

STM8AF61xx STM8AH61xx

Automotive 8-bit MCU, with up to 32 Kbytes Flash, EEPROM,
10-bit ADC, timers, LIN, SPI, I²C, 3 V to 5.5 V

Features

Core

- Max f_{CPU} : 16 MHz
- Advanced STM8A core with Harvard architecture and 3-stage pipeline
- Average 1.6 cycles/instruction resulting in 10 MIPS at 16 MHz f_{CPU} for industry standard benchmark

Memories

- Program memory: 16 to 32 Kbytes Flash; data retention 20 years at 55 °C after 1 kcycle
- Data memory: 0.5 to 1 Kbyte true data EEPROM; endurance 300 kcycles
- RAM: 1 to 2 Kbytes

Clock management

- Low power crystal resonator oscillator with external clock input
- Internal, user-trimmable 16 MHz RC and low power 128 kHz RC oscillators
- Clock security system with clock monitor

Reset and supply management

- Multiple low power modes (wait, slow, auto wakeup, halt) with user definable clock gating
- Low consumption power-on and power-down reset

Interrupt management

- Nested interrupt controller with 32 interrupt vectors
- Up to 34 external interrupts on 5 vectors

Timers

- Up to 2 auto-reload 16-bit PWM timers with up to 3 CAPCOM channels each (IC, OC or PWM)
- Multipurpose timer: 16-bit, 4 CAPCOM channels, 3 complementary outputs, dead-time insertion and flexible synchronization

- 8-bit AR system timer with 8-bit prescaler
- Auto wakeup timer
- Two watchdog timers: Window and standard

Communication interfaces

- LINUART LIN 2.1 compliant, master/slave modes with automatic resynchronization
- SPI interface up to 8 Mbit/s or $f_{CPU}/2$
- I²C interface up to 400 Kbit/s

Analog-to-digital converter (ADC)

- 10-bit accuracy, 2LSB TUE accuracy, 2 LSB TUE linearity ADC and up to 10 multiplexed channels with individual data buffer
- Analog watchdog, scan and continuous sampling mode

I/Os

- Up to 38 user pins including 10 high sink I/Os
- Highly robust I/O design, immune against current injection

Operating temperature

- Up to 145 °C

1 Introduction

This datasheet refers to the STM8AF61xx and STM8AH61xx products with 16 to 32 Kbytes of program memory. The STM8AF61xx and STM8AH61xx are hereafter referred to as the STM8AF/H61xx. 'F' refers to product versions with data EEPROM and 'H' refers to product versions without EEPROM. The identifiers 'F' and 'H' do not both appear in an order code.

The datasheet contains the description of family features, pinout, electrical characteristics, mechanical data and ordering information.

- For complete information on the STM8A microcontroller memory, registers and peripherals, please refer to STM8A microcontroller family reference manual (RM0009).
- For information on programming, erasing and protection of the internal Flash memory please refer to the STM8 Flash programming manual (PM0047).
- For information on the debug and SWIM (single wire interface module) refer to the STM8 SWIM communication protocol and debug module user manual (UM0470).
- For information on the STM8 core, please refer to the STM8 CPU programming manual (PM0044).

2 Description

The STM8A automotive 8-bit microcontrollers offer from 16 to 32 Kbytes of program memory and integrated true data EEPROM.

All devices of the STM8A product line provide the following benefits:

- Reduced system cost
 - Integrated true data EEPROM for up to 300 k write/erase cycles
 - High system integration level with internal clock oscillators, watchdog and brown-out reset.
- Performance and robustness
 - Average performance 10 MIPS at 16 MHz CPU clock frequency
 - Robust I/O, independent watchdogs with separate clock source
 - Clock security system
- Short development cycles
 - Applications scalability across a common family product architecture with compatible pinout, memory map and modular peripherals.
 - Full documentation and a wide choice of development tools
- Product longevity
 - Advanced core and peripherals made in a state-of-the art technology
 - Native automotive product family operating both at 3.3 V and 5 V supply

All STM8A and ST7 microcontrollers are supported by the same tools including STVD/STVP development environment, the STice emulator and a low-cost, third party in-circuit debugging tool (for more details, see [Section 15: STM8 development tools on page 96](#)).

3 Product line-up

5 Product features

This section is intended to describe the family features that are actually implemented in the products covered by this datasheet.

For more detailed information on each feature please refer to the STM8A microcontroller family reference manual (RM0009).

5.1 Central processing unit STM8A (CPU)

The 8-bit STM8A core is a modern CISC core and has been designed for code efficiency and performance. It contains 21 internal registers (six directly addressable in each execution context), 20 addressing modes including indexed indirect and relative addressing and 80 instructions.

5.1.1 Architecture and registers

- Harvard architecture
- 3-stage pipeline
- 32-bit wide program memory bus with single cycle fetching for most instructions
- X and Y 16-bit index registers, enabling indexed addressing modes with or without offset and read-modify-write type data manipulations
- 8-bit accumulator
- 24-bit program counter with 16-Mbyte linear memory space
- 16-bit stack pointer with access to a 64 Kbyte stack
- 8-bit condition code register with seven condition flags for the result of the last instruction.

5.1.2 Addressing

- 20 addressing modes
- Indexed indirect addressing mode for look-up tables located anywhere in the address space
- Stack pointer relative addressing mode for efficient implementation of local variables and parameter passing

5.1.3 Instruction set

- 80 instructions with 2-byte average instruction size
- Standard data movement and logic/arithmetic functions
- 8-bit by 8-bit multiplication
- 16-bit by 8-bit and 16-bit by 16-bit division
- Bit manipulation
- Data transfer between stack and accumulator (push/pop) with direct stack access
- Data transfer using the X and Y registers or direct memory-to-memory transfers

5.2 Non-volatile memory

- 8 Kbytes to 32 Kbytes of single voltage program Flash memory
- Up to 1 Kbytes true (not emulated) data EEPROM
- Read while write: Writing in the data memory is possible while executing code in the program memory
- The device setup is stored in a user option area in the non-volatile memory

5.2.1 Architecture

- The memory is organized in blocks of 128 bytes each
- Read granularity: 1 word = 4 bytes
- Write/erase granularity: 1 word (4 bytes) or 1 block (128 bytes) in parallel
- Writing, erasing, word and block management is handled automatically by the memory interface.

5.2.2 Write protection (WP)

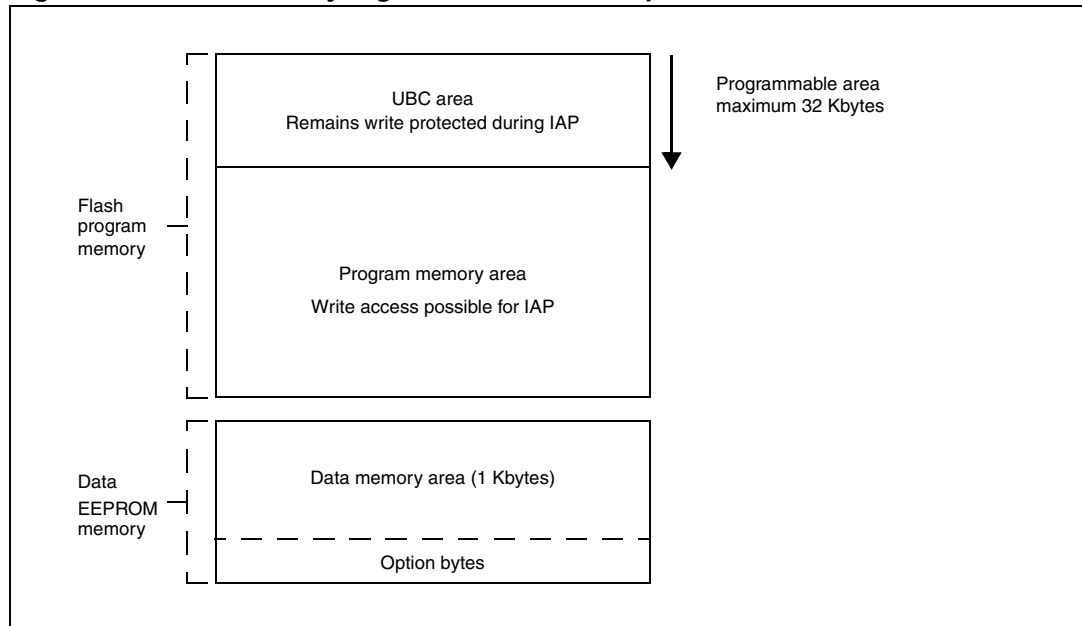

Write protection in application mode is intended to avoid unintentional overwriting of the memory. The write protection can be removed temporarily by executing a specific sequence in the user software.

5.2.3 Protection of user boot code (UBC)

If the user chooses to update the program memory using a specific boot code to perform in application programming (IAP), this boot code needs to be protected against unwanted modification.

In the STM8A a memory area of up to 32 Kbytes can be protected from overwriting at user option level. Other than the standard write protection, the UBC protection can exclusively be modified via the debug interface, the user software cannot modify the UBC protection status.

The UBC memory area contains the reset and interrupt vectors and its size can be adjusted in increments of 512 bytes by programming the UBC and NUBC option bytes (see [Section 10: Option bytes on page 50](#)).

Figure 2. Flash memory organization of STM8A products

5.2.4 Read-out protection (ROP)

The STM8A provides a read-out protection of the code and data memory which can be activated by an option byte setting (see the ROP option byte in section 10).

The read-out protection prevents reading and writing program memory, data memory and option bytes via the debug module and SWIM interface. This protection is active in all device operation modes. Any attempt to remove the protection by overwriting the ROP option byte triggers a global erase of the program and data memory.

The ROP circuit may provide a temporary access for debugging or failure analysis. The temporary read access is protected by a user defined, 8-byte keyword stored in the option byte area. This keyword must be entered via the SWIM interface to temporarily unlock the device.

If desired, the temporary unlock mechanism can be permanently disabled by the user.

5.3 Single wire interface module (SWIM) and debug module

5.3.1 SWIM

The single wire interface module, SWIM, together with an integrated debug module, permits non-intrusive, real-time in-circuit debugging and fast memory programming. The interface can be activated in all device operation modes and can be connected to a running device (hot plugging). The maximum data transmission speed is 145 bytes/ms.

5.3.2 Debug module

The non-intrusive debugging module features a performance close to a full-flavored emulator. Besides memory and peripheral operation, CPU operation can also be monitored in real-time by means of shadow registers.

- R/W of RAM and peripheral registers in real-time
- R/W for all resources when the application is stopped
- Breakpoints on all program-memory instructions (software breakpoints), except the interrupt vector table
- Two advanced breakpoints and 23 predefined breakpoint configurations

5.4 Clock and clock controller

The clock controller distributes the system clock coming from different oscillators to the core and the peripherals. It also manages clock gating for low-power modes and ensures clock robustness.

5.4.1 Features

- **Clock sources:**
 - Internal 16 MHz and 128 kHz RC oscillators
 - Crystal/resonator oscillator
 - External clock input
- **Reset:** After reset the microcontroller restarts by default with an internal 2-MHz clock (16 MHz/8). The clock source and speed can be changed by the application program as soon as the code execution starts.
- **Safe clock switching:** Clock sources can be changed safely on the fly in run mode through a configuration register. The clock signal is not switched until the new clock source is ready. The design guarantees glitch-free switching.
- **Clock management:** To reduce power consumption, the clock controller can stop the clock to the core or individual peripherals.
- **Wakeup:** In case the device wakes up from low-power modes, the internal RC oscillator (16 MHz/8) is used for quick startup. After a stabilization time, the device switches to the clock source that was selected before halt mode was entered.
- **Clock security system (CSS):** The CSS permits monitoring of external clock sources and automatic switching to the internal RC (16 MHz/8) in case of a clock failure.
- **Configurable main clock output (CCO):** This feature permits to outputs a clock signal for use by the application.

