3. When the BUSY bit in the **I2CMCS** register is 0, the Master writes 0x3 to the **I2CMCS** register to initiate a transfer.
4. The Master does not generate a STOP condition but instead writes another slave address to the **I2CMSA** register and then writes 0x3 to initiate the repeated START.

A repeated start sequence for a Master receive is similar:

1. When the device is in idle, the Master writes the slave address to the **I2CMSA** register and configures the R/S bit for the desired transfer type.
2. The master reads data from the **I2CMDBR** register.
3. When the BUSY bit in the **I2CMCS** register is 0, the Master writes 0x3 to the **I2CMCS** register to initiate a transfer.
4. The Master does not generate a STOP condition but instead writes another slave address to the **I2CMSA** register and then writes 0x3 to initiate the repeated START.

For more information on repeated START, refer to Figure 15-12 on page 943 and Figure 15-13 on page 944.

#### 15.3.1.6 Clock Low Timeout (CLTO)

The I<sup>2</sup>C slave can extend the transaction by pulling the clock low periodically to create a slow bit transfer rate. The I<sup>2</sup>C module has a 12-bit programmable counter that is used to track how long the clock has been held low. The upper 8 bits of the count value are software programmable through the **I<sup>2</sup>C Master Clock Low Timeout Count (I2CMCLKOCNT)** register. The lower four bits are not user visible and are 0x0. The CNTL value programmed in the **I2CMCLKOCNT** register has to be greater than 0x01. The application can program the eight most significant bits of the counter to reflect the acceptable cumulative low period in transaction. The count is loaded at the START condition and counts down on each falling edge of the internal bus clock of the Master. Note that the internal bus clock generated for this counter keeps running at the programmed I<sup>2</sup>C speed even if SCL is held low on the bus. Upon reaching terminal count, the master state machine forces ABORT on the bus by issuing a STOP condition at the instance of SCL and SDA release.

As an example, if an I<sup>2</sup>C module was operating at 100 kHz speed, programming the **I2CMCLKOCNT** register to 0xDA would translate to the value 0xDA0 since the lower four bits are set to 0x0. This would translate to a decimal value of 3488 clocks or a cumulative clock low period of 34.88 ms at 100 kHz.

The CLKRIS bit in the **I<sup>2</sup>C Master Raw Interrupt Status (I2CMRIS)** register is set when the clock timeout period is reached, allowing the master to start corrective action to resolve the remote slave state. In addition, the CLKTO bit in the **I<sup>2</sup>C Master Control/Status (I2CMCS)** register is set; this bit is cleared when a STOP condition is sent or during the I<sup>2</sup>C master reset. The status of the raw SDA and SCL signals are readable by software through the SDA and SCL bits in the **I<sup>2</sup>C Master Bus Monitor (I2CMBMON)** register to help determine the state of the remote slave.

In the event of a CLTO condition, application software must choose how it intends to attempt bus recovery. Most applications may attempt to manually toggle the I<sup>2</sup>C pins to force the slave to let go of the clock signal (a common solution is to attempt to force a STOP on the bus). If a CLTO is detected before the end of a burst transfer, and the bus is successfully recovered by the master, the master hardware attempts to finish the pending burst operation. Depending on the state of the

slave after bus recovery, the actual behavior on the bus varies. If the slave resumes in a state where it can acknowledge the master (essentially, where it was before the bus hang), it continues where it left off. However, if the slave resumes in a reset state (or if a forced STOP by the master causes the slave to enter the idle state), it may ignore the master's attempt to complete the burst operation and NAK the first data byte that the master sends or requests.

Since the behavior of slaves cannot always be predicted, it is suggested that the application software always write the STOP bit in the **I<sup>2</sup>C Master Configuration (I2CMCR)** register during the CLTO interrupt service routine. This limits the amount of data the master attempts to send or receive upon bus recovery to a single byte, and after the single byte is on the wire, the master issues a STOP. An alternative solution is to have the application software reset the I<sup>2</sup>C peripheral before attempting to manually recover the bus. This solution allows the I<sup>2</sup>C master hardware to be returned to a known good (and idle) state before attempting to recover a stuck bus and prevents any unwanted data from appearing on the wire.

**Note:** The Master Clock Low Timeout counter counts for the entire time SCL is held Low continuously. If SCL is deasserted at any point, the Master Clock Low Timeout Counter is reloaded with the value in the **I2CMCLKOCNT** register and begins counting down from this value.

#### 15.3.1.7 Dual Address

The I<sup>2</sup>C interface supports dual address capability for the slave. The additional programmable address is provided and can be matched if enabled. In legacy mode with dual address disabled, the I<sup>2</sup>C slave provides an ACK on the bus if the address matches the OAR field in the **I2CSOAR** register. In dual address mode, the I<sup>2</sup>C slave provides an ACK on the bus if either the OAR field in the **I2CSOAR** register or the OAR2 field in the **I2CSOAR2** register is matched. The enable for dual address is programmable through the OAR2EN bit in the **I2CSOAR2** register and there is no disable on the legacy address.

The OAR2SEL bit in the **I2CSCSR** register indicates if the address that was ACKed is the alternate address or not. When this bit is clear, it indicates either legacy operation or no address match.

#### 15.3.1.8 Arbitration

A master may start a transfer only if the bus is idle. It's possible for two or more masters to generate a START condition within minimum hold time of the START condition. In these situations, an arbitration scheme takes place on the SDA line, while SCL is High. During arbitration, the first of the competing master devices to place a 1 (High) on SDA, while another master transmits a 0 (Low), switches off its data output stage and retires until the bus is idle again.

Arbitration can take place over several bits. Its first stage is a comparison of address bits, and if both masters are trying to address the same device, arbitration continues on to the comparison of data bits.

#### 15.3.1.9 Glitch Suppression in Multi-Master Configuration

When a multi-master configuration is being used, the GFE bit in the **I<sup>2</sup>C Master Configuration (I2CMCR)** register can be set to enable glitch suppression on the SCL and SDA lines and assure proper signal values. The filter can be programmed to different filter widths using the GFPW bit in the **I<sup>2</sup>C Master Configuration 2 (I2CMCR2)** register. The glitch suppression value is in terms of buffered system clocks. Note that all signals will be delayed internally when glitch suppression is nonzero. For example, if GFPW is set to 0x7, 31 clocks should be added onto the calculation for the expected transaction time.

### 15.3.2 Available Speed Modes

The I<sup>2</sup>C bus can run in Standard mode (100 kbps), Fast mode (400 kbps), Fast mode plus (1 Mbps) or High-Speed mode (3.33 Mbps). The selected mode should match the speed of the other I<sup>2</sup>C devices on the bus.

#### 15.3.2.1 Standard, Fast, and Fast Plus Modes

Standard, Fast, and Fast Plus modes are selected using a value in the **I<sup>2</sup>C Master Timer Period (I2CMTPR)** register that results in an SCL frequency of 100 kbps for Standard mode, 400 kbps for Fast mode, or 1 Mbps for Fast mode plus.

The I<sup>2</sup>C clock rate is determined by the parameters *CLK\_PRD*, *TIMER\_PRD*, *SCL\_LP*, and *SCL\_HP* where:

*CLK\_PRD* is the system clock period

*SCL\_LP* is the low phase of SCL (fixed at 6)

*SCL\_HP* is the high phase of SCL (fixed at 4)

*TIMER\_PRD* is the programmed value in the **I2CMTPR** register (see page 957). This value is determined by replacing the known variables in the equation below and solving for *TIMER\_PRD*.

The I<sup>2</sup>C clock period is calculated as follows:

$$SCL\_PERIOD = 2 \times (1 + TIMER\_PRD) \times (SCL\_LP + SCL\_HP) \times CLK\_PRD$$

For example:

$$CLK\_PRD = 50 \text{ ns}$$

$$TIMER\_PRD = 2$$

$$SCL\_LP = 6$$

$$SCL\_HP = 4$$

yields a SCL frequency of:

$$1/SCL\_PERIOD = 333 \text{ Khz}$$

Table 15-2 gives examples of the timer periods that should be used to generate Standard, Fast mode, and Fast mode plus SCL frequencies based on various system clock frequencies.

**Table 15-2. Examples of I<sup>2</sup>C Master Timer Period Versus Speed Mode**

| System Clock | Timer Period | Standard Mode | Timer Period | Fast Mode | Timer Period | Fast Mode Plus |
|--------------|--------------|---------------|--------------|-----------|--------------|----------------|
| 4 MHz        | 0x01         | 100 Kbps      | -            | -         | -            | -              |
| 6 MHz        | 0x02         | 100 Kbps      | -            | -         | -            | -              |
| 12.5 MHz     | 0x06         | 89 Kbps       | 0x01         | 312 Kbps  | -            | -              |
| 16.7 MHz     | 0x08         | 93 Kbps       | 0x02         | 278 Kbps  | -            | -              |
| 20 MHz       | 0x09         | 100 Kbps      | 0x02         | 333 Kbps  | -            | -              |
| 25 MHz       | 0x0C         | 96.2 Kbps     | 0x03         | 312 Kbps  | -            | -              |
| 33 MHz       | 0x10         | 97.1 Kbps     | 0x04         | 330 Kbps  | -            | -              |
| 40 MHz       | 0x13         | 100 Kbps      | 0x04         | 400 Kbps  | 0x01         | 1000 Kbps      |
| 50 MHz       | 0x18         | 100 Kbps      | 0x06         | 357 Kbps  | 0x02         | 833 Kbps       |
| 80 MHz       | 0x27         | 100 Kbps      | 0x09         | 400 Kbps  | 0x03         | 1000 Kbps      |

### 15.3.2.2 High-Speed Mode

The TM4C1232H6PM I<sup>2</sup>C peripheral has support for High-speed operation as both a master and slave. High-Speed mode is configured by setting the HS bit in the **I<sup>2</sup>C Master Control/Status (I2CMCS)** register. High-Speed mode transmits data at a high bit rate with a 66.6%/33.3% duty cycle, but communication and arbitration are done at Standard, Fast mode, or Fast-mode plus speed, depending on which is selected by the user. When the HS bit in the **I2CMCS** register is set, current mode pull-ups are enabled.

The clock period can be selected using the equation below, but in this case, SCL\_LP=2 and SCL\_HP=1.

$$SCL\_PERIOD = 2 \times (1 + TIMER\_PRD) \times (SCL\_LP + SCL\_HP) \times CLK\_PRD$$

So for example:

```
CLK_PRD = 25 ns
TIMER_PRD = 1
SCL_LP=2
SCL_HP=1
```

yields a SCL frequency of:

$$1/T = 3.33 \text{ Mhz}$$

Table 15-3 on page 936 gives examples of timer period and system clock in High-Speed mode. Note that the HS bit in the **I2CMTPR** register needs to be set for the TPR value to be used in High-Speed mode.

**Table 15-3. Examples of I<sup>2</sup>C Master Timer Period in High-Speed Mode**

| System Clock | Timer Period | Transmission Mode |
|--------------|--------------|-------------------|
| 40 MHz       | 0x01         | 3.33 Mbps         |
| 50 MHz       | 0x02         | 2.77 Mbps         |
| 80 MHz       | 0x03         | 3.33 Mbps         |

When operating as a master, the protocol is shown in Figure 15-7. The master is responsible for sending a master code byte in either Standard (100 Kbps) or Fast-mode (400 Kbps) before it begins transferring in High-speed mode. The master code byte must contain data in the form of 0000.1XXX and is used to tell the slave devices to prepare for a High-speed transfer. The master code byte should never be acknowledged by a slave since it is only used to indicate that the upcoming data is going to be transferred at a higher data rate. To send the master code byte, software should place the value of the master code byte into the **I2CMSA** register and write the **I2CMCS** register with a value of 0x13. This places the I<sup>2</sup>C master peripheral in High-speed mode, and all subsequent transfers (until STOP) are carried out at High-speed data rate using the normal **I2CMCS** command bits, without setting the HS bit in the **I2CMCS** register. Again, setting the HS bit in the **I2CMCS** register is only necessary during the master code byte.

When operating as a High-speed slave, there is no additional software required.

**Figure 15-7. High-Speed Data Format**

**Note:** High-Speed mode is 3.4 Mbps, provided correct system clock frequency is set and there is appropriate pull strength on SCL and SDA lines.

### 15.3.3 Interrupts

The I<sup>2</sup>C can generate interrupts when the following conditions are observed:

- Master transaction completed
- Master arbitration lost
- Master transaction error
- Master bus timeout
- Slave transaction received
- Slave transaction requested
- Stop condition on bus detected
- Start condition on bus detected

The I<sup>2</sup>C master and I<sup>2</sup>C slave modules have separate interrupt signals. While both modules can generate interrupts for multiple conditions, only a single interrupt signal is sent to the interrupt controller.

#### 15.3.3.1 I<sup>2</sup>C Master Interrupts

The I<sup>2</sup>C master module generates an interrupt when a transaction completes (either transmit or receive), when arbitration is lost, or when an error occurs during a transaction. To enable the I<sup>2</sup>C master interrupt, software must set the IM bit in the **I<sup>2</sup>C Master Interrupt Mask (I2CMIMR)** register. When an interrupt condition is met, software must check the ERROR and ABLST bits in the **I<sup>2</sup>C Master Control/Status (I2CMCS)** register to verify that an error didn't occur during the last transaction and to ensure that arbitration has not been lost. An error condition is asserted if the last transaction wasn't acknowledged by the slave. If an error is not detected and the master has not lost arbitration, the application can proceed with the transfer. The interrupt is cleared by writing a 1 to the IC bit in the **I<sup>2</sup>C Master Interrupt Clear (I2CMICR)** register.

If the application doesn't require the use of interrupts, the raw interrupt status is always visible via the **I<sup>2</sup>C Master Raw Interrupt Status (I2CMRIS)** register.

#### 15.3.3.2 I<sup>2</sup>C Slave Interrupts

The slave module can generate an interrupt when data has been received or requested. This interrupt is enabled by setting the DATAIM bit in the **I<sup>2</sup>C Slave Interrupt Mask (I2CSIMR)** register. Software

determines whether the module should write (transmit) or read (receive) data from the **I<sup>2</sup>C Slave Data (I2CSDR)** register, by checking the RREQ and TREQ bits of the **I<sup>2</sup>C Slave Control/Status (I2CSCSR)** register. If the slave module is in receive mode and the first byte of a transfer is received, the FBR bit is set along with the RREQ bit. The interrupt is cleared by setting the DATAIC bit in the **I<sup>2</sup>C Slave Interrupt Clear (I2CSICR)** register.

In addition, the slave module can generate an interrupt when a start and stop condition is detected. These interrupts are enabled by setting the STARTIM and STOPIM bits of the **I<sup>2</sup>C Slave Interrupt Mask (I2CSIMR)** register and cleared by writing a 1 to the STOPIC and STARTIC bits of the **I<sup>2</sup>C Slave Interrupt Clear (I2CSICR)** register.

If the application doesn't require the use of interrupts, the raw interrupt status is always visible via the **I<sup>2</sup>C Slave Raw Interrupt Status (I2CSRIS)** register.

### **15.3.4 Loopback Operation**

The I<sup>2</sup>C modules can be placed into an internal loopback mode for diagnostic or debug work by setting the LPBK bit in the **I<sup>2</sup>C Master Configuration (I2CMCR)** register. In loopback mode, the SDA and SCL signals from the master and are tied to the SDA and SCL signals of the slave module to allow internal testing of the device without having to go through I/O.

### **15.3.5 Command Sequence Flow Charts**

This section details the steps required to perform the various I<sup>2</sup>C transfer types in both master and slave mode.

#### **15.3.5.1 I<sup>2</sup>C Master Command Sequences**

The figures that follow show the command sequences available for the I<sup>2</sup>C master.

Figure 15-8. Master Single TRANSMIT

Figure 15-9. Master Single RECEIVE

Figure 15-10. Master TRANSMIT of Multiple Data Bytes

Figure 15-11. Master RECEIVE of Multiple Data Bytes

**Figure 15-12. Master RECEIVE with Repeated START after Master TRANSMIT**

Figure 15-13. Master TRANSMIT with Repeated START after Master RECEIVE

Figure 15-14. Standard High Speed Mode Master Transmit

### 15.3.5.2 I<sup>2</sup>C Slave Command Sequences

Figure 15-15 on page 946 presents the command sequence available for the I<sup>2</sup>C slave.

**Figure 15-15. Slave Command Sequence**

## 15.4 Initialization and Configuration

### 15.4.1 Configure the I<sup>2</sup>C Module to Transmit a Single Byte as a Master

The following example shows how to configure the I<sup>2</sup>C module to transmit a single byte as a master. This assumes the system clock is 20 MHz.

1. Enable the I<sup>2</sup>C clock using the **RCGCI2C** register in the System Control module (see page 326).
2. Enable the clock to the appropriate GPIO module via the **RCGCGPIO** register in the System Control module (see page 319). To find out which GPIO port to enable, refer to Table 20-5 on page 1117.
3. In the GPIO module, enable the appropriate pins for their alternate function using the **GPIOAFSEL** register (see page 604). To determine which GPIOs to configure, see Table 20-4 on page 1113.

4. Enable the I2CSDA pin for open-drain operation. See page 609.
5. Configure the PMCN fields in the **GPIOPCTL** register to assign the I<sup>2</sup>C signals to the appropriate pins. See page 621 and Table 20-5 on page 1117.
6. Initialize the I<sup>2</sup>C Master by writing the **I2CMCR** register with a value of 0x0000.0010.
7. Set the desired SCL clock speed of 100 Kbps by writing the **I2CMTPR** register with the correct value. The value written to the **I2CMTPR** register represents the number of system clock periods in one SCL clock period. The TPR value is determined by the following equation:

$$\begin{aligned} \text{TPR} &= (\text{System Clock} / (2 * (\text{SCL\_LP} + \text{SCL\_HP}) * \text{SCL\_CLK})) - 1; \\ \text{TPR} &= (20\text{MHz} / (2 * (6+4) * 100000)) - 1; \\ \text{TPR} &= 9 \end{aligned}$$

Write the **I2CMTPR** register with the value of 0x0000.0009.

8. Specify the slave address of the master and that the next operation is a Transmit by writing the **I2CMSA** register with a value of 0x0000.0076. This sets the slave address to 0x3B.
9. Place data (byte) to be transmitted in the data register by writing the **I2CMDR** register with the desired data.
10. Initiate a single byte transmit of the data from Master to Slave by writing the **I2CMCS** register with a value of 0x0000.0007 (STOP, START, RUN).
11. Wait until the transmission completes by polling the **I2CMCS** register's BUSBSY bit until it has been cleared.
12. Check the ERROR bit in the **I2CMCS** register to confirm the transmit was acknowledged.

#### 15.4.2 Configure the I<sup>2</sup>C Master to High Speed Mode

To configure the I<sup>2</sup>C master to High Speed mode:

1. Enable the I<sup>2</sup>C clock using the **RCGCI2C** register in the System Control module (see page 326).
2. Enable the clock to the appropriate GPIO module via the **RCGCGPIO** register in the System Control module (see page 319). To find out which GPIO port to enable, refer to Table 20-5 on page 1117.
3. In the GPIO module, enable the appropriate pins for their alternate function using the **GPIOAFASEL** register (see page 604). To determine which GPIOs to configure, see Table 20-4 on page 1113.
4. Enable the I2CSDA pin for open-drain operation. See page 609.
5. Configure the PMCN fields in the **GPIOPCTL** register to assign the I<sup>2</sup>C signals to the appropriate pins. See page 621 and Table 20-5 on page 1117.
6. Initialize the I<sup>2</sup>C Master by writing the **I2CMCR** register with a value of 0x0000.0010.
7. Set the desired SCL clock speed of 3.33 Mbps by writing the **I2CMTPR** register with the correct value. The value written to the **I2CMTPR** register represents the number of system clock periods in one SCL clock period. The TPR value is determined by the following equation:

```

TPR = (System Clock / (2 * (SCL_LP + SCL_HP) * SCL_CLK)) - 1;
TPR = (80 MHz / (2 * (2 + 1) * 3330000)) - 1;
TPR = 3

```

Write the **I2CMTPR** register with the value of 0x0000.0003.

8. To send the master code byte, software should place the value of the master code byte into the **I2CMSA** register and write the **I2CMCS** register with a value of 0x13.
9. This places the I2C master peripheral in High-speed mode, and all subsequent transfers (until STOP) are carried out at High-speed data rate using the normal **I2CMCS** command bits, without setting the HS bit in the **I2CMCS** register.
10. The transaction is ended by setting the STOP bit in the **I2CMCS** register.
11. Wait until the transmission completes by polling the **I2CMCS** register's BUSBSY bit until it has been cleared.
12. Check the ERROR bit in the **I2CMCS** register to confirm the transmit was acknowledged.

## 15.5 Register Map

Table 15-4 on page 948 lists the I<sup>2</sup>C registers. All addresses given are relative to the I<sup>2</sup>C base address:

- I<sup>2</sup>C 0: 0x4002.0000
- I<sup>2</sup>C 1: 0x4002.1000
- I<sup>2</sup>C 2: 0x4002.2000
- I<sup>2</sup>C 3: 0x4002.3000
- I<sup>2</sup>C 4: 0x400C.0000
- I<sup>2</sup>C 5: 0x400C.1000

Note that the I<sup>2</sup>C module clock must be enabled before the registers can be programmed (see page 326). There must be a delay of 3 system clocks after the I<sup>2</sup>C module clock is enabled before any I<sup>2</sup>C module registers are accessed.

The hw\_i2c.h file in the TivaWare™ Driver Library uses a base address of 0x800 for the I<sup>2</sup>C slave registers. Be aware when using registers with offsets between 0x800 and 0x818 that TivaWare™ for C Series uses an offset between 0x000 and 0x018 with the slave base address.

**Table 15-4. Inter-Integrated Circuit (I<sup>2</sup>C) Interface Register Map**

| Offset                       | Name    | Type | Reset       | Description                     | See page |
|------------------------------|---------|------|-------------|---------------------------------|----------|
| <b>I<sup>2</sup>C Master</b> |         |      |             |                                 |          |
| 0x000                        | I2CMSA  | RW   | 0x0000.0000 | I2C Master Slave Address        | 950      |
| 0x004                        | I2CMCS  | RW   | 0x0000.0020 | I2C Master Control/Status       | 951      |
| 0x008                        | I2CMDR  | RW   | 0x0000.0000 | I2C Master Data                 | 956      |
| 0x00C                        | I2CMTPR | RW   | 0x0000.0001 | I2C Master Timer Period         | 957      |
| 0x010                        | I2CMIMR | RW   | 0x0000.0000 | I2C Master Interrupt Mask       | 958      |
| 0x014                        | I2CMRIS | RO   | 0x0000.0000 | I2C Master Raw Interrupt Status | 959      |

**Table 15-4. Inter-Integrated Circuit (I<sup>2</sup>C) Interface Register Map (continued)**

| Offset                                   | Name        | Type | Reset       | Description                        | See page |
|------------------------------------------|-------------|------|-------------|------------------------------------|----------|
| 0x018                                    | I2CMMIS     | RO   | 0x0000.0000 | I2C Master Masked Interrupt Status | 960      |

## 15.6 Register Descriptions (I<sup>2</sup>C Master)

The remainder of this section lists and describes the I<sup>2</sup>C master registers, in numerical order by address offset.

**Register 1: I<sup>2</sup>C Master Slave Address (I2CMSA), offset 0x000**

This register consists of eight bits: seven address bits (A6-A0), and a Receive/Send bit, which determines if the next operation is a Receive (High), or Transmit (Low).

**I2C Master Slave Address (I2CMSA)**

I2C 0 base: 0x4002.0000  
 I2C 1 base: 0x4002.1000

## Register 2: I<sup>2</sup>C Master Control/Status (I2CMCS), offset 0x004

This register accesses status bits when read and control bits when written. When read, the status register indicates the state of the I<sup>2</sup>C bus controller. When written, the control register configures the I<sup>2</sup>C controller operation.

The START bit generates the START or REPEATED START condition. The STOP bit determines if the cycle stops at the end of the data cycle or continues to the next transfer cycle, which could be a repeated START. To generate a single transmit cycle, the **I<sup>2</sup>C Master Slave Address (I2CMSA)** register is written with the desired address, the R/S bit is cleared, and this register is written with ACK=X (0 or 1), STOP=1, START=1, and RUN=1 to perform the operation and stop. When the operation is completed (or aborted due an error), an interrupt becomes active and the data may be read from the **I2CMDR** register. When the I<sup>2</sup>C module operates in Master receiver mode, the ACK bit is normally set, causing the I<sup>2</sup>C bus controller to transmit an acknowledge automatically after each byte. This bit must be cleared when the I<sup>2</sup>C bus controller requires no further data to be transmitted from the slave transmitter.

|                 | All other combinations not listed are non-operations. |             |      |       |     | NOP.                                                                                                                 |

a. An X in a table cell indicates the bit can be 0 or 1.

b. In Master Receive mode, a STOP condition should be generated only after a Data Negative Acknowledge executed by the master or an Address Negative Acknowledge executed by the slave.

Register 3: I<sup>2</sup>C Master Data (I2CMDR), offset 0x008

**Important:** This register is read-sensitive. See the register description for details.

This register contains the data to be transmitted when in the Master Transmit state and the data received when in the Master Receive state.

## Register 10: I<sup>2</sup>C Master Clock Low Timeout Count (I2CMCLKOCNT), offset 0x024

This register contains the upper 8 bits of a 12-bit counter that can be used to keep the timeout limit for clock stretching by a remote slave. The lower four bits of the counter are not user visible and are always 0x0.

