

2.5V-12V Output MD1422N

DESCRIPTION

The MD1422N is a high-efficiency step down DC-DC converter power integrated circuit with main MOSFET switch and synchronous rectification MOSFET. The MD1422N can deliver high efficiency over a wide input voltage range. This device has output voltage digitally selectable from 2.5V to 12V. With the MD1422N you can construct a complete DC-DC converter using only a few external components. Featuring an SSOP 32-pin surface mount package, the MD1422N allows you to incorporate a very small and thin power supply on your circuit board.

- **Vref** - Temperature compensated internal voltage. You can pull 1mA maximum for external circuit.
- **OSC** - MCD1422N uses internal oscillator without external component. Frequency (Saw tooth wave form) is trimmed to 250kHz on chip.
- **Error Amp** - Error Amp detects output voltage of DC-DC converter and controls PWM signal. You can adjust the loop gain when you connect feedback resistor and capacitor between AmpOUT and Amp (-). It will provide stable phase compensation.
- **Overcurrent protection** - MD1422N uses pulse-by-pulse current protection. Current will be sensed voltage drop of external current sensing resistor. Threshold of OCL is 0.19V.