5.4.2 Internal 16 MHz RC oscillator

- Default clock after reset 2 MHz (16 MHz/8)
- Fast wakeup time

User trimming

The register CLK_HSITRIMR with three trimming bits plus one additional bit for the sign permits frequency tuning by the application program. The adjustment range covers all possible frequency variations versus supply voltage and temperature. This trimming does not change the initial production setting.

For reason of compatibility with other devices from the STM8A family, a special mode with only two trimming bits plus sign can be selected. This selection is controlled with the bit **16MHZTRIM0** in the option byte registers **OPT3** and **NOPT3**.

5.4.3 Internal 128 kHz RC oscillator

The frequency of this clock is 128 kHz and it is independent from the main clock. It drives the independent watchdog or the AWU wakeup timer.

In systems which do not need independent clock sources for the watchdog counters, the 128 kHz signal can be used as the system clock. This configuration has to be enabled by setting an option byte (OPT3/OPT3N, bit LSI_EN).

5.4.4 Internal high-speed crystal oscillator

The internal high-speed crystal oscillator can be selected to deliver the main clock in normal run mode. It operates with quartz crystals and ceramic resonators.

- Frequency range: 1 MHz to 16 MHz
- Crystal oscillation mode: preferred fundamental
- I/Os: standard I/O pins multiplexed with OSCIN, OSCOUT

5.4.5 External clock input

An external clock signal can be applied to the OSCIN input pin of the crystal oscillator. The frequency range is 0 to 16 MHz.

5.4.6 Clock security system (CSS)

The clock security system protects against a system stall in case of an external crystal clock failure.

In case of a clock failure an interrupt is generated and the high-speed internal clock (HSI) is automatically selected with a frequency of 2 MHz (16 MHz/8).

5.5 Low-power operating modes

The product features various low-power modes:

- Slow mode: prescaled CPU clock, selected peripherals at full clock speed
- Active halt mode: CPU and peripheral clocks are stopped, the device cyclically goes back to run mode, controlled by the AWU timer. Wakeup through external events is possible.
- Halt mode: CPU and peripheral clocks are stopped, the device remains powered on. Wakeup is triggered by an external interrupt.

In all modes the CPU and peripherals remain permanently powered on, the system clock is applied only to selected modules. The RAM content is preserved and the brown-out reset circuit remains activated.

5.6 Interrupt controller

- Nested interrupts with three software priority levels
- 21 interrupt vectors with hardware priority
- Five vectors for external interrupts (up to 34 depending on the package)
- Trap and reset interrupts

5.7 Input/output specifications

The product features four different I/O types:

- Standard I/O 2 MHz
- Fast I/O 10 MHz
- High sink 8 mA, 2 MHz
- True open drain (I²C interface)

To decrease EMI (electromagnetic interference), high sink I/Os have a limited maximum slew rate. The rise and fall times are similar to those of standard I/Os.

The analog inputs are equipped with a low leakage analog switch. Additionally, the schmitt-trigger input stage on the analog I/Os can be disabled in order to reduce the device standby consumption.

STM8A I/Os are designed to withstand current injection. For a negative injection current of 4 mA, the resulting leakage current in the adjacent input does not exceed 1 µA. Thanks to this feature, external protection diodes against current injection are no longer required.

5.8 Timers

5.8.1 Watchdog timers

The watchdog system is based on two independent timers providing maximum security to the applications. The watchdog timer activity is controlled by the application program or option bytes. Once the watchdog is activated, it cannot be disabled by the user program without going through reset.

Window watchdog timer

The window watchdog is used to detect the occurrence of a software fault, usually generated by external interferences or by unexpected logical conditions, which cause the application program to abandon its normal sequence.

The window function can be used to trim the watchdog behavior to match the application timing perfectly. The application software must refresh the counter before time-out and during a limited time window. If the counter is refreshed outside this time window, a reset is issued.

Independent watchdog timer

The independent watchdog peripheral can be used to resolve malfunctions due to hardware or software failures.

It is clocked by the 128 kHz LSI internal RC clock source, and thus stays active even in case of a CPU clock failure. If the hardware watchdog feature is enabled through the device option bits, the watchdog is automatically enabled at power-on, and generates a reset unless the key register is written by software before the counter reaches the end of count.

5.8.2 Auto wakeup counter

This counter is used to cyclically wakeup the device in active halt mode. It can be clocked by the internal 128 kHz internal low-frequency RC oscillator or external clock

5.8.3 Beeper

This function generates a rectangular signal in the range of 1, 2 or 4 kHz which can be output on a pin. This is useful when audible sounds without interference need to be generated for use in the application.

5.8.4 Multipurpose and PWM timers

STM8A devices described in this datasheet, contain up to three 16-bit multipurpose and PWM timers providing nine CAPCOM channels in total. A CAPCOM channel can be used either as input compare, output compare or PWM channel. These timers are named TIM1, TIM2 and TIM3.

Table 3. PWM timers

Timer	Counter width	Counter type	Prescaler factor	Channels	Inverted outputs	Repetition counter	trigger unit	External trigger	Break input
TIM1	16-bit	Up/down	1 to 65536	4	3	Yes	Yes	Yes	Yes
TIM2	16-bit	Up	2^n $n = 0$ to 15	3	None	No	No	No	No
TIM3	16-bit	Up	2^n $n = 0$ to 15	2	None	No	No	No	No

TIM1: Multipurpose PWM timer

This is a high-end timer designed for a wide range of control applications. With its complementary outputs, dead-time control and center-aligned PWM capability, the field of applications is extended to motor control, lighting and bridge driver.

- 16-bit up, down and up/down AR (auto-reload) counter with 16-bit fractional prescaler.
- Four independent CAPCOM channels configurable as input capture, output compare, PWM generation (edge and center aligned mode) and single pulse mode output
- Trigger module which allows the interaction of TIM1 with other on-chip peripherals. In the present implementation it is possible to trigger the ADC upon a timer event.
- External trigger to change the timer behavior depending on external signals
- Break input to force the timer outputs into a defined state
- Three complementary outputs with adjustable dead time
- Interrupt sources: 4 x input capture/output compare, 1 x overflow/update, 1 x break

TIM2 and TIM3: 16-bit PWM timers

- 16-bit auto-reload up-counter
- 15-bit prescaler adjustable to fixed power of two ratios 1...32768
- Timers with three or two individually configurable CAPCOM channels
- Interrupt sources: 2 or 3 x input capture/output compare, 1 x overflow/update

5.8.5 System timer

The typical usage of this timer (TIM4) is the generation of a clock tick.

Table 4. TIM4

Timer	Counter width	Counter type	Prescaler factor	Channels	Inverted outputs	Repetition counter	trigger unit	External trigger	Break input
TIM4	8-bit	Up	2^n $n = 0 \text{ to } 7$	0	None	No	No	No	No

- 8-bit auto-reload, adjustable prescaler ratio to any power of two from 1 to 128
- Clock source: master clock
- Interrupt source: 1 x overflow/update

5.9 Communication interfaces

5.9.1 Serial peripheral interface (SPI)

The devices covered by this datasheet contain one SPI. The SPI is available on all the supported packages.

- Maximum speed: 8 Mbit/s or $f_{\text{MASTER}}/2$ both for master and slave
- Full duplex synchronous transfers
- Simplex synchronous transfers on two lines with a possible bidirectional data line
- Master or slave operation - selectable by hardware or software
- CRC calculation
- 1 byte Tx and Rx buffer
- Slave mode/master mode management by hardware or software for both master and slave
- Programmable clock polarity and phase
- Programmable data order with MSB-first or LSB-first shifting
- Dedicated transmission and reception flags with interrupt capability
- SPI bus busy status flag
- Hardware CRC feature for reliable communication:
 - CRC value can be transmitted as last byte in Tx mode
 - CRC error checking for last received byte

5.9.2 Inter integrated circuit (I²C) interface

The devices covered by this datasheet contain one I²C interface. The interface is available on all the supported packages.

- I²C master features:
 - Clock generation
 - Start and stop generation
- I²C slave features:
 - Programmable I²C address detection
 - Stop bit detection
- Generation and detection of 7-bit/10-bit addressing and general call
- Supports different communication speeds:
 - Standard speed (up to 100 kHz),
 - Fast speed (up to 400 kHz)
- Status flags:
 - Transmitter/receiver mode flag
 - End-of-byte transmission flag
 - I²C busy flag
- Error flags:
 - Arbitration lost condition for master mode
 - Acknowledgement failure after address/data transmission

- Detection of misplaced start or stop condition
- Overrun/underrun if clock stretching is disabled
- Interrupt:
 - Successful address/data communication
 - Error condition
 - Wakeup from halt
- Wakeup from halt on address detection in slave mode

5.9.3 Universal asynchronous receiver/transmitter with LIN support (LINUART)

The devices covered by this datasheet contain one LINUART interface. The interface is available on all the supported packages. The LINUART is an asynchronous serial communication interface which supports extensive LIN functions tailored for LIN slave applications. In LIN mode it is compliant to the LIN standards rev 1.2 to rev 2.1.

Detailed feature list:

LIN mode

Master mode:

- LIN break and delimiter generation
- LIN break and delimiter detection with separate flag and interrupt source for read back checking.

Slave mode:

- Autonomous header handling – one single interrupt per valid header
- Mute mode to filter responses
- Identifier parity error checking
- LIN automatic resynchronization, allowing operation with internal RC oscillator (HSI) clock source
- Break detection at any time, even during a byte reception
- Header errors detection:
 - Delimiter too short
 - Synch field error
 - Deviation error (if automatic resynchronization is enabled)
 - Framing error in synch field or identifier field
 - Header time-out

UART mode

- Full duplex, asynchronous communications - NRZ standard format (mark/space)
- High-precision baud rate generator
 - A common programmable transmit and receive baud rates up to $f_{\text{MASTER}}/16$
- Programmable data word length (8 or 9 bits) – 1 or 2 stop bits – parity control
- Separate enable bits for transmitter and receiver
- Error detection flags
- Reduced power consumption mode
- Multi-processor communication - enter mute mode if address match does not occur
- Wakeup from mute mode (by idle line detection or address mark detection)
- Two receiver wakeup modes:
 - Address bit (MSB)
 - Idle line

5.10 Analog-to-digital converter (ADC)

The STM8A products described in this datasheet contain a 10-bit successive approximation ADC with up to 16 multiplexed input channels, depending on the package.

ADC features:

- 10-bit resolution
- Single and continuous conversion modes
- Programmable prescaler: f_{MASTER} divided by 2 to 18
- Conversion trigger on timer events and external events
- Interrupt generation at end of conversion
- Selectable alignment of 10-bit data in 2 x 8 bit result register
- Shadow registers for data consistency
- ADC input range: $V_{\text{SSA}} = V_{\text{IN}} = V_{\text{DDA}}$
- Analog watchdog
- Schmitt-trigger on analog inputs can be disabled to reduce power consumption
- Scan mode (single and continuous)
- Dedicated result register for each conversion channel
- Buffer mode for continuous conversion

6 Pinouts and pin description

6.1 Package pinouts

48	32	PD7/TLI ⁽⁴⁾	I/O	X	X	X	-	O1	X	X	Port D7	Top level interrupt		—

- In halt/active halt mode this pad behaves in the following way:
 - the input/output path is disabled
 - if the HSE clock is used for wakeup, the internal weak pull up is disabled
 - if the HSE clock is off, internal weak pull up setting from corresponding OR bit is used
 By managing the OR bit correctly, it must be ensured that the pad is not left floating during halt/active halt.
- On this pin, a pull-up resistor as specified in [Table 49](#). I/O static characteristics is enabled during the reset phase of the product.
- In the open-drain output column, 'T' defines a true open-drain I/O (P-buffer and protection diode to V_{DD} are not implemented)
- If this pin is configured as interrupt pin, it will trigger the TLI.