**Note:** The Master Clock Low Timeout counter counts for the entire time SCL is held Low continuously. If SCL is deasserted at any point, the Master Clock Low Timeout Counter is reloaded with the value in the **I2CMCLKOCNT** register and begins counting down from this value.

### I2C Master Clock Low Timeout Count (I2CMCLKOCNT)

**15.7 Register Descriptions (I<sup>2</sup>C Slave)**

The remainder of this section lists and describes the I<sup>2</sup>C slave registers, in numerical order by address offset.

**Register 13: I<sup>2</sup>C Slave Own Address (I2CSOAR), offset 0x800**

This register consists of seven address bits that identify the TM4C1232H6PM I<sup>2</sup>C device on the I<sup>2</sup>C bus.

**I<sup>2</sup>C Slave Own Address (I2CSOAR)**

|           |          |      |            | 0 Disables the I <sup>2</sup> C slave operation.                                                                                                                                              |
|           |          |      |            | 1 Enables the I <sup>2</sup> C slave operation.                                                                                                                                               |
|           |          |      |            | Once this bit has been set, it should not be set again unless it has been cleared by writing a 0 or by a reset, otherwise transfer failures may occur.                                        |

Register 15: I<sup>2</sup>C Slave Data (I2CSDR), offset 0x808

**Important:** This register is read-sensitive. See the register description for details.

This register contains the data to be transmitted when in the Slave Transmit state, and the data received when in the Slave Receive state.

I2C Slave Data (I2CSDR)

## 16 Controller Area Network (CAN) Module

Controller Area Network (CAN) is a multicast, shared serial bus standard for connecting electronic control units (ECUs). CAN was specifically designed to be robust in electromagnetically-noisy environments and can utilize a differential balanced line like RS-485 or a more robust twisted-pair wire. Originally created for automotive purposes, it is also used in many embedded control applications (such as industrial and medical). Bit rates up to 1 Mbps are possible at network lengths less than 40 meters. Decreased bit rates allow longer network distances (for example, 125 Kbps at 500 meters).

The TM4C1232H6PM microcontroller includes one CAN unit with the following features:

- CAN protocol version 2.0 part A/B
- Bit rates up to 1 Mbps
- 32 message objects with individual identifier masks
- Maskable interrupt
- Disable Automatic Retransmission mode for Time-Triggered CAN (TTCAN) applications
- Programmable loopback mode for self-test operation
- Programmable FIFO mode enables storage of multiple message objects
- Gluelessly attaches to an external CAN transceiver through the CANnTX and CANnRX signals

# 16.1 Block Diagram

Figure 16-1. CAN Controller Block Diagram

# 16.2 Signal Description

The following table lists the external signals of the CAN controller and describes the function of each. The CAN controller signals are alternate functions for some GPIO signals and default to be GPIO signals at reset. The column in the table below titled "Pin Mux/Pin Assignment" lists the possible GPIO pin placements for the CAN signals. The AFSEL bit in the **GPIO Alternate Function Select (GPIOAFSEL)** register (page 604) should be set to choose the CAN controller function. The number in parentheses is the encoding that must be programmed into the PMCN field in the **GPIO Port Control (GPIOCTL)** register (page 621) to assign the CAN signal to the specified GPIO port pin. For more information on configuring GPIOs, see "General-Purpose Input/Outputs (GPIOs)" on page 582.

**Table 16-1. Controller Area Network Signals (64LQFP)**

| Pin Name | Pin Number     | Pin Mux / Pin Assignment      | Pin Type | Buffer Type <sup>a</sup> | Description            |
|----------|----------------|-------------------------------|----------|--------------------------|------------------------|
| CAN0Rx   | 28<br>58<br>59 | PF0 (3)<br>PB4 (8)<br>PE4 (8) | I        | TTL                      | CAN module 0 receive.  |
| CAN0Tx   | 31<br>57<br>60 | PF3 (3)<br>PB5 (8)<br>PE5 (8) | O        | TTL                      | CAN module 0 transmit. |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

## 16.3 Functional Description

The TM4C1232H6PM CAN controller conforms to the CAN protocol version 2.0 (parts A and B). Message transfers that include data, remote, error, and overload frames with an 11-bit identifier (standard) or a 29-bit identifier (extended) are supported. Transfer rates can be programmed up to 1 Mbps.

The CAN module consists of three major parts:

- CAN protocol controller and message handler
- Message memory
- CAN register interface

A data frame contains data for transmission, whereas a remote frame contains no data and is used to request the transmission of a specific message object. The CAN data/remote frame is constructed as shown in Figure 16-2.

**Figure 16-2. CAN Data/Remote Frame**

The protocol controller transfers and receives the serial data from the CAN bus and passes the data on to the message handler. The message handler then loads this information into the appropriate message object based on the current filtering and identifiers in the message object memory. The message handler is also responsible for generating interrupts based on events on the CAN bus.

The message object memory is a set of 32 identical memory blocks that hold the current configuration, status, and actual data for each message object. These memory blocks are accessed via either of the CAN message object register interfaces.

The message memory is not directly accessible in the TM4C1232H6PM memory map, so the TM4C1232H6PM CAN controller provides an interface to communicate with the message memory via two CAN interface register sets for communicating with the message objects. These two interfaces must be used to read or write to each message object. The two message object interfaces allow parallel access to the CAN controller message objects when multiple objects may have new information that must be processed. In general, one interface is used for transmit data and one for receive data.

### 16.3.1 Initialization

To use the CAN controller, the peripheral clock must be enabled using the **RCGC0** register (see page 423). In addition, the clock to the appropriate GPIO module must be enabled via the **RCGC2** register (see page 429). To find out which GPIO port to enable, refer to Table 20-4 on page 1113. Set the GPIO AFSEL bits for the appropriate pins (see page 604). Configure the PMCN fields in the **GPIOCTL** register to assign the CAN signals to the appropriate pins. See page 621 and Table 20-5 on page 1117.

Software initialization is started by setting the INIT bit in the **CAN Control (CANCTL)** register (with software or by a hardware reset) or by going bus-off, which occurs when the transmitter's error counter exceeds a count of 255. While INIT is set, all message transfers to and from the CAN bus are stopped and the CANnTX signal is held High. Entering the initialization state does not change the configuration of the CAN controller, the message objects, or the error counters. However, some configuration registers are only accessible while in the initialization state.

To initialize the CAN controller, set the **CAN Bit Timing (CANBIT)** register and configure each message object. If a message object is not needed, label it as not valid by clearing the MSGVAL bit in the **CAN IFn Arbitration 2 (CANIFnARB2)** register. Otherwise, the whole message object must be initialized, as the fields of the message object may not have valid information, causing unexpected results. Both the INIT and CCE bits in the **CANCTL** register must be set in order to access the **CANBIT** register and the **CAN Baud Rate Prescaler Extension (CANBRPE)** register to configure the bit timing. To leave the initialization state, the INIT bit must be cleared. Afterwards, the internal Bit Stream Processor (BSP) synchronizes itself to the data transfer on the CAN bus by waiting for the occurrence of a sequence of 11 consecutive recessive bits (indicating a bus idle condition) before it takes part in bus activities and starts message transfers. Message object initialization does not require the CAN to be in the initialization state and can be done on the fly. However, message objects should all be configured to particular identifiers or set to not valid before message transfer starts. To change the configuration of a message object during normal operation, clear the MSGVAL bit in the **CANIFnARB2** register to indicate that the message object is not valid during the change. When the configuration is completed, set the MSGVAL bit again to indicate that the message object is once again valid.

### 16.3.2 Operation

Two sets of CAN Interface Registers (**CANIF1x** and **CANIF2x**) are used to access the message objects in the Message RAM. The CAN controller coordinates transfers to and from the Message RAM to and from the registers. The two sets are independent and identical and can be used to

queue transactions. Generally, one interface is used to transmit data and one is used to receive data.

Once the CAN module is initialized and the INIT bit in the **CANCTL** register is cleared, the CAN module synchronizes itself to the CAN bus and starts the message transfer. As each message is received, it goes through the message handler's filtering process, and if it passes through the filter, is stored in the message object specified by the MNUM bit in the **CAN IFn Command Request (CANIFnCRQ)** register. The whole message (including all arbitration bits, data-length code, and eight data bytes) is stored in the message object. If the Identifier Mask (the MSK bits in the **CAN IFn Mask 1** and **CAN IFn Mask 2 (CANIFnMSKn)** registers) is used, the arbitration bits that are masked to "don't care" may be overwritten in the message object.

The CPU may read or write each message at any time via the CAN Interface Registers. The message handler guarantees data consistency in case of concurrent accesses.

The transmission of message objects is under the control of the software that is managing the CAN hardware. Message objects can be used for one-time data transfers or can be permanent message objects used to respond in a more periodic manner. Permanent message objects have all arbitration and control set up, and only the data bytes are updated. At the start of transmission, the appropriate TXRQST bit in the **CAN Transmission Request n (CANTXRQn)** register and the NEWDAT bit in the **CAN New Data n (CANNWDAn)** register are set. If several transmit messages are assigned to the same message object (when the number of message objects is not sufficient), the whole message object has to be configured before the transmission of this message is requested.

The transmission of any number of message objects may be requested at the same time; they are transmitted according to their internal priority, which is based on the message identifier (MNUM) for the message object, with 1 being the highest priority and 32 being the lowest priority. Messages may be updated or set to not valid any time, even when their requested transmission is still pending. The old data is discarded when a message is updated before its pending transmission has started. Depending on the configuration of the message object, the transmission of a message may be requested autonomously by the reception of a remote frame with a matching identifier.

Transmission can be automatically started by the reception of a matching remote frame. To enable this mode, set the RMTEN bit in the **CAN IFn Message Control (CANIFnMCTL)** register. A matching received remote frame causes the TXRQST bit to be set, and the message object automatically transfers its data or generates an interrupt indicating a remote frame was requested. A remote frame can be strictly a single message identifier, or it can be a range of values specified in the message object. The CAN mask registers, **CANIFnMSKn**, configure which groups of frames are identified as remote frame requests. The UMASK bit in the **CANIFnMCTL** register enables the MSK bits in the **CANIFnMSKn** register to filter which frames are identified as a remote frame request. The MXTD bit in the **CANIFnMSK2** register should be set if a remote frame request is expected to be triggered by 29-bit extended identifiers.

### 16.3.3 Transmitting Message Objects

If the internal transmit shift register of the CAN module is ready for loading, and if a data transfer is not occurring between the CAN Interface Registers and message RAM, the valid message object with the highest priority that has a pending transmission request is loaded into the transmit shift register by the message handler and the transmission is started. The message object's NEWDAT bit in the **CANNWDAn** register is cleared. After a successful transmission, and if no new data was written to the message object since the start of the transmission, the TXRQST bit in the **CANTXRQn** register is cleared. If the CAN controller is configured to interrupt on a successful transmission of a message object, (the TXIE bit in the **CAN IFn Message Control (CANIFnMCTL)** register is set), the INTPND bit in the **CANIFnMCTL** register is set after a successful transmission. If the CAN module has lost the arbitration or if an error occurred during the transmission, the message is

re-transmitted as soon as the CAN bus is free again. If, meanwhile, the transmission of a message with higher priority has been requested, the messages are transmitted in the order of their priority.

### 16.3.4 Configuring a Transmit Message Object

The following steps illustrate how to configure a transmit message object.

1. In the **CAN IFn Command Mask (CANIFnCMASK)** register:
  - Set the WRNRD bit to specify a write to the **CANIFnCMASK** register; specify whether to transfer the IDMASK, DIR, and MXTD of the message object into the **CAN IFn** registers using the MASK bit
  - Specify whether to transfer the ID, DIR, XTD, and MSGVAL of the message object into the interface registers using the ARB bit
  - Specify whether to transfer the control bits into the interface registers using the CONTROL bit
  - Specify whether to clear the INTPND bit in the **CANIFnMCTL** register using the CLRINTPND bit
  - Specify whether to clear the NEWDAT bit in the **CANNWDAn** register using the NEWDAT bit
  - Specify which bits to transfer using the DATAA and DATAB bits
2. In the **CANIFnMSK1** register, use the MSK[15:0] bits to specify which of the bits in the 29-bit or 11-bit message identifier are used for acceptance filtering. Note that MSK[15:0] in this register are used for bits [15:0] of the 29-bit message identifier and are not used for an 11-bit identifier. A value of 0x00 enables all messages to pass through the acceptance filtering. Also note that in order for these bits to be used for acceptance filtering, they must be enabled by setting the UMASK bit in the **CANIFnMCTL** register.
3. In the **CANIFnMSK2** register, use the MSK[12:0] bits to specify which of the bits in the 29-bit or 11-bit message identifier are used for acceptance filtering. Note that MSK[12:0] are used for bits [28:16] of the 29-bit message identifier; whereas MSK[12:2] are used for bits [10:0] of the 11-bit message identifier. Use the MXTD and MDIR bits to specify whether to use XTD and DIR for acceptance filtering. A value of 0x00 enables all messages to pass through the acceptance filtering. Also note that in order for these bits to be used for acceptance filtering, they must be enabled by setting the UMASK bit in the **CANIFnMCTL** register.
4. For a 29-bit identifier, configure ID[15:0] in the **CANIFnARB1** register for bits [15:0] of the message identifier and ID[12:0] in the **CANIFnARB2** register for bits [28:16] of the message identifier. Set the XTD bit to indicate an extended identifier; set the DIR bit to indicate transmit; and set the MSGVAL bit to indicate that the message object is valid.
5. For an 11-bit identifier, disregard the **CANIFnARB1** register and configure ID[12:2] in the **CANIFnARB2** register for bits [10:0] of the message identifier. Clear the XTD bit to indicate a standard identifier; set the DIR bit to indicate transmit; and set the MSGVAL bit to indicate that the message object is valid.
6. In the **CANIFnMCTL** register:

- Optionally set the UMASK bit to enable the mask (MSK, MXTD, and MDIR specified in the **CANIFnMSK1** and **CANIFnMSK2** registers) for acceptance filtering
  - Optionally set the TXIE bit to enable the INTPND bit to be set after a successful transmission
  - Optionally set the RMTEN bit to enable the TXRQST bit to be set on the reception of a matching remote frame allowing automatic transmission
  - Set the EOB bit for a single message object
  - Configure the DLC[3:0] field to specify the size of the data frame. Take care during this configuration not to set the NEWDAT, MSGLST, INTPND or TXRQST bits.
7. Load the data to be transmitted into the **CAN IFn Data (CANIFnDA1, CANIFnDA2, CANIFnDB1, CANIFnDB2)** registers. Byte 0 of the CAN data frame is stored in DATA[7:0] in the **CANIFnDA1** register.
  8. Program the number of the message object to be transmitted in the MNUM field in the **CAN IFn Command Request (CANIFnCRQ)** register.
  9. When everything is properly configured, set the TXRQST bit in the **CANIFnMCTL** register. Once this bit is set, the message object is available to be transmitted, depending on priority and bus availability. Note that setting the RMTEN bit in the **CANIFnMCTL** register can also start message transmission if a matching remote frame has been received.

### 16.3.5 Updating a Transmit Message Object

The CPU may update the data bytes of a Transmit Message Object any time via the CAN Interface Registers and neither the MSGVAL bit in the **CANIFnARB2** register nor the TXRQST bits in the **CANIFnMCTL** register have to be cleared before the update.

Even if only some of the data bytes are to be updated, all four bytes of the corresponding **CANIFnDAn/CANIFnDBn** register have to be valid before the content of that register is transferred to the message object. Either the CPU must write all four bytes into the **CANIFnDAn/CANIFnDBn** register or the message object is transferred to the **CANIFnDAn/CANIFnDBn** register before the CPU writes the new data bytes.

In order to only update the data in a message object, the WRNRD, DATAA and DATAB bits in the **CANIFnMSKn** register are set, followed by writing the updated data into **CANIFnDA1, CANIFnDA2, CANIFnDB1, and CANIFnDB2** registers, and then the number of the message object is written to the MNUM field in the **CAN IFn Command Request (CANIFnCRQ)** register. To begin transmission of the new data as soon as possible, set the TXRQST bit in the **CANIFnMSKn** register.

To prevent the clearing of the TXRQST bit in the **CANIFnMCTL** register at the end of a transmission that may already be in progress while the data is updated, the NEWDAT and TXRQST bits have to be set at the same time in the **CANIFnMCTL** register. When these bits are set at the same time, NEWDAT is cleared as soon as the new transmission has started.

### 16.3.6 Accepting Received Message Objects

When the arbitration and control field (the ID and XTD bits in the **CANIFnARB2** and the RMTEN and DLC[3:0] bits of the **CANIFnMCTL** register) of an incoming message is completely shifted into the CAN controller, the message handling capability of the controller starts scanning the message RAM for a matching valid message object. To scan the message RAM for a matching message object, the controller uses the acceptance filtering programmed through the mask bits in the **CANIFnMSKn** register and enabled using the UMASK bit in the **CANIFnMCTL** register. Each valid

message object, starting with object 1, is compared with the incoming message to locate a matching message object in the message RAM. If a match occurs, the scanning is stopped and the message handler proceeds depending on whether it is a data frame or remote frame that was received.

### 16.3.7 Receiving a Data Frame

The message handler stores the message from the CAN controller receive shift register into the matching message object in the message RAM. The data bytes, all arbitration bits, and the DLC bits are all stored into the corresponding message object. In this manner, the data bytes are connected with the identifier even if arbitration masks are used. The NEWDAT bit of the **CANIFnMCTL** register is set to indicate that new data has been received. The CPU should clear this bit when it reads the message object to indicate to the controller that the message has been received, and the buffer is free to receive more messages. If the CAN controller receives a message and the NEWDAT bit is already set, the MSGLST bit in the **CANIFnMCTL** register is set to indicate that the previous data was lost. If the system requires an interrupt on successful reception of a frame, the RXIE bit of the **CANIFnMCTL** register should be set. In this case, the INTPND bit of the same register is set, causing the **CANINT** register to point to the message object that just received a message. The TXRQST bit of this message object should be cleared to prevent the transmission of a remote frame.

### 16.3.8 Receiving a Remote Frame

A remote frame contains no data, but instead specifies which object should be transmitted. When a remote frame is received, three different configurations of the matching message object have to be considered:

**Table 16-2. Message Object Configurations**

| Configuration in <b>CANIFnMCTL</b>                                                                                                                                                                                                                                                                                                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>■ DIR = 1 (direction = transmit); programmed in the <b>CANIFnARB2</b> register</li> <li>■ RMTEN = 1 (set the TXRQST bit of the <b>CANIFnMCTL</b> register at reception of the frame to enable transmission)</li> <li>■ UMASK = 1 or 0</li> </ul>                                                                           | At the reception of a matching remote frame, the TXRQST bit of this message object is set. The rest of the message object remains unchanged, and the controller automatically transfers the data in the message object as soon as possible.                                                                                                                                                                                                                                                                                                                                                                                      |
| <ul style="list-style-type: none"> <li>■ DIR = 1 (direction = transmit); programmed in the <b>CANIFnARB2</b> register</li> <li>■ RMTEN = 0 (do not change the TXRQST bit of the <b>CANIFnMCTL</b> register at reception of the frame)</li> <li>■ UMASK = 0 (ignore mask in the <b>CANIFnMSKn</b> register)</li> </ul>                                             | At the reception of a matching remote frame, the TXRQST bit of this message object remains unchanged, and the remote frame is ignored. This remote frame is disabled, the data is not transferred and nothing indicates that the remote frame ever happened.                                                                                                                                                                                                                                                                                                                                                                     |
| <ul style="list-style-type: none"> <li>■ DIR = 1 (direction = transmit); programmed in the <b>CANIFnARB2</b> register</li> <li>■ RMTEN = 0 (do not change the TXRQST bit of the <b>CANIFnMCTL</b> register at reception of the frame)</li> <li>■ UMASK = 1 (use mask (MSK, MXTD, and MDIR in the <b>CANIFnMSKn</b> register) for acceptance filtering)</li> </ul> | At the reception of a matching remote frame, the TXRQST bit of this message object is cleared. The arbitration and control field (ID + XTD + RMTEN + DLC) from the shift register is stored into the message object in the message RAM, and the NEWDAT bit of this message object is set. The data field of the message object remains unchanged; the remote frame is treated similar to a received data frame. This mode is useful for a remote data request from another CAN device for which the TM4C1232H6PM controller does not have readily available data. The software must fill the data and answer the frame manually. |

### 16.3.9 Receive/Transmit Priority

The receive/transmit priority for the message objects is controlled by the message number. Message object 1 has the highest priority, while message object 32 has the lowest priority. If more than one transmission request is pending, the message objects are transmitted in order based on the message object with the lowest message number. This prioritization is separate from that of the message identifier which is enforced by the CAN bus. As a result, if message object 1 and message object 2 both have valid messages to be transmitted, message object 1 is always transmitted first regardless of the message identifier in the message object itself.

#### 16.3.10 Configuring a Receive Message Object

The following steps illustrate how to configure a receive message object.

1. Program the **CAN IFn Command Mask (CANIFnCMASK)** register as described in the “Configuring a Transmit Message Object” on page 984 section, except that the WRNRD bit is set to specify a write to the message RAM.
2. Program the **CANIFnMSK1** and **CANIFnMSK2** registers as described in the “Configuring a Transmit Message Object” on page 984 section to configure which bits are used for acceptance filtering. Note that in order for these bits to be used for acceptance filtering, they must be enabled by setting the UMASK bit in the **CANIFnMCTL** register.
3. In the **CANIFnMSK2** register, use the MSK[12:0] bits to specify which of the bits in the 29-bit or 11-bit message identifier are used for acceptance filtering. Note that MSK[12:0] are used for bits [28:16] of the 29-bit message identifier; whereas MSK[12:2] are used for bits [10:0] of the 11-bit message identifier. Use the MXTD and MDIR bits to specify whether to use XTD and DIR for acceptance filtering. A value of 0x00 enables all messages to pass through the acceptance filtering. Also note that in order for these bits to be used for acceptance filtering, they must be enabled by setting the UMASK bit in the **CANIFnMCTL** register.
4. Program the **CANIFnARB1** and **CANIFnARB2** registers as described in the “Configuring a Transmit Message Object” on page 984 section to program XTD and ID bits for the message identifier to be received; set the MSGVAL bit to indicate a valid message; and clear the DIR bit to specify receive.
5. In the **CANIFnMCTL** register:
  - Optionally set the UMASK bit to enable the mask (MSK, MXTD, and MDIR specified in the **CANIFnMSK1** and **CANIFnMSK2** registers) for acceptance filtering
  - Optionally set the RXIE bit to enable the INTPND bit to be set after a successful reception
  - Clear the RMTEN bit to leave the TXRQST bit unchanged
  - Set the EOB bit for a single message object
  - Configure the DLC[3:0] field to specify the size of the data frame

Take care during this configuration not to set the NEWDAT, MSGLST, INTPND or TXRQST bits.
6. Program the number of the message object to be received in the MNUM field in the **CAN IFn Command Request (CANIFnCRQ)** register. Reception of the message object begins as soon as a matching frame is available on the CAN bus.

When the message handler stores a data frame in the message object, it stores the received Data Length Code and eight data bytes in the **CANIFnDA1**, **CANIFnDA2**, **CANIFnDB1**, and **CANIFnDB2** register. Byte 0 of the CAN data frame is stored in DATA[7:0] in the **CANIFnDA1** register. If the Data Length Code is less than 8, the remaining bytes of the message object are overwritten by unspecified values.

The CAN mask registers can be used to allow groups of data frames to be received by a message object. The CAN mask registers, **CANIFnMSKn**, configure which groups of frames are received by a message object. The UMASK bit in the **CANIFnMCTL** register enables the MSK bits in the **CANIFnMSKn** register to filter which frames are received. The MXTD bit in the **CANIFnMSK2** register should be set if only 29-bit extended identifiers are expected by this message object.

### 16.3.11 Handling of Received Message Objects

The CPU may read a received message any time via the CAN Interface registers because the data consistency is guaranteed by the message handler state machine.

Typically, the CPU first writes 0x007F to the **CANIFnCMSGK** register and then writes the number of the message object to the **CANIFnCRQ** register. That combination transfers the whole received message from the message RAM into the Message Buffer registers (**CANIFnMSKn**, **CANIFnARBn**, and **CANIFnMCTL**). Additionally, the NEWDAT and INTPND bits are cleared in the message RAM, acknowledging that the message has been read and clearing the pending interrupt generated by this message object.

If the message object uses masks for acceptance filtering, the **CANIFnARBn** registers show the full, unmasked ID for the received message.

The NEWDAT bit in the **CANIFnMCTL** register shows whether a new message has been received since the last time this message object was read. The MSGLSST bit in the **CANIFnMCTL** register shows whether more than one message has been received since the last time this message object was read. MSGLSST is not automatically cleared, and should be cleared by software after reading its status.

Using a remote frame, the CPU may request new data from another CAN node on the CAN bus. Setting the TXRQST bit of a receive object causes the transmission of a remote frame with the receive object's identifier. This remote frame triggers the other CAN node to start the transmission of the matching data frame. If the matching data frame is received before the remote frame could be transmitted, the TXRQST bit is automatically reset. This prevents the possible loss of data when the other device on the CAN bus has already transmitted the data slightly earlier than expected.

#### 16.3.11.1 Configuration of a FIFO Buffer

With the exception of the EOB bit in the **CANIFnMCTL** register, the configuration of receive message objects belonging to a FIFO buffer is the same as the configuration of a single receive message object (see "Configuring a Receive Message Object" on page 987). To concatenate two or more message objects into a FIFO buffer, the identifiers and masks (if used) of these message objects have to be programmed to matching values. Due to the implicit priority of the message objects, the message object with the lowest message object number is the first message object in a FIFO buffer. The EOB bit of all message objects of a FIFO buffer except the last one must be cleared. The EOB bit of the last message object of a FIFO buffer is set, indicating it is the last entry in the buffer.

