

Low-Power, Serial, 14-Bit DACs with Force/Sense Voltage Output

General Description

The MAX5171/MAX5173 low-power, serial, voltage-output, 14-bit digital-to-analog converters (DACs) feature a precision output amplifier in a space-saving 16-pin QSOP package. The MAX5171 operates from a +5V single supply, and the MAX5173 operates from a +3V single supply. The output amplifier's inverting input is available to allow specific gain configurations, remote sensing, and high output current capability. This makes the MAX5171/MAX5173 ideal for a wide range of applications, including industrial process control. Both devices draw only 260µA of supply current, which reduces to 1µA in shutdown mode. In addition, the programmable power-up reset feature allows for a user-selectable output voltage of either 0 or midscale.

The 3-wire serial interface is compatible with SPI™, QSPI™, and MICROWIRE™ standards. An input register followed by a DAC register provides a double-buffered input, allowing the input and DAC registers to be updated independently or simultaneously with a 16-bit serial word. Additional features include software and hardware shutdown, shutdown lockout, a hardware clear pin, and a reference input capable of accepting DC and offset AC signals. These devices provide a programmable digital output pin for added functionality and a serial-data output pin for daisy-chaining. All logic inputs are TTL/CMOS-compatible and are internally buffered with Schmitt triggers to allow direct interfacing to optocouplers.

The MAX5171/MAX5173 incorporate a proprietary on-chip circuit that keeps the output voltage virtually "glitch free," limiting the glitches to a few millivolts during power-up.

Both devices are available in 16-pin QSOP packages and are specified for the extended (-40°C to +85°C) temperature range. The MAX5171/MAX5173 are pin-compatible upgrades to the 12-bit MAX5175/MAX5177. For 100% pin-compatible DACs with an internal reference, see the 13-bit MAX5132/MAX5133 and the 12-bit MAX5122/MAX5123 data sheets.

Applications

Digitally Programmable 4–20mA Current Loops
Industrial Process Control
Digital Offset and Gain Adjustment
Motion Control
Automatic Test Equipment (ATE)
Remote Industrial Controls
µP-Controlled Systems

SPI and QSPI are trademarks of Motorola, Inc.

MICROWIRE is a trademark of National Semiconductor Corp.

Rail-to-Rail is a registered trademark of Nippon Motorola, Ltd.

Features

- ♦ **±1 LSB INL**
- ♦ **1µA Shutdown Current**
- ♦ **"Glitch Free" Output Voltage at Power-Up**
- ♦ **Single-Supply Operation: +5V (MAX5171)
+3V (MAX5173)**
- ♦ **Full-Scale Output Range:**
+2.048V (MAX5173, VREF = +1.25V)
+4.096V (MAX5171, VREF = +2.5V)
- ♦ **Rail-to-Rail® Output Amplifier**
- ♦ **Low THD (-80dB) in Multiplying Operation**
- ♦ **SPI/QSPI/MICROWIRE-Compatible 3-Wire
Serial Interface**
- ♦ **Programmable Shutdown Mode and Power-Up
Reset**
- ♦ **Buffered Output Capable of Driving 5kΩ || 100pF
Loads**
- ♦ **User-Programmable Digital Output Pin Allows
Serial Control of External Components**
- ♦ **Pin-Compatible Upgrade to the 12-Bit
MAX5175/MAX5177**

Ordering Information

Pin Description

PIN	NAME	FUNCTION
1	FB	Feedback Input
2	OUT	Voltage Output. High impedance in shutdown. Output voltage is limited to V_{DD} .
3	RS	Reset Mode Select (digital input). Connect to V_{DD} to select midscale reset output value. Connect to DGND to select 0 reset output value.
4	$\overline{PDL}$	Power-Down Lockout (digital input). Connect to V_{DD} to allow shutdown. Connect to DGND to disable shutdown.
5	$\overline{CLR}$	Clear DAC (digital input). Clears the DAC to its predetermined output state as set by RS.
6	$\overline{CS}$	Chip-Select Input (digital input)
7	DIN	Serial-Data Input (digital input). Data is clocked in on the rising edge of SCLK.
8	SCLK	Serial Clock Input (digital input)
9	DGND	Digital Ground
10	DOUT	Serial-Data Output
11	UPO	User-Programmable Output. State is set by serial input.
12	SHDN	Shutdown (digital input). Pulling SHDN high when $\overline{PDL} = V_{DD}$ places the chip in shutdown mode with a maximum shutdown current of $10\mu A$.
13	AGND	Analog Ground
14	REF	Reference Input. Maximum V_{REF} is $V_{DD} - 1.4V$.
15	N.C.	No Connection
16	V_{DD}	Positive Supply. Bypass to AGND with a $4.7\mu F$ capacitor in parallel with a $0.1\mu F$ capacitor.