6.2.1 Alternate function remapping

As shown in the rightmost column of [Table 6](#), some alternate functions can be remapped at different I/O ports by programming one of eight AFR (alternate function remap) option bits. Refer to [Section 10: Option bytes on page 50](#). When the remapping option is active, the default alternate function is no longer available.

To use an alternate function, the corresponding peripheral must be enabled in the peripheral registers.

Alternate function remapping does not effect GPIO capabilities of the I/O ports (see the GPIO section of the STM8A microcontroller family reference manual, RM0009).

7 Memory map

Figure 5. Register and memory map of STM8A products

Table 7. Memory model for the devices covered in this datasheet

Program memory size	Program memory end address	RAMsize	RAM end address	Stack roll-over address
32K	0FFFFh	2K	07FFh	0600h
16K	0BFFFh	1K	03FFh	n/a ⁽¹⁾
8K	09FFFh	512B	01FFh	n/a ⁽¹⁾

1. If the device is containing the super set silicon (salestype contains SSS), the roll-over address is the same as on the superset device. For more information on stack handling refer to section 2.1.2 in the reference manual RM0009. For more information on salestype composition, refer to section [Section 13](#) in the present document.

8 Interrupt table

Table 8. STM8A interrupt table

Priority	Source block	Description	Interrupt vector address	Wakeup from halt	Comments
—	Reset	Reset	6000h	Yes	Reset vector in ROM

9.3 CPU registers

Table 11. CPU registers

Address	Block	Register label	Register name	Reset status
00 7F00h	CPU ⁽¹⁾	A	Accumulator	00h
00 7F01h		PCE	Program counter extended	00h
00 7F02h		PCH	Program counter high	80h
00 7F03h		PCL	Program counter low	00h
00 7F04h		XH	X index register high	00h
00 7F05h		XL	X index register low	00h
00 7F06h		YH	Y index register high	00h
00 7F07h		YL	Y index register low	00h
00 7F08h		SPH	Stack pointer high	17h ⁽²⁾
00 7F09h		SPL	Stack pointer low	FFh
00 7F0Ah		CC	Condition code register	28h

1. Accessible by debug module only

2. Product dependent value, see [Figure 5: Register and memory map of STM8A products](#).

9.4 Miscellaneous registers

9.4.1 Global configuration register

Table 12. CFG_GCR register map

Address	Register name	7	6	5	4	3	2	1	0
00 7F60h	CFG_GCR Reset value	- 0	- 0	- 0	- 0	- 0	- 0	AL 0	SWD 0

9.4.2 Reset status register

Table 13. RST_SR register map

Address	Register name	7	6	5	4	3	2	1	0
00 50B3h	RST_SR Reset value	- x	- x	- x	EMCF x	SWIMF x	ILLOPF x	IWDGF x	WWDGF x

9.4.3 Temporary memory unprotection key registers

Table 14. TMU register map and reset values

Address	Register name	7	6	5	4	3	2	1	0
00 5800h	TMU_K1 Reset value	K7 0	K6 0	K5 0	K4 0	K3 0	K2 0	K1 0	K0 0
00 5801h	TMU_K2 Reset value	K7 0	K6 0	K5 0	K4 0	K3 0	K2 0	K1 0	K0 0
00 5802h	TMU_K3 Reset value	K7 0	K6 0	K5 0	K4 0	K3 0	K2 0	K1 0	K0 0
00 5803h	TMU_K4 Reset value	K7 0	K6 0	K5 0	K4 0	K3 0	K2 0	K1 0	K0 0
00 5804h	TMU_K5 Reset value	K7 0	K6 0	K5 0	K4 0	K3 0	K2 0	K1 0	K0 0
00 5805h	TMU_K6 Reset value	K7 0	K6 0	K5 0	K4 0	K3 0	K2 0	K1 0	K0 0
00 5807h	TMU_K8 Reset value	K7 0	K6 0	K5 0	K4 0	K3 0	K2 0	K1 0	K0 0
00 5808h	TMU_CSR Reset value	- 0	- 0	- 0	- 0	ROPS 0	TIMUE 0	TMUB 0	TMUS 0

9.5 Clock and clock controller

Table 15. CLK register map and reset values

1. In this table, the default alignment of the register is shown. The register alignment can be chosen by software.

10 Option bytes

Option bytes contain configurations for device hardware features as well as the memory protection of the device. They are stored in a dedicated block of the memory. Each option byte has to be stored twice, for redundancy, in a regular form (OPTx) and a complemented one (NOPTx), except for the ROP (read-out protection) option byte and option bytes 8 to 16.

Option bytes can be modified in ICP mode (via SWIM) by accessing the EEPROM address shown in [Table 30: Option bytes](#) below.

Option bytes can also be modified 'on the fly' by the application in IAP mode, except the ROP and UBC options that can only be toggled in ICP mode (via SWIM).

Refer to the STM8 Flash programming manual (PM0047) and STM8 SWIM communication protocol and debug module user manual (UM0470) for information on SWIM programming procedures.

Table 30. Option bytes

Addr.	Option name	Option byte no.	Option bits								Factory default setting

Table 31. Option byte description (continued)

Option byte no.	Description
OPT3	HSITRIM: Trimming option for 16 MHz internal RC oscillator 0: 3-bit on-the-fly trimming (compatible with devices based on the 128K silicon) 1: 4-bit on-the-fly trimming
	LSI_EN: Low speed internal clock enable 0: LSI clock is not available as CPU clock source 1: LSI clock is available as CPU clock source
	IWDG_HW: Independent watchdog 0: IWDG independent watchdog activated by software 1: IWDG independent watchdog activated by hardware
	WWDG_HW: Window watchdog activation 0: WWDG window watchdog activated by software 1: WWDG window watchdog activated by hardware
	WWDG_HALT: Window watchdog reset on halt 0: No reset generated on halt if WWDG active 1: Reset generated on halt if WWDG active
OPT4	EXTCLK: External clock selection 0: External crystal connected to OSCIN/OSCAOUT 1: External clock signal on OSCIN
	CKAWUSEL: Auto wakeup unit/clock 0: LSI clock source selected for AWU 1: HSE clock with prescaler selected as clock source for for AWU
	PRSC[1:0]: AWU clock prescaler 00: Reserved 01: 16 MHz to 128 kHz prescaler 10: 8 MHz to 128 kHz prescaler 11: 4 MHz to 128 kHz prescaler
OPT5	HSECNT[7:0]: HSE crystal oscillator stabilization time This configures the stabilisation time to 0.5, 8, 128, and 2048 HSE cycles with corresponding option byte values of E1h, D2h, B4h, and 00h.
OPT6	TMU[3:0]: Enable temporary memory unprotection 0101: TMU disabled (permanent ROP). Any other value: TMU enabled.
OPT7	Reserved
OPT8	TMU_KEY 1 [7:0]: Temporary unprotection key 0 Temporary unprotection key: Must be different from 00h or FFh
OPT9	TMU_KEY 2 [7:0]: Temporary unprotection key 1 Temporary unprotection key: Must be different from 00h or FFh
OPT10	TMU_KEY 3 [7:0]: Temporary unprotection key 2 Temporary unprotection key: Must be different from 00h or FFh
OPT11	TMU_KEY 4 [7:0]: Temporary unprotection key 3 Temporary unprotection key: Must be different from 00h or FFh

Table 31. Option byte description (continued)

Option byte no.	Description
OPT12	TMU_KEY 5 [7:0]: Temporary unprotection key 4 Temporary unprotection key: Must be different from 00h or FFh
OPT13	TMU_KEY 6 [7:0]: Temporary unprotection key 5 Temporary unprotection key: Must be different from 00h or FFh
OPT14	TMU_KEY 7 [7:0]: Temporary unprotection key 6 Temporary unprotection key: Must be different from 00h or FFh
OPT15	TMU_KEY 8 [7:0]: Temporary unprotection key 7 Temporary unprotection key: Must be different from 00h or FFh
OPT16	TMU_MAXATT [7:0]: TMU access failure counter Every unsuccessful trial to enter the temporary unprotection procedure increments the counter. More than 64 unsuccessful trials trigger the global erase of the code and data memory.
OPT17	BL_EN [7:0]: Bootloader enable If this optionbyte is set to 55h (complementary value AAh) the bootloader program is activated also in case of a programmed code memory (for more details, see the bootloader user manual, UM0500).

11 Electrical characteristics

11.1 Parameter conditions

Unless otherwise specified, all voltages are referred to V_{SS} .

11.1.1 Minimum and maximum values

Unless otherwise specified the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and frequencies by tests in production on 100 % of the devices with an ambient temperature at $T_A = -40\text{ }^{\circ}\text{C}$, $T_A = 25\text{ }^{\circ}\text{C}$, and $T_A = T_{Amax}$ (given by the selected temperature range).

Data based on characterization results, design simulation and/or technology characteristics are indicated in the table footnotes and are not tested in production.

11.1.2 Typical values

Unless otherwise specified, typical data are based on $T_A = 25\text{ }^{\circ}\text{C}$, $V_{DD} = 5.0\text{ V}$. They are given only as design guidelines and are not tested.

Typical ADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range.

11.1.3 Typical curves

Unless otherwise specified, all typical curves are given only as design guidelines and are not tested.

11.1.4 Loading capacitor

The loading conditions used for pin parameter measurement are shown in [Figure 6](#).

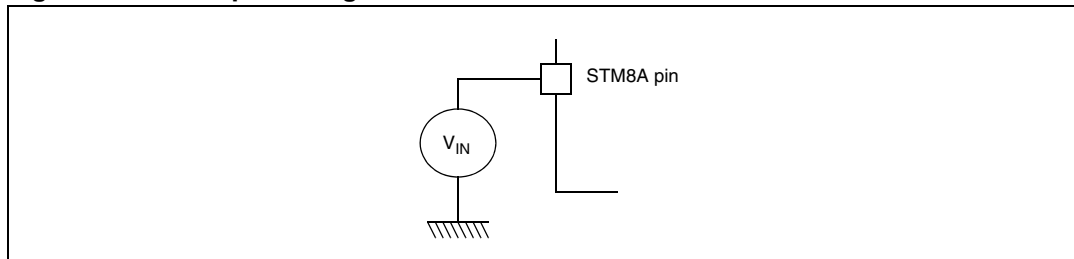

Figure 6. Pin loading conditions

11.1.5 Pin input voltage

The input voltage measurement on a pin of the device is described in [Figure 7](#).