#### 16.3.11.2 Reception of Messages with FIFO Buffers

Received messages with identifiers matching to a FIFO buffer are stored starting with the message object with the lowest message number. When a message is stored into a message object of a FIFO buffer, the NEWDAT of the **CANIFnMCTL** register bit of this message object is set. By setting

NEWDAT while EOB is clear, the message object is locked and cannot be written to by the message handler until the CPU has cleared the NEWDAT bit. Messages are stored into a FIFO buffer until the last message object of this FIFO buffer is reached. Until all of the preceding message objects have been released by clearing the NEWDAT bit, all further messages for this FIFO buffer are written into the last message object of the FIFO buffer and therefore overwrite previous messages.

#### 16.3.11.3 Reading from a FIFO Buffer

When the CPU transfers the contents of a message object from a FIFO buffer by writing its number to the **CANIFnCRQ** register, the TXRQST and CLRINTPND bits in the **CANIFnCMSK** register should be set such that the NEWDAT and INTPEND bits in the **CANIFnMCTL** register are cleared after the read. The values of these bits in the **CANIFnMCTL** register always reflect the status of the message object before the bits are cleared. To assure the correct function of a FIFO buffer, the CPU should read out the message objects starting with the message object with the lowest message number. When reading from the FIFO buffer, the user should be aware that a new received message is placed in the message object with the lowest message number for which the NEWDAT bit of the **CANIFnMCTL** register is clear. As a result, the order of the received messages in the FIFO is not guaranteed. Figure 16-3 on page 990 shows how a set of message objects which are concatenated to a FIFO Buffer can be handled by the CPU.

Figure 16-3. Message Objects in a FIFO Buffer

### 16.3.12 Handling of Interrupts

If several interrupts are pending, the **CAN Interrupt (CANINT)** register points to the pending interrupt with the highest priority, disregarding their chronological order. The status interrupt has the highest

priority. Among the message interrupts, the message object's interrupt with the lowest message number has the highest priority. A message interrupt is cleared by clearing the message object's INTPND bit in the **CANIFnMCTL** register or by reading the **CAN Status (CANSTS)** register. The status Interrupt is cleared by reading the **CANSTS** register.

The interrupt identifier INTID in the **CANINT** register indicates the cause of the interrupt. When no interrupt is pending, the register reads as 0x0000. If the value of the INTID field is different from 0, then an interrupt is pending. If the IE bit is set in the **CANCTL** register, the interrupt line to the interrupt controller is active. The interrupt line remains active until the INTID field is 0, meaning that all interrupt sources have been cleared (the cause of the interrupt is reset), or until IE is cleared, which disables interrupts from the CAN controller.

The INTID field of the **CANINT** register points to the pending message interrupt with the highest interrupt priority. The SIE bit in the **CANCTL** register controls whether a change of the RXOK, TXOK, and LEC bits in the **CANSTS** register can cause an interrupt. The EIE bit in the **CANCTL** register controls whether a change of the BOFF and EWARN bits in the **CANSTS** register can cause an interrupt. The IE bit in the **CANCTL** register controls whether any interrupt from the CAN controller actually generates an interrupt to the interrupt controller. The **CANINT** register is updated even when the IE bit in the **CANCTL** register is clear, but the interrupt is not indicated to the CPU.

A value of 0x8000 in the **CANINT** register indicates that an interrupt is pending because the CAN module has updated, but not necessarily changed, the **CANSTS** register, indicating that either an error or status interrupt has been generated. A write access to the **CANSTS** register can clear the RXOK, TXOK, and LEC bits in that same register; however, the only way to clear the source of a status interrupt is to read the **CANSTS** register.

The source of an interrupt can be determined in two ways during interrupt handling. The first is to read the INTID bit in the **CANINT** register to determine the highest priority interrupt that is pending, and the second is to read the **CAN Message Interrupt Pending (CANMSGnINT)** register to see all of the message objects that have pending interrupts.

An interrupt service routine reading the message that is the source of the interrupt may read the message and clear the message object's INTPND bit at the same time by setting the CLRINTPND bit in the **CANIFnCMSK** register. Once the INTPND bit has been cleared, the **CANINT** register contains the message number for the next message object with a pending interrupt.

### 16.3.13 Test Mode

A Test Mode is provided which allows various diagnostics to be performed. Test Mode is entered by setting the TEST bit in the **CANCTL** register. Once in Test Mode, the TX[1:0], LBACK, SILENT and BASIC bits in the **CAN Test (CANTST)** register can be used to put the CAN controller into the various diagnostic modes. The RX bit in the **CANTST** register allows monitoring of the CANnRX signal. All **CANTST** register functions are disabled when the TEST bit is cleared.

#### 16.3.13.1 Silent Mode

Silent Mode can be used to analyze the traffic on a CAN bus without affecting it by the transmission of dominant bits (Acknowledge Bits, Error Frames). The CAN Controller is put in Silent Mode setting the SILENT bit in the **CANTST** register. In Silent Mode, the CAN controller is able to receive valid data frames and valid remote frames, but it sends only recessive bits on the CAN bus and cannot start a transmission. If the CAN Controller is required to send a dominant bit (ACK bit, overload flag, or active error flag), the bit is rerouted internally so that the CAN Controller monitors this dominant bit, although the CAN bus remains in recessive state.

### 16.3.13.2 Loopback Mode

Loopback mode is useful for self-test functions. In Loopback Mode, the CAN Controller internally routes the CANnTX signal on to the CANnRX signal and treats its own transmitted messages as received messages and stores them (if they pass acceptance filtering) into the message buffer. The CAN Controller is put in Loopback Mode by setting the LBACK bit in the **CANTST** register. To be independent from external stimulation, the CAN Controller ignores acknowledge errors (a recessive bit sampled in the acknowledge slot of a data/remote frame) in Loopback Mode. The actual value of the CANnRX signal is disregarded by the CAN Controller. The transmitted messages can be monitored on the CANnTX signal.

### 16.3.13.3 Loopback Combined with Silent Mode

Loopback Mode and Silent Mode can be combined to allow the CAN Controller to be tested without affecting a running CAN system connected to the CANnTX and CANnRX signals. In this mode, the CANnRX signal is disconnected from the CAN Controller and the CANnTX signal is held recessive. This mode is enabled by setting both the LBACK and SILENT bits in the **CANTST** register.

### 16.3.13.4 Basic Mode

Basic Mode allows the CAN Controller to be operated without the Message RAM. In Basic Mode, The CANIF1 registers are used as the transmit buffer. The transmission of the contents of the IF1 registers is requested by setting the BUSY bit of the **CANIF1CRQ** register. The CANIF1 registers are locked while the BUSY bit is set. The BUSY bit indicates that a transmission is pending. As soon the CAN bus is idle, the CANIF1 registers are loaded into the shift register of the CAN Controller and transmission is started. When the transmission has completed, the BUSY bit is cleared and the locked CANIF1 registers are released. A pending transmission can be aborted at any time by clearing the BUSY bit in the **CANIF1CRQ** register while the CANIF1 registers are locked. If the CPU has cleared the BUSY bit, a possible retransmission in case of lost arbitration or an error is disabled.

The CANIF2 Registers are used as a receive buffer. After the reception of a message, the contents of the shift register are stored in the CANIF2 registers, without any acceptance filtering. Additionally, the actual contents of the shift register can be monitored during the message transfer. Each time a read message object is initiated by setting the BUSY bit of the **CANIF2CRQ** register, the contents of the shift register are stored into the CANIF2 registers.

In Basic Mode, all message-object-related control and status bits and of the control bits of the **CANIFnCMSK** registers are not evaluated. The message number of the **CANIFnCRQ** registers is also not evaluated. In the **CANIF2MCTL** register, the NEWDAT and MSGST bits retain their function, the DLC[3:0] field shows the received DLC, the other control bits are cleared.

Basic Mode is enabled by setting the BASIC bit in the **CANTST** register.

### 16.3.13.5 Transmit Control

Software can directly override control of the CANnTX signal in four different ways.

- CANnTX is controlled by the CAN Controller
- The sample point is driven on the CANnTX signal to monitor the bit timing
- CANnTX drives a low value
- CANnTX drives a high value

The last two functions, combined with the readable CAN receive pin CANnRX, can be used to check the physical layer of the CAN bus.

The Transmit Control function is enabled by programming the TX[1:0] field in the **CANTST** register. The three test functions for the CANnTX signal interfere with all CAN protocol functions. TX[1:0] must be cleared when CAN message transfer or Loopback Mode, Silent Mode, or Basic Mode are selected.

### 16.3.14 Bit Timing Configuration Error Considerations

Even if minor errors in the configuration of the CAN bit timing do not result in immediate failure, the performance of a CAN network can be reduced significantly. In many cases, the CAN bit synchronization amends a faulty configuration of the CAN bit timing to such a degree that only occasionally an error frame is generated. In the case of arbitration, however, when two or more CAN nodes simultaneously try to transmit a frame, a misplaced sample point may cause one of the transmitters to become error passive. The analysis of such sporadic errors requires a detailed knowledge of the CAN bit synchronization inside a CAN node and of the CAN nodes' interaction on the CAN bus.

### 16.3.15 Bit Time and Bit Rate

The CAN system supports bit rates in the range of lower than 1 Kbps up to 1000 Kbps. Each member of the CAN network has its own clock generator. The timing parameter of the bit time can be configured individually for each CAN node, creating a common bit rate even though the CAN nodes' oscillator periods may be different.

Because of small variations in frequency caused by changes in temperature or voltage and by deteriorating components, these oscillators are not absolutely stable. As long as the variations remain inside a specific oscillator's tolerance range, the CAN nodes are able to compensate for the different bit rates by periodically resynchronizing to the bit stream.

According to the CAN specification, the bit time is divided into four segments (see Figure 16-4 on page 994): the Synchronization Segment, the Propagation Time Segment, the Phase Buffer Segment 1, and the Phase Buffer Segment 2. Each segment consists of a specific, programmable number of time quanta (see Table 16-3 on page 994). The length of the time quantum ( $t_q$ ), which is the basic time unit of the bit time, is defined by the CAN controller's input clock ( $f_{sys}$ ) and the Baud Rate Prescaler (BRP):

$$t_q = \text{BRP} / f_{sys}$$

The  $f_{sys}$  input clock is the system clock frequency as configured by the **RCC** or **RCC2** registers (see page 241 or page 247).

The Synchronization Segment Sync is that part of the bit time where edges of the CAN bus level are expected to occur; the distance between an edge that occurs outside of Sync and the Sync is called the phase error of that edge.

The Propagation Time Segment Prop is intended to compensate for the physical delay times within the CAN network.

The Phase Buffer Segments Phase1 and Phase2 surround the Sample Point.

The (Re-)Synchronization Jump Width (SJW) defines how far a resynchronization may move the Sample Point inside the limits defined by the Phase Buffer Segments to compensate for edge phase errors.

A given bit rate may be met by different bit-time configurations, but for the proper function of the CAN network, the physical delay times and the oscillator's tolerance range have to be considered.

Figure 16-4. CAN Bit Time

Table 16-3. CAN Protocol Ranges<sup>a</sup>

| Parameter | Range          | Remark                                                                                                              |
|-----------|----------------|---------------------------------------------------------------------------------------------------------------------|
| BRP       | [1 .. 64]      | Defines the length of the time quantum $t_q$ . The <b>CANBRPE</b> register can be used to extend the range to 1024. |
| Sync      | 1 $t_q$        | Fixed length, synchronization of bus input to system clock                                                          |
| Prop      | [1 .. 8] $t_q$ | Compensates for the physical delay times                                                                            |
| Phase1    | [1 .. 8] $t_q$ | May be lengthened temporarily by synchronization                                                                    |
| Phase2    | [1 .. 8] $t_q$ | May be shortened temporarily by synchronization                                                                     |
| SJW       | [1 .. 4] $t_q$ | May not be longer than either Phase Buffer Segment                                                                  |

a. This table describes the minimum programmable ranges required by the CAN protocol.

The bit timing configuration is programmed in two register bytes in the **CANBIT** register. In the **CANBIT** register, the four components TSEG2, TSEG1, SJW, and BRP have to be programmed to a numerical value that is one less than its functional value; so instead of values in the range of [1..n], values in the range of [0..n-1] are programmed. That way, for example, SJW (functional range of [1..4]) is represented by only two bits in the SJW bit field. Table 16-4 shows the relationship between the **CANBIT** register values and the parameters.

Table 16-4. CANBIT Register Values

| CANBIT Register Field | Setting           |
|-----------------------|-------------------|
| TSEG2                 | Phase2 - 1        |
| TSEG1                 | Prop + Phase1 - 1 |
| SJW                   | SJW - 1           |
| BRP                   | BRP               |

Therefore, the length of the bit time is (programmed values):

$$[TSEG1 + TSEG2 + 3] \times t_q$$

or (functional values):

$$[Sync + Prop + Phase1 + Phase2] \times t_q$$

The data in the **CANBIT** register is the configuration input of the CAN protocol controller. The baud rate prescaler (configured by the BRP field) defines the length of the time quantum, the basic time

unit of the bit time; the bit timing logic (configured by TSEG1, TSEG2, and SJW) defines the number of time quanta in the bit time.

The processing of the bit time, the calculation of the position of the sample point, and occasional synchronizations are controlled by the CAN controller and are evaluated once per time quantum.

The CAN controller translates messages to and from frames. In addition, the controller generates and discards the enclosing fixed format bits, inserts and extracts stuff bits, calculates and checks the CRC code, performs the error management, and decides which type of synchronization is to be used. The bit value is received or transmitted at the sample point. The information processing time (IPT) is the time after the sample point needed to calculate the next bit to be transmitted on the CAN bus. The IPT includes any of the following: retrieving the next data bit, handling a CRC bit, determining if bit stuffing is required, generating an error flag or simply going idle.

The IPT is application-specific but may not be longer than  $2 t_q$ ; the CAN's IPT is  $0 t_q$ . Its length is the lower limit of the programmed length of Phase2. In case of synchronization, Phase2 may be shortened to a value less than IPT, which does not affect bus timing.

### 16.3.16 Calculating the Bit Timing Parameters

Usually, the calculation of the bit timing configuration starts with a required bit rate or bit time. The resulting bit time (1/bit rate) must be an integer multiple of the system clock period.

The bit time may consist of 4 to 25 time quanta. Several combinations may lead to the required bit time, allowing iterations of the following steps.

The first part of the bit time to be defined is Prop. Its length depends on the delay times measured in the system. A maximum bus length as well as a maximum node delay has to be defined for expandable CAN bus systems. The resulting time for Prop is converted into time quanta (rounded up to the nearest integer multiple of  $t_q$ ).

Sync is  $1 t_q$  long (fixed), which leaves (bit time - Prop -  $1 t_q$ ) for the two Phase Buffer Segments. If the number of remaining  $t_q$  is even, the Phase Buffer Segments have the same length, that is, Phase2 = Phase1, else Phase2 = Phase1 + 1.

The minimum nominal length of Phase2 has to be regarded as well. Phase2 may not be shorter than the CAN controller's Information Processing Time, which is, depending on the actual implementation, in the range of  $[0..2] t_q$ .

The length of the synchronization jump width is set to the least of 4, Phase1 or Phase2.

The oscillator tolerance range necessary for the resulting configuration is calculated by the formula given below:

$$(1 - df) \times f_{nom} \leq f_{osc} \leq (1 + df) \times f_{nom}$$

where:

- $df$  = Maximum tolerance of oscillator frequency
- $f_{osc}$  = Actual oscillator frequency
- $f_{nom}$  = Nominal oscillator frequency

Maximum frequency tolerance must take into account the following formulas:

$$df \leq \frac{(\text{Phase\_seg1}, \text{Phase\_seg2}) \min}{2 \times (13 \times t_{bit} - \text{Phase\_Seg2})}$$

$$df_{\max} = 2 \times df \times f_{nom}$$

where:

- Phase1 and Phase2 are from Table 16-3 on page 994
- $t_{bit}$  = Bit Time
- $df_{\max}$  = Maximum difference between two oscillators

If more than one configuration is possible, that configuration allowing the highest oscillator tolerance range should be chosen.

CAN nodes with different system clocks require different configurations to come to the same bit rate. The calculation of the propagation time in the CAN network, based on the nodes with the longest delay times, is done once for the whole network.

The CAN system's oscillator tolerance range is limited by the node with the lowest tolerance range.

The calculation may show that bus length or bit rate have to be decreased or that the oscillator frequencies' stability has to be increased in order to find a protocol-compliant configuration of the CAN bit timing.

### 16.3.16.1 Example for Bit Timing at High Baud Rate

In this example, the frequency of CAN clock is 25 MHz, and the bit rate is 1 Mbps.

$$\text{bit time} = 1 \mu\text{s} = n \times t_q = 5 \times t_q$$

$$t_q = 200 \text{ ns}$$

$$t_q = (\text{Baud rate Prescaler}) / \text{CAN Clock}$$

$$\text{Baud rate Prescaler} = t_q \times \text{CAN Clock}$$

$$\text{Baud rate Prescaler} = 200 \times 10^{-9} \times 25 \times 10^6 = 5$$

$$t_{\text{Sync}} = 1 \times t_q = 200 \text{ ns}$$

\\fixed at 1 time quanta

delay of bus driver 50 ns

delay of receiver circuit 30 ns

delay of bus line (40m) 220 ns

$$t_{\text{Prop}} 400 \text{ ns} = 2 \times t_q$$

\\400 is next integer multiple of  $t_q$

$$\text{bit time} = t_{\text{Sync}} + t_{\text{TSeg1}} + t_{\text{TSeg2}} = 5 \times t_q$$

$$\text{bit time} = t_{\text{Sync}} + t_{\text{Prop}} + t_{\text{Phase 1}} + t_{\text{Phase 2}}$$

$$t_{\text{Phase 1}} + t_{\text{Phase 2}} = \text{bit time} - t_{\text{Sync}} - t_{\text{Prop}}$$

$$t_{\text{Phase 1}} + t_{\text{Phase 2}} = (5 \times t_q) - (1 \times t_q) - (2 \times t_q)$$

$$t_{\text{Phase 1}} + t_{\text{Phase 2}} = 2 \times t_q$$

$$t_{\text{Phase 1}} = 1 \times t_q$$

$$t_{\text{Phase 2}} = 1 \times t_q$$

\\tPhase2 = tPhase1

$$tTSeg1 = tProp + tPhase1$$

$$tTSeg1 = (2 * t_q) + (1 * t_q)$$

$$tTSeg1 = 3 * t_q$$

$$tTSeg2 = tPhase2$$

$$tTSeg2 = (\text{Information Processing Time} + 1) * t_q$$

$$tTSeg2 = 1 * t_q \quad \backslash\backslash \text{Assumes IPT}=0$$

$$tSJW = 1 * t_q \quad \backslash\backslash \text{Least of 4, Phase1 and Phase2}$$

In the above example, the bit field values for the **CANBIT** register are:

|       |                                           |
|-------|-------------------------------------------|
| TSEG2 | = TSeg2 -1<br>= 1-1<br>= 0                |
| TSEG1 | = TSeg1 -1<br>= 3-1<br>= 2                |
| SJW   | = SJW -1<br>= 1-1<br>= 0                  |
| BRP   | = Baud rate prescaler - 1<br>= 5-1<br>= 4 |

The final value programmed into the **CANBIT** register = 0x0204.

### 16.3.16.2 Example for Bit Timing at Low Baud Rate

In this example, the frequency of the CAN clock is 50 MHz, and the bit rate is 100 Kbps.

$$\text{bit time} = 10 \mu\text{s} = n * t_q = 10 * t_q$$

$$t_q = 1 \mu\text{s}$$

$$t_q = (\text{Baud rate Prescaler}) / \text{CAN Clock}$$

$$\text{Baud rate Prescaler} = t_q * \text{CAN Clock}$$

$$\text{Baud rate Prescaler} = 1\text{E}-6 * 50\text{E}6 = 50$$

$$tSync = 1 * t_q = 1 \mu\text{s} \quad \backslash\backslash \text{fixed at 1 time quanta}$$

$$\text{delay of bus driver } 200 \text{ ns}$$

$$\text{delay of receiver circuit } 80 \text{ ns}$$

$$\text{delay of bus line (40m) } 220 \text{ ns}$$

$$tProp 1 \mu\text{s} = 1 * t_q \quad \backslash\backslash 1 \mu\text{s is next integer multiple of } t_q$$

$$\text{bit time} = tSync + tTSeg1 + tTSeg2 = 10 * t_q$$

$$\text{bit time} = tSync + tProp + tPhase 1 + tPhase2$$

$$tPhase 1 + tPhase2 = \text{bit time} - tSync - tProp$$

$$tPhase 1 + tPhase2 = (10 * t_q) - (1 * t_q) - (1 * t_q)$$

$$tPhase 1 + tPhase2 = 8 * t_q$$

$$tPhase1 = 4 * t_q$$

$$tPhase2 = 4 * t_q \quad \backslash\backslash tPhase1 = tPhase2$$

$$\begin{aligned}
 tTSeg1 &= tProp + tPhase1 \\
 tTSeg1 &= (1 * t_q) + (4 * t_q) \\
 tTSeg1 &= 5 * t_q \\
 tTSeg2 &= tPhase2 \\
 tTSeg2 &= (Information Processing Time + 4) * t_q \\
 tTSeg2 &= 4 * t_q \quad \quad \quad \backslash\backslash \text{Assumes IPT}=0 \\
 \\ 
 tSJW &= 4 * t_q \quad \quad \quad \backslash\backslash \text{Least of 4, Phase1, and Phase2}
 \end{aligned}$$

|       |                                            |
|-------|--------------------------------------------|
| TSEG2 | = TSeg2 -1<br>= 4-1<br>= 3                 |
| TSEG1 | = TSeg1 -1<br>= 5-1<br>= 4                 |
| SJW   | = SJW -1<br>= 4-1<br>= 3                   |
| BRP   | = Baud rate prescaler - 1<br>= 50-1<br>=49 |

The final value programmed into the **CANBIT** register = 0x34F1.

## 16.4 Register Map

Table 16-5 on page 998 lists the registers. All addresses given are relative to the CAN base address of:

■ CAN0: 0x4004.0000

Note that the CAN controller clock must be enabled before the registers can be programmed (see page 329). There must be a delay of 3 system clocks after the CAN module clock is enabled before any CAN module registers are accessed.

## 16.5 CAN Register Descriptions

The remainder of this section lists and describes the CAN registers, in numerical order by address offset. There are two sets of Interface Registers that are used to access the Message Objects in the Message RAM: **CANIF1x** and **CANIF2x**. The function of the two sets are identical and are used to queue transactions.

**Register 1: CAN Control (CANCTL), offset 0x000**

This control register initializes the module and enables test mode and interrupts.

The bus-off recovery sequence (see CAN Specification Rev. 2.0) cannot be shortened by setting or clearing INIT. If the device goes bus-off, it sets INIT, stopping all bus activities. Once INIT has been cleared by the CPU, the device then waits for 129 occurrences of Bus Idle (129 \* 11 consecutive High bits) before resuming normal operations. At the end of the bus-off recovery sequence, the Error Management Counters are reset.

During the waiting time after INIT is cleared, each time a sequence of 11 High bits has been monitored, a BITERROR0 code is written to the **CANSTS** register (the LEC field = 0x5), enabling the CPU to readily check whether the CAN bus is stuck Low or continuously disturbed, and to monitor the proceeding of the bus-off recovery sequence.

**CAN Control (CANCTL)**

| 1         | An interrupt is generated when a message has successfully been transmitted or received, or a CAN bus error has been detected. A change in the TXOK, RXOK or LEC bits in the <b>CANSTS</b> register generates an interrupt. |      |       |                                                                                                                                                                                                                                                                                                                                                                                                          |       |             |   |                                         |   |                                                                                                                                                                                                                            |

**Register 2: CAN Status (CANSTS), offset 0x004**

**Important:** This register is read-sensitive. See the register description for details.

The status register contains information for interrupt servicing such as Bus-Off, error count threshold, and error types.

The LEC field holds the code that indicates the type of the last error to occur on the CAN bus. This field is cleared when a message has been transferred (reception or transmission) without error. The unused error code 0x7 may be written by the CPU to manually set this field to an invalid error so that it can be checked for a change later.

An error interrupt is generated by the BOFF and EWARN bits, and a status interrupt is generated by the RXOK, TXOK, and LEC bits, if the corresponding enable bits in the **CAN Control (CANCTL)** register are set. A change of the EPASS bit or a write to the RXOK, TXOK, or LEC bits does not generate an interrupt.

Reading the **CAN Status (CANSTS)** register clears the **CAN Interrupt (CANINT)** register, if it is pending.

