of error normally associated with the log amp when operated in the current input mode. The worst-case error for any given ratio of I_1/I_2 is the largest of the two errors when I_1 and I_2 are considered separately. Temperature can affect total error.

ERRORS RTO AND RTI

As with any transfer function, errors generated by the function itself may be Referred-to-Output (RTO) or Referred-to-Input (RTI). In this respect, log amps have a unique property:

Given some error voltage at the log amp's output, that error corresponds to a constant percent of the input regardless of the actual input level.

MEASURING AVALANCHE PHOTODIODE CURRENT

The wide dynamic range of the LOG104 is useful for measuring avalanche photodiode current (APD), as shown in Figure 13.

LOG CONFORMITY

For the LOG104, log conformity is calculated the same as linearity and is plotted I_1/I_2 on a semi-log scale. In many applications, log conformity is the most important specification. This is true because bias current errors are negligible (5pA compared to input currents of 100pA and above) and the scale factor and offset errors may be trimmed to zero or removed by system calibration. This leaves log conformity as the major source of error.

Log conformity is defined as the peak deviation from the best fit straight line of the V_{OUT} versus log (I_1/I_2) curve. This is expressed as a percent of ideal full-scale output. Thus, the nonlinearity error expressed in volts over m decades is:

$$V_{OUT\ (NONLIN)} = 0.5V/\text{dec} \cdot 2Nm \text{ V} \qquad (7)$$
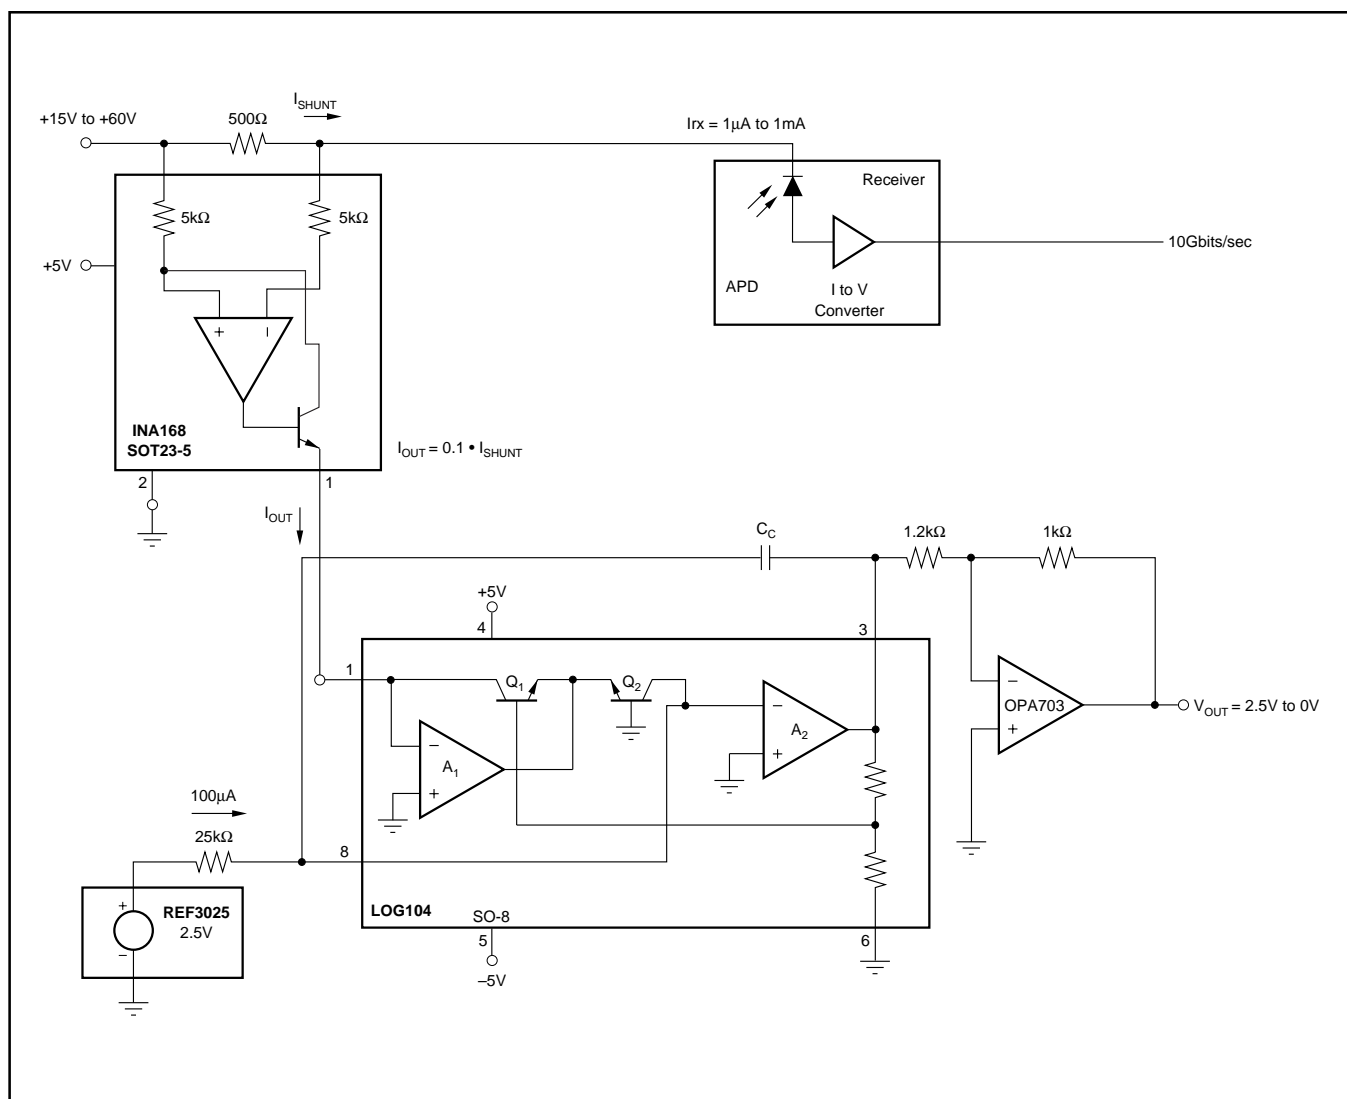