Figure 7. Pin input voltage

11.2 Absolute maximum ratings

Stresses above those listed as 'absolute maximum ratings' may cause permanent damage to the device. This is a stress rating only and functional operation of the device under these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Table 32. Voltage characteristics

Symbol	Ratings	Min	Max	Unit
V _{DDx} - V _{SS}	Supply voltage (including V _{DDA} and V _{DDIO}) ⁽¹⁾	-0.3	6.5	V
V _{IN}	Input voltage on true open drain pins (PE1, PE2) ⁽²⁾	V _{SS} - 0.3	6.5	V
	Input voltage on any other pin ⁽²⁾	V _{SS} - 0.3	V _{DD} + 0.3	
V _{DDx} - V _{DD}	Variations between different power pins	—	50	mV
V _{SSx} - V _{SS}	Variations between all the different ground pins	—	50	
V _{ESD}	Electrostatic discharge voltage	see <i>Absolute maximum ratings (electrical sensitivity) on page 83</i>		

1. All power (V_{DD} , V_{DDIO} , V_{DDA}) and ground (V_{SS} , V_{SSIO} , V_{SSA}) pins must always be connected to the external power supply
2. $I_{INJ(PIN)}$ must never be exceeded. This is implicitly insured if V_{IN} maximum is respected. If V_{IN} maximum cannot be respected, the injection current must be limited externally to the $I_{INJ(PIN)}$ value. A positive injection is induced by $V_{IN} > V_{DD}$ while a negative injection is induced by $V_{IN} < V_{SS}$. For true open-drain pads, there is no positive injection current, and the corresponding V_{IN} maximum must always be respected

Table 33. Current characteristics

Symbol	Ratings	Max.	Unit
I_{VDDIO}	Total current into V_{DDIO} power lines (source) ⁽¹⁾⁽²⁾⁽³⁾	100	mA
I_{VSSIO}	Total current out of V_{SSIO} ground lines (sink) ⁽¹⁾⁽²⁾⁽³⁾	100	
I_{IO}	Output current sunk by any I/O and control pin	20	
	Output current source by any I/Os and control pin	-20	
$I_{INJ(PIN)}^{(4)}$	Injected current on any pin	±10	
$I_{INJ(TOT)}$	Sum of injected currents	50	

1. All power (V_{DD} , V_{DDIO} , V_{DDA}) and ground (V_{SS} , V_{SSIO} , V_{SSA}) pins must always be connected to the external supply.
2. The total limit applies to the sum of operation and injected currents.
3. V_{DDIO} includes the sum of the positive injection currents. V_{SSIO} includes the sum of the negative injection currents..
4. This condition is implicitly insured if V_{IN} maximum is respected. If V_{IN} maximum cannot be respected, the injection current must be limited externally to the $I_{INJ(PIN)}$ value. A positive injection is induced by $V_{IN} > V_{DD}$ while a negative injection is induced by $V_{IN} < V_{SS}$. For true open-drain pads, there is no positive injection current allowed and the corresponding V_{IN} maximum must always be respected.

Table 34. Thermal characteristics

Symbol	Ratings	Value	Unit
T_{STG}	Storage temperature range	-65 to 150	°C
T_J	Maximum junction temperature	160	

11.3 Operating conditions

Table 35. General operating conditions

Symbol	Parameter	Conditions	Min	Max	Unit
f_{CPU}	Internal CPU clock frequency	$T_A = -40\text{ }^{\circ}\text{C}$ to $145\text{ }^{\circ}\text{C}$	0	16	MHz
$V_{\text{DD}}/V_{\text{DDIO}}$	Standard operating voltage	—	3.0	5.5	V
$V_{\text{CAP}}^{(1)}$	Voltage regulator stabilization capacitor	—	470 nF ⁽²⁾	1 μF	
T_A	Ambient temperature	Suffix A	-40	85	$^{\circ}\text{C}$
		Suffix B		105	
		Suffix C		125	
		Suffix D		145	
T_J	Junction temperature range	A suffix version		90	
		B suffix version		110	
		C suffix version		130	
		D suffix version		150	

1. V_{CAP} capacitor should have an ESR smaller than $0.3\text{ }\Omega$. Such values are valid for frequencies and temperatures within the interval 1 MHz to 100 MHz. The ESL should be less than 2 nH.

2. The minimum V_{CAP} value should be 470 nF, taking all tolerances into account.

Figure 8. f_{CPUmax} versus V_{DD}

Table 36. Operating conditions at power-up/power-down

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
t_{VDD}	V_{DD} rise time rate	—	20 ⁽¹⁾	—	∞	$\mu\text{s/V}$
	V_{DD} fall time rate	—	20 ⁽¹⁾	—	∞	
t_{TEMP}	Reset release delay	V_{DD} rising	—	3	—	ms
	Reset generation delay	V_{DD} falling	—	3	—	μs
V_{IT+}	Power-on reset threshold ⁽²⁾	—	2.65	2.8	2.95	V
V_{IT-}	Brown-out reset threshold	—	2.58	2.73	2.88	
$V_{HYS(BOR)}$	Brown-out reset hysteresis	—	—	70 ⁽¹⁾		mV

1. Guaranteed by design, not tested in production

2. If V_{DD} is below 3 V, the code execution is guaranteed above the V_{IT-} and V_{IT+} thresholds. RAM content is kept. The EEPROM programming sequence must not be initiated.

11.3.1 Supply current characteristics

The current consumption is measured as described in [Figure 6 on page 55](#) and [Figure 7 on page 56](#).

If not explicitly stated, general conditions of temperature and voltage apply.

General conditions for VDD apply. TA = -40 °C to 145 °C

Table 37. Total current consumption in run, wait and slow mode.

Symbol	Parameter	Conditions	Typ	Max	Unit
$I_{DD(RUN)}^{(1)}$	Supply current in run mode	All peripherals clocked, code executed from EEPROM, HSE external clock	$f_{CPU} = 16\text{ MHz}$	7.4	14
			$f_{CPU} = 8\text{ MHz}$	4.0	7.4 ⁽²⁾
			$f_{CPU} = 4\text{ MHz}$	2.4	4.1 ⁽²⁾
			$f_{CPU} = 2\text{ MHz}$	1.5	2.5
$I_{DD(RUN)}^{(1)}$	Supply current in run mode	All peripherals clocked, code executed from RAM and EEPROM, HSE external clock	$f_{CPU} = 16\text{ MHz}$	3.7	5.0
			$f_{CPU} = 8\text{ MHz}$	2.2	3.0 ⁽²⁾
			$f_{CPU} = 4\text{ MHz}$	1.4	2.0 ⁽²⁾
			$f_{CPU} = 2\text{ MHz}$	1.0	1.5
$I_{DD(WFI)}^{(1)}$	Supply current in wait mode	CPU stopped, all peripherals off, HSE external clock	$f_{CPU} = 16\text{ MHz}$	1.65	2.5
			$f_{CPU} = 8\text{ MHz}$	1.15	1.9 ⁽²⁾
			$f_{CPU} = 4\text{ MHz}$	0.90	1.6 ⁽²⁾
			$f_{CPU} = 2\text{ MHz}$	0.80	1.5
$I_{DD(SLOW)}^{(1)}$	Supply current in slow mode	f_{CPU} scaled down, all peripherals off, code executed from RAM	Extclock 16 MHz $f_{CPU} = 125\text{ kHz}$	1.50	1.95
			LSI internal RC $f_{CPU} = 128\text{ kHz}$	1.50	1.80 ⁽²⁾

1. The current due to I/O utilization is not taken into account in these values.

2. Values not tested in production. Design guidelines only.

General conditions for VDD apply. TA = -40 °C to 55 °C unless otherwise stated

Table 38. Total current consumption in halt and active halt modes.

Symbol	Parameter	Conditions	Typ	Max	Unit
I _{DD(H)}	Supply current in halt mode	Clocks stopped, Flash in power-down mode	5	35 ⁽¹⁾	μA
		Clocks stopped, Flash in power-down mode, T _A = 25 °C	5	25	
I _{DD(FAH)}	Supply current in fast active halt mode	Extclock 16 MHz f _{MASTER} = 125 kHz	770	900 ⁽¹⁾	
		LSI clock 128 kHz	150	230 ⁽¹⁾	
I _{DD(SAH)}	Supply current in slow active halt mode	LSI clock 128 kHz	25	42 ⁽¹⁾	
		LSI clock 128 kHz, T _A = 25 °C	25	30	
t _{WU(FAH)}	Wakeup time from fast active halt mode	T _A = -40 °C to 145 °C	10	30 ⁽¹⁾	μs
t _{WU(SAH)}	Wakeup time from slow active halt mode		50	80 ⁽¹⁾	

1. Data based on characterization results. Not tested in production.

On-chip peripherals

Table 39. Oscillator current consumption

Symbol	Parameter	Conditions		Typ	Max ⁽¹⁾	Unit
I _{DD(OSC)}	HSE oscillator current consumption ⁽²⁾	Quartz or ceramic resonator, CL = 33 pF V _{DD} = 5 V	f _{OSC} = 24 MHz	1	2.0 ⁽³⁾	mA
			f _{OSC} = 16 MHz	0.6	—	
			f _{OSC} = 8 MHz	0.57	—	
I _{DD(OSC)}	HSE oscillator current consumption ⁽²⁾	Quartz or ceramic resonator, CL = 33 pF V _{DD} = 3.3 V	f _{OSC} = 24 MHz	0.5	1.0 ⁽³⁾	
			f _{OSC} = 16 MHz	0.25	—	
			f _{OSC} = 8 MHz	0.18	—	

1. During startup, the oscillator current consumption may reach 6 mA.

2. The supply current of the oscillator can be further optimized by selecting a high quality resonator with small R_m value. Refer to crystal manufacturer for more details

3. Informative data.

Table 40. Programming current consumption

Symbol	Parameter	Conditions	Typ	Max	Unit
I _{DD(PROG)}	Programming current	V _{DD} = 5 V, -40 °C to 145 °C, erasing and programming data or program memory	1.0	1.7	mA

Current consumption curves

Figure 9 to Figure 14 show typical current consumption measured with code executing in RAM.

Figure 9. Typ. $I_{DD(RUN)HSE}$ vs. V_{DD}

Table 41. Typical peripheral current consumption $V_{DD} = 5.0\text{ V}^{(1)}$

Symbol	Parameter	Typ. $f_{\text{master}} = 2\text{ MHz}$	Typ. $f_{\text{master}} = 16\text{ MHz}$	Unit
$I_{DD}(\text{TIM1})$	TIM1 supply current ⁽²⁾	0.03	0.23	mA
$I_{DD}(\text{TIM2})$	TIM2 supply current ⁽²⁾	0.02	0.12	
$I_{DD}(\text{TIM3})$	TIM3 supply current ⁽²⁾	0.01	0.1	
$I_{DD}(\text{TIM4})$	TIM4 supply current ⁽²⁾	0.004	0.03	
$I_{DD}(\text{USART})$	USART supply current ⁽²⁾	0.03	0.09	
$I_{DD}(\text{LINUART})$	LINUART supply current ⁽²⁾	0.03	0.11	
$I_{DD}(\text{SPI})$	SPI supply current ⁽²⁾	0.01	0.04	
$I_{DD}(\text{I}^2\text{C})$	I ² C supply current ⁽²⁾	0.02	0.06	
$I_{DD}(\text{CAN})$	CAN supply current ⁽³⁾	0.06	0.30	
$I_{DD}(\text{AWU})$	AWU supply current ⁽²⁾	0.003	0.02	
$I_{DD}(\text{TOT_DIG})$	All digital peripherals on	0.22	1	
$I_{DD}(\text{ADC})$	ADC supply current when converting ⁽⁴⁾	0.93	0.95	

1. Typical values not tested in production. Since the peripherals are powered by an internally regulated, constant digital supply voltage, the values are similar in the full supply voltage range.
2. Data based on a differential I_{DD} measurement between no peripheral clocked and a single active peripheral. This measurement does not include the pad toggling consumption.
3. Data based on a differential I_{DD} measurement between reset configuration (CAN disabled) and a permanent CAN data transmit sequence in loopback mode at 1 MHz. This measurement does not include the pad toggling consumption.
4. Data based on a differential I_{DD} measurement between reset configuration and continuous A/D conversions.

11.3.2 External clock sources and timing characteristics

HSE user external clock

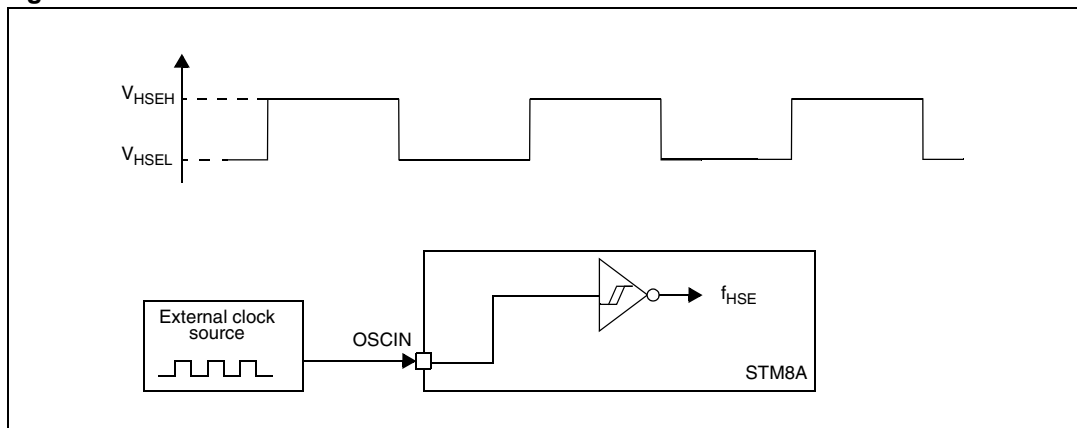

Subject to general operating conditions for V_{DD} and T_A .

