

2.7 VOLT 32K X 8 STATIC RAM

Features

- High-speed: 35, 70 ns
- Ultra low DC operating current of 2mA (max.)
- Low Power Dissipation:
 - TTL Standby: 0.5 mA (Max.)
 - CMOS Standby: 10 μ A (Max.)
- Fully static operation
- All inputs and outputs directly compatible
- Three state outputs
- Ultra low data retention current ($V_{CC} = 2V$)
- Extended operating voltage: 2.7V–3.6V

■ Packages

- 28-pin TSOP (Standard)
- 28-pin 300 mil SOP (450 mil pin-to-pin)

Description

The V62C318256 is a 262,144-bit static random access memory organized as 32,768 words by 8 bits. It is built with MOSEL VITELIC's high performance CMOS process. Inputs and three-state outputs are TTL compatible and allow for direct interfacing with common system bus structures.

Pin Descriptions**A₀–A₁₄ Address Inputs**

These 15 address inputs select one of the 32,768 x 8 bit segments in the RAM.

 $\overline{\text{CE}}$ Chip Enable Inputs

$\overline{\text{CE}}$ is an active LOW input. Chip Enable must be LOW when reading from or writing to the device. When HIGH, the device is in standby mode with I/O pins in the high impedance state.

 $\overline{\text{OE}}$ Output Enable Input

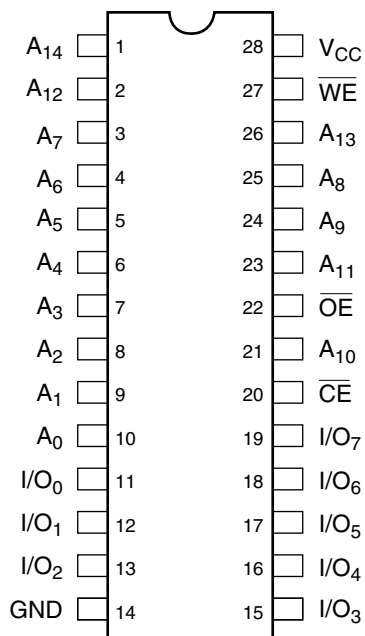

The Output Enable input is active LOW. When $\overline{\text{OE}}$ is LOW with $\overline{\text{CE}}$ LOW and $\overline{\text{WE}}$ HIGH, data of the selected memory location will be available on the I/O pins. When $\overline{\text{OE}}$ is HIGH, the I/O pins will be in the high impedance state.

 $\overline{\text{WE}}$ Write Enable Input

An active LOW input, $\overline{\text{WE}}$ input controls read and write operations. When $\overline{\text{CE}}$ and $\overline{\text{WE}}$ inputs are both LOW, the data present on the I/O pins will be written into the selected memory location.

I/O₀–I/O₇ Data Input and Data Output Ports

These 8 bidirectional ports are used to read data from and write data into the RAM.

- Stresses greater than those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reli-

ability.

NOTES:

1. $\overline{WE} = V_{IH}$.
2. $\overline{CE} = V_{IL}$.
3. Address valid prior to or coincident with \overline{CE} transition LOW.
4. $\overline{OE} = V_{IL}$.
5. Transition is measured $\pm 500\text{mV}$ from steady state with $C_L = 5\text{pF}$. This parameter is guaranteed and not 100% tested.

Switching Waveforms (Write Cycle)**Write Cycle 1 (\overline{WE} Controlled)⁽⁴⁾****Write Cycle 2 (\overline{CE} Controlled)⁽⁴⁾****NOTES:**

1. The internal write time of the memory is defined by the overlap of \overline{CE} active and \overline{WE} low. Both signals must be active to initiate and any one signal can terminate a write by going inactive. The data input setup and hold timing should be referenced to the second transition edge of the signal that terminates the write.
2. t_{WR} is measured from the earlier of \overline{CE} or \overline{WE} going HIGH.
3. During this period, I/O pins are in the output state so that the input signals of opposite phase to the outputs must not be applied.
4. $\overline{OE} = V_{IL}$ or V_{IH} . However it is recommended to keep \overline{OE} at V_{IH} during write cycle to avoid bus contention.
5. If \overline{CE} is LOW during this period, I/O pins are in the output state. Then the data input signals of opposite phase to the outputs must not be applied to them.
6. t_{CW} is measured from \overline{CE} going LOW to the end of write.