Low-Power, Serial, 14-Bit DACs with Force/Sense Voltage Output

Detailed Description

The MAX5171/MAX5173 14-bit, serial, voltage-output DACs operate with a 3-wire serial interface. These devices include a 16-bit shift register and a double-buffered input composed of an input register and a DAC register (see *Functional Diagram*). In addition, the negative terminal of the output amplifier is available. The DACs are designed with an inverted R-2R ladder network (Figure 1), which produces a weighted voltage proportional to the reference voltage.

Reference Input

The reference input accepts both AC and DC values with a voltage range extending from 0 to $V_{DD} - 1.4V$. The following equation represents the resulting output voltage:

$$V_{OUT} = \frac{V_{REF} \cdot N \cdot \text{Gain}}{16384}$$

where N is the numeric value of the DAC's binary input code (0 to 16383), V_{REF} is the reference voltage, and Gain is the externally set voltage gain. The maximum output voltage is V_{DD} . The reference pin has a minimum impedance of 18k Ω and is code dependent.

Output Amplifier

The MAX5171/MAX5173's DAC output is internally buffered by a precision amplifier with a typical slew rate of 0.6V/ μ s. Access to the output amplifier's inverting input provides flexibility in output gain setting and signal conditioning (see *Applications Information*).

The output amplifier settles to $\pm 0.5\text{LSB}$ from a full-scale transition within 12 μ s, when loaded with 5k Ω in parallel with 100pF. Loads less than 2k Ω degrade performance.

Shutdown Mode

The MAX5171/MAX5173 feature a software- and hardware-programmable shutdown mode that reduces the typical supply current to 1 μ A. Enter shutdown by writing the appropriate input-control word as shown in Table 1, or by using the hardware shutdown. In shutdown mode, the reference input and amplifier output become high-impedance, and the serial interface remains active. Data in the input register is saved, allowing the MAX5171/MAX5173 to recall the prior output state when returning to normal operation. To exit shutdown, reload the DAC register from the shift register by simultaneously loading the input and DAC registers or by toggling $\overline{\text{PDL}}$. When returning from shutdown, wait 40 μ s for the output to settle.

Figure 1. Simplified DAC Circuit Diagram

Power-Down Lockout

Power-down lockout disables the software/hardware shutdown mode. A high-to-low transition on $\overline{\text{PDL}}$ brings the device out of shutdown, returning the output to its previous state.

Shutdown

Pulling SHDN high while $\overline{\text{PDL}}$ is high places the MAX5171/MAX5173 in shutdown mode. Pulling SHDN low does not return the device to normal operation. A high-to-low transition on $\overline{\text{PDL}}$ or an appropriate command from the serial data line is required to exit shutdown (see Table 1 for commands).

Serial Interface

The MAX5171/MAX5173 3-wire serial interface is compatible with SPI/QSPI (Figure 2) and MICROWIRE (Figure 3) interface standards. The 16-bit serial input word consists of two control bits and 14 bits of data (MSB to LSB).

The control bits determine the MAX5171/MAX5173's response as outlined in Table 1. The MAX5171/MAX5173's digital inputs are double buffered, which allows any of the following:

- Loading the input register without updating the DAC register.
- Updating the DAC register from the input register.
- Updating the input and DAC registers simultaneously.

Low-Power, Serial, 14-Bit DACs with Force/Sense Voltage Output

Figure 2. Connections for SPI/QSPI

Figure 3. Connections for MICROWIRE

The MAX5171/MAX5173 accepts one 16-bit packet or two 8-bit packets sent while $\overline{CS}$ remains low. The MAX5171/MAX5173 allow the following to be configured:

- Clock edge on which serial data output (DOUT) is clocked.
- State of the user-programmable logic output.
- Configuration of the reset state.

Specific commands for setting these are shown in Table 1.

The general timing diagram in Figure 4 illustrates how the MAX5171/MAX5173 acquire data. $\overline{CS}$ must go low at least t_{CSS} before the rising edge of the serial clock (SCLK). With $\overline{CS}$ low, data is clocked into the register on the rising edge of SCLK. The maximum serial clock frequency guaranteed for proper operation is 10MHz for the MAX5171 and 6MHz for the MAX5173. See Figure 5 for a detailed timing diagram of the serial interface.

Serial Data Output (DOUT)

The serial-data output, DOUT, is the internal shift register's output; it allows for daisy-chaining of multiple devices as well as data readback (see *Applications Information*). By default upon start-up, data shifts out of DOUT on the serial clock's rising edge (Mode 0) and provides a lag of 16 clock cycles, thus maintaining SPI, QSPI, and MICROWIRE compatibility. However, if the device is programmed for Mode 1, then the output data lags DIN by 16.5 clock cycles and is clocked out on the serial clock's rising edge. During shutdown, DOUT retains its last digital state prior to shutdown.