Table 42. HSE user external clock characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{HSE_ext}	User external clock source frequency	T_A is -40 to 145 °C	0 ⁽¹⁾	—	16	MHz
V_{HSEdHL}	Comparator hysteresis	—	$0.1 \times V_{DD}$	—	—	V
V_{HSEH}	OSCIN input pin high level voltage	—	$0.7 \times V_{DD}$	—	V_{DD}	
V_{HSEL}	OSCIN input pin low level voltage	—	V_{SS}	—	$0.3 \times V_{DD}$	
I_{LEAK_HSE}	OSCIN input leakage current	$V_{SS} < V_{IN} < V_{DD}$	-1	—	+1	μA

1. In CSS is used, the external clock must have a frequency above 500 kHz.

Figure 15. HSE external clock source

HSE crystal/ceramic resonator oscillator

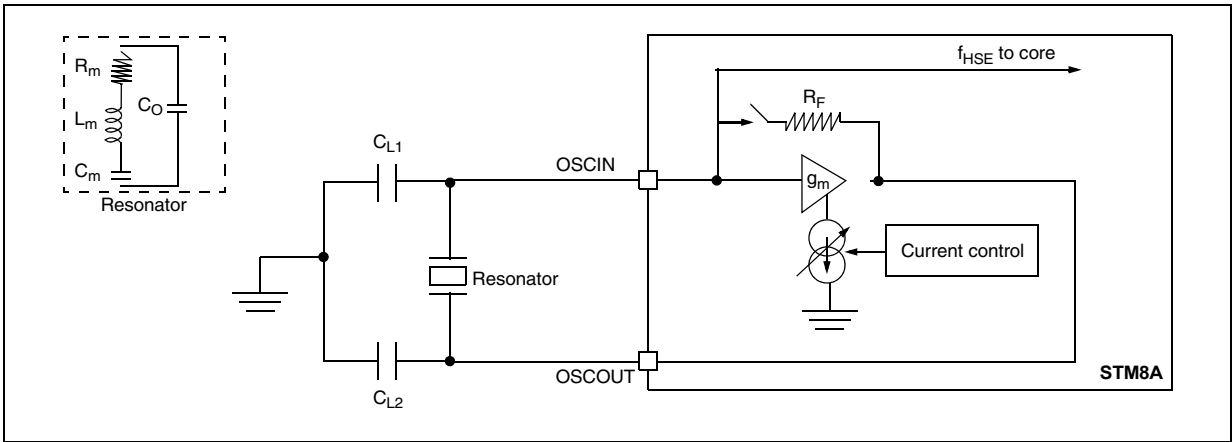

The HSE clock can be supplied using a crystal/ceramic resonator oscillator of up to 16 MHz. All the information given in this paragraph is based on characterization results with specified typical external components. In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details (frequency, package, accuracy...).

Table 43. HSE oscillator characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
R_F	Feedback resistor	—	—	220	—	k Ω
$C_{L1}/C_{L2}^{(1)}$	Recommended load capacitance	—	—	—	20	pF
g_m	Oscillator transconductance	—	5	—	—	mA/V
$t_{SU(HSE)}^{(2)}$	Startup time	V_{DD} is stabilized	—	2.8	—	ms

1. The oscillator needs two load capacitors, C_{L1} and C_{L2} , to act as load for the crystal. The total load capacitance (Cload) is $(C_{L1} * C_{L2}) / (C_{L1} + C_{L2})$. If $C_{L1} = C_{L2}$, Cload = $C_{L1} / 2$. Some oscillators have built-in load capacitors, C_{L1} and C_{L2} .
2. This value is the startup time, measured from the moment it is enabled (by software) until a stabilized 16 MHz oscillation is reached. It can vary with the crystal type that is used.

Figure 16. HSE oscillator circuit diagram

HSE oscillator critical g_m formula

The crystal characteristics have to be checked with the following formula:

$$g_m \gg g_{m_{crit}}$$

where $g_{m_{crit}}$ can be calculated with the crystal parameters as follows:

$$g_{m_{crit}} = (2 \times \Pi \times f_{HSE})^2 \times R_m (2C_o + C)^2$$

R_m : Notional resistance (see crystal specification)

L_m : Notional inductance (see crystal specification)

C_m : Notional capacitance (see crystal specification)

C_o : Shunt capacitance (see crystal specification)

$C_{L1} = C_{L2} = C$: Grounded external capacitance

11.3.3 Internal clock sources and timing characteristics

Subject to general operating conditions for V_{DD} and T_A .

High speed internal RC oscillator (HSI)

Table 44. HSI oscillator characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{HSI}	Frequency	—	—	16	—	MHz
ACC_{HS}	HSI oscillator user trimming accuracy	Trimmed by the application for any V_{DD} and T_A conditions	-1 ⁽¹⁾	—	1 ⁽¹⁾	%
	HSI oscillator accuracy (factory calibrated)	$V_{DD} = 3.0\text{ V} \leq V_{DD} \leq 5.5\text{ V}$, $-40\text{ °C} \leq T_A \leq 145\text{ °C}$	-0.5 ⁽¹⁾	—	0.5 ⁽¹⁾	%
$t_{su(HSI)}$	HSI oscillator wakeup time	—	—	—	2 ⁽²⁾	μs

1. Depending on option byte setting (OPT3 and NOPT3)

2. Guaranteed by characterization, not tested in production

Figure 17. Typical HSI frequency vs V_{DD}

Low speed internal RC oscillator (LSI)

Subject to general operating conditions for V_{DD} and T_A .

Table 45. LSI oscillator characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{LSI}	Frequency	—	112	128	144	kHz
$t_{su(LSI)}$	LSI oscillator wakeup time	—	—	—	7 ⁽¹⁾	μs

1. Data based on characterization results, not tested in production.

Figure 18. Typical LSI frequency vs V_{DD}

11.3.4 Memory characteristics

Flash program memory/data EEPROM memory

General conditions: $T_A = -40$ to $125\text{ }^{\circ}\text{C}$.

Table 46. Flash program memory/data EEPROM memory

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{DD}	Operating voltage (all modes, execution/write/erase)	f_{CPU} is 0 to 16 MHz with 0 ws	3.0	—	5.5	V
V_{DD}	Operating voltage (code execution)	f_{CPU} is 0 to 16 MHz with 0 ws	2.6	—	5.5	
t_{prog}	Standard programming time (including erase) for byte/word/block (1 byte/4 bytes/128 bytes)	—	—	6	6.6	ms
	Fast programming time for 1 block (128 bytes)	—	—	3	3.3	
t_{erase}	Erase time for 1 block (128 bytes)	—	—	3	3.3	ms

Table 47. Program memory

Symbol	Parameter	Condition	Min	Max	Unit
T_{WE}	Temperature for writing and erasing	—	-40	125	$^{\circ}\text{C}$
N_{WE}	Program memory endurance (erase/write cycles) ⁽¹⁾	$T_A = 25\text{ }^{\circ}\text{C}$	1000	—	cycles
t_{RET}	Data retention time	$T_A = 25\text{ }^{\circ}\text{C}$	40	—	years
		$T_A = 55\text{ }^{\circ}\text{C}$	20	—	

1. The physical granularity of the memory is four bytes, so cycling is performed on four bytes even when a write/erase operation addresses a single byte.

Table 48. Data memory

Symbol	Parameter	Condition	Min	Max	Unit
T _{WE}	Temperature for writing and erasing	—	-40	125	°C
				145	
N _{WE}	Data memory endurance ⁽¹⁾ (erase/write cycles)	T _A = 25 °C	300 k	—	cycles
		T _A = -40°C to 125 °C	100 k ⁽²⁾	—	
t _{RET}	Data retention time	T _A = 25 °C	40 ⁽²⁾⁽³⁾	—	years
		T _A = 55 °C	20 ⁽²⁾⁽³⁾	—	

1. The physical granularity of the memory is four bytes, so cycling is performed on four bytes even when a write/erase operation addresses a single byte.
2. More information on the relationship between data retention time and number of write/erase cycles is available in a separate technical document.
3. Retention time for 256B of data memory after up to 1000 cycles at 125 °C.

11.3.5 I/O port pin characteristics

General characteristics

Subject to general operating conditions for V_{DD} and T_A unless otherwise specified. All unused pins must be kept at a fixed voltage, using the output mode of the I/O for example or an external pull-up or pull-down resistor.

Table 49. I/O static characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{IL}	Input low level voltage	—	-0.3 V		$0.3 \times V_{DD}$	—
V_{IH}	Input high level voltage		$0.7 \times V_{DD}$		$V_{DD} + 0.3 \text{ V}$	
V_{hys}	Hysteresis ⁽¹⁾		—	$0.1 \times V_{DD}$	—	
V_{OH}	Output high level voltage	Standard I/O, $V_{DD} = 5 \text{ V}$, $I = 3 \text{ mA}$	$V_{DD} - 0.5 \text{ V}$	—	—	—
		Standard I/O, $V_{DD} = 3 \text{ V}$, $I = 1.5 \text{ mA}$	$V_{DD} - 0.4 \text{ V}$	—	—	
V_{OL}	Output low level voltage	High sink and true open drain I/O, $V_{DD} = 5 \text{ V}$ $I = 8 \text{ mA}$	—	—	0.5	V
		Standard I/O, $V_{DD} = 5 \text{ V}$ $I = 3 \text{ mA}$	—	—	0.6	
		Standard I/O, $V_{DD} = 3 \text{ V}$ $I = 1.5 \text{ mA}$	—	—	0.4	
R_{pu}	Pull-up resistor	$V_{DD} = 5 \text{ V}$, $V_{IN} = V_{SS}$	35	50	65	k Ω
t_R, t_F	Rise and fall time (10% - 90%)	Fast I/Os Load = 50 pF	—	—	20 ⁽²⁾	ns
		Standard and high sink I/Os Load = 50 pF	—	—	125 ⁽²⁾	
I_{lkg}	Digital input pad leakage current	$V_{SS} \leq V_{IN} \leq V_{DD}$	—	—	± 1	μA
$I_{lkg \text{ ana}}$	Analog input pad leakage current	$V_{SS} \leq V_{IN} \leq V_{DD}$ $-40^\circ\text{C} < T_A < 125^\circ\text{C}$	—	—	± 250	nA
$I_{lkg \text{ ana}}$	Analog input pad leakage current	$V_{SS} \leq V_{IN} \leq V_{DD}$ $-40^\circ\text{C} < T_A < 145^\circ\text{C}$	—	—	TBD	
$I_{lkg(inj)}$	Leakage current in adjacent I/O ⁽²⁾	Injection current $\pm 4 \text{ mA}$	—	—	± 1 ⁽²⁾	μA
I_{DDIO}	Total current on either V_{DDIO} or V_{SSIO}	Including injection currents	—	—	60	mA

1. Hysteresis voltage between Schmitt trigger switching levels. Based on characterization results, not tested in production.