**CAN Status (CANSTS)**

CAN0 base: 0x4004.0000

Offset 0x004

Type RW, reset 0x0000.0000

When the arbitration field is transmitted, data conflicts are a part of the arbitration protocol. When other frame fields are transmitted, data conflicts are considered errors. |  | A Bit 1 Error indicates that the device wanted to send a High level (logical 1) but the monitored bus value was Low (logical 0). | 0x5 | Bit 0 Error |  | A Bit 0 Error indicates that the device wanted to send a Low level (logical 0), but the monitored bus value was High (logical 1). |  | During bus-off recovery, this status is set each time a sequence of 11 High bits has been monitored. By checking for this status, software can monitor the proceeding of the bus-off recovery sequence without any disturbances to the bus. | 0x6 | CRC Error |  | The CRC checksum was incorrect in the received message, indicating that the calculated value received did not match the calculated CRC of the data. | 0x7 | No Event |  | When the LEC bit shows this value, no CAN bus event was detected since this value was written to the LEC field. |
| Value     | Description                                                                                                                                                                                                                                                                         |      |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |       |             |     |          |     |             |  |                                                                                                               |     |              |  |                                                                 |     |           |  |                                                               |     |             |  |                                                                                                                                                                                                                                                                                     |  |                                                                                                                                  |     |             |  |                                                                                                                                   |  |                                                                                                                                                                                                                                             |     |           |  |                                                                                                                                                     |     |          |  |                                                                                                                 |

|           | When a message is transmitted, the CAN controller monitors the data lines to detect any conflicts. When the arbitration field is transmitted, data conflicts are a part of the arbitration protocol. When other frame fields are transmitted, data conflicts are considered errors. |      |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |       |             |     |          |     |             |  |                                                                                                               |     |              |  |                                                                 |     |           |  |                                                               |     |             |  |                                                                                                                                                                                                                                                                                     |  |                                                                                                                                  |     |             |  |                                                                                                                                   |  |                                                                                                                                                                                                                                             |     |           |  |                                                                                                                                                     |     |          |  |                                                                                                                 |
|           | A Bit 1 Error indicates that the device wanted to send a High level (logical 1) but the monitored bus value was Low (logical 0).                                                                                                                                                    |      |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |       |             |     |          |     |             |  |                                                                                                               |     |              |  |                                                                 |     |           |  |                                                               |     |             |  |                                                                                                                                                                                                                                                                                     |  |                                                                                                                                  |     |             |  |                                                                                                                                   |  |                                                                                                                                                                                                                                             |     |           |  |                                                                                                                                                     |     |          |  |                                                                                                                 |

|           | A Bit 0 Error indicates that the device wanted to send a Low level (logical 0), but the monitored bus value was High (logical 1).                                                                                                                                                   |      |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |       |             |     |          |     |             |  |                                                                                                               |     |              |  |                                                                 |     |           |  |                                                               |     |             |  |                                                                                                                                                                                                                                                                                     |  |                                                                                                                                  |     |             |  |                                                                                                                                   |  |                                                                                                                                                                                                                                             |     |           |  |                                                                                                                                                     |     |          |  |                                                                                                                 |
|           | During bus-off recovery, this status is set each time a sequence of 11 High bits has been monitored. By checking for this status, software can monitor the proceeding of the bus-off recovery sequence without any disturbances to the bus.                                         |      |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |       |             |     |          |     |             |  |                                                                                                               |     |              |  |                                                                 |     |           |  |                                                               |     |             |  |                                                                                                                                                                                                                                                                                     |  |                                                                                                                                  |     |             |  |                                                                                                                                   |  |                                                                                                                                                                                                                                             |     |           |  |                                                                                                                                                     |     |          |  |                                                                                                                 |

**Register 3: CAN Error Counter (CANERR), offset 0x008**

This register contains the error counter values, which can be used to analyze the cause of an error.

**CAN Error Counter (CANERR)**

CAN0 base: 0x4004.0000

Offset 0x008

Type RO, reset 0x0000.0000

**Register 4: CAN Bit Timing (CANBIT), offset 0x00C**

This register is used to program the bit width and bit quantum. Values are programmed to the system clock frequency. This register is write-enabled by setting the CCE and INIT bits in the **CANCTL** register. See “Bit Time and Bit Rate” on page 993 for more information.

| 14:12     | TSEG2    | RW   | 0x2    | Time Segment after Sample Point<br>0x00-0x07: The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.<br>So, for example, the reset value of 0x2 means that 3 (2+1) bit time quanta are defined for Phase2 (see Figure 16-4 on page 994). The bit time quanta is defined by the BRP field.                                                                                                                                                                  |
| 11:8      | TSEG1    | RW   | 0x3    | Time Segment Before Sample Point<br>0x00-0x0F: The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.<br>So, for example, the reset value of 0x3 means that 4 (3+1) bit time quanta are defined for Phase1 (see Figure 16-4 on page 994). The bit time quanta is defined by the BRP field.                                                                                                                                                                 |
| 7:6       | SJW      | RW   | 0x0    | (Re)Synchronization Jump Width<br>0x00-0x03: The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.<br>During the start of frame (SOF), if the CAN controller detects a phase error (misalignment), it can adjust the length of TSEG2 or TSEG1 by the value in SJW. So the reset value of 0 adjusts the length by 1 bit time quanta.                                                                                                                       |
| 5:0       | BRP      | RW   | 0x1    | Baud Rate Prescaler<br>The value by which the oscillator frequency is divided for generating the bit time quanta. The bit time is built up from a multiple of this quantum.<br>0x00-0x03F: The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.<br>BRP defines the number of CAN clock periods that make up 1 bit time quanta, so the reset value is 2 bit time quanta (1+1).<br>The <b>CANBRPE</b> register can be used to further divide the bit time. |

**Register 5: CAN Interrupt (CANINT), offset 0x010**

This register indicates the source of the interrupt.

If several interrupts are pending, the **CAN Interrupt (CANINT)** register points to the pending interrupt with the highest priority, disregarding the order in which the interrupts occurred. An interrupt remains pending until the CPU has cleared it. If the INTID field is not 0x0000 (the default) and the IE bit in the **CANCTL** register is set, the interrupt is active. The interrupt line remains active until the INTID field is cleared by reading the **CANSTS** register, or until the IE bit in the **CANCTL** register is cleared.

**Note:** Reading the **CAN Status (CANSTS)** register clears the **CAN Interrupt (CANINT)** register, if it is pending.

**Register 6: CAN Test (CANTST), offset 0x014**

This register is used for self-test and external pin access. It is write-enabled by setting the TEST bit in the **CANCTL** register. Different test functions may be combined, however, CAN transfers are affected if the TX bits in this register are not zero.

**CAN Test (CANTST)**

CAN0 base: 0x4004.0000

Offset 0x014

Type RW, reset 0x0000.0000

**Register 7: CAN Baud Rate Prescaler Extension (CANBRPE), offset 0x018**

This register is used to further divide the bit time set with the BRP bit in the **CANBIT** register. It is write-enabled by setting the CCE bit in the **CANCTL** register.

**CAN Baud Rate Prescaler Extension (CANBRPE)**

**Register 8: CAN IF1 Command Request (CANIF1CRQ), offset 0x020****Register 9: CAN IF2 Command Request (CANIF2CRQ), offset 0x080**

A message transfer is started as soon as there is a write of the message object number to the MNUM field when the TXRQST bit in the **CANIF1MCTL** register is set. With this write operation, the BUSY bit is automatically set to indicate that a transfer between the CAN Interface Registers and the internal message RAM is in progress. After a wait time of 3 to 6 CAN\_CLK periods, the transfer between the interface register and the message RAM completes, which then clears the BUSY bit.

**Register 10: CAN IF1 Command Mask (CANIF1CMSK), offset 0x024****Register 11: CAN IF2 Command Mask (CANIF2CMSK), offset 0x084**

Reading the Command Mask registers provides status for various functions. Writing to the Command Mask registers specifies the transfer direction and selects which buffer registers are the source or target of the data transfer.

Note that when a read from the message object buffer occurs when the WRNRD bit is clear and the CLRINTPND and/or NEWDAT bits are set, the interrupt pending and/or new data flags in the message object buffer are cleared.

| 1         | If WRNRD is clear, the new data status is cleared in the message buffer. Note the value of this bit that is transferred to the <b>CANIFnMCTL</b> register always reflects the status of the bits before clearing.<br>If WRNRD is set, a transmission is requested. Note that when this bit is set, the TXRQST bit in the <b>CANIFnMCTL</b> register is ignored. |      |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |       |             |   |                                                                                                                                                                                                         |   |                                                                                                                                                                                                                                                                                                                                                                 |

**Register 12: CAN IF1 Mask 1 (CANIF1MSK1), offset 0x028****Register 13: CAN IF2 Mask 1 (CANIF2MSK1), offset 0x088**

The mask information provided in this register accompanies the data (**CANIFnDAn**), arbitration information (**CANIFnARBn**), and control information (**CANIFnMCTL**) to the message object in the message RAM. The mask is used with the ID bit in the **CANIFnARBn** register for acceptance filtering. Additional mask information is contained in the **CANIFnMSK2** register.

**CAN IFn Mask 1 (CANIFnMSK1)**

CAN0 base: 0x4004.0000

Offset 0x028

Type RW, reset 0x0000.FFFF

**Register 14: CAN IF1 Mask 2 (CANIF1MSK2), offset 0x02C****Register 15: CAN IF2 Mask 2 (CANIF2MSK2), offset 0x08C**

This register holds extended mask information that accompanies the **CANIFnMSK1** register.

**CAN IFn Mask 2 (CANIFnMSK2)**

CAN0 base: 0x4004.0000

Offset 0x02C

Type RW, reset 0x0000.FFFF

**Register 20: CAN IF1 Message Control (CANIF1MCTL), offset 0x038****Register 21: CAN IF2 Message Control (CANIF2MCTL), offset 0x098**

This register holds the control information associated with the message object to be sent to the Message RAM.

**CAN IFn Message Control (CANIFnMCTL)**

CAN0 base: 0x4004.0000

Offset 0x038

Type RW, reset 0x0000.0000

These registers contain the data to be sent or that has been received. In a CAN data frame, data byte 0 is the first byte to be transmitted or received and data byte 7 is the last byte to be transmitted or received. In CAN's serial bit stream, the MSB of each byte is transmitted first.

**Register 30: CAN Transmission Request 1 (CANTXRQ1), offset 0x100****Register 31: CAN Transmission Request 2 (CANTXRQ2), offset 0x104**

The **CANTXRQ1** and **CANTXRQ2** registers hold the TXRQST bits of the 32 message objects. By reading out these bits, the CPU can check which message object has a transmission request pending. The TXRQST bit of a specific message object can be changed by three sources: (1) the CPU via the **CANIFnMCTL** register, (2) the message handler state machine after the reception of a remote frame, or (3) the message handler state machine after a successful transmission.

The **CANTXRQ1** register contains the TXRQST bits of the first 16 message objects in the message RAM; the **CANTXRQ2** register contains the TXRQST bits of the second 16 message objects.

**Register 32: CAN New Data 1 (CANNWDA1), offset 0x120****Register 33: CAN New Data 2 (CANNWDA2), offset 0x124**

The **CANNWDA1** and **CANNWDA2** registers hold the NEWDAT bits of the 32 message objects. By reading these bits, the CPU can check which message object has its data portion updated. The NEWDAT bit of a specific message object can be changed by three sources: (1) the CPU via the **CANIFnMCTL** register, (2) the message handler state machine after the reception of a data frame, or (3) the message handler state machine after a successful transmission.

The **CANNWDA1** register contains the NEWDAT bits of the first 16 message objects in the message RAM; the **CANNWDA2** register contains the NEWDAT bits of the second 16 message objects.

|           | 1        | The message handler or the CPU has written new data into the data portion of the corresponding message object.                                                      |        |                                                                                                                                                                                               |

**Register 34: CAN Message 1 Interrupt Pending (CANMSG1INT), offset 0x140****Register 35: CAN Message 2 Interrupt Pending (CANMSG2INT), offset 0x144**

The **CANMSG1INT** and **CANMSG2INT** registers hold the INTPND bits of the 32 message objects. By reading these bits, the CPU can check which message object has an interrupt pending. The INTPND bit of a specific message object can be changed through two sources: (1) the CPU via the **CANIFnMCTL** register, or (2) the message handler state machine after the reception or transmission of a frame.

This field is also encoded in the **CANINT** register.

The **CANMSG1INT** register contains the INTPND bits of the first 16 message objects in the message RAM; the **CANMSG2INT** register contains the INTPND bits of the second 16 message objects.

| 1                      |          | The corresponding message object is configured and should be considered by the message handler. |        |                                                                                                                                                                                               |

## 17 Universal Serial Bus (USB) Controller

The TM4C1232H6PM USB controller operates as a full-speed function controller during point-to-point communications with USB Host functions. The controller complies with the USB 2.0 standard, which includes SUSPEND and RESUME signaling. 16 endpoints including two hard-wired for control transfers (one endpoint for IN and one endpoint for OUT) plus 14 endpoints defined by firmware along with a dynamic sizable FIFO support multiple packet queueing.  $\mu$ DMA access to the FIFO allows minimal interference from system software. Software-controlled connect and disconnect allows flexibility during USB device startup.

The TM4C1232H6PM USB module has the following features:

- Complies with USB-IF (Implementer's Forum) certification standards
- USB 2.0 full-speed (12 Mbps) operation with integrated PHY
- 4 transfer types: Control, Interrupt, Bulk, and Isochronous
- 16 endpoints
  - 1 dedicated control IN endpoint and 1 dedicated control OUT endpoint
  - 7 configurable IN endpoints and 7 configurable OUT endpoints
- 4 KB dedicated endpoint memory: one endpoint may be defined for double-buffered 1023-byte isochronous packet size
- Efficient transfers using Micro Direct Memory Access Controller ( $\mu$ DMA)
  - Separate channels for transmit and receive for up to three IN endpoints and three OUT endpoints
  - Channel requests asserted when FIFO contains required amount of data

### 17.1 Block Diagram

Figure 17-1. USB Module Block Diagram

## 17.2 Signal Description

The following table lists the external signals of the USB controller and describes the function of each. These signals have dedicated functions and are not alternate functions for any GPIO signals.

**Table 17-1. USB Signals (64LQFP)**

| Pin Name | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description                                                              |
|----------|------------|--------------------------|----------|--------------------------|--------------------------------------------------------------------------|
| USB0DM   | 43         | PD4                      | I/O      | Analog                   | Bidirectional differential data pin (D- per USB specification) for USB0. |
| USB0DP   | 44         | PD5                      | I/O      | Analog                   | Bidirectional differential data pin (D+ per USB specification) for USB0. |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

## 17.3 Functional Description

The TM4C1232H6PM USB controller provides the ability for the controller to serve as a Device-only controller. The controller can only be used in Device mode to connect USB-enabled peripherals to the USB controller. For Device mode, the USB controller requires a B connector in the system to provide Device connectivity.

**Note:** When the USB module is in operation, MOSC must be the clock source, either with or without using the PLL, and the system clock must be at least 20 MHz.

### 17.3.1 Operation

This section describes the TM4C1232H6PM USB controller's actions. IN endpoints, OUT endpoints, entry into and exit from SUSPEND mode, and recognition of Start of Frame (SOF) are all described.

IN transactions are controlled by an endpoint's transmit interface and use the transmit endpoint registers for the given endpoint. OUT transactions are handled with an endpoint's receive interface and use the receive endpoint registers for the given endpoint.

When configuring the size of the FIFOs for endpoints, take into account the maximum packet size for an endpoint.

- **Bulk.** Bulk endpoints should be the size of the maximum packet (up to 64 bytes) or twice the maximum packet size if double buffering is used (described further in the following section).
- **Interrupt.** Interrupt endpoints should be the size of the maximum packet (up to 64 bytes) or twice the maximum packet size if double buffering is used.
- **Isochronous.** Isochronous endpoints are more flexible and can be up to 1023 bytes.
- **Control.** It is also possible to specify a separate control endpoint for a USB Device. However, in most cases the USB Device should use the dedicated control endpoint on the USB controller's endpoint 0.

#### 17.3.1.1 Endpoints

The USB controller provides two dedicated control endpoints (IN and OUT) and 14 configurable endpoints (7 IN and 7 OUT) that can be used for communications with a Host controller. The endpoint number and direction associated with an endpoint is directly related to its register designation. For example, when the Host is transmitting to endpoint 1, all configuration and data is in the endpoint 1 transmit register interface.

Endpoint 0 is a dedicated control endpoint used for all control transactions to endpoint 0 during enumeration or when any other control requests are made to endpoint 0. Endpoint 0 uses the first 64 bytes of the USB controller's FIFO RAM as a shared memory for both IN and OUT transactions.

The remaining 14 endpoints can be configured as control, bulk, interrupt, or isochronous endpoints. They should be treated as 7 configurable IN and 7 configurable OUT endpoints. The endpoint pairs are not required to have the same type for their IN and OUT endpoint configuration. For example, the OUT portion of an endpoint pair could be a bulk endpoint, while the IN portion of that endpoint pair could be an interrupt endpoint. The address and size of the FIFOs attached to each endpoint can be modified to fit the application's needs.

### 17.3.1.2 IN Transactions

Data for IN transactions is handled through the FIFOs attached to the transmit endpoints. The sizes of the FIFOs for the 7 configurable IN endpoints are determined by the **USB Transmit FIFO Start Address (USBTXFIFOADD)** register. The maximum size of a data packet that may be placed in a transmit endpoint's FIFO for transmission is programmable and is determined by the value written to the **USB Maximum Transmit Data Endpoint n (USBTXMAXPn)** register for that endpoint. The endpoint's FIFO can also be configured to use double-packet or single-packet buffering. When double-packet buffering is enabled, two data packets can be buffered in the FIFO, which also requires that the FIFO is at least two packets in size. When double-packet buffering is disabled, only one packet can be buffered, even if the packet size is less than half the FIFO size.

**Note:** The maximum packet size set for any endpoint must not exceed the FIFO size. The **USBTXMAXPn** register should not be written to while data is in the FIFO as unexpected results may occur.

#### *Single-Packet Buffering*

If the size of the transmit endpoint's FIFO is less than twice the maximum packet size for this endpoint (as set in the **USB Transmit Dynamic FIFO Sizing (USBTXFIFOSZ)** register), only one packet can be buffered in the FIFO and single-packet buffering is required. When each packet is completely loaded into the transmit FIFO, the TXRDY bit in the **USB Transmit Control and Status Endpoint n Low (USBTXCSSLn)** register must be set. If the AUTOSET bit in the **USB Transmit Control and Status Endpoint n High (USBTXCSRHn)** register is set, the TXRDY bit is automatically set when a maximum-sized packet is loaded into the FIFO. For packet sizes less than the maximum, the TXRDY bit must be set manually. When the TXRDY bit is set, either manually or automatically, the packet is ready to be sent. When the packet has been successfully sent, both TXRDY and FIFONE are cleared, and the appropriate transmit endpoint interrupt signaled. At this point, the next packet can be loaded into the FIFO.

#### *Double-Packet Buffering*

If the size of the transmit endpoint's FIFO is at least twice the maximum packet size for this endpoint, two packets can be buffered in the FIFO and double-packet buffering is allowed. As each packet is loaded into the transmit FIFO, the TXRDY bit in the **USBTXCSSLn** register must be set. If the AUTOSET bit in the **USBTXCSRHn** register is set, the TXRDY bit is automatically set when a maximum-sized packet is loaded into the FIFO. For packet sizes less than the maximum, TXRDY must be set manually. When the TXRDY bit is set, either manually or automatically, the packet is ready to be sent. After the first packet is loaded, TXRDY is immediately cleared and an interrupt is generated. A second packet can now be loaded into the transmit FIFO and TXRDY set again (either manually or automatically if the packet is the maximum size). At this point, both packets are ready to be sent. After each packet has been successfully sent, TXRDY is automatically cleared and the appropriate transmit endpoint interrupt signaled to indicate that another packet can now be loaded into the transmit FIFO. The state of the FIFONE bit in the **USBTXCSSLn** register at this point

indicates how many packets may be loaded. If the FIFONE bit is set, then another packet is in the FIFO and only one more packet can be loaded. If the FIFONE bit is clear, then no packets are in the FIFO and two more packets can be loaded.

**Note:** Double-packet buffering is disabled if an endpoint's corresponding EPn bit is set in the **USB Transmit Double Packet Buffer Disable (USBTXDPKTBUFDIS)** register. This bit is set by default, so it must be cleared to enable double-packet buffering.

### 17.3.1.3 OUT Transactions

OUT transactions are handled through the USB controller receive FIFOs. The sizes of the receive FIFOs for the 7 configurable OUT endpoints are determined by the **USB Receive FIFO Start Address (USBRXFIFOADD)** register. The maximum amount of data received by an endpoint in any packet is determined by the value written to the **USB Maximum Receive Data Endpoint n (USBRXMAXPn)** register for that endpoint. When double-packet buffering is enabled, two data packets can be buffered in the FIFO. When double-packet buffering is disabled, only one packet can be buffered even if the packet is less than half the FIFO size.

**Note:** In all cases, the maximum packet size must not exceed the FIFO size.

#### **Single-Packet Buffering**

If the size of the receive endpoint FIFO is less than twice the maximum packet size for an endpoint, only one data packet can be buffered in the FIFO and single-packet buffering is required. When a packet is received and placed in the receive FIFO, the RXRDY and FULL bits in the **USB Receive Control and Status Endpoint n Low (USBRXCSSLn)** register are set and the appropriate receive endpoint is signaled, indicating that a packet can now be unloaded from the FIFO. After the packet has been unloaded, the RXRDY bit must be cleared in order to allow further packets to be received. This action also generates the acknowledge signaling to the Host controller. If the AUTOCL bit in the **USB Receive Control and Status Endpoint n High (USBRXCSSLn)** register is set and a maximum-sized packet is unloaded from the FIFO, the RXRDY and FULL bits are cleared automatically. For packet sizes less than the maximum, RXRDY must be cleared manually.

#### **Double-Packet Buffering**

If the size of the receive endpoint FIFO is at least twice the maximum packet size for the endpoint, two data packets can be buffered and double-packet buffering can be used. When the first packet is received and loaded into the receive FIFO, the RXRDY bit in the **USBRXCSSLn** register is set and the appropriate receive endpoint interrupt is signaled to indicate that a packet can now be unloaded from the FIFO.

**Note:** The FULL bit in **USBRXCSSLn** is not set when the first packet is received. It is only set if a second packet is received and loaded into the receive FIFO.

After each packet has been unloaded, the RXRDY bit must be cleared to allow further packets to be received. If the AUTOCL bit in the **USBRXCSSLn** register is set and a maximum-sized packet is unloaded from the FIFO, the RXRDY bit is cleared automatically. For packet sizes less than the maximum, RXRDY must be cleared manually. If the FULL bit is set when RXRDY is cleared, the USB controller first clears the FULL bit, then sets RXRDY again to indicate that there is another packet waiting in the FIFO to be unloaded.

**Note:** Double-packet buffering is disabled if an endpoint's corresponding EPn bit is set in the **USB Receive Double Packet Buffer Disable (USBRXDPKTBUFDIS)** register. This bit is set by default, so it must be cleared to enable double-packet buffering.

#### 17.3.1.4 Scheduling

The Device has no control over the scheduling of transactions as scheduling is determined by the Host controller. The TM4C1232H6PM USB controller can set up a transaction at any time. The USB controller waits for the request from the Host controller and generates an interrupt when the transaction is complete or if it was terminated due to some error. If the Host controller makes a request and the Device controller is not ready, the USB controller sends a busy response (NAK) to all requests until it is ready.

#### 17.3.1.5 Additional Actions

The USB controller responds automatically to certain conditions on the USB bus or actions by the Host controller such as when the USB controller automatically stalls a control transfer or unexpected zero length OUT data packets.

##### ***Stalled Control Transfer***

The USB controller automatically issues a STALL handshake to a control transfer under the following conditions:

1. The Host sends more data during an OUT data phase of a control transfer than was specified in the Device request during the SETUP phase. This condition is detected by the USB controller when the Host sends an OUT token (instead of an IN token) after the last OUT packet has been unloaded and the DATAEND bit in the **USB Control and Status Endpoint 0 Low (USBCSRL0)** register has been set.
2. The Host requests more data during an IN data phase of a control transfer than was specified in the Device request during the SETUP phase. This condition is detected by the USB controller when the Host sends an IN token (instead of an OUT token) after the CPU has cleared TXRDY and set DATAEND in response to the ACK issued by the Host to what should have been the last packet.
3. The Host sends more than **USBRXMAXP<sub>n</sub>** bytes of data with an OUT data token.
4. The Host sends more than a zero length data packet for the OUT STATUS phase.

##### ***Zero Length OUT Data Packets***

A zero-length OUT data packet is used to indicate the end of a control transfer. In normal operation, such packets should only be received after the entire length of the Device request has been transferred.

However, if the Host sends a zero-length OUT data packet before the entire length of Device request has been transferred, it is signaling the premature end of the transfer. In this case, the USB controller automatically flushes any IN token ready for the data phase from the FIFO and sets the DATAEND bit in the **USBCSRL0** register.

##### ***Setting the Device Address***

When a Host is attempting to enumerate the USB Device, it requests that the Device change its address from zero to some other value. The address is changed by writing the value that the Host requested to the **USB Device Functional Address (USBFADDR)** register. However, care should be taken when writing to **USBFADDR** to avoid changing the address before the transaction is complete. This register should only be set after the SET\_ADDRESS command is complete. Like all control transactions, the transaction is only complete after the Device has left the STATUS phase. In the case of a SET\_ADDRESS command, the transaction is completed by responding to the IN

request from the Host with a zero-byte packet. Once the Device has responded to the IN request, the **USBFADDR** register should be programmed to the new value as soon as possible to avoid missing any new commands sent to the new address.

**Note:** If the **USBFADDR** register is set to the new value as soon as the Device receives the OUT transaction with the SET\_ADDRESS command in the packet, it changes the address during the control transfer. In this case, the Device does not receive the IN request that allows the USB transaction to exit the STATUS phase of the control transfer because it is sent to the old address. As a result, the Host does not get a response to the IN request, and the Host fails to enumerate the Device.