User-Programmable Logic Output (UPO)

The UPO allows control of an external device through the serial interface, thereby reducing the number of

Table 1. Serial-Interface Programming Commands

16-BIT SERIAL WORD			FUNCTION
C1	C0	D13.....D0	
0	0	14-bit DAC data	Load input register; DAC registers are unchanged.
0	1	14-bit DAC data	Load input register; DAC registers are updated (start up DAC with new data).
1	0	x x x xxx xxxx xxxx	Update DAC register from input register (start up DAC with data previously stored in the input registers).
1	1	0 0 x xxx xxxx xxxx	No operation (NOP).
1	1	0 1 x xxx xxxx xxxx	Shut down DAC (provided $\overline{PDL} = 1$).
1	1	1 0 0 xxx xxxx xxxx	UPO goes low (default).
1	1	1 0 1 xxx xxxx xxxx	UPO goes high.
1	1	1 1 0 xxx xxxx xxxx	Mode 1, DOUT clocked out on SCLK's rising edge.
1	1	1 1 1 xxx xxxx xxxx	Mode 0, DOUT clocked out on SCLK's falling edge (default).

Low-Power, Serial, 14-Bit DACs with Force/Sense Voltage Output

Figure 4. Serial-Interface Timing Diagram

Figure 5. Detailed Serial-Interface Timing Diagram

microcontroller I/O pins required. During power-down, this output will retain its digital state prior to shutdown. When $\overline{\text{CLR}}$ is pulled low, UPO will reset to its programmed default state. See Table 1 for specific commands to control the UPO.

Reset (RS) and Clear ($\overline{\text{CLR}}$)

The MAX5171/MAX5173 offers a clear pin which resets the output voltage. If $\text{RST} = \text{DGND}$, then $\overline{\text{CLR}}$ resets the output voltage to the minimum voltage (0 if no offset is introduced). If $\text{RST} = \text{VDD}$, then $\overline{\text{CLR}}$ resets the output voltage to midscale. In either case, $\overline{\text{CLR}}$ resets UPO to its programmed default state.

Applications Information

Unipolar Output

Figure 6 shows the MAX5171/MAX5173 configured for unipolar, rail-to-rail operation with a gain of +2V/V. Table 2 lists the codes for unipolar output voltages. The output voltage is limited to VDD .

Bipolar Output

Figure 7 shows the MAX5171/MAX5173 configured for bipolar output operation. The output voltage is given by the following equation ($\text{FB} = \text{OUT}$):

$$\text{V}_{\text{OUT}} = \text{V}_{\text{REF}} \left(\frac{2 \cdot \text{N}}{16384} - 1 \right)$$

where N represents the numeric value of the DAC's binary input code and V_{REF} is the voltage of the external reference. Table 3 shows digital codes and the corresponding output voltage for Figure 7's circuit.

00	0000 0000 0000	0

Daisy-Chaining Devices

The serial data output pin (DOUT) allows multiple MAX5171/MAX5173s to be daisy-chained together, as shown in Figure 8. The advantage of this is that only two lines are needed to control all of the DACs on the line. The disadvantage is that it takes n commands to program the DACs. Figure 9 shows several MAX5171/MAX5173s sharing one common DIN signal line. In this configuration, the data bus is common to all devices. However, this configuration uses more I/O lines because each device requires a dedicated $\overline{CS}$ line. The benefit is that only one command is needed to program any DAC.

Using an AC Reference

The MAX5171/MAX5173 accepts reference voltages with AC components as long as the reference voltage remains between 0 and $V_{DD} - 1.4V$. Figure 10 shows a technique for applying a sine-wave signal to the REF. The reference voltage must remain above AGND.

Digitally Programmable Current Source

The circuit of Figure 11 places an NPN transistor within the op amp feedback loop to implement a digitally programmable, unidirectional current source. The output current is calculated with the following equation:

$$I_{OUT} = \frac{V_{REF} \cdot N}{R \cdot 16384}$$

where N is the numeric value of the DAC's binary input code and R is the sense resistor shown in Figure 11.

Low-Power, Serial, 14-Bit DACs with Force/Sense Voltage Output

Power-Supply and Layout Considerations
Wire-wrap boards are not recommended. For optimum system performance, use PC boards with separate analog and digital ground planes. Connect the two ground planes together at the low-impedance power-supply source. Connect the DGND and AGND pins together at the IC. The best ground connection is achieved by connecting the DAC's DGND and AGND pins together and connecting that point to the system analog ground plane. If the DAC's DGND is connected to the system digital ground, digital noise may get through to the DAC's analog portion.

Bypass the power supply with a $4.7\mu\text{F}$ capacitor in parallel with a $0.1\mu\text{F}$ capacitor to AGND. Minimize the capacitor lead lengths to reduce inductance. If noise becomes an issue, use shielding and/or ferrite beads to increase isolation.

To maintain INL and DNL performance, as well as gain drift, it is extremely important to provide the lowest possible reference output impedance at the DAC reference input pin. INL degrades if the series resistance on the REF pin exceeds 0.1Ω . The same consideration must be made for the AGND pin.