2. Data based on characterization results, not tested in production.

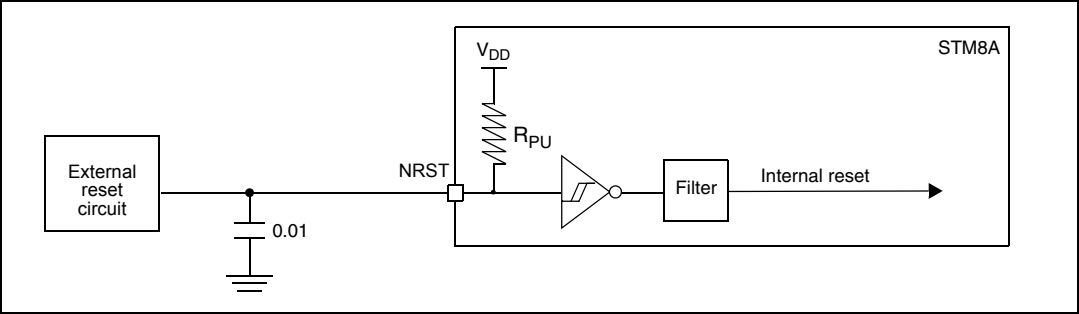

Figure 34. Typical NRST pull-up current I_{pu} vs V_{DD}

The reset network shown in [Figure 35](#) protects the device against parasitic resets.

Figure 35. Recommended reset pin protection

11.3.7 TIM 1, 2, 3, and 4 timer specifications

Subject to general operating conditions for V_{DD} , f_{MASTER} , and T_A unless otherwise specified.

Table 51. TIM 1, 2, 3, and 4 electrical specifications

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{EXT}	Timer external clock frequency ⁽¹⁾	—	—	—	16	MHz

1. Not tested in production. On 64 Kbyte devices, the frequency is limited to 16 MHz.

11.3.8 SPI serial peripheral interface

Unless otherwise specified, the parameters given in [Table 52](#) are derived from tests performed under ambient temperature, f_{MASTER} frequency and V_{DD} supply voltage conditions. $t_{\text{MASTER}} = 1/f_{\text{MASTER}}$.

Refer to I/O port characteristics for more details on the input/output alternate function characteristics (NSS, SCK, MOSI, MISO).

Table 52. SPI characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
f_{SCK} $1/t_{\text{c(SCK)}}$	SPI clock frequency	Master mode	0	10	MHz
		Slave mode	$V_{\text{DD}} < 4.5 \text{ V}$	6 ⁽¹⁾	
			$V_{\text{DD}} = 4.5 \text{ V to } 5.5 \text{ V}$	8 ⁽¹⁾

11.3.9 I²C interface characteristicsTable 53. I²C characteristics

Symbol	Parameter	Standard mode I ² C		Fast mode I ² C ⁽¹⁾		Unit
		Min ⁽²⁾	Max ⁽²⁾	Min ⁽²⁾	Max ⁽²⁾	
t _w (SCLL)	SCL clock low time	4.7	—	1.3	—	μs
t _w (SCLH)	SCL clock high time	4.0	—	0.6	—	
t _{su} (SDA)	SDA setup time	250	—	100	—	ns
t _h (SDA)	SDA data hold time	0 ⁽³⁾	—	0 ⁽⁴⁾	900 ⁽³⁾	
t _r (SDA) t _r (SCL)	SDA and SCL rise time (V _{DD} 3 ... 5.5 V)	—	1000	—	300	
t _f (SDA) t _f (SCL)	SDA and SCL fall time (V _{DD} 3 ... 5.5 V)	—	300	—	300	
t _h (STA)	START condition hold time	4.0	—	0.6	—	μs
t _{su} (STA)	Repeated START condition setup time	4.7	—	0.6	—	
t _{su} (STO)	STOP condition setup time	4.0	—	0.6	—	μs
t _w (STO:STA)	STOP to START condition time (bus free)	4.7	—	1.3	—	μs
C _b	Capacitive load for each bus line	—	400	—	400	pF

1. f_{MASTER} must be at least 8 MHz to achieve max fast I²C speed (400 kHz)
2. Data based on standard I²C protocol requirement, not tested in production
3. The maximum hold time of the start condition has only to be met if the interface does not stretch the low time
4. The device must internally provide a hold time of at least 300 ns for the SDA signal in order to bridge the undefined region of the falling edge of SCL

11.3.10 10-bit ADC characteristics

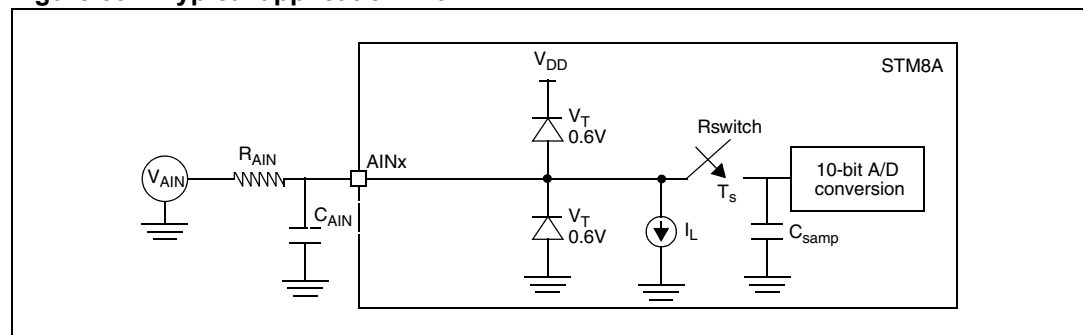

Subject to general operating conditions for V_{DDA} , f_{MASTER} , and T_A unless otherwise specified.

Table 54. ADC characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{ADC}	ADC clock frequency	—	111 kHz	—	4 MHz	kHz/MHz
V_{DDA}	Analog supply	—	3	—	5.5	V
V_{REF+}	Positive reference voltage	—	2.75	—	V_{DDA}	
V_{REF-}	Negative reference voltage	—	V_{SSA}	—	0.5	
V_{AIN}	Conversion voltage range ⁽¹⁾	—	V_{SSA}	—	V_{DDA}	
		Devices with external V_{REF+}/V_{REF-} pins	V_{REF-}	—	V_{REF+}	
C_{smp}	Internal sample and hold capacitor	—	—	—	3	pF
$t_S^{(1)}$	Sampling time ($3 \times 1/f_{ADC}$)	$f_{ADC} = 2$ MHz	—	1.5	—	μs
		$f_{ADC} = 4$ MHz	—	0.75	—	
t_{STAB}	Wakeup time from standby	$f_{ADC} = 2$ MHz	—	7	—	
		$f_{ADC} = 4$ MHz	—	3.5	—	
t_{CONV}	Total conversion time including sampling time ($14 \times 1/f_{ADC}$)	$f_{ADC} = 2$ MHz	—	7	—	
		$f_{ADC} = 4$ MHz	—	3.5	—	
R_{switch}	Equivalent switch resistance	—	—	—	30	k Ω

1. During the sample time, the sampling capacitance, C_{smp} (3 pF typ), can be charged/discharged by the external source. The internal resistance of the analog source must allow the capacitance to reach its final voltage level within t_S . After the end of the sample time t_S , changes of the analog input voltage have no effect on the conversion result.

Figure 39. Typical application with ADC

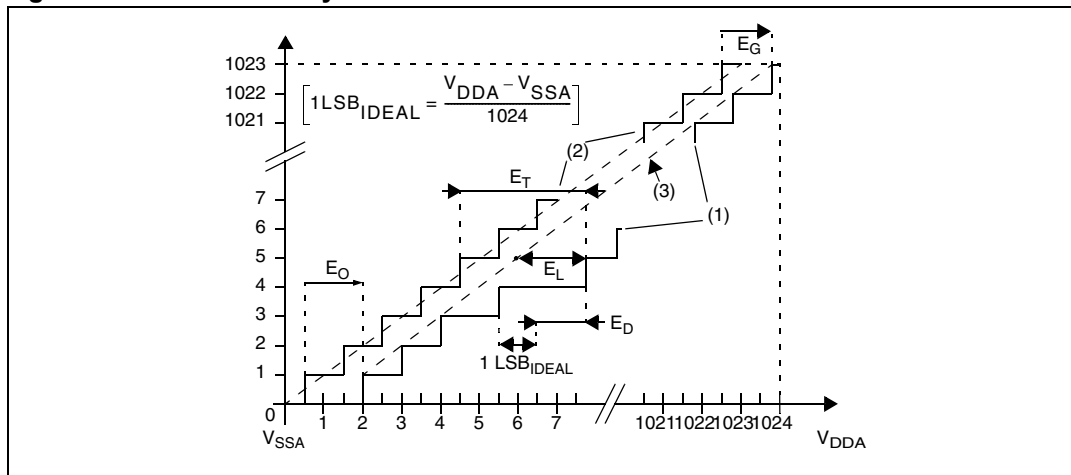

1. Legend: R_{AIN} = external resistance, C_{AIN} = capacitors, C_{smp} = internal sample and hold capacitor.

Table 55. ADC accuracy for $V_{DDA} = 5\text{ V}$

Symbol	Parameter	Conditions	Typ	Max ⁽¹⁾	Unit
$ E_T $	Total unadjusted error ⁽²⁾	$f_{\text{ADC}} = 2\text{ MHz}$	1.4	3 ⁽³⁾	LSB
$ E_O $	Offset error ⁽²⁾		0.8	3	
$ E_G $	Gain error ⁽²⁾		0.1	2	
$ E_D $	Differential linearity error ⁽²⁾		0.9	1	
$ E_L $	Integral linearity error ⁽²⁾		0.7	1.5	
$ E_T $	Total unadjusted error ⁽²⁾	$f_{\text{ADC}} = 4\text{ MHz}$	1.9 ⁽⁴⁾	4 ⁽⁴⁾	
$ E_O $	Offset error ⁽²⁾		1.3 ⁽⁴⁾	4 ⁽⁴⁾	
$ E_G $	Gain error ⁽²⁾		0.6 ⁽⁴⁾	3 ⁽⁴⁾	
$ E_D $	Differential linearity error ⁽²⁾		1.5 ⁽⁴⁾	2 ⁽⁴⁾	
$ E_L $	Integral linearity error ⁽²⁾		1.2 ⁽⁴⁾	1.5 ⁽⁴⁾	

1. Max value is based on characterization, not tested in production.
2. ADC accuracy vs. injection current: Any positive or negative injection current within the limits specified for $I_{\text{INJ(PIN)}}$ and $\Sigma I_{\text{INJ(PIN)}}$ in [Section 11.3.5](#) does not affect the ADC accuracy.
3. TUE 2LSB can be reached on specific salestypes in the whole temperature range.
4. Target values.

Figure 40. ADC accuracy characteristics

1. Example of an actual transfer curve
2. The ideal transfer curve
3. End point correlation line
 E_T = Total unadjusted error: Maximum deviation between the actual and the ideal transfer curves.
 E_O = Offset error: Deviation between the first actual transition and the first ideal one.
 E_G = Gain error: Deviation between the last ideal transition and the last actual one.
 E_D = Differential linearity error: Maximum deviation between actual steps and the ideal one.
 E_L = Integral linearity error: Maximum deviation between any actual transition and the end point correlation line.

11.3.11 EMC characteristics

Susceptibility tests are performed on a sample basis during product characterization.

Functional EMS (electromagnetic susceptibility)

While executing a simple application (toggling 2 LEDs through I/O ports), the product is stressed by two electromagnetic events until a failure occurs (indicated by the LEDs).

- **ESD:** Electrostatic discharge (positive and negative) is applied on all pins of the device until a functional disturbance occurs. This test conforms with the IEC 1000-4-2 standard.
- **FTB:** A burst of fast transient voltage (positive and negative) is applied to V_{DD} and V_{SS} through a 100 pF capacitor, until a functional disturbance occurs. This test conforms with the IEC 1000-4-4 standard.

A device reset allows normal operations to be resumed. The test results are given in the table below based on the EMS levels and classes defined in application note AN1709.