#### 17.3.1.6 SUSPEND

When no activity has occurred on the USB bus for 3 ms, the USB controller automatically enters SUSPEND mode. If the SUSPEND interrupt has been enabled in the **USB Interrupt Enable (USBIE)** register, an interrupt is generated at this time. When in SUSPEND mode, the PHY also goes into SUSPEND mode. When RESUME signaling is detected, the USB controller exits SUSPEND mode and takes the PHY out of SUSPEND. If the RESUME interrupt is enabled, an interrupt is generated. The USB controller can also be forced to exit SUSPEND mode by setting the RESUME bit in the **USB Power (USBPOWER)** register. When this bit is set, the USB controller exits SUSPEND mode and drives RESUME signaling onto the bus. The RESUME bit must be cleared after 10 ms (a maximum of 15 ms) to end RESUME signaling.

To meet USB power requirements, the controller can be put into Deep Sleep mode which keeps the controller in a static state.

---

**Important:** When configured as a self-powered Device, the USB module meets the response timing and power draw requirements for USB compliance of SUSPEND mode. When configured as a bus-powered Device, the USB can operate in SUSPEND mode but produces a higher power draw than required to be compliant.

---

#### 17.3.1.7 Start-of-Frame

When the USB controller is operating in Device mode, it receives a Start-Of-Frame (SOF) packet from the Host once every millisecond. When the SOF packet is received, the 11-bit frame number contained in the packet is written into the **USB Frame Value (USBFRAME)** register, and an SOF interrupt is also signaled and can be handled by the application. Once the USB controller has started to receive SOF packets, it expects one every millisecond. If no SOF packet is received after 1.00358 ms, the packet is assumed to have been lost, and the **USBFRAME** register is not updated. The USB controller continues and resynchronizes these pulses to the received SOF packets when these packets are successfully received again.

#### 17.3.1.8 USB RESET

When a RESET condition is detected on the USB bus, the USB controller automatically performs the following actions:

- Clears the **USBFADDR** register.
- Clears the **USB Endpoint Index (USBEPIDX)** register.
- Flushes all endpoint FIFOs.
- Clears all control/status registers.
- Enables all endpoint interrupts.

- Generates a RESET interrupt.

When the application software driving the USB controller receives a RESET interrupt, any open pipes are closed and the USB controller waits for bus enumeration to begin.

### 17.3.1.9 Connect/Disconnect

The USB controller connection to the USB bus is handled by software. The USB PHY can be switched between normal mode and non-driving mode by setting or clearing the SOFTCONN bit of the **USBPOWER** register. When the SOFTCONN bit is set, the PHY is placed in its normal mode, and the USB0DP/USB0DM lines of the USB bus are enabled. At the same time, the USB controller is placed into a state, in which it does not respond to any USB signaling except a USB RESET.

When the SOFTCONN bit is cleared, the PHY is put into non-driving mode, USB0DP and USB0DM are tristated, and the USB controller appears to other devices on the USB bus as if it has been disconnected. The non-driving mode is the default so the USB controller appears disconnected until the SOFTCONN bit has been set. The application software can then choose when to set the PHY into its normal mode. Systems with a lengthy initialization procedure may use this to ensure that initialization is complete, and the system is ready to perform enumeration before connecting to the USB bus. Once the SOFTCONN bit has been set, the USB controller can be disconnected by clearing this bit.

**Note:** The USB controller does not generate an interrupt when the Device is connected to the Host. However, an interrupt is generated when the Host terminates a session.

### 17.3.2 DMA Operation

The USB peripheral provides an interface connected to the  $\mu$ DMA controller with separate channels for 3 transmit endpoints and 3 receive endpoints. Software selects which endpoints to service with the  $\mu$ DMA channels using the **USB DMA Select (USBDMASEL)** register. The  $\mu$ DMA operation of the USB is enabled through the **USBTXCSRHn** and **USBRXCSRHn** registers, for the TX and RX channels respectively. When  $\mu$ DMA operation is enabled, the USB asserts a  $\mu$ DMA request on the enabled receive or transmit channel when the associated FIFO can transfer data. When either FIFO can transfer data, the burst request for that channel is asserted. The  $\mu$ DMA channel must be configured to operate in Basic mode, and the size of the  $\mu$ DMA transfer must be restricted to whole multiples of the size of the USB FIFO. Both read and write transfers of the USB FIFOs using  $\mu$ DMA must be configured in this manner. For example, if the USB endpoint is configured with a FIFO size of 64 bytes, the  $\mu$ DMA channel can be used to transfer 64 bytes to or from the endpoint FIFO. If the number of bytes to transfer is less than 64, then a programmed I/O method must be used to copy the data to or from the FIFO.

If the DMAMOD bit in the **USBTXCSRHn/USBRXCSRHn** register is clear, an interrupt is generated after every packet is transferred, but the  $\mu$ DMA continues transferring data. If the DMAMOD bit is set, an interrupt is generated only when the entire  $\mu$ DMA transfer is complete. The interrupt occurs on the USB interrupt vector. Therefore, if interrupts are used for USB operation and the  $\mu$ DMA is enabled, the USB interrupt handler must be designed to handle the  $\mu$ DMA completion interrupt.

Care must be taken when using the  $\mu$ DMA to unload the receive FIFO as data is read from the receive FIFO in 4 byte chunks regardless of value of the MAXLOAD field in the **USBRXCSRHn** register. The RXRDY bit is cleared as follows.

**Table 17-2. Remainder (MAXLOAD/4)**

| Value | Description        |
|-------|--------------------|
| 0     | MAXLOAD = 64 bytes |

Table 17-2. Remainder (MAXLOAD/4) (continued)

| Value | Description        |
|-------|--------------------|
| 1     | MAXLOAD = 61 bytes |
| 2     | MAXLOAD = 62 bytes |
| 3     | MAXLOAD = 63 bytes |

Table 17-3. Actual Bytes Read

| Value | Description |
|-------|-------------|
| 0     | MAXLOAD     |
| 1     | MAXLOAD+3   |
| 2     | MAXLOAD+2   |
| 3     | MAXLOAD+1   |

Table 17-4. Packet Sizes That Clear RXRDY

| Value | Description                              |
|-------|------------------------------------------|
| 0     | MAXLOAD, MAXLOAD-1, MAXLOAD-2, MAXLOAD-3 |
| 1     | MAXLOAD                                  |
| 2     | MAXLOAD, MAXLOAD-1                       |
| 3     | MAXLOAD, MAXLOAD-1, MAXLOAD-2            |

To enable DMA operation for the endpoint receive channel, the DMAEN bit of the **USBRXCSRHn** register should be set. To enable DMA operation for the endpoint transmit channel, the DMAEN bit of the **USBTXCSRHn** register must be set.

See “Micro Direct Memory Access (μDMA)” on page 518 for more details about programming the μDMA controller.

## 17.4 Initialization and Configuration

To use the USB Controller, the peripheral clock must be enabled via the **RCGCUSB** register (see page 328).

The initial configuration in all cases requires that the processor enable the USB controller and USB controller's physical layer interface (PHY) before setting any registers. The next step is to enable the USB PLL so that the correct clocking is provided to the PHY.

The USB controller provides a method to set the current operating mode of the USB controller. This register should be written with the desired default mode so that the controller can respond to external USB events.

### 17.4.1 Endpoint Configuration

To start communication, the endpoint registers must first be configured. An endpoint must be configured before enumerating to the Host controller.

The endpoint 0 configuration is limited because it is a fixed-function, fixed-FIFO-size endpoint. The endpoint requires little setup but does require a software-based state machine to progress through the setup, data, and status phases of a standard control transaction. The configuration of the remaining endpoints is done once before enumerating and then only changed if an alternate configuration is selected by the Host controller. Once the type of endpoint is configured, a FIFO area must be assigned to each endpoint. In the case of bulk, control and interrupt endpoints, each

has a maximum of 64 bytes per transaction. Isochronous endpoints can have packets with up to 1023 bytes per packet. In either mode, the maximum packet size for the given endpoint must be set prior to sending or receiving data.

Configuring each endpoint's FIFO involves reserving a portion of the overall USB FIFO RAM to each endpoint. The total FIFO RAM available is 2 Kbytes with the first 64 bytes reserved for endpoint 0. The endpoint's FIFO must be at least as large as the maximum packet size. The FIFO can also be configured as a double-buffered FIFO so that interrupts occur at the end of each packet and allow filling the other half of the FIFO.

The USB Device controller's soft connect must be enabled when the Device is ready to start communications, indicating to the Host controller that the Device is ready to start the enumeration process.

## 17.5 Register Map

Table 17-5 on page 1037 lists the registers. All addresses given are relative to the USB base address of 0x4005.0000. Note that the USB controller clock must be enabled before the registers can be programmed (see page 328). There must be a delay of 3 system clocks after the USB module clock is enabled before any USB module registers are accessed.

**Table 17-5. Universal Serial Bus (USB) Controller Register Map**

| Offset | Name     | Type | Reset       | Description                   | See page |
|--------|----------|------|-------------|-------------------------------|----------|
| 0x000  | USBFADDR | RW   | 0x00        | USB Device Functional Address | 1041     |

## 17.6 Register Descriptions

The TM4C1232H6PM USB controller has Device only capabilities as specified in the USB0 bit field in the **DC6** register (see page 409).

**Register 1: USB Device Functional Address (USBFADDR), offset 0x000**

**USBFADDR** is an 8-bit register that contains the 7-bit address of the Device part of the transaction.

This register must be written with the address received through a SET\_ADDRESS command, which is then used for decoding the function address in subsequent token packets.

---

**Important:** See the section called “Setting the Device Address” on page 1033 for special considerations when writing this register.

---

**Register 2: USB Power (USBPOWER), offset 0x001**

**USBPOWER** is an 8-bit register used for controlling SUSPEND and RESUME signaling and some basic operational aspects of the USB controller.

**USB Power (USBPOWER)**

**Register 3: USB Transmit Interrupt Status (USBTXIS), offset 0x002**

**Important:** This register is read-sensitive. See the register description for details.

**USBTXIS** is a 16-bit read-only register that indicates which interrupts are currently active for endpoint 0 and the transmit endpoints 1–7. The meaning of the EPn bits in this register is based on the mode of the device. The EP1 through EP7 bits always indicate that the USB controller is sending data; however, the bits refer to IN endpoints. The EP0 bit is special and indicates that either a control IN or control OUT endpoint has generated an interrupt.

**Note:** Bits relating to endpoints that have not been configured always return 0. Note also that all active interrupts are cleared when this register is read.

## Register 4: USB Receive Interrupt Status (USBRXIS), offset 0x004

**Important:** This register is read-sensitive. See the register description for details.

**USBXIS** is a 16-bit read-only register that indicates which of the interrupts for receive endpoints 1–7 are currently active.

**Note:** Bits relating to endpoints that have not been configured always return 0. Note also that all active interrupts are cleared when this register is read.

**Register 5: USB Transmit Interrupt Enable (USBTXIE), offset 0x006**

**USBTXIE** is a 16-bit register that provides interrupt enable bits for the interrupts in the **USBTXIS** register. When a bit is set, the USB interrupt is asserted to the interrupt controller when the corresponding interrupt bit in the **USBTXIS** register is set. When a bit is cleared, the interrupt in the **USBTXIS** register is still set but the USB interrupt to the interrupt controller is not asserted. On reset, all interrupts are enabled.

|           |      |      |       | 0 The EP0 transmit and receive interrupt is suppressed and not sent to the interrupt controller.           |
|           |      |      |       | 1 An interrupt is sent to the interrupt controller when the EP0 bit in the <b>USBTXIS</b> register is set. |

**Register 6: USB Receive Interrupt Enable (USBXIE), offset 0x008**

**USBXIE** is a 16-bit register that provides interrupt enable bits for the interrupts in the **USBXIS** register. When a bit is set, the USB interrupt is asserted to the interrupt controller when the corresponding interrupt bit in the **USBXIS** register is set. When a bit is cleared, the interrupt in the **USBXIS** register is still set but the USB interrupt to the interrupt controller is not asserted. On reset, all interrupts are enabled.

**USB Receive Interrupt Enable (USBXIE)**

Base 0x4005.0000

Offset 0x008

Type RW, reset 0xFFFE

## Register 7: USB General Interrupt Status (USBIS), offset 0x00A

**Important:** This register is read-sensitive. See the register description for details.

**USBIS** is an 8-bit read-only register that indicates which USB interrupts are currently active. All active interrupts are cleared when this register is read.

**Register 12: USB FIFO Endpoint 0 (USBFIFO0), offset 0x020**

**Register 13: USB FIFO Endpoint 1 (USBFIFO1), offset 0x024**

**Register 14: USB FIFO Endpoint 2 (USBFIFO2), offset 0x028**

**Register 15: USB FIFO Endpoint 3 (USBFIFO3), offset 0x02C**

**Register 16: USB FIFO Endpoint 4 (USBFIFO4), offset 0x030**

**Register 17: USB FIFO Endpoint 5 (USBFIFO5), offset 0x034**

**Register 18: USB FIFO Endpoint 6 (USBFIFO6), offset 0x038**

**Register 19: USB FIFO Endpoint 7 (USBFIFO7), offset 0x03C**

**Important:** This register is read-sensitive. See the register description for details.

These 32-bit registers provide an address for CPU access to the FIFOs for each endpoint. Writing to these addresses loads data into the Transmit FIFO for the corresponding endpoint. Reading from these addresses unloads data from the Receive FIFO for the corresponding endpoint.

Transfers to and from FIFOs may be 8-bit, 16-bit or 32-bit as required, and any combination of accesses is allowed provided the data accessed is contiguous. All transfers associated with one packet must be of the same width so that the data is consistently byte-, halfword- or word-aligned. However, the last transfer may contain fewer bytes than the previous transfers in order to complete an odd-byte or odd-word transfer.

Depending on the size of the FIFO and the expected maximum packet size, the FIFOs support either single-packet or double-packet buffering (see the section called “Single-Packet Buffering” on page 1032). Burst writing of multiple packets is not supported as flags must be set after each packet is written.

Following a STALL response or a transmit error on endpoint 1–7, the associated FIFO is completely flushed.

#### USB FIFO Endpoint n (USBFIFOn)

Base 0x4005.0000  
Offset 0x020  
Type RW, reset 0x0000.0000

Register 20: USB Transmit Dynamic FIFO Sizing (USBTXFIFOSZ), offset 0x062

Register 21: USB Receive Dynamic FIFO Sizing (USBRXFIFOSZ), offset 0x063

These 8-bit registers allow the selected TX/RX endpoint FIFOs to be dynamically sized. USBEPIDX is used to configure each transmit endpoint's FIFO size.

USB Dynamic FIFO Sizing (USBnXFIFOSZ)

**Register 27: USB Maximum Transmit Data Endpoint 1 (USBTXMAXP1), offset 0x110**

**Register 28: USB Maximum Transmit Data Endpoint 2 (USBTXMAXP2), offset 0x120**

**Register 29: USB Maximum Transmit Data Endpoint 3 (USBTXMAXP3), offset 0x130**

**Register 30: USB Maximum Transmit Data Endpoint 4 (USBTXMAXP4), offset 0x140**

**Register 31: USB Maximum Transmit Data Endpoint 5 (USBTXMAXP5), offset 0x150**

**Register 32: USB Maximum Transmit Data Endpoint 6 (USBTXMAXP6), offset 0x160**

**Register 33: USB Maximum Transmit Data Endpoint 7 (USBTXMAXP7), offset 0x170**

The **USBTXMAXPn** 16-bit register defines the maximum amount of data that can be transferred through the transmit endpoint in a single operation.

Bits 10:0 define (in bytes) the maximum payload transmitted in a single transaction. The value set can be up to 1024 bytes but is subject to the constraints placed by the *USB Specification* on packet sizes for bulk, interrupt and isochronous transfers in full-speed operation.

The total amount of data represented by the value written to this register must not exceed the FIFO size for the transmit endpoint, and must not exceed half the FIFO size if double-buffering is required.

If this register is changed after packets have been sent from the endpoint, the transmit endpoint FIFO must be completely flushed (using the FLUSH bit in **USBTXCSRLn**) after writing the new value to this register.

**Note:** **USBTXMAXPn** must be set to an even number of bytes for proper interrupt generation in  $\mu$ DMA Basic Mode.

|           |          |      |       | 1 Flushes the next packet to be transmitted/read from the endpoint 0 FIFO. The FIFO pointer is reset and the TXRDY/RXRDY bit is cleared.                                                      |

This bit is automatically cleared after the flush is performed.

**Important:** This bit should only be set when TXRDY is clear and RXRDY is set. At other times, it may cause data to be corrupted.

**Register 36: USB Receive Byte Count Endpoint 0 (USBCOUNT0), offset 0x108**

**USBCOUNT0** is an 8-bit read-only register that indicates the number of received data bytes in the endpoint 0 FIFO. The value returned changes as the contents of the FIFO change and is only valid while the RXRDY bit is set.

|-----------|---------|------|-------|-------------|
| 7         | AUTOSET | RW   | 0     | Auto Set    |

Value Description

0 The TXRDY bit must be set manually.

1 Enables the TXRDY bit to be automatically set when data of the maximum packet size (value in **USBTXMAXPn**) is loaded into the transmit FIFO. If a packet of less than the maximum packet size is loaded, then the TXRDY bit must be set manually.

**Register 55: USB Maximum Receive Data Endpoint 5 (USBRXMAXP5), offset 0x154**

**Register 56: USB Maximum Receive Data Endpoint 6 (USBRXMAXP6), offset 0x164**

**Register 57: USB Maximum Receive Data Endpoint 7 (USBRXMAXP7), offset 0x174**

The **USBRXMAXPn** is a 16-bit register which defines the maximum amount of data that can be transferred through the selected receive endpoint in a single operation.

Bits 10:0 define (in bytes) the maximum payload transmitted in a single transaction. The value set can be up to 1024 bytes but is subject to the constraints placed by the *USB Specification* on packet sizes for bulk, interrupt and isochronous transfers in full-speed operations.

The total amount of data represented by the value written to this register must not exceed the FIFO size for the receive endpoint, and must not exceed half the FIFO size if double-buffering is required.

**Note:** **USBRXMAXPn** must be set to an even number of bytes for proper interrupt generation in  $\mu$ DMA Basic mode.

| 1     | Enables the RXRDY bit to be automatically cleared when a packet of <b>USBXMAXPn</b> bytes has been unloaded from the receive FIFO. When packets of less than the maximum packet size are unloaded, RXRDY must be cleared manually. Care must be taken when using $\mu$ DMA to unload the receive FIFO as data is read from the receive FIFO in 4 byte chunks regardless of the value of the MAXLOAD field in the <b>USBXMAXPn</b> register, see "DMA Operation" on page 1035. |

**Register 72: USB Receive Byte Count Endpoint 1 (USBRXCOUNT1), offset 0x118**

**Register 73: USB Receive Byte Count Endpoint 2 (USBRXCOUNT2), offset 0x128**

**Register 74: USB Receive Byte Count Endpoint 3 (USBRXCOUNT3), offset 0x138**

**Register 75: USB Receive Byte Count Endpoint 4 (USBRXCOUNT4), offset 0x148**

**Register 76: USB Receive Byte Count Endpoint 5 (USBRXCOUNT5), offset 0x158**

**Register 77: USB Receive Byte Count Endpoint 6 (USBRXCOUNT6), offset 0x168**

**Register 78: USB Receive Byte Count Endpoint 7 (USBRXCOUNT7), offset 0x178**

**Note:** The value returned changes as the FIFO is unloaded and is only valid while the RXRDY bit in the **USBRXCSSLn** register is set.

**USBRXCOUNTn** is a 16-bit read-only register that holds the number of data bytes in the packet currently in line to be read from the receive FIFO. If the packet is transmitted as multiple bulk packets, the number given is for the combined packet.

## Register 81: USB Device RESUME Raw Interrupt Status (USBDRRIS), offset 0x410

The **USBDRRIS** 32-bit register is the raw interrupt status register. On a read, this register gives the current raw status value of the corresponding interrupt prior to masking. A write has no effect.

### USB Device RESUME Raw Interrupt Status (USBDRRIS)

Base 0x4005.0000

#### Value Description

0 An interrupt has not occurred.

1 A RESUME status has been detected.

This bit is cleared by writing a 1 to the RESUME bit in the **USBDRIIC** register.

Register 82: USB Device RESUME Interrupt Mask (USBDRIM), offset 0x414

The **USBDRIM** 32-bit register is the masked interrupt status register. On a read, this register gives the current value of the mask on the corresponding interrupt. Setting a bit sets the mask, preventing the interrupt from being signaled to the interrupt controller. Clearing a bit clears the corresponding mask, enabling the interrupt to be sent to the interrupt controller.

## 18 Analog Comparators

An analog comparator is a peripheral that compares two analog voltages and provides a logical output that signals the comparison result.

**Note:** Not all comparators have the option to drive an output pin. See “Signal Description” on page 1086 for more information.

The comparator can provide its output to a device pin, acting as a replacement for an analog comparator on the board. In addition, the comparator can signal the application via interrupts or trigger the start of a sample sequence in the ADC. The interrupt generation and ADC triggering logic is separate and independent. This flexibility means, for example, that an interrupt can be generated on a rising edge and the ADC triggered on a falling edge.

The TM4C1232H6PM microcontroller provides two independent integrated analog comparators with the following functions:

- Compare external pin input to external pin input or to internal programmable voltage reference
- Compare a test voltage against any one of the following voltages:
  - An individual external reference voltage
  - A shared single external reference voltage
  - A shared internal reference voltage

## 18.1 Block Diagram

Figure 18-1. Analog Comparator Module Block Diagram

**Note:** This block diagram depicts the maximum number of analog comparators and comparator outputs for the family of microcontrollers; the number for this specific device may vary. See page 1099 for what is included on this device.

## 18.2 Signal Description

The following table lists the external signals of the Analog Comparators and describes the function of each. The Analog Comparator output signals are alternate functions for some GPIO signals and default to be GPIO signals at reset. The column in the table below titled "Pin Mux/Pin Assignment" lists the possible GPIO pin placements for the Analog Comparator signals. The AFSEL bit in the **GPIO Alternate Function Select (GPIOAFSEL)** register (page 604) should be set to choose the Analog Comparator function. The number in parentheses is the encoding that must be programmed into the PMCN field in the **GPIO Port Control (GPIOPCTL)** register (page 621) to assign the Analog Comparator signal to the specified GPIO port pin. The positive and negative input signals are configured by clearing the DEN bit in the **GPIO Digital Enable (GPIODEN)** register. For more information on configuring GPIOs, see "General-Purpose Input/Outputs (GPIOs)" on page 582.

Table 18-1. Analog Comparators Signals (64LQFP)

| Pin Name | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description                         |

| C1-      | 16         | PC4                      | I        | Analog                   | Analog comparator 1 negative input. |
| C1o      | 29         | PF1 (9)                  | O        | TTL                      | Analog comparator 1 output.         |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

## 18.3 Functional Description

The comparator compares the VIN- and VIN+ inputs to produce an output, VOUT.

$VIN- < VIN+, VOUT = 1$

$VIN- > VIN+, VOUT = 0$

As shown in Figure 18-2 on page 1087, the input source for VIN- is an external input, Cn -, where n is the analog comparator number. In addition to an external input, Cn+, input sources for VIN+ can be the C0+ or an internal reference, V<sub>REF</sub>.

**Figure 18-2. Structure of Comparator Unit**

A comparator is configured through two status/control registers, **Analog Comparator Control (ACCTL)** and **Analog Comparator Status (ACSTAT)**. The internal reference is configured through one control register, **Analog Comparator Reference Voltage Control (ACREFCTL)**. Interrupt status and control are configured through three registers, **Analog Comparator Masked Interrupt Status (ACMIS)**, **Analog Comparator Raw Interrupt Status (ACRIS)**, and **Analog Comparator Interrupt Enable (ACINTEN)**.

Typically, the comparator output is used internally to generate an interrupt as controlled by the ISEN bit in the **ACCTL** register. The output may also be used to drive one of the external pins (Cno), or generate an analog-to-digital converter (ADC) trigger.

**Important:** The ASRCP bits in the **ACCTL** register must be set before using the analog comparators.

### 18.3.1 Internal Reference Programming

The structure of the internal reference is shown in Figure 18-3 on page 1088. The internal reference is controlled by a single configuration register (**ACREFCTL**).

**Figure 18-3. Comparator Internal Reference Structure**

**Note:** In the figure above, N\*R represents a multiple of the R value that produces the results specified in Table 18-2 on page 1088.

The internal reference can be programmed in one of two modes (low range or high range) depending on the RNG bit in the **ACREFCTL** register. When RNG is clear, the internal reference is in high-range mode, and when RNG is set the internal reference is in low-range mode.

In each range, the internal reference, V<sub>IREF</sub>, has 16 preprogrammed thresholds or step values. The threshold to be used to compare the external input voltage against is selected using the VREF field in the **ACREFCTL** register.

In the high-range mode, the V<sub>IREF</sub> threshold voltages start at the ideal high-range starting voltage of V<sub>DDA</sub>/4.2 and increase in ideal constant voltage steps of V<sub>DDA</sub>/29.4.

In the low-range mode, the V<sub>IREF</sub> threshold voltages start at 0 V and increase in ideal constant voltage steps of V<sub>DDA</sub>/22.12. The ideal V<sub>IREF</sub> step voltages for each mode and their dependence on the RNG and VREF fields are summarized in Table 18-2.