where N is the log conformity error, in percent.

FIGURE 14. High Side Shunt for Avalanche Photodiode (APD) Measures 3-Decades of APD Current.

INDIVIDUAL ERROR COMPONENTS

The ideal transfer function with current input is:

$$V_{OUT} = (0.5V) \bullet \log \frac{I_1}{I_2} \qquad (8)$$

The actual transfer function with the major components of error is:

$$V_{OUT} = (0.5V)(1 \pm \Delta K) \log \frac{I_1 - I_{B1}}{I_2 - I_{B2}} \pm Nm \pm V_{OSO} \qquad (9)$$

The individual component of error is:

ΔK = gain accuracy (0.15%, typ), as specified in specification table.

I_{B1} = bias current of A_1 (5pA, typ)
I_{B2} = bias current of A_2 (5pA, typ)

N = log conformity error (0.01%, 0.06%, typ)

0.01% for n = 5, 0.06% for n = 7.5

V_{OSO} = output offset voltage (3mV, typ)

m = number of decades over which N is specified:

Example: what is the error when

$$I_1 = 1\mu A \text{ and } I_2 = 100nA \qquad (10)$$

$$V_{OUT} = (0.5 \pm 0.0015) \log \frac{10^{-6} - 5 \bullet 10^{-12}}{10^{-7} - 5 \bullet 10^{-12}} \pm (2)(0.0001)5 \pm 3.0mV$$

$$= 0.5055V \qquad (11)$$

Since the ideal output is 0.5V, the error as a percent of reading is

$$\% \text{ error} = \frac{0.5055}{0.5} \bullet 100\% = 1.1\% \qquad (12)$$

For the case of voltage inputs, the actual transfer function is

$$V_{OUT} = (0.5V)(1 \pm \Delta K) \log \frac{\frac{V_1}{R_1} - I_{B_1} \pm \frac{E_{OS_1}}{R_1}}{\frac{V_2}{R_2} - I_{B_2} \pm \frac{E_{OS_2}}{R_2}} \pm Nm \pm V_{OSO} \qquad (13)$$

Where $\frac{E_{OS1}}{R_1}$ and $\frac{E_{OS2}}{R_2}$ are considered to be zero for large values of resistance from external input current sources.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

NOTES: A.   All linear dimensions are in inches (millimeters).
         B.   This drawing is subject to change without notice.
         ⚠C   Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall
              not exceed 0.006 (0,15) each side.
         ⚠D   Body width does not include interlead flash. Interlead flash shall not exceed 0.017 (0,43) each side.
         E.   Reference JEDEC MS−012 variation AA.

4211283−2/E 08/12

NOTES: A. All linear dimensions are in millimeters.
         B. This drawing is subject to change without notice.
         C. Publication IPC−7351 is recommended for alternate designs.
         D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should
             contact their board assembly site for stencil design recommendations. Refer to IPC−7525 for other stencil recommendations.
         E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.