Designing hardened software to avoid noise problems

EMC characterization and optimization are performed at component level with a typical application environment and simplified MCU software. It should be noted that good EMC performance is highly dependent on the user application and the software in particular.

Therefore it is recommended that the user applies EMC software optimization and prequalification tests in relation with the EMC level requested for his application.

Software recommendations

The software flowchart must include the management of runaway conditions such as:

- Corrupted program counter
- Unexpected reset
- Critical data corruption (control registers...)

Prequalification trials

Most of the common failures (unexpected reset and program counter corruption) can be recovered by applying a low state on the NRST pin or the oscillator pins for 1 second.

To complete these trials, ESD stress can be applied directly on the device, over the range of specification values. When unexpected behavior is detected, the software can be hardened to prevent unrecoverable errors occurring (see application note AN1015).

Table 56. EMS data

Symbol	Parameter	Conditions	Level/class
V_{FESD}	Voltage limits to be applied on any I/O pin to induce a functional disturbance	$V_{DD} = 3.3\text{ V}$, $T_A = 25\text{ }^{\circ}\text{C}$, $f_{MASTER} = 16\text{ MHz}$ (HSI clock), Conforms to IEC 1000-4-2	3B
V_{EFTB}	Fast transient voltage burst limits to be applied through 100 pF on V_{DD} and V_{SS} pins to induce a functional disturbance	$V_{DD} = 3.3\text{ V}$, $T_A = 25\text{ }^{\circ}\text{C}$, $f_{MASTER} = 16\text{ MHz}$ (HSI clock), Conforms to IEC 1000-4-4	4A

Electromagnetic interference (EMI)

Emission tests conform to the SAE J 1752/3 standard for test software, board layout and pin loading.

Table 57. EMI data

Symbol	Parameter	Conditions				Unit
		General conditions	Monitored frequency band	Max f _{CPU} ⁽¹⁾		
				8 MHz	16 MHz	
S _{EMI}	Peak level	V _{DD} = 5 V, T _A = 25 °C, LQFP80 package conforming to SAE J 1752/3	0.1 MHz to 30 MHz	15	17	dBμV
			30 MHz to 130 MHz	18	22	
			130 MHz to 1 GHz	-1	3	
	SAE EMI level		—	2	2.5	

1. Data based on characterization results, not tested in production.

Absolute maximum ratings (electrical sensitivity)

Based on two different tests (ESD and LU) using specific measurement methods, the product is stressed to determine its performance in terms of electrical sensitivity. For more details, refer to the application note AN1181.

Electrostatic discharge (ESD)

Electrostatic discharges (3 positive then 3 negative pulses separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts*(n+1) supply pin). This test conforms to the JESD22-A114A/A115A standard. For more details, refer to the application note AN1181.

Table 58. ESD absolute maximum ratings

Symbol	Ratings	Conditions	Class	Maximum value ⁽¹⁾	Unit
$V_{ESD(HBM)}$	Electrostatic discharge voltage (Human body model)	$T_A = 25\text{ }^{\circ}\text{C}$, conforming to JESD22-A114	3A	4000	V
$V_{ESD(CDM)}$	Electrostatic discharge voltage (Charge device model)	$T_A = 25\text{ }^{\circ}\text{C}$, conforming to JESD22-C101	3	500	
$V_{ESD(MM)}$	Electrostatic discharge voltage (Machine model)	$T_A = 25\text{ }^{\circ}\text{C}$, conforming to JESD22-A115	B	200	

1. Data based on characterization results, not tested in production

Static latch-up

Two complementary static tests are required on 10 parts to assess the latch-up performance.

- A supply overvoltage (applied to each power supply pin) and
- A current injection (applied to each input, output and configurable I/O pin) are performed on each sample.

This test conforms to the EIA/JESD 78 IC latch-up standard. For more details, refer to the application note AN1181.

Table 59. Electrical sensitivities

Symbol	Parameter	Conditions	Class ⁽¹⁾
LU	Static latch-up class	T _A = 25 °C	A
		T _A = 85 °C	
		T _A = 125 °C	
		T _A = 145 °C	

1. Class description: A Class is an STMicroelectronics internal specification. All its limits are higher than the JEDEC specifications, that means when a device belongs to class A it exceeds the JEDEC standard. B class strictly covers all the JEDEC criteria (international standard).

11.4 Thermal characteristics

In case the maximum chip junction temperature (T_{Jmax}) specified in [Table 35: General operating conditions on page 58](#) is exceeded, the functionality of the device cannot be guaranteed.

T_{Jmax} , in degrees Celsius, may be calculated using the following equation:

$$T_{Jmax} = T_{Amax} + (P_{Dmax} \times \Theta_{JA})$$

Where:

- T_{Amax} is the maximum ambient temperature in °C
- Θ_{JA} is the package junction-to-ambient thermal resistance in °C/W
- P_{Dmax} is the sum of P_{INTmax} and $P_{I/Omax}$ ($P_{Dmax} = P_{INTmax} + P_{I/Omax}$)
- P_{INTmax} is the product of I_{DD} and V_{DD} , expressed in Watts. This is the maximum chip internal power.
- $P_{I/Omax}$ represents the maximum power dissipation on output pins

Where:

$$P_{I/Omax} = \Sigma (V_{OL} \cdot I_{OL}) + \Sigma ((V_{DD} - V_{OH}) \cdot I_{OH}),$$

taking into account the actual V_{OL}/I_{OL} and V_{OH}/I_{OH} of the I/Os at low and high level in the application.

Table 60. Thermal characteristics⁽¹⁾

Symbol	Parameter	Value	Unit
Θ_{JA}	Thermal resistance junction-ambient LQFP 48 - 7 x 7 mm	57	°C/W
Θ_{JA}	Thermal resistance junction-ambient LQFP 32 - 7 x 7 mm	59	°C/W

1. Thermal resistances are based on JEDEC JESD51-2 with 4-layer PCB in a natural convection environment.

11.4.1 Reference document

JESD51-2 integrated circuits thermal test method environment conditions - natural convection (still air). Available from www.jedec.org.

11.4.2 Selecting the product temperature range

When ordering the microcontroller, the temperature range is specified in the order code (see [Figure 43: STM8A order codes on page 90](#)).

The following example shows how to calculate the temperature range needed for a given application.

Assuming the following application conditions:

Maximum ambient temperature $T_{Amax} = 82\text{ }^{\circ}\text{C}$ (measured according to JESD51-2),
 $I_{DDmax} = 14\text{ mA}$, $V_{DD} = 5\text{ V}$, maximum 20 I/Os used at the same time in output at low level with $I_{OL} = 8\text{ mA}$, $V_{OL} = 0.4\text{ V}$

$$P_{INTmax} = 14\text{ mA} \times 5\text{ V} = 70\text{ mW}$$

$$P_{IOmax} = 20 \times 8\text{ mA} \times 0.4\text{ V} = 64\text{ mW}$$

This gives: $P_{INTmax} = 70\text{ mW}$ and $P_{IOmax} = 64\text{ mW}$:

$$P_{Dmax} = 70\text{ mW} + 64\text{ mW}$$

Thus: $P_{Dmax} = 134\text{ mW}$.

Using the values obtained in [Table 60: Thermal characteristics on page 85](#) T_{Jmax} is calculated as follows:

For LQFP64 $46\text{ }^{\circ}\text{C/W}$

$$T_{Jmax} = 82\text{ }^{\circ}\text{C} + (46\text{ }^{\circ}\text{C/W} \times 134\text{ mW}) = 82\text{ }^{\circ}\text{C} + 6\text{ }^{\circ}\text{C} = 88\text{ }^{\circ}\text{C}$$

This is within the range of the suffix B version parts ($-40 < T_J < 105\text{ }^{\circ}\text{C}$).

Parts must be ordered at least with the temperature range suffix B.

12 Package characteristics

To meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions, and product status are available at www.st.com.

12.1 Package mechanical data

Figure 41. 48-pin low profile quad flat package (7 x 7)

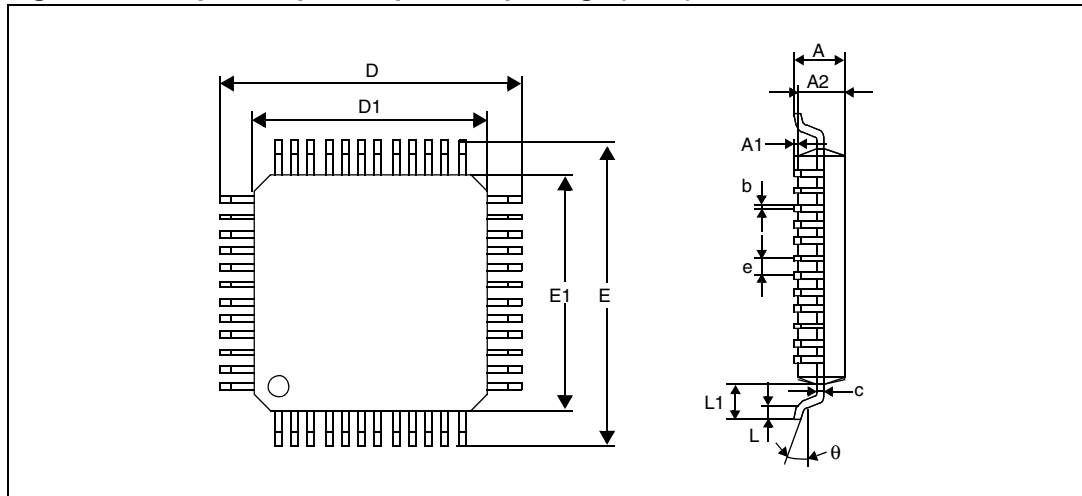

Table 61. 48-pin low profile quad flat package mechanical data

13 Ordering information

Figure 43. STM8A order codes

1. Customer specific FASTROM code or custom device configuration. This field shows 'SSS' if the device contains a super set silicon, usually equipped with bigger memory and more I/Os. This silicon is supposed to be replaced later by the target silicon.

14 Known limitations

14.1 Core

14.1.1 Wait for event (WFE) instruction not supported

Description

The WFE instruction is not implemented in devices covered by this datasheet. The WFE instruction is used to synchronize computing resources and not relevant for the present implementation. For further details on this instruction, see the STM8 CPU programming manual (PM0044) on www.st.com.

Workaround

Not applicable.

14.1.2 JRIL and JRIH instructions not supported

Description

JRIL (jump if port INT pin = 0) and JRIH (jump if port INT pin = 1) are not supported in devices covered by this datasheet. If implemented, they are conditional jumps: JRIL jumps if one of the external interrupt lines is low and JRIH jumps if one of the external interrupt lines is high. In these devices, JRIL is equivalent to an unconditional jump and JRIH is equivalent to NOP. For further details on these instructions, see the STM8 CPU programming manual (PM0044) on www.st.com.

Workaround

Not applicable.

14.1.3 CPU does not return to HALT if AL bit is set

Description

When the AL bit is set, the cpu does not return to HALT mode after exiting an ISR. It returns to main and executes the next instruction after the HALT instruction.

Workaround

Not applicable.

14.1.4 Main does not resume after ISR resets the AL bit

Description

If the core is in wait for interrupt state and the AL bit is set, the core returns to the wait for interrupt state after executing an ISR. If it is needed to continue the main program, the AL bit has to be reset inside the ISR. In case resetting the bit is performed just before exiting the ISR, the core may remain stalled.

Workaround

The AL bit has to be reset at least two instructions before the IRET instruction.

14.2 I²C interface

14.2.1 Misplaced NACK when receiving 2 bytes

Description

When receiving two bytes (in Master mode) the usual flow is:

1. Set POS and ACK to '1'
2. Wait for ADDR event, program ACK to '0' and clear ADDR
3. Wait for BTF event, program STOP to '1' and read the 2 received bytes.