**Table 18-2. Internal Reference Voltage and ACREFCTL Field Values**

| ACREFCTL Register |               | Output Reference Voltage Based on VREF Field Value                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EN Bit Value      | RNG Bit Value |                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| EN=0              | RNG=X         | 0 V (GND) for any value of VREF. It is recommended that RNG=1 and VREF=0 to minimize noise on the reference ground.                                                                                                                                                                                                                                                                                                                                |
| EN=1              | RNG=0         | V <sub>IREF</sub> High Range: 16 voltage threshold values indexed by VREF = 0x0 .. 0xF<br>Ideal starting voltage (VREF=0): V <sub>DDA</sub> / 4.2<br>Ideal step size: V <sub>DDA</sub> / 29.4<br>Ideal V <sub>IREF</sub> threshold values: V <sub>IREF</sub> (VREF) = V <sub>DDA</sub> / 4.2 + VREF * (V <sub>DDA</sub> / 29.4), for VREF = 0x0 .. 0xF<br>For minimum and maximum V <sub>IREF</sub> threshold values, see Table 18-3 on page 1089. |
|                   | RNG=1         | V <sub>IREF</sub> Low Range: 16 voltage threshold values indexed by VREF = 0x0 .. 0xF<br>Ideal starting voltage (VREF=0): 0 V<br>Ideal step size: V <sub>DDA</sub> / 22.12<br>Ideal V <sub>IREF</sub> threshold values: V <sub>IREF</sub> (VREF) = VREF * (V <sub>DDA</sub> / 22.12), for VREF = 0x0 .. 0xF<br>For minimum and maximum V <sub>IREF</sub> threshold values, see Table 18-4 on page 1089.                                            |

Note that the values shown in Table 18-2 are the ideal values of the  $V_{IREF}$  thresholds. These values actually vary between minimum and maximum values for each threshold step, depending on process and temperature. The minimum and maximum values for each step are given by:

- $V_{IREF}(VREF) [Min] = \text{Ideal } V_{IREF}(VREF) - (\text{Ideal Step size} - 2 \text{ mV}) / 2$
- $V_{IREF}(VREF) [Max] = \text{Ideal } V_{IREF}(VREF) + (\text{Ideal Step size} - 2 \text{ mV}) / 2$

Examples of minimum and maximum  $V_{IREF}$  values for  $V_{DDA} = 3.3V$  for high and low ranges, are shown in Table 18-3 and Table 18-4. Note that these examples are only valid for  $V_{DDA} = 3.3V$ ; values scale up and down with  $V_{DDA}$ .

**Table 18-3. Analog Comparator Voltage Reference Characteristics,  $V_{DDA} = 3.3V$ ,  $EN = 1$ , and  $RNG = 0$**

## 18.4 Initialization and Configuration

The following example shows how to configure an analog comparator to read back its output value from an internal register.

1. Enable the analog comparator clock by writing a value of 0x0000.0001 to the **RCGCACMP** register in the System Control module (see page 331).
2. Enable the clock to the appropriate GPIO modules via the **RCGCGPIO** register (see page 319). To find out which GPIO ports to enable, refer to Table 20-5 on page 1117.
3. In the GPIO module, enable the GPIO port/pin associated with the input signals as GPIO inputs. To determine which GPIO to configure, see Table 20-4 on page 1113.
4. Configure the PMCN fields in the **GPIOCTL** register to assign the analog comparator output signals to the appropriate pins (see page 621 and Table 20-5 on page 1117).
5. Configure the internal voltage reference to 1.65 V by writing the **ACREFCTL** register with the value 0x0000.030C.
6. Configure the comparator to use the internal voltage reference and to *not* invert the output by writing the **ACCTLn** register with the value of 0x0000.040C.
7. Delay for 10  $\mu$ s.
8. Read the comparator output value by reading the **ACSTATn** register's OVAL value.

Change the level of the comparator negative input signal C- to see the OVAL value change.

## 18.5 Register Map

Table 18-5 on page 1090 lists the comparator registers. The offset listed is a hexadecimal increment to the register's address, relative to the Analog Comparator base address of 0x4003.C000. Note that the analog comparator clock must be enabled before the registers can be programmed (see page 331). There must be a delay of 3 system clocks after the analog comparator module clock is enabled before any analog comparator module registers are accessed.

**Table 18-5. Analog Comparators Register Map**

| Offset | Name  | Type | Reset       | Description                               | See page |

## 18.6 Register Descriptions

The remainder of this section lists and describes the Analog Comparator registers, in numerical order by address offset.

## Register 1: Analog Comparator Masked Interrupt Status (ACMIS), offset 0x000

This register provides a summary of the interrupt status (masked) of the comparators.

### Analog Comparator Masked Interrupt Status (ACMIS)

Base 0x4003.C000

Offset 0x000

Type RW1C, reset 0x0000.0000

|       | 31       | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17   | 16   |
|-------|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|------|------|
|       | reserved |    |    |    |    |    |    |    |    |    |    |    |    |    |      |      |

## 19 Pin Diagram

The TM4C1232H6PM microcontroller pin diagram is shown below.

Each GPIO signal is identified by its GPIO port unless it defaults to an alternate function on reset. In this case, the GPIO port name is followed by the default alternate function. To see a complete list of possible functions for each pin, see Table 20-5 on page 1117.

**Figure 19-1. 64-Pin LQFP Package Pin Diagram**

## 20 Signal Tables

The following tables list the signals available for each pin. Signals are configured as GPIOs on reset, except for those noted below. Use the **GPIOAMSEL** register (see page 620) to select analog mode. For a GPIO pin to be used for an alternate digital function, the corresponding bit in the **GPIOAFSEL** register (see page 604) must be set. Further pin muxing options are provided through the PMCx bit field in the **GPIOPCTL** register (see page 621), which selects one of several available peripheral functions for that GPIO.

**Important:** Table 9-1 on page 583 shows special consideration GPIO pins. Most GPIO pins are configured as GPIOs and tri-stated by default (**GPIOAFSEL**=0, **GPIODEN**=0, **GPIOPDR**=0, **GPIOPUR**=0, and **GPIOPCTL**=0). Special consideration pins may be programmed to a non-GPIO function or may have special commit controls out of reset. In addition, a Power-On-Reset (POR) or asserting RST returns these GPIO to their original special consideration state.

**Table 20-1. GPIO Pins With Special Considerations**

| GPIO Pins | Default Reset State | GPIOAFSEL | GPIODEN | GPIOPDR | GPIOPUR | GPIOPCTL | GPIOCR |
|-----------|---------------------|-----------|---------|---------|---------|----------|--------|
| PA[1:0]   | UART0               | 0         | 0       | 0       | 0       | 0x1      | 1      |
| PA[5:2]   | SSI0                | 0         | 0       | 0       | 0       | 0x2      | 1      |
| PB[3:2]   | I <sup>2</sup> C0   | 0         | 0       | 0       | 0       | 0x3      | 1      |
| PC[3:0]   | JTAG/SWD            | 1         | 1       | 0       | 1       | 0x1      | 0      |
| PD[7]     | GPIO <sup>a</sup>   | 0         | 0       | 0       | 0       | 0x0      | 0      |
| PF[0]     | GPIO <sup>a</sup>   | 0         | 0       | 0       | 0       | 0x0      | 0      |

a. This pin is configured as a GPIO by default but is locked and can only be reprogrammed by unlocking the pin in the **GPIOLCK** register and uncommitting it by setting the **GPIOCR** register.

Table 20-2 on page 1102 shows the pin-to-signal-name mapping, including functional characteristics of the signals. Each possible alternate analog and digital function is listed for each pin.

Table 20-3 on page 1107 lists the signals in alphabetical order by signal name. If it is possible for a signal to be on multiple pins, each possible pin assignment is listed. The "Pin Mux" column indicates the GPIO and the encoding needed in the PMCx bit field in the **GPIOPCTL** register.

Table 20-4 on page 1113 groups the signals by functionality, except for GPIOs. If it is possible for a signal to be on multiple pins, each possible pin assignment is listed.

Table 20-5 on page 1117 lists the GPIO pins and their analog and digital alternate functions. The AINx analog signals are not 5-V tolerant and go through an isolation circuit before reaching their circuitry. These signals are configured by clearing the corresponding DEN bit in the **GPIO Digital Enable (GPIODEN)** register and setting the corresponding AMSEL bit in the **GPIO Analog Mode Select (GPIOAMSEL)** register. Other analog signals are 5-V tolerant and are connected directly to their circuitry (C0-, C0+, C1-, C1+). These signals are configured by clearing the DEN bit in the **GPIO Digital Enable (GPIODEN)** register. The digital signals are enabled by setting the appropriate bit in the **GPIO Alternate Function Select (GPIOAFSEL)** and **GPIODEN** registers and configuring the PMCx bit field in the **GPIO Port Control (GPIOPCTL)** register to the numeric encoding shown in the table below. Table entries that are shaded gray are the default values for the corresponding GPIO pin.

Table 20-6 on page 1120 lists the signals based on number of possible pin assignments. This table can be used to plan how to configure the pins for a particular functionality. Application Note AN01274 Configuring Tiva™ C Series Microcontrollers with Pin Multiplexing provides an overview of the pin muxing implementation, an explanation of how a system designer defines a pin configuration, and examples of the pin configuration process.

**Note:** All digital inputs are Schmitt triggered.

## 20.1 Signals by Pin Number

**Table 20-2. Signals by Pin Number**

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                                              |
|------------|----------|----------|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1          | PB6      | I/O      | TTL                      | GPIO port B bit 6.                                                                                                                                                                                                                                                                                                                       |
|            | I2C5SCL  | I/O      | OD                       | I <sup>2</sup> C module 5 clock. Note that this signal has an active pull-up. The corresponding port pin should not be configured as open drain.                                                                                                                                                                                         |
|            | SSI2Rx   | I        | TTL                      | SSI module 2 receive.                                                                                                                                                                                                                                                                                                                    |
|            | T0CCP0   | I/O      | TTL                      | 16/32-Bit Timer 0 Capture/Compare/PWM 0.                                                                                                                                                                                                                                                                                                 |
| 2          | VDDA     | -        | Power                    | The positive supply for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions. VDDA pins must be supplied with a voltage that meets the specification in Table 21-5 on page 1126, regardless of system implementation. |
| 3          | GNDA     | -        | Power                    | The ground reference for the analog circuits (ADC, Analog Comparators, etc.). These are separated from GND to minimize the electrical noise contained on VDD from affecting the analog functions.                                                                                                                                        |
| 4          | PB7      | I/O      | TTL                      | GPIO port B bit 7.                                                                                                                                                                                                                                                                                                                       |
|            | I2C5SDA  | I/O      | OD                       | I <sup>2</sup> C module 5 data.                                                                                                                                                                                                                                                                                                          |
|            | SSI2Tx   | O        | TTL                      | SSI module 2 transmit.                                                                                                                                                                                                                                                                                                                   |
|            | T0CCP1   | I/O      | TTL                      | 16/32-Bit Timer 0 Capture/Compare/PWM 1.                                                                                                                                                                                                                                                                                                 |
| 5          | PF4      | I/O      | TTL                      | GPIO port F bit 4.                                                                                                                                                                                                                                                                                                                       |
|            | T2CCP0   | I/O      | TTL                      | 16/32-Bit Timer 2 Capture/Compare/PWM 0.                                                                                                                                                                                                                                                                                                 |

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                      |
|------------|----------|----------|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| 36         | PG1      | I/O      | TTL                      | GPIO port G bit 1.                                                                                                                               |
|            | I2C3SDA  | I/O      | OD                       | I <sup>2</sup> C module 3 data.                                                                                                                  |
|            | T4CCP1   | I/O      | TTL                      | 16/32-Bit Timer 4 Capture/Compare/PWM 1.                                                                                                         |
| 37         | PG0      | I/O      | TTL                      | GPIO port G bit 0.                                                                                                                               |
|            | I2C3SCL  | I/O      | OD                       | I <sup>2</sup> C module 3 clock. Note that this signal has an active pull-up. The corresponding port pin should not be configured as open drain. |
|            | T4CCP0   | I/O      | TTL                      | 16/32-Bit Timer 4 Capture/Compare/PWM 0.                                                                                                         |
| 38         | RST      | I        | TTL                      | System reset input.                                                                                                                              |
| 39         | GND      | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                         |
| 40         | OSC0     | I        | Analog                   | Main oscillator crystal input or an external clock reference input.                                                                              |
| 41         | OSC1     | O        | Analog                   | Main oscillator crystal output. Leave unconnected when using a single-ended clock source.                                                        |
| 42         | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                                                                                          |
| 43         | PD4      | I/O      | TTL                      | GPIO port D bit 4. This pin is not 5-V tolerant.                                                                                                 |
|            | U6Rx     | I        | TTL                      | UART module 6 receive.                                                                                                                           |
|            | USB0DM   | I/O      | Analog                   | Bidirectional differential data pin (D- per USB specification) for USB0.                                                                         |
|            | WT4CCP0  | I/O      | TTL                      | 32/64-Bit Wide Timer 4 Capture/Compare/PWM 0.                                                                                                    |
| 44         | PD5      | I/O      | TTL                      | GPIO port D bit 5. This pin is not 5-V tolerant.                                                                                                 |
|            | U6Tx     | O        | TTL                      | UART module 6 transmit.                                                                                                                          |
|            | USB0DP   | I/O      | Analog                   | Bidirectional differential data pin (D+ per USB specification) for USB0.                                                                         |
|            | WT4CCP1  | I/O      | TTL                      | 32/64-Bit Wide Timer 4 Capture/Compare/PWM 1.                                                                                                    |
| 45         | PB0      | I/O      | TTL                      | GPIO port B bit 0. This pin is not 5-V tolerant.                                                                                                 |
|            | T2CCP0   | I/O      | TTL                      | 16/32-Bit Timer 2 Capture/Compare/PWM 0.                                                                                                         |
|            | U1Rx     | I        | TTL                      | UART module 1 receive.                                                                                                                           |
| 46         | PB1      | I/O      | TTL                      | GPIO port B bit 1. This pin is not 5-V tolerant.                                                                                                 |
|            | T2CCP1   | I/O      | TTL                      | 16/32-Bit Timer 2 Capture/Compare/PWM 1.                                                                                                         |
|            | U1Tx     | O        | TTL                      | UART module 1 transmit.                                                                                                                          |
| 47         | PB2      | I/O      | TTL                      | GPIO port B bit 2.                                                                                                                               |
|            | I2C0SCL  | I/O      | OD                       | I <sup>2</sup> C module 0 clock. Note that this signal has an active pull-up. The corresponding port pin should not be configured as open drain. |
|            | T3CCP0   | I/O      | TTL                      | 16/32-Bit Timer 3 Capture/Compare/PWM 0.                                                                                                         |
| 48         | PB3      | I/O      | TTL                      | GPIO port B bit 3.                                                                                                                               |
|            | I2C0SDA  | I/O      | OD                       | I <sup>2</sup> C module 0 data.                                                                                                                  |
|            | T3CCP1   | I/O      | TTL                      | 16/32-Bit Timer 3 Capture/Compare/PWM 1.                                                                                                         |
| 49         | PC3      | I/O      | TTL                      | GPIO port C bit 3.                                                                                                                               |
|            | SW0      | O        | TTL                      | JTAG TDO and SWO.                                                                                                                                |
|            | T5CCP1   | I/O      | TTL                      | 16/32-Bit Timer 5 Capture/Compare/PWM 1.                                                                                                         |
|            | TD0      | O        | TTL                      | JTAG TDO and SWO.                                                                                                                                |
| 50         | PC2      | I/O      | TTL                      | GPIO port C bit 2.                                                                                                                               |
|            | T5CCP0   | I/O      | TTL                      | 16/32-Bit Timer 5 Capture/Compare/PWM 0.                                                                                                         |
|            | TDI      | I        | TTL                      | JTAG TDI.                                                                                                                                        |

Table 20-2. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                       |
|------------|----------|----------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 51         | PC1      | I/O      | TTL                      | GPIO port C bit 1.                                                                                                                                                                                                                                                                                |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

## 20.2 Signals by Signal Name

Table 20-3. Signals by Signal Name

| Pin Name | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description                           |
|----------|------------|--------------------------|----------|--------------------------|---------------------------------------|
| AIN0     | 6          | PE3                      | I        | Analog                   | Analog-to-digital converter input 0.  |
| AIN1     | 7          | PE2                      | I        | Analog                   | Analog-to-digital converter input 1.  |
| AIN2     | 8          | PE1                      | I        | Analog                   | Analog-to-digital converter input 2.  |
| AIN3     | 9          | PE0                      | I        | Analog                   | Analog-to-digital converter input 3.  |
| AIN4     | 64         | PD3                      | I        | Analog                   | Analog-to-digital converter input 4.  |
| AIN5     | 63         | PD2                      | I        | Analog                   | Analog-to-digital converter input 5.  |
| AIN6     | 62         | PD1                      | I        | Analog                   | Analog-to-digital converter input 6.  |
| AIN7     | 61         | PD0                      | I        | Analog                   | Analog-to-digital converter input 7.  |
| AIN8     | 60         | PE5                      | I        | Analog                   | Analog-to-digital converter input 8.  |
| AIN9     | 59         | PE4                      | I        | Analog                   | Analog-to-digital converter input 9.  |
| AIN10    | 58         | PB4                      | I        | Analog                   | Analog-to-digital converter input 10. |
| AIN11    | 57         | PB5                      | I        | Analog                   | Analog-to-digital converter input 11. |

Table 20-3. Signals by Signal Name (continued)

| Pin Name | Pin Number           | Pin Mux / Pin Assignment      | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                       |
|----------|----------------------|-------------------------------|----------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| C0+      | 14                   | PC6                           | I        | Analog                   | Analog comparator 0 positive input.                                                                                                                                                               |

| USB0DP   | 44                   | PD5                      | I/O      | Analog                   | Bidirectional differential data pin (D+ per USB specification) for USB0.                                                                                                                                                                                                                                                                 |
| VDD      | 11<br>26<br>42<br>54 | fixed                    | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                                                                                                  |
| VDDA     | 2                    | fixed                    | -        | Power                    | The positive supply for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions. VDDA pins must be supplied with a voltage that meets the specification in Table 21-5 on page 1126, regardless of system implementation. |
| VDDC     | 25<br>56             | fixed                    | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals. The voltage on this pin is 1.2 V and is supplied by the on-chip LDO. The VDDC pins should only be connected to each other and an external capacitor as specified in Table 21-12 on page 1139 .                                        |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

## 20.3 Signals by Function, Except for GPIO

Table 20-4. Signals by Function, Except for GPIO

| Function                | Pin Name | Pin Number     | Pin Type | Buffer Type <sup>a</sup> | Description                           |
|-------------------------|----------|----------------|----------|--------------------------|---------------------------------------|
| ADC                     | AIN0     | 6              | I        | Analog                   | Analog-to-digital converter input 0.  |
|                         | AIN1     | 7              | I        | Analog                   | Analog-to-digital converter input 1.  |
|                         | AIN2     | 8              | I        | Analog                   | Analog-to-digital converter input 2.  |
|                         | AIN3     | 9              | I        | Analog                   | Analog-to-digital converter input 3.  |
|                         | AIN4     | 64             | I        | Analog                   | Analog-to-digital converter input 4.  |
|                         | AIN5     | 63             | I        | Analog                   | Analog-to-digital converter input 5.  |
|                         | AIN6     | 62             | I        | Analog                   | Analog-to-digital converter input 6.  |
|                         | AIN7     | 61             | I        | Analog                   | Analog-to-digital converter input 7.  |
|                         | AIN8     | 60             | I        | Analog                   | Analog-to-digital converter input 8.  |

|                        | WT0CCP0  | 16<br>33   | I/O      | TTL                      | 32/64-Bit Wide Timer 0 Capture/Compare/PWM 0. |
|                        | WT0CCP1  | 15<br>32   | I/O      | TTL                      | 32/64-Bit Wide Timer 0 Capture/Compare/PWM 1. |
|                        | WT1CCP0  | 14         | I/O      | TTL                      | 32/64-Bit Wide Timer 1 Capture/Compare/PWM 0. |
|                        | WT1CCP1  | 13         | I/O      | TTL                      | 32/64-Bit Wide Timer 1 Capture/Compare/PWM 1. |
|                        | WT2CCP0  | 61         | I/O      | TTL                      | 32/64-Bit Wide Timer 2 Capture/Compare/PWM 0. |
|                        | WT2CCP1  | 62         | I/O      | TTL                      | 32/64-Bit Wide Timer 2 Capture/Compare/PWM 1. |
|                        | WT3CCP0  | 63         | I/O      | TTL                      | 32/64-Bit Wide Timer 3 Capture/Compare/PWM 0. |
|                        | WT3CCP1  | 64         | I/O      | TTL                      | 32/64-Bit Wide Timer 3 Capture/Compare/PWM 1. |
|                        | WT4CCP0  | 43         | I/O      | TTL                      | 32/64-Bit Wide Timer 4 Capture/Compare/PWM 0. |
|                        | WT4CCP1  | 44         | I/O      | TTL                      | 32/64-Bit Wide Timer 4 Capture/Compare/PWM 1. |
|                        | WT5CCP0  | 53         | I/O      | TTL                      | 32/64-Bit Wide Timer 5 Capture/Compare/PWM 0. |
|                        | WT5CCP1  | 10         | I/O      | TTL                      | 32/64-Bit Wide Timer 5 Capture/Compare/PWM 1. |

Table 20-4. Signals by Function, Except for GPIO (*continued*)

| Function     | Pin Name | Pin Number | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                      |
|--------------|----------|------------|----------|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| I2C          | I2C0SCL  | 47         | I/O      | OD                       | I <sup>2</sup> C module 0 clock. Note that this signal has an active pull-up. The corresponding port pin should not be configured as open drain. |
|              | I2C0SDA  | 48         | I/O      | OD                       | I <sup>2</sup> C module 0 data.                                                                                                                  |
|              | I2C1SCL  | 23<br>33   | I/O      | OD                       | I <sup>2</sup> C module 1 clock. Note that this signal has an active pull-up. The corresponding port pin should not be configured as open drain. |
|              | I2C1SDA  | 24<br>32   | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                                                                                                  |
|              | I2C2SCL  | 59         | I/O      | OD                       | I <sup>2</sup> C module 2 clock. Note that this signal has an active pull-up. The corresponding port pin should not be configured as open drain. |
|              | I2C2SDA  | 60         | I/O      | OD                       | I <sup>2</sup> C module 2 data.                                                                                                                  |
|              | I2C3SCL  | 37<br>61   | I/O      | OD                       | I <sup>2</sup> C module 3 clock. Note that this signal has an active pull-up. The corresponding port pin should not be configured as open drain. |
|              | I2C3SDA  | 36<br>62   | I/O      | OD                       | I <sup>2</sup> C module 3 data.                                                                                                                  |
|              | I2C4SCL  | 35         | I/O      | OD                       | I <sup>2</sup> C module 4 clock. Note that this signal has an active pull-up. The corresponding port pin should not be configured as open drain. |
|              | I2C4SDA  | 34         | I/O      | OD                       | I <sup>2</sup> C module 4 data.                                                                                                                  |
|              | I2C5SCL  | 1          | I/O      | OD                       | I <sup>2</sup> C module 5 clock. Note that this signal has an active pull-up. The corresponding port pin should not be configured as open drain. |
|              | I2C5SDA  | 4          | I/O      | OD                       | I <sup>2</sup> C module 5 data.                                                                                                                  |
| JTAG/SWD/SWO | SWCLK    | 52         | I        | TTL                      | JTAG/SWD CLK.                                                                                                                                    |
|              | SWDIO    | 51         | I/O      | TTL                      | JTAG TMS and SWDIO.                                                                                                                              |
|              | SWO      | 49         | O        | TTL                      | JTAG TDO and SWO.                                                                                                                                |
|              | TCK      | 52         | I        | TTL                      | JTAG/SWD CLK.                                                                                                                                    |
|              | TDI      | 50         | I        | TTL                      | JTAG TDI.                                                                                                                                        |
|              | TDO      | 49         | O        | TTL                      | JTAG TDO and SWO.                                                                                                                                |
|              | TMS      | 51         | I        | TTL                      | JTAG TMS and SWDIO.                                                                                                                              |

Table 20-4. Signals by Function, Except for GPIO (*continued*)

| Function | Pin Name | Pin Number           | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                                              |
|----------|----------|----------------------|----------|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Power    | GND      | 12<br>27<br>39<br>55 | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                                                                                                                 |
|          | GNDA     | 3                    | -        | Power                    | The ground reference for the analog circuits (ADC, Analog Comparators, etc.). These are separated from GND to minimize the electrical noise contained on VDD from affecting the analog functions.                                                                                                                                        |
|          | VDD      | 11<br>26<br>42<br>54 | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                                                                                                  |
|          | VDDA     | 2                    | -        | Power                    | The positive supply for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions. VDDA pins must be supplied with a voltage that meets the specification in Table 21-5 on page 1126, regardless of system implementation. |
|          | VDDC     | 25<br>56             | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals. The voltage on this pin is 1.2 V and is supplied by the on-chip LDO. The VDDC pins should only be connected to each other and an external capacitor as specified in Table 21-12 on page 1139 .                                        |
| SSI      | SSI0Clk  | 19                   | I/O      | TTL                      | SSI module 0 clock                                                                                                                                                                                                                                                                                                                       |
|          | SSI0Fss  | 20                   | I/O      | TTL                      | SSI module 0 frame signal                                                                                                                                                                                                                                                                                                                |

|                         | USB0DP   | 44         | I/O      | Analog                   | Bidirectional differential data pin (D+ per USB specification) for USB0.                  |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

## 20.4 GPIO Pins and Alternate Functions

Table 20-5. GPIO Pins and Alternate Functions

a. The digital signals that are shaded gray are the power-on default values for the corresponding GPIO pin. Encodings 10-13 are not used on this device.

## 20.5 Possible Pin Assignments for Alternate Functions

Table 20-6. Possible Pin Assignments for Alternate Functions

| # of Possible Assignments | Alternate Function | GPIO Function |
|---------------------------|--------------------|---------------|
| one                       | AIN0               | PE3           |
|                           | AIN1               | PE2           |
|                           | AIN10              | PB4           |
|                           | AIN11              | PB5           |
|                           | AIN2               | PE1           |
|                           | AIN3               | PE0           |
|                           | AIN4               | PD3           |
|                           | AIN5               | PD2           |
|                           | AIN6               | PD1           |

## 20.6 Connections for Unused Signals

Table 20-7 on page 1122 shows how to handle signals for functions that are not used in a particular system implementation for devices that are in a 64-pin LQFP package. Two options are shown in the table: an acceptable practice and a preferred practice for reduced power consumption and improved EMC characteristics. If a module is not used in a system, and its inputs are grounded, it is important that the clock to the module is never enabled by setting the corresponding bit in the **RCGCx** register.

Table 20-7. Connections for Unused Signals (64-Pin LQFP)

| Function    | Signal Name      | Pin Number                                    | Acceptable Practice | Preferred Practice |
|-------------|------------------|-----------------------------------------------|---------------------|--------------------|
| GPIO        | All unused GPIOs | -                                             | NC                  | GND                |
| No Connects | NC               | See NC pin numbers in Table 20-3 on page 1107 | NC                  | NC                 |

**Table 20-7. Connections for Unused Signals (64-Pin LQFP) (continued)**

| Function       | Signal Name | Pin Number | Acceptable Practice | Preferred Practice                         |
|----------------|-------------|------------|---------------------|--------------------------------------------|
| System Control | OSC0        | 40         | NC                  | GND                                        |
|                | OSC1        | 41         | NC                  | NC                                         |
|                | RST         | 38         | VDD                 | Pull up as shown in Figure 5-1 on page 204 |
| USB            | USB0DM      | 43         | NC                  | GND                                        |
|                | USB0DP      | 44         | NC                  | GND                                        |

## 21 Electrical Characteristics

### 21.1 Maximum Ratings

The maximum ratings are the limits to which the device can be subjected without permanently damaging the device. Device reliability may be adversely affected by exposure to absolute-maximum ratings for extended periods.

**Note:** The device is not guaranteed to operate properly at the maximum ratings.

**Table 21-1. Absolute Maximum Ratings**

| Parameter            | Parameter Name <sup>a</sup>                                                                 | Value |                       | Unit |
|----------------------|---------------------------------------------------------------------------------------------|-------|-----------------------|------|
|                      |                                                                                             | Min   | Max                   |      |
| V <sub>DD</sub>      | V <sub>DD</sub> supply voltage                                                              | 0     | 4                     | V    |
| V <sub>DDA</sub>     | V <sub>DDA</sub> supply voltage <sup>b</sup>                                                | 0     | 4                     | V    |
| V <sub>BATRMP</sub>  | V <sub>BAT</sub> battery supply voltage ramp time                                           | 0     | 0.7                   | V/μs |
| V <sub>IN_GPIO</sub> | Input voltage on GPIOs, regardless of whether the microcontroller is powered <sup>cde</sup> | -0.3  | 5.5                   | V    |
|                      | Input voltage for PD4, PD5, PB0 and PB1 when configured as GPIO                             | -0.3  | V <sub>DD</sub> + 0.3 | V    |
| I <sub>GPIOMAX</sub> | Maximum current per output pin                                                              | -     | 25                    | mA   |
| T <sub>S</sub>       | Unpowered storage temperature range                                                         | -65   | 150                   | °C   |
| T <sub>JMAX</sub>    | Maximum junction temperature                                                                | -     | 150                   | °C   |

a. Voltages are measured with respect to GND.

b. To ensure proper operation, VDDA must be powered before VDD if sourced from different supplies, or connected to the same supply as VDD. Note that the minimum operating voltage for VDD differs from the minimum operating voltage for VDDA. This change should be accounted for in the system design if both are sourced from the same supply. There is not a restriction on order for powering off.

c. Applies to static and dynamic signals including overshoot.

d. Refer to Figure 21-15 on page 1150 for a representation of the ESD protection on GPIOs.

e. For additional details, see the note on GPIO pad tolerance in “GPIO Module Characteristics” on page 1149.

**Important:** This device contains circuitry to protect the I/Os against damage due to high-static voltages; however, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are connected to an appropriate logic voltage level (see “Connections for Unused Signals” on page 1122).

**Table 21-2. ESD Absolute Maximum Ratings**

|                                                 | Parameter                        | Min | Nom | Max | Unit |
|-------------------------------------------------|----------------------------------|-----|-----|-----|------|
| Component-Level ESD Stress Voltage <sup>a</sup> | V <sub>ESDHBM</sub> <sup>b</sup> | -   | -   | 2.0 | kV   |
|                                                 | V <sub>ESDCDM</sub> <sup>c</sup> | -   | -   | 500 | V    |

a. Electrostatic discharge (ESD) to measure device sensitivity/immunity to damage caused by electrostatic discharges in device.

b. Level listed is passing level per ANSI/ESDA/JEDEC JS-001. JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process.

c. Level listed is the passing level per EIA-JEDEC JESD22-C101E. JEDEC document JEP157 states that 250V CDM allows safe manufacturing with a standard ESD control process.

## 21.2 Operating Characteristics

**Table 21-3. Temperature Characteristics**

| Characteristic                       | Symbol | Value      | Unit |
|--------------------------------------|--------|------------|------|
| Ambient operating temperature range  | $T_A$  | -40 to +85 | °C   |
| Case operating temperature range     | $T_C$  | -40 to +93 | °C   |
| Junction operating temperature range | $T_J$  | -40 to +96 | °C   |

**Table 21-4. Thermal Characteristics<sup>a</sup>**

| Characteristic                                        | Symbol        | Value                                                                                                                                     | Unit |
|-------------------------------------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------|------|
| Thermal resistance (junction to ambient) <sup>b</sup> | $\Theta_{JA}$ | 54.8                                                                                                                                      | °C/W |
| Thermal resistance (junction to board) <sup>b</sup>   | $\Theta_{JB}$ | 27.5                                                                                                                                      | °C/W |
| Thermal resistance (junction to case) <sup>b</sup>    | $\Theta_{JC}$ | 15.8                                                                                                                                      | °C/W |
| Thermal metric (junction to top of package)           | $\Psi_{JT}$   | 0.7                                                                                                                                       | °C/W |
| Thermal metric (junction to board)                    | $\Psi_{JB}$   | 27.1                                                                                                                                      | °C/W |
| Junction temperature formula                          | $T_J$         | $T_C + (P \cdot \Psi_{JT})$<br>$T_{PCB} + (P \cdot \Psi_{JB})^c$<br>$T_A + (P \cdot \Theta_{JA})^d$<br>$T_B + (P \cdot \Theta_{JB})^{ef}$ | °C   |

a. For more details about thermal metrics and definitions, see the *Semiconductor and IC Package Thermal Metrics Application Report* (literature number [SPRA953](#)).

b. Junction to ambient thermal resistance ( $\Theta_{JA}$ ), junction to board thermal resistance ( $\Theta_{JB}$ ), and junction to case thermal resistance ( $\Theta_{JC}$ ) numbers are determined by a package simulator.

c.  $T_{PCB}$  is the temperature of the board acquired by following the steps listed in the EAI/JESD 51-8 standard summarized in the *Semiconductor and IC Package Thermal Metrics Application Report* (literature number [SPRA953](#)).

d. Because  $\Theta_{JA}$  is highly variable and based on factors such as board design, chip/pad size, altitude, and external ambient temperature, it is recommended that equations containing  $\Psi_{JT}$  and  $\Psi_{JB}$  be used for best results.

e.  $T_B$  is temperature of the board.

f.  $\Theta_{JB}$  is not a pure reflection of the internal resistance of the package because it includes the resistance of the testing board and environment. It is recommended that equations containing  $\Psi_{JT}$  and  $\Psi_{JB}$  be used for best results.

## 21.3 Recommended Operating Conditions

For special high-current applications, the GPIO output buffers may be used with the following restrictions. With the GPIO pins configured as 8-mA output drivers, a total of four GPIO outputs may be used to sink current loads up to 18 mA each. At 18-mA sink current loading, the  $V_{OL}$  value is specified as 1.2 V. The high-current GPIO package pins must be selected such that there are only a maximum of two per side of the physical package with the total number of high-current GPIO outputs not exceeding four for the entire package.

**Table 21-5. Recommended DC Operating Conditions**

| Parameter        | Parameter Name                            | Min  | Nom | Max  | Unit |
|------------------|-------------------------------------------|------|-----|------|------|
| $V_{DD}$         | $V_{DD}$ supply voltage                   | 3.15 | 3.3 | 3.63 | V    |
| $V_{DDA}$        | $V_{DDA}$ supply voltage                  | 2.97 | 3.3 | 3.63 | V    |
| $V_{DDC}$        | $V_{DDC}$ supply voltage                  | 1.08 | 1.2 | 1.32 | V    |
| $V_{DDCDS}^{ab}$ | $V_{DDC}$ supply voltage, Deep-sleep mode | 1.08 | -   | 1.32 | V    |

a. These values are valid when LDO is in operation.

b. There are peripheral timing restrictions for SSI and LPC in Deep-sleep mode. Please refer to those peripheral characteristic sections for more information.

**Table 21-6. Recommended GPIO Pad Operating Conditions**

| Parameter | Parameter Name                              | Min             | Nom | Max             | Unit |
|-----------|---------------------------------------------|-----------------|-----|-----------------|------|
| $V_{IH}$  | GPIO high-level input voltage               | $0.65 * V_{DD}$ | -   | 5.5             | V    |
| $V_{IL}$  | GPIO low-level input voltage                | 0               | -   | $0.35 * V_{DD}$ | V    |
| $V_{HYS}$ | GPIO input hysteresis                       | 0.2             | -   | -               | V    |
| $V_{OH}$  | GPIO high-level output voltage              | 2.4             | -   | -               | V    |
| $V_{OL}$  | GPIO low-level output voltage               | -               | -   | 0.4             | V    |
| $I_{OH}$  | High-level source current, $V_{OH}=2.4 V^a$ |                 |     |                 |      |
|           | 2-mA Drive                                  | 2.0             | -   | -               | mA   |
|           | 4-mA Drive                                  | 4.0             | -   | -               | mA   |
|           | 8-mA Drive                                  | 8.0             | -   | -               | mA   |
| $I_{OL}$  | Low-level sink current, $V_{OL}=0.4 V^a$    |                 |     |                 |      |
|           | 2-mA Drive                                  | 2.0             | -   | -               | mA   |
|           | 4-mA Drive                                  | 4.0             | -   | -               | mA   |
|           | 8-mA Drive                                  | 8.0             | -   | -               | mA   |
|           | 8-mA Drive, $V_{OL}=1.2 V$                  | 18.0            | -   | -               | mA   |

a.  $I_O$  specifications reflect the maximum current where the corresponding output voltage meets the  $V_{OH}/V_{OL}$  thresholds.  $I_O$  current can exceed these limits (subject to absolute maximum ratings).

**Table 21-7. GPIO Current Restrictions<sup>a</sup>**

| Parameter  | Parameter Name                                                | Min | Nom | Max | Unit |
|------------|---------------------------------------------------------------|-----|-----|-----|------|
| $I_{MAXL}$ | Cumulative maximum GPIO current per side, left <sup>b</sup>   | -   | -   | 30  | mA   |
| $I_{MAXB}$ | Cumulative maximum GPIO current per side, bottom <sup>b</sup> | -   | -   | 35  | mA   |
| $I_{MAXR}$ | Cumulative maximum GPIO current per side, right <sup>b</sup>  | -   | -   | 40  | mA   |
| $I_{MAXT}$ | Cumulative maximum GPIO current per side, top <sup>b</sup>    | -   | -   | 40  | mA   |

a. Based on design simulations, not tested in production.

b. Sum of sink and source current for GPIOs as shown in Table 21-8 on page 1127.

**Table 21-8. GPIO Package Side Assignments**

| Side   | GPIOs                                |
|--------|--------------------------------------|
| Left   | PB[6-7], PC[4-7], PD7, PE[0-3], PF4  |
| Bottom | PA[0-7], PF[0-3], PG5                |
| Right  | PB[0-3], PD[4-5], PG[0-4]            |
| Top    | PB[4-5], PC[0-3], PD[0-3,6], PE[4-5] |

## 21.4 Load Conditions

Unless otherwise specified, the following conditions are true for all timing measurements.

**Figure 21-1. Load Conditions**

## 21.5 JTAG and Boundary Scan

Table 21-9. JTAG Characteristics

| Parameter No. | Parameter       | Parameter Name                                                            | Min | Nom         | Max | Unit |
|---------------|-----------------|---------------------------------------------------------------------------|-----|-------------|-----|------|
| J1            | $F_{TCK}$       | TCK operational clock frequency <sup>a</sup>                              | 0   | -           | 10  | MHz  |
| J2            | $T_{TCK}$       | TCK operational clock period                                              | 100 | -           | -   | ns   |
| J3            | $T_{TCK\_LOW}$  | TCK clock Low time                                                        | -   | $t_{TCK}/2$ | -   | ns   |
| J4            | $T_{TCK\_HIGH}$ | TCK clock High time                                                       | -   | $t_{TCK}/2$ | -   | ns   |
| J5            | $T_{TCK\_R}$    | TCK rise time                                                             | 0   | -           | 10  | ns   |
| J6            | $T_{TCK\_F}$    | TCK fall time                                                             | 0   | -           | 10  | ns   |
| J7            | $T_{TMS\_SU}$   | TMS setup time to TCK rise                                                | 8   | -           | -   | ns   |
| J8            | $T_{TMS\_HLD}$  | TMS hold time from TCK rise                                               | 4   | -           | -   | ns   |
| J9            | $T_{TDI\_SU}$   | TDI setup time to TCK rise                                                | 18  | -           | -   | ns   |
| J10           | $T_{TDI\_HLD}$  | TDI hold time from TCK rise                                               | 4   | -           | -   | ns   |
| J11           | $T_{TDO\_ZDV}$  | TCK fall to Data Valid from High-Z, 2-mA drive                            | -   | 13          | 35  | ns   |
|               |                 | TCK fall to Data Valid from High-Z, 4-mA drive                            |     | 9           | 26  | ns   |
|               |                 | TCK fall to Data Valid from High-Z, 8-mA drive                            |     | 8           | 26  | ns   |
|               |                 | TCK fall to Data Valid from High-Z, 8-mA drive with slew rate control     |     | 10          | 29  | ns   |
| J12           | $T_{TDO\_DV}$   | TCK fall to Data Valid from Data Valid, 2-mA drive                        | -   | 14          | 20  | ns   |
|               |                 | TCK fall to Data Valid from Data Valid, 4-mA drive                        |     | 10          | 26  | ns   |
|               |                 | TCK fall to Data Valid from Data Valid, 8-mA drive                        |     | 8           | 21  | ns   |
|               |                 | TCK fall to Data Valid from Data Valid, 8-mA drive with slew rate control |     | 10          | 26  | ns   |
| J13           | $T_{TDO\_DVZ}$  | TCK fall to High-Z from Data Valid, 2-mA drive                            | -   | 7           | 16  | ns   |
|               |                 | TCK fall to High-Z from Data Valid, 4-mA drive                            |     | 7           | 16  | ns   |
|               |                 | TCK fall to High-Z from Data Valid, 8-mA drive                            |     | 7           | 16  | ns   |
|               |                 | TCK fall to High-Z from Data Valid, 8-mA drive with slew rate control     |     | 8           | 19  | ns   |

a. A ratio of at least 8:1 must be kept between the system clock and TCK.

## 21.6 Power and Brown-Out

Table 21-10. Power-On and Brown-Out Levels

| Parameter No. | Parameter          | Parameter Name                         | Min   | Nom  | Max      | Unit    |
|---------------|--------------------|----------------------------------------|-------|------|----------|---------|
| P1            | $T_{VDDA\_RISE}$   | Analog Supply Voltage (VDDA) Rise Time | -     | -    | $\infty$ | $\mu s$ |
| P2            | $T_{VDD\_RISE}$    | I/O Supply Voltage (VDD) Rise Time     | -     | -    | $\infty$ | $\mu s$ |
| P3            | $T_{VDDC\_RISE}^a$ | Core Supply Voltage (VDDC) Rise Time   | 10.00 | -    | 150.00   | $\mu s$ |
| P4            | $V_{POR}$          | Power-On Reset Threshold               | 2.00  | 2.30 | 2.60     | V       |
| P5            | $V_{VDDA\_POK}$    | VDDA Power-OK Threshold (Rising Edge)  | 2.70  | 2.85 | 3.00     | V       |
|               |                    | VDDA Power-OK Threshold (Falling Edge) | 2.71  | 2.80 | 2.89     | V       |
| P6            | $V_{VDD\_POK}^b$   | VDD Power-OK Threshold (Rising Edge)   | 2.85  | 3.00 | 3.15     | V       |
|               |                    | VDD Power-OK Threshold (Falling Edge)  | 2.70  | 2.78 | 2.87     | V       |
| P7            | $V_{VDD\_BOR0}$    | Brown-Out 0 Reset Threshold            | 2.93  | 3.02 | 3.11     | V       |
| P8            | $V_{VDD\_BOR1}$    | Brown-Out 1 Reset Threshold            | 2.83  | 2.92 | 3.01     | V       |
| P9            | $V_{VDDC\_POK}$    | VDDC Power-OK Threshold (Rising Edge)  | 0.80  | 0.95 | 1.10     | V       |
|               |                    | VDDC Power-OK Threshold (Falling Edge) | 0.71  | 0.80 | 0.89     | V       |

a. The MIN and MAX values are guaranteed by design assuming the external filter capacitor load is within the range of CLDO. Please refer to "On-Chip Low Drop-Out (LDO) Regulator" on page 1139 for the CLDO value.

b. Digital logic, Flash memory, and SRAM are all designed to operate at VDD voltages below 2.70 V. The internal POK reset protects the device from unpredictable operation on power down.

### 21.6.1 VDDA Levels

The  $V_{DDA}$  supply has two monitors:

- Power-On Reset (POR)
- Power-OK (POK)

The POR monitor is used to keep the analog circuitry in reset until the  $V_{DDA}$  supply has reached the correct range for the analog circuitry to begin operating. The POK monitor is used to keep the digital circuitry in reset until the  $V_{DDA}$  power supply is at an acceptable operational level. The digital Power-On Reset (Digital POR) is only released when the Power-On Reset has deasserted and all of the Power-OK monitors for each of the supplies indicate that power levels are in operational ranges.

Once the  $V_{DDA}$  POK monitor has released the digital Power-On Reset on the initial power-up, voltage drops on the  $V_{DDA}$  supply will only be reflected in the following bits. The digital Power-On Reset will not be re-asserted.

- VDDARIS bit in the **Raw Interrupt Status (RIS)** register (see page 231).
- VDDAMIS bit in the **Masked Interrupt Status and Clear (MISC)** register (see page 236). This bit is set only if the VDDAIM bit in the **Interrupt Mask Control (IMC)** register has been set.

Figure 21-4 on page 1132 shows the relationship between  $V_{DDA}$ , POR, POK, and an interrupt event.

Figure 21-4. Power Assertions versus VDDA Levels

## 21.6.2 VDD Levels

The  $V_{DD}$  supply has three monitors:

- Power-OK (POK)
- Brown-Out Reset0 (BOR0)
- Brown-Out Reset1 (BOR1)

The POK monitor is used to keep the digital circuitry in reset until the  $V_{DD}$  power supply is at an acceptable operational level. The digital Power-On Reset (Digital POR) is only released when the Power-On Reset has deasserted and all of the Power-OK monitors for each of the supplies indicate that power levels are in operational ranges. The BOR0 and the BOR1 monitors are used to generate a reset to the device or assert an interrupt if the  $V_{DD}$  supply drops below its operational range. The BOR1 monitor's threshold is in between the BOR0 and POK thresholds.

If either a BOR0 event or a BOR1 event occurs, the following bits are affected:

- BOR0RIS or BOR1RIS bits in the **Raw Interrupt Status (RIS)** register (see page 231).
- BOR0MIS or BOR1MIS bits in the **Masked Interrupt Status and Clear (MISC)** register (see page 236). These bits are set only if the respective BOR0IM or BOR1IM bits in the **Interrupt Mask Control (IMC)** register have been set.
- BOR bit in the **Reset Cause (RESC)** register (see page 239). This bit is set only if either of the BOR0 or BOR1 events have been configured to initiate a reset.

In addition, the following bits control both the BOR0 and BOR1 events:

- BOR0IM or BOR1IM bits in the **Interrupt Mask Control (IMC)** register (see page 234).

- BOR0 or BOR1 bits in the **Power-On and Brown-Out Reset Control (PBORCTL)** register (see page 230).

Figure 21-5 on page 1133 shows the relationship between:

- $V_{DD}$ , POK, and a BOR0 event
- $V_{DD}$ , POK, and a BOR1 event

**Figure 21-5. Power and Brown-Out Assertions versus VDD Levels**

### 21.6.3 VDDC Levels

The  $V_{DDC}$  supply has one monitor: the Power-OK (POK). The POK monitor is used to keep the digital circuitry in reset until the  $V_{DDC}$  power supply is at an acceptable operational level. The digital Power-On Reset (Digital POR) is only released when the Power-On Reset has deasserted and all of the Power-OK monitors for each of the supplies indicate that power levels are in operational ranges. Figure 21-6 on page 1134 shows the relationship between POK and  $V_{DDC}$ .

Figure 21-6. POK assertion vs VDDC

### 21.6.4 VDD Glitches

Figure 21-7 on page 1134 shows the response of the BOR0, BOR1, and the POR circuit to glitches on the  $V_{DD}$  supply.

Figure 21-7. POR-BOR0-BOR1 VDD Glitch Response

### 21.6.5 VDD Droop Response

Figure 21-8 on page 1135 shows the response of the BOR0, BOR1, and the POR monitors to a drop on the  $V_{DD}$  supply.

Figure 21-8. POR-BOR0-BOR1 VDD Droop Response

## 21.7 Reset

Table 21-11. Reset Characteristics

| Parameter No. | Parameter     | Parameter Name                                                                | Min  | Nom  | Max               | Unit    |
|---------------|---------------|-------------------------------------------------------------------------------|------|------|-------------------|---------|
| R1            | $T_{DPODLY}$  | Digital POR to Internal Reset assertion delay <sup>a</sup>                    | 0.80 | -    | 5.35              | $\mu$ s |
| R2            | $T_{IRTOUT}$  | Standard Internal Reset time                                                  | -    | 9    | 11.5              | ms      |
|               |               | Internal Reset time with recovery code repair (program or erase) <sup>b</sup> | -    | -    | 6400 <sup>c</sup> | ms      |
| R3            | $T_{BOR0DLY}$ | BOR0 to Internal Reset assertion delay <sup>a</sup>                           | 0.25 | -    | 1.95              | $\mu$ s |
| R3            | $T_{BOR1DLY}$ | BOR1 to Internal Reset assertion delay <sup>a</sup>                           | 0.75 | -    | 5.95              | $\mu$ s |
| R4            | $T_{RSTMIN}$  | Minimum RST pulse width                                                       | -    | 250  | -                 | ns      |
| R5            | $T_{IRHWDLY}$ | RST to Internal Reset assertion delay                                         | -    | 250  | -                 | ns      |
| R6            | $T_{IRSWR}$   | Internal reset timeout after software-initiated system reset                  | -    | 2.07 | -                 | $\mu$ s |
| R7            | $T_{IRWDR}$   | Internal reset timeout after Watchdog reset                                   | -    | 2.10 | -                 | $\mu$ s |
| R8            | $T_{IRMFR}$   | Internal reset timeout after MOSC failure reset                               | -    | 1.92 | -                 | $\mu$ s |

a. Timing values are dependent on the  $V_{DD}$  power-down ramp rate.

b. This parameter applies only in situations where a power-loss or brown-out event occurs during an EEPROM program or erase operation, and EEPROM needs to be repaired (which is a rare case). For all other sequences, there is no impact to normal Power-On Reset (POR) timing. This delay is in addition to other POR delays.

c. This value represents the maximum internal reset time when the EEPROM reaches its endurance limit.

Figure 21-9. Digital Power-On Reset Timing

**Note:** The digital Power-On Reset is only released when the analog Power-On Reset has deasserted and all of the Power-OK monitors for each of the supplies indicate that power levels are in operational ranges.

**Figure 21-10. Brown-Out Reset Timing****Figure 21-11. External Reset Timing ( $\overline{\text{RST}}$ )****Figure 21-12. Software Reset Timing****Figure 21-13. Watchdog Reset Timing**

**Figure 21-14. MOSC Failure Reset Timing**

## 21.8 On-Chip Low Drop-Out (LDO) Regulator

**Table 21-12. LDO Regulator Characteristics**

| Parameter    | Parameter Name                                                        | Min  | Nom | Max  | Unit             |
|--------------|-----------------------------------------------------------------------|------|-----|------|------------------|
| $C_{LDO}$    | External filter capacitor size for internal power supply <sup>a</sup> | 2.5  | -   | 4.0  | $\mu\text{F}$    |
| ESR          | Filter capacitor equivalent series resistance                         | 10   | -   | 100  | $\text{m}\Omega$ |
| ESL          | Filter capacitor equivalent series inductance                         | -    | -   | 0.5  | $\text{nH}$      |
| $V_{LDO}$    | LDO output voltage                                                    | 1.08 | 1.2 | 1.32 | V                |
| $I_{INRUSH}$ | Inrush current                                                        | 50   | -   | 250  | $\text{mA}$      |

a. The capacitor should be connected as close as possible to pin 56.

## 21.9 Clocks

The following sections provide specifications on the various clock sources and mode.