As there is a limitation in the interpretation of the POS bit, it may occur that the NACK bit is sent erroneously after the first byte. The sender will receive a wrongly placed NACK.

Workaround

Use a different software flow for ADDR and ACK clearing:

1. Wait for ADDR flag to be set
2. Mask interrupts
3. Clear ADDR
4. Clear ACK bit
5. Re-enable interrupts

As the TLI is not maskable, this sw workaround can not be applied in an application that makes use of the TLI.

14.2.2 Data register corrupted

Description

When BTF = 1 (last data received) and the SW sequence

```
SET STOP  
READ N-1  
READ N
```

is delayed - for instance by an interrupt - and the N-1 data is not read before the next SCL rising edge, the content of the shift register may be shifted to the left by 1 bit. In this case the second data cannot be read correctly.

Workaround

Mask all active interrupts between the SET STOP and the READ N-1 instruction. As the TLI is not maskable, this sw workaround can not be applied in an application that makes use of the TLI.

14.2.3 Delay in programming of STOP leads to reception of supplementary byte

Description

Usually, when receiving one byte in master mode the STOP bit in the control register will be programmed right after the ADDR clearing in order to generate a STOP condition after the reception of the byte. If the programming of the STOP bit is delayed after the end of the

reception of the first byte, the master may receive another byte before the STOP condition assertion.

Consequently one false data is received.

Workaround

Mask interrupts while performing ADDR clear and the STOP bit programming. As the TLI is not maskable, this sw workaround can not be applied in an application that makes use of the TLI.

14.2.4 START badly generated after misplaced STOP

Description

In case START is requested in the control register I²C_CR2 and a misplaced STOP occurs on the bus, leading to a bus error, the START condition on the bus may be badly generated by the I²C peripheral (glitch on SDA then SDA and SCL tied low at the same time).

Workaround

If a bus error is detected (via flag and/or interrupt), the sw should check whether a START condition was requested through the control register. If this is the case, a STOP condition should be generated followed by a new START condition. This does not avoid the badly generated START condition, but the network is able to re-synchronize on the new START condition.

14.3 USART interface

14.3.1 Parity error flag (PE) is not correctly set in overrun condition

Description

If an overrun condition occurs, the parity error flag is not set for the frame which is leading to the overrun condition. The PE flag represents the status of the last correctly received frame.

Workaround

Not applicable.

14.4 LINUART

14.4.1 Framing error issue with data byte 0x00

Description

If LINUART is configured in LIN slave mode and active mode with break detection threshold set to 11-bit, receiving a data byte with value 0x00 with a framing error, followed by a recessive state, will not set FE and RXNE flags. This occurs only if the dominant state length is in between 9.56 and 10.56 bit times.

Workaround

The LIN driver sw can handle this exceptional case by implementing frame timeouts in sw. In this case the application behavior is conform to the LIN standard. This method is implemented in the ST LIN 2.1 driver stack which passes the LIN conformance tests.

14.4.2 Framing error issue at reception of identifier (ID)

Description

In case of ID framing error when the IP is in active mode, both flags LHE and LHDF are set at the end of the LIN header with ID framing error.

Workaround

The LIN driver sw can handle this case by evaluating both all of the flags upon header reception.

14.4.3 Parity error issue at reception of identifier (ID)

Description

In case of ID parity error IP wakes up from mute mode and both flags LHE and LHDF are set at the end of the LIN header with parity error. The PE flag is also set.

Workaround

The LIN driver sw can handle this case by evaluating all of the flags upon header reception.

14.4.4 OR flag not correctly set in LIN master mode

Description

If the LINUART operates in master mode, the OR flag is not set in case an overrun condition occurs.

Workaround

The LIN driver sw will detect this case through a LIN protocol error.

14.4.5 LIN header error when automatic resynchronization is enabled

Description

If the LINUART is configured in LIN slave mode (LSLV bit is set) and if automatic resynchronization is enabled (LASE bit is set), LHE flag may be set instead of LHDF flag when receiving a valid header.

Workaround

There is no workaround.

14.5 Clock controller

14.5.1 HSI cannot be switched off in run mode

Description

The internal 16MHz RC oscillator cannot be switched off in run mode, even if the HSIEN bit is programmed to "0".

Workaround

Not applicable.

14.6 SPI interface

14.6.1 Last bit too short if SPI is disabled during communication

Description

The issue may arise in the case that the SPI is acting as a master, the baud rate generator has his prescaler equal to 2. If under these conditions, the SPI is disabled during an ongoing communication, the AFOEN (alternate function output enable) signal of the data and clock output are switched off at the last strobing edge of the SPI clock.

As a consequence the length of the last bit is out of specification and its reception on the bus is not ensured.

Workaround

Check whether a communication is ongoing before disabling the SPI by observing the BSY bit.

14.7 ADC

14.7.1 EOC interrupt triggered when AWDIE=1 and EOCIE=1

Description

When the analog watchdog is enabled and AWDIE and EOCIE are both set to one, the ADC interrupt should only be triggered in case the conversion result exceeds one of the analog watchdog thresholds (see table 79 in the reference manual RM 0009).

In the present device however, in this configuration, the interrupt is triggered after each conversion, leading to a high interrupt load.

Workaround

Use the configuration AWDIE=1 and EOCIE=0 instead and stop the conversions inside the ISR by resetting the CONT bit. However the latest conversion result having triggered the watchdog may be overwritten.

15 STM8 development tools

Development tools for the STM8A microcontrollers include the

- STice emulation system offering tracing and code profiling
- STVD high-level language debugger including assembler and visual development environment - seamless integration of third party C compilers.
- STVP Flash programming software

In addition, the STM8A comes with starter kits, evaluation boards and low-cost in-circuit debugging/programming tools.

15.1 Emulation and in-circuit debugging tools

The STM8 tool line includes the STice emulation system offering a complete range of emulation and in-circuit debugging features on a platform that is designed for versatility and cost-effectiveness. In addition, STM8A application development is supported by a low-cost in-circuit debugger/programmer.

The STice is the fourth generation of full-featured emulators from STMicroelectronics. It offers new advanced debugging capabilities including tracing, profiling and code coverage analysis to help detect execution bottlenecks and dead code.

In addition, STice offers in-circuit debugging and programming of STM8A microcontrollers via the STM8 single wire interface module (SWIM), which allows non-intrusive debugging of an application while it runs on the target microcontroller.

For improved cost effectiveness, STice is based on a modular design that allows you to order exactly what you need to meet your development requirements and to adapt your emulation system to support existing and future ST microcontrollers.

15.1.1 STice key features

- Program and data trace recording up to 128 K records
- Advanced breakpoints with up to 4 levels of conditions
- Data breakpoints
- Real-time read/write of all device resources during emulation
- Occurrence and time profiling and code coverage analysis (new features)
- In-circuit debugging/programming via SWIM protocol
- 8-bit probe analyzer
- 1 input and 2 output triggers
- USB 2.0 high speed interface to host PC
- Power supply follower managing application voltages between 1.62 to 5.5 V
- Modularity that allows you to specify the components you need to meet your development requirements and adapt to future requirements.
- Supported by free software tools that include integrated development environment (IDE), programming software interface and assembler for STM8.

15.2 Software tools

STM8 development tools are supported by a complete, free software package from STMicroelectronics that includes ST visual develop (STVD) IDE and the ST visual programmer (STVP) software interface. STVD provides seamless integration of the Cosmic C compiler for STM8, which is available in a free version that outputs up to 16 Kbytes of code.

15.2.1 STM8 toolset

The STM8 toolset with STVD integrated development environment and STVP programming software is available for free download at www.st.com/mcu. This package includes:

ST visual develop

Full-featured integrated development environment from STMicroelectronics, featuring:

- Seamless integration of C and ASM toolsets
- Full-featured debugger
- Project management
- Syntax highlighting editor
- Integrated programming interface
- Support of advanced emulation features for STice such as code profiling and coverage

ST visual programmer (STVP)

Easy-to-use, unlimited graphical interface allowing read, write and verification of the STM8A microcontroller's Flash memory. STVP also offers project mode for saving programming configurations and automating programming sequences.

15.2.2 C and assembly toolchains

Control of C and assembly toolchains is seamlessly integrated into the STVD integrated development environment, making it possible to configure and control the building of your application directly from an easy-to-use graphical interface.

Available toolchains include:

C compiler for STM8

Available in a free version that outputs up to 16 Kbytes of code. For more information, see www.cosmic-software.com, www.raisonance.com

STM8 assembler linker

Free assembly toolchain included in the STM8 toolset, which allows you to assemble and link your application source code.

15.3 Programming tools

During the development cycle, STice provides in-circuit programming of the STM8A Flash microcontroller on your application board via the SWIM protocol. Additional tools are to include a low-cost in-circuit programmer as well as ST socket boards, which provide dedicated programming platforms with sockets for programming your STM8A.

For production environments, programmers will include a complete range of gang and automated programming solutions from third-party tool developers already supplying programmers for the STM8 family.

16 Revision history

Table 63. Document revision history

Date	Revision	Changes
22-Aug-2008	1	Initial release
10-Aug-2009	2	Document revised as the following: Updated Features on page 1 ; Updated Table 1: Device summary ; Updated Section 3: Product line-up ; Changed Section 5: Product features ; Updated Section 6: Pinouts and pin description ; Changed Section 9: Memory map ; Updated Section 8: Interrupt table ; Updated Section 10: Option bytes ; Updated Section 11: Electrical characteristics ; Updated Section 12: Package characteristics ; Updated Section 13: Ordering information ; Added Section 14: Known limitations .
22-Oct-2009	3	Updated Table 6: STM8A 32 Kbytes microcontroller pin description . Added Section 14.4.5: LIN header error when automatic resynchronization is enabled .

Please Read Carefully:

Information in this document is provided solely in connection with ST products. STMicroelectronics NV and its subsidiaries ("ST") reserve the right to make changes, corrections, modifications or improvements, to this document, and the products and services described herein at any time, without notice.

All ST products are sold pursuant to ST's terms and conditions of sale.

Purchasers are solely responsible for the choice, selection and use of the ST products and services described herein, and ST assumes no liability whatsoever relating to the choice, selection or use of the ST products and services described herein.

No license, express or implied, by estoppel or otherwise, to any intellectual property rights is granted under this document. If any part of this document refers to any third party products or services it shall not be deemed a license grant by ST for the use of such third party products or services, or any intellectual property contained therein or considered as a warranty covering the use in any manner whatsoever of such third party products or services or any intellectual property contained therein.

UNLESS OTHERWISE SET FORTH IN ST'S TERMS AND CONDITIONS OF SALE ST DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY WITH RESPECT TO THE USE AND/OR SALE OF ST PRODUCTS INCLUDING WITHOUT LIMITATION IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE (AND THEIR EQUIVALENTS UNDER THE LAWS OF ANY JURISDICTION), OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.

UNLESS EXPRESSLY APPROVED IN WRITING BY AN AUTHORIZED ST REPRESENTATIVE, ST PRODUCTS ARE NOT RECOMMENDED, AUTHORIZED OR WARRANTED FOR USE IN MILITARY, AIR CRAFT, SPACE, LIFE SAVING, OR LIFE SUSTAINING APPLICATIONS, NOR IN PRODUCTS OR SYSTEMS WHERE FAILURE OR MALFUNCTION MAY RESULT IN PERSONAL INJURY, DEATH, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE. ST PRODUCTS WHICH ARE NOT SPECIFIED AS "AUTOMOTIVE GRADE" MAY ONLY BE USED IN AUTOMOTIVE APPLICATIONS AT USER'S OWN RISK.

Resale of ST products with provisions different from the statements and/or technical features set forth in this document shall immediately void any warranty granted by ST for the ST product or service described herein and shall not create or extend in any manner whatsoever, any liability of ST.