### 21.9.1 PLL Specifications

The following tables provide specifications for using the PLL.

**Table 21-13. Phase Locked Loop (PLL) Characteristics**

| Parameter             | Parameter Name                                                                                                       | Min            | Nom | Max                      | Unit                          |
|-----------------------|----------------------------------------------------------------------------------------------------------------------|----------------|-----|--------------------------|-------------------------------|
| F <sub>REF_XTAL</sub> | Crystal reference                                                                                                    | 5 <sup>a</sup> | -   | 25                       | MHz                           |
| F <sub>REF_EXT</sub>  | External clock reference <sup>a</sup>                                                                                | 5 <sup>a</sup> | -   | 25                       | MHz                           |
| F <sub>PLL</sub>      | PLL frequency <sup>b</sup>                                                                                           | -              | 400 | -                        | MHz                           |
| T <sub>READY</sub>    | PLL lock time, enabling the PLL                                                                                      | -              | -   | 512 * (N+1) <sup>c</sup> | reference clocks <sup>d</sup> |
|                       | PLL lock time, changing the XTAL field in the <b>RCC/RCC2</b> register or changing the OSCSRC between MOSC and PIOSC | -              | -   | 128 * (N+1) <sup>c</sup> | reference clocks <sup>d</sup> |

a. If the PLL is not used, the minimum input frequency can be 4 MHz.

b. PLL frequency is automatically calculated by the hardware based on the XTAL field of the **RCC** register. The PLL frequency that is set by the hardware can be calculated using the values in the **PLLREQ0** and **PLLREQ1** registers.

c. N is the value in the N field in the **PLLREQ1** register.

d. A reference clock is the clock period of the crystal being used, which can be MOSC or PIOSC. For example, a 16-MHz crystal connected to MOSC yields a reference clock of 62.5 ns.

Table 21-14 on page 1140 shows the actual frequency of the PLL based on the crystal frequency used (defined by the XTAL field in the **RCC** register).

**Table 21-14. Actual PLL Frequency**

| XTAL | Crystal Frequency (MHz) | MINT | MFRAC | Q   | N   | PLL Multiplier | PLL Frequency (MHz) | Error   |
|------|-------------------------|------|-------|-----|-----|----------------|---------------------|---------|
| 0x09 | 5.0                     | 0x50 | 0x0   | 0x0 | 0x0 | 80             | 400                 | -       |

Table 21-14. Actual PLL Frequency (*continued*)

| XTAL | Crystal Frequency (MHz) | MINT | MFRAC | Q   | N   | PLL Multiplier | PLL Frequency (MHz) | Error |
|------|-------------------------|------|-------|-----|-----|----------------|---------------------|-------|
| 0x1A | 25                      | 0x50 | 0x0   | 0x0 | 0x4 | 80             | 400                 | -     |

## 21.9.2 PIOSC Specifications

Table 21-15. PIOSC Clock Characteristics

| Parameter          | Parameter Name                                                                                                                                                      | Min | Nom | Max              | Unit |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|-----|------------------|------|
| F <sub>PIOSC</sub> | Factory calibration:<br>Internal 16-MHz precision oscillator frequency variance across the specified voltage and temperature range when factory calibration is used | -   | -   | ±3%              | -    |
|                    | Recalibration:<br>Internal 16-MHz precision oscillator frequency variance when 7-bit recalibration is used                                                          | -   | -   | ±1% <sup>a</sup> | -    |
| T <sub>START</sub> | PIOSC startup time <sup>b</sup>                                                                                                                                     | -   | -   | 1                | μs   |

a. ±1% is only guaranteed at the specific voltage/temperature condition where the recalibration occurs.

b. PIOSC startup time is part of reset and is included in the internal reset timeout value (T<sub>IRTOU</sub>) given in Table 21-11 on page 1136. Note that the T<sub>START</sub> value is based on simulation.

## 21.9.3 Low-Frequency Internal Oscillator (LFIOSC) Specifications

Table 21-16. Low-Frequency internal Oscillator Characteristics

| Parameter           | Parameter Name                                       | Min | Nom | Max | Unit |
|---------------------|------------------------------------------------------|-----|-----|-----|------|
| F <sub>LFIOSC</sub> | Low-frequency internal oscillator (LFIOSC) frequency | 10  | 33  | 90  | KHz  |

## 21.9.4 Main Oscillator Specifications

Table 21-17. Main Oscillator Input Characteristics

| Parameter                       | Parameter Name                                             | Min            | Nom                | Max | Unit |
|---------------------------------|------------------------------------------------------------|----------------|--------------------|-----|------|
| F <sub>MOSC</sub>               | Parallel resonance frequency                               | 4 <sup>a</sup> | -                  | 25  | MHz  |
| C <sub>1</sub> , C <sub>2</sub> | External load capacitance on OSC0, OSC1 pins <sup>b</sup>  | 10             | -                  | 24  | pF   |
| C <sub>PKG</sub>                | Device package stray shunt capacitance <sup>b</sup>        | -              | 0.5                | -   | pF   |
| C <sub>PCB</sub>                | PCB stray shunt capacitance <sup>b</sup>                   | -              | 0.5                | -   | pF   |
| C <sub>SHUNT</sub>              | Total shunt capacitance <sup>b</sup>                       | -              | -                  | 4   | pF   |
| ESR                             | Crystal effective series resistance, 4 MHz <sup>cd</sup>   | -              | -                  | 300 | Ω    |
|                                 | Crystal effective series resistance, 6 MHz <sup>cd</sup>   | -              | -                  | 200 | Ω    |
|                                 | Crystal effective series resistance, 8 MHz <sup>cd</sup>   | -              | -                  | 130 | Ω    |
|                                 | Crystal effective series resistance, 12 MHz <sup>cd</sup>  | -              | -                  | 120 | Ω    |
|                                 | Crystal effective series resistance, 16 MHz <sup>cd</sup>  | -              | -                  | 100 | Ω    |
|                                 | Crystal effective series resistance, 25 MHz <sup>cd</sup>  | -              | -                  | 50  | Ω    |
| DL                              | Oscillator output drive level <sup>e</sup>                 | -              | OSC <sub>PWR</sub> | -   | mW   |
| T <sub>START</sub>              | Oscillator startup time, when using a crystal <sup>f</sup> | -              | -                  | 18  | ms   |

**Table 21-17. Main Oscillator Input Characteristics (continued)**

| Parameter             | Parameter Name                                                  | Min                    | Nom | Max                    | Unit |
|-----------------------|-----------------------------------------------------------------|------------------------|-----|------------------------|------|
| V <sub>IH</sub>       | CMOS input high level, when using an external oscillator        | 0.65 * V <sub>DD</sub> | -   | V <sub>DD</sub>        | V    |
| V <sub>IL</sub>       | CMOS input low level, when using an external oscillator         | GND                    | -   | 0.35 * V <sub>DD</sub> | V    |
| V <sub>HYS</sub>      | CMOS input buffer hysteresis, when using an external oscillator | 150                    | -   | -                      | mV   |
| DC <sub>OSC_EXT</sub> | External clock reference duty cycle                             | 45                     | -   | 55                     | %    |

a. 5 MHz is the minimum when using the PLL.

b. See information below table.

c. Crystal ESR specified by crystal manufacturer.

d. Crystal vendors can be contacted to confirm these specifications are met for a specific crystal part number if the vendors generic crystal datasheet show limits outside of these specifications.

e.  $OSC_{PWR} = (2 * \pi * F_P * C_L * 2.5)^2 * ESR / 2$ . An estimation of the typical power delivered to the crystal is based on the  $C_L$ ,  $F_P$  and ESR parameters of the crystal in the circuit as calculated by the  $OSC_{PWR}$  equation. Ensure that the value calculated for  $OSC_{PWR}$  does not exceed the crystal's drive-level maximum.

f. Oscillator startup time is specified from the time the oscillator is enabled to when it reaches a stable point of oscillation such that the internal clock is valid.

The load capacitors added on the board,  $C_1$  and  $C_2$ , should be chosen such that the following equation is satisfied (see Table 21-17 on page 1141 for typical values and Table 21-18 on page 1143 for detailed crystal parameter information).

- $C_L$  = load capacitance specified by crystal manufacturer
- $C_L = (C_1 * C_2) / (C_1 + C_2) + C_{SHUNT}$
- $C_{SHUNT} = C_0 + C_{PKG} + C_{PCB}$  (total shunt capacitance seen across OSC0, OSC1 crystal inputs)
- $C_{PKG}$ ,  $C_{PCB}$  = the mutual caps as measured across the OSC0, OSC1 pins excluding the crystal.
- $C_0$  = Shunt capacitance of crystal specified by the crystal manufacturer

Table 21-18 on page 1143 lists part numbers of crystals that have been simulated and confirmed to operate within the specifications in Table 21-17 on page 1141. Other crystals that have nearly identical crystal parameters can be expected to work as well.

In the table below, the crystal parameters labeled C0, C1 and L1 are values that are obtained from the crystal manufacturer. These numbers are usually a result of testing a relevant batch of crystals on a network analyzer. The parameters labeled ESR, DL and  $C_L$  are maximum numbers usually available in the data sheet for a crystal.

The table also includes three columns of Recommended Component Values. These values apply to system board components.  $C_1$  and  $C_2$  are the values in pico Farads of the load capacitors that should be put on each leg of the crystal pins to ensure oscillation at the correct frequency.  $R_s$  is the value in k $\Omega$  of a resistor that is placed in series with the crystal between the OSC1 pin and the crystal pin.  $R_s$  dissipates some of the power so the Max DI crystal parameter is not exceeded. Only use the recommended  $C_1$ ,  $C_2$ , and  $R_s$  values with the associated crystal part. The values in the table were used in the simulation to ensure crystal startup and to determine the worst case drive level (WC DI). The value in the WC DI column should not be greater than the Max DI Crystal parameter. The WC DI value can be used to determine if a crystal with similar parameter values but a lower Max DI value is acceptable.

Table 21-18. Crystal Parameters

| MFG      | MFG Part#                    | Holder   | PKG Size<br>(mm x mm) | Freq (MHz) | Crystal Spec<br>(Tolerance / Stability) | Crystal Parameters |         |         |                  |             |                     | Recommended<br>Component<br>Values |                     |                  | WC DI (μW) |
|----------|------------------------------|----------|-----------------------|------------|-----------------------------------------|--------------------|---------|---------|------------------|-------------|---------------------|------------------------------------|---------------------|------------------|------------|

a.  $R_S$  values as low as 0 Ohms can be used. Using a lower  $R_S$  value will result in the WC DL to increase towards the Max DL of the crystal.

b. Although this ESR value is outside of the recommended crystal ESR maximum for this frequency, this crystal has been simulated to confirm proper operation and is valid for use with this device.

c.  $R_S$  values as low as 500 Ohms can be used. Using a lower  $R_S$  value will result in the WC DL to increase towards the Max DL of the crystal.

Table 21-19. Supported MOSC Crystal Frequencies<sup>a</sup>

| Value    | Crystal Frequency (MHz) Not Using the PLL | Crystal Frequency (MHz) Using the PLL |
|----------|-------------------------------------------|---------------------------------------|
| 0x00-0x5 | reserved                                  |                                       |

**Table 21-19. Supported MOSC Crystal Frequencies (continued)**

| Value | Crystal Frequency (MHz) Not Using the PLL | Crystal Frequency (MHz) Using the PLL |
|-------|-------------------------------------------|---------------------------------------|
| 0x11  |                                           | 12.0 MHz (USB)                        |
| 0x12  |                                           | 12.288 MHz                            |
| 0x13  |                                           | 13.56 MHz                             |
| 0x14  |                                           | 14.31818 MHz                          |
| 0x15  |                                           | 16.0 MHz (reset value)(USB)           |
| 0x16  |                                           | 16.384 MHz                            |
| 0x17  |                                           | 18.0 MHz (USB)                        |
| 0x18  |                                           | 20.0 MHz (USB)                        |
| 0x19  |                                           | 24.0 MHz (USB)                        |
| 0x1A  |                                           | 25.0 MHz (USB)                        |

a. Frequencies that may be used with the USB interface are indicated in the table.

## 21.9.5 System Clock Specification with ADC Operation

**Table 21-20. System Clock Characteristics with ADC Operation**

| Parameter           | Parameter Name                                                                               | Min     | Nom | Max     | Unit |
|---------------------|----------------------------------------------------------------------------------------------|---------|-----|---------|------|
| F <sub>sysadc</sub> | System clock frequency when the ADC module is operating (when PLL is bypassed). <sup>a</sup> | 15.9952 | 16  | 16.0048 | MHz  |

a. Clock frequency (plus jitter) must be stable inside specified range. ADC can be clocked from the PLL, directly from an external clock source, or from the PLOSC, as long as frequency absolute precision is inside specified range.

## 21.9.6 System Clock Specification with USB Operation

**Table 21-21. System Clock Characteristics with USB Operation**

| Parameter           | Parameter Name                                                                                                                          | Min | Nom | Max | Unit |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------|-----|-----|-----|------|
| F <sub>sysusb</sub> | System clock frequency when the USB module is operating (note that MOSC must be the clock source, either with or without using the PLL) | 20  | -   | -   | MHz  |

## 21.10 Sleep Modes

**Table 21-22. Sleep Modes AC Characteristics<sup>a</sup>**

| Parameter No | Parameter                | Parameter Name                                                                                                         | Min | Nom  | Max                | Unit          |
|--------------|--------------------------|------------------------------------------------------------------------------------------------------------------------|-----|------|--------------------|---------------|
| D1           | T <sub>WAKE_S</sub>      | Time to wake from interrupt in sleep mode <sup>b</sup>                                                                 | -   | -    | 2                  | system clocks |
|              | T <sub>WAKE_DS</sub>     | Time to wake from interrupt in deep-sleep mode, using PIOSC for both Run mode and Deep-sleep mode <sup>b c</sup>       | -   | 1.25 | -                  | μs            |
|              |                          | Time to wake from interrupt in deep-sleep mode, using PIOSC for Run mode and LFIOSC for Deep-sleep mode <sup>b c</sup> | -   | 350  | -                  | μs            |
| D2           | T <sub>WAKE_PLL_DS</sub> | Time to wake from interrupt in deep-sleep mode when using the PLL <sup>b</sup>                                         | -   | -    | T <sub>READY</sub> | ms            |

a. Values in this table assume the LFIOSC is the clock source during sleep or deep-sleep mode.

b. Specified from registering the interrupt to first instruction.

c. If the main oscillator is used for run mode, add the main oscillator startup time, T<sub>START</sub>.

**Table 21-23. Time to Wake with Respect to Low-Power Modes<sup>ab</sup>**

| Mode  | Run Mode Clock/Frequency | Sleep/Deep-Sleep Mode Clock/Frequency | FLASHPM | SRAMP | Time to Wake |        | Unit |
|-------|--------------------------|---------------------------------------|---------|-------|--------------|--------|------|
|       |                          |                                       |         |       | Min          | Max    |      |
| Sleep | MOSC, PLL on - 80MHz     | MOSC, PLL on - 80MHz                  | 0x0     | 0x0   | 0.28         | 0.30   | μs   |
|       |                          |                                       |         | 0x1   | 33.57        | 35.00  | μs   |
|       |                          |                                       |         | 0x3   | 33.75        | 35.05  | μs   |

|            |                          |                                        |         | 0x1   | 18.94        | 19.54  | ms   |
|            |                          |                                        |         | 0x3   | 18.95        | 19.53  | ms   |
|            |                          |                                        | 0x2     | 0x0   | 18.95        | 19.54  | ms   |
|            |                          |                                        |         | 0x1   | 18.94        | 19.53  | ms   |
|            |                          |                                        |         | 0x3   | 18.95        | 19.54  | ms   |

a. Time from wake event to first instruction of code execution.

b. If the LDO voltage is adjusted, it will take an extra 4 us to wake up from Sleep or Deep-sleep mode.

c. PIOSC is turned off by setting the PIOSCPD bit in the **DSLPCLKCFG** register.

## 21.11 Flash Memory and EEPROM

**Table 21-24. Flash Memory Characteristics**

| Parameter           | Parameter Name                                                    | Min     | Nom | Max  | Unit   |
|---------------------|-------------------------------------------------------------------|---------|-----|------|--------|
| PE <sub>CYC</sub>   | Number of program/erase cycles before failure <sup>a</sup>        | 100,000 | -   | -    | cycles |
| T <sub>RET</sub>    | Data retention, -40°C to +85°C                                    | 20      | -   | -    | years  |
| T <sub>PROG64</sub> | Program time for double-word-aligned 64 bits of data <sup>b</sup> | 30      | 50  | 300  | μs     |
| T <sub>ERASE</sub>  | Page erase time, <1k cycles                                       | -       | 8   | 15   | ms     |
|                     | Page erase time, 10k cycles                                       | -       | 15  | 40   | ms     |
|                     | Page erase time, 100k cycles                                      | -       | 75  | 500  | ms     |
| T <sub>ME</sub>     | Mass erase time, <1k cycles                                       | -       | 10  | 25   | ms     |
|                     | Mass erase time, 10k cycles                                       | -       | 20  | 70   | ms     |
|                     | Mass erase time, 100k cycles                                      | -       | 300 | 2500 | ms     |

a. A program/erase cycle is defined as switching the bits from 1-> 0 -> 1.

b. If programming fewer than 64 bits of data, the programming time is the same. For example, if only 32 bits of data need to be programmed, the other 32 bits are masked off.

**Table 21-25. EEPROM Characteristics<sup>a</sup>**

| Parameter                       | Parameter Name                                                                                                                                     | Min     | Nom | Max  | Unit          |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----|------|---------------|
| EPE <sub>CYC</sub> <sup>b</sup> | Number of mass program/erase cycles of a single word before failure <sup>c</sup>                                                                   | 500,000 | -   | -    | cycles        |
| ET <sub>RET</sub>               | Data retention, -40°C to +85°C                                                                                                                     | 20      | -   | -    | years         |
| ET <sub>PROG</sub>              | Program time for 32 bits of data - space available                                                                                                 | -       | 110 | 600  | μs            |
|                                 | Program time for 32 bits of data - requires a copy to the copy buffer, copy buffer has space and less than 10% of EEPROM endurance used            | -       | 30  | -    | ms            |
|                                 | Program time for 32 bits of data - requires a copy to the copy buffer, copy buffer has space and greater than 90% of EEPROM endurance used         | -       | -   | 900  | ms            |
|                                 | Program time for 32 bits of data - requires a copy to the copy buffer, copy buffer requires an erase and less than 10% of EEPROM endurance used    | -       | 60  | -    | ms            |
|                                 | Program time for 32 bits of data - requires a copy to the copy buffer, copy buffer requires an erase and greater than 90% of EEPROM endurance used | -       | -   | 1800 | ms            |
| ET <sub>READ</sub>              | Read access time                                                                                                                                   | -       | 4   | -    | system clocks |
| ET <sub>ME</sub>                | Mass erase time, <1k cycles                                                                                                                        | -       | 8   | 15   | ms            |
|                                 | Mass erase time, 10k cycles                                                                                                                        | -       | 15  | 40   | ms            |
|                                 | Mass erase time, 100k cycles                                                                                                                       | -       | 75  | 500  | ms            |

a. Because the EEPROM operates as a background task and does not prevent the CPU from executing from Flash memory, the operation will complete within the maximum time specified provided the EEPROM operation is not stalled by a Flash memory program or erase operation.

b. One word can be written more than 500K times, but these writes impact the endurance of the words in the meta-block that the word is within. Different words can be written such that any or all words can be written more than 500K times when write counts per word stay about the same. See the section called "Endurance" on page 471 for more information.

c. A program/erase cycle is defined as switching the bits from 1-> 0 -> 1.

## 21.12 Input/Output Pin Characteristics

### 21.12.1 GPIO Module Characteristics

**Note:** All GPIO signals are 5-V tolerant when configured as inputs except for PD4, PD5, PB0 and PB1, which are limited to 3.6 V. See “Signal Description” on page 582 for more information on GPIO configuration.

**Note:** GPIO pads are tolerant to 5-V digital inputs without creating reliability issues, as long as the supply voltage, VDD, is present. There are limitations to how long a 5-V input can be present on any given I/O pad if VDD is not present. Not meeting these conditions will affect reliability of the device and affect the GPIO characteristics specifications.

- If the voltage applied to a GPIO pad is in the high voltage range (5V +/- 10%) while VDD is not present, such condition should be allowed for a maximum of 10,000 hours at 27°C or 5,000 hours at 85°C, over the lifetime of the device.
- If the voltage applied to a GPIO pad is in the normal voltage range (3.3V +/- 10%) while VDD is not present or if the voltage applied is in the high voltage range (5V +/- 10%) while VDD is present, there are no constraints on the lifetime of the device.

**Table 21-26. GPIO Module Characteristics<sup>a</sup>**

| Parameter           | Parameter Name                                                                                                                | Min | Nom  | Max  | Unit |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------|-----|------|------|------|
| C <sub>GPIO</sub>   | GPIO Digital Input Capacitance                                                                                                | -   | 8    | -    | pF   |
| R <sub>GPIOPU</sub> | GPIO internal pull-up resistor                                                                                                | 13  | 20   | 30   | kΩ   |
| R <sub>GPIOPD</sub> | GPIO internal pull-down resistor                                                                                              | 13  | 20   | 35   | kΩ   |
| I <sub>LKG+</sub>   | GPIO input leakage current, 0 V ≤ V <sub>IN</sub> ≤ V <sub>DD</sub> GPIO pins <sup>b</sup>                                    | -   | -    | 1.0  | μA   |
|                     | GPIO input leakage current, 0 V < V <sub>IN</sub> ≤ V <sub>DD</sub> , GPIO pins configured as ADC or analog comparator inputs | -   | -    | 2.0  | μA   |
| T <sub>GPIOR</sub>  | GPIO rise time, 2-mA drive <sup>c</sup>                                                                                       | -   | 14.2 | 16.1 | ns   |

a. V<sub>DD</sub> must be within the range specified in Table 21-5 on page 1126.

b. The leakage current is measured with V<sub>IN</sub> applied to the corresponding pin(s). The leakage of digital port pins is measured individually. The port pin is configured as an input and the pull-up/pull-down resistor is disabled.

c. Time measured from 20% to 80% of V<sub>DD</sub>.

d. Time measured from 80% to 20% of V<sub>DD</sub>.

### 21.12.2 Types of I/O Pins and ESD Protection

With respect to ESD and leakage current, three types of I/O pins exist on the device: Power I/O pins, I/O pins with fail-safe ESD protection (GPIOs other than PD4 and PD5) and I/O pins with non-fail-safe ESD protection (any non-power, non-GPIO (other than PD4 and PD5) and pins). This

section covers I/O pins with fail-safe ESD protection and I/O pins with non-fail-safe ESD protection. Power I/O pin voltage and current limitations are specified in “Recommended Operating Conditions” on page 1126.

### 21.12.2.1 Fail-Safe Pins

GPIOs other than PD4 and PD5 and I/O pins for the USB PHY use ESD protection as shown in Figure 21-15 on page 1150.

An unpowered device cannot be parasitically powered through any of these pins. This ESD protection prevents a direct path between these I/O pads and any power supply rails in the device. GPIO pad input voltages should be kept inside the maximum ratings specified in Table 21-1 on page 1124 to ensure current leakage and current injections are within acceptable range. Current leakages and current injection for these pins are specified in Table 21-26 on page 1149.

Figure 21-15 on page 1150 shows a diagram of the ESD protection on fail-safe pins.

Some GPIOs when configured as inputs require a strong pull-up resistor to maintain a threshold above the minimum value of  $V_{IH}$  during power-on. See Table 21-28 on page 1151.

**Figure 21-15. ESD Protection on Fail-Safe Pins**

**Table 21-27. Pad Voltage/Current Characteristics for Fail-Safe Pins<sup>a</sup>**

| Parameter  | Parameter Name                                                | Min | Nom | Max        | Unit    |
|------------|---------------------------------------------------------------|-----|-----|------------|---------|
| $I_{LKG+}$ | GPIO input leakage current, $V_{DD} < V_{IN} \leq 4.5 V^{bb}$ | -   | -   | 700        | $\mu A$ |
|            | GPIO input leakage current, $4.5 V < V_{IN} \leq 5.5 V^{bc}$  | -   | -   | 100        | $\mu A$ |
| $I_{LKG-}$ | GPIO input leakage current, $V_{IN} < -0.3 V^{bd}$            | -   | -   | $-^e$      | $\mu A$ |
|            | GPIO input leakage current, $-0.3 V \leq V_{IN} < 0 V^b$      | -   | -   | 10         | $\mu A$ |
| $I_{INJ+}$ | DC injection current, $V_{DD} < V_{IN} \leq 5.5 V^{fg}$       | -   | -   | $I_{LKG+}$ | $\mu A$ |
| $I_{INJ-}$ | DC injection current, $V_{IN} \leq 0 V^g$                     | -   | -   | 0.5        | mA      |

a.  $V_{IN}$  must be within the range specified in Table 21-1 on page 1124.

b. To protect internal circuitry from over-voltage, the GPIOs have an internal voltage clamp that limits internal swings to  $V_{DD}$  without affecting swing at the I/O pad. This internal clamp starts turning on while  $V_{DD} < V_{IN} < 4.5 V$  and causes a somewhat larger (but bounded) current draw. To save power, static input voltages between  $V_{DD}$  and 4.5 V should be avoided.

c. Leakage current above maximum voltage ( $V_{IN} = 5.5 V$ ) is not guaranteed, this condition is not allowed and can result in permanent damage to the device.

d. Leakage outside the minimum range ( $-0.3 V$ ) is unbounded and must be limited to  $I_{INJ-}$  using an external resistor.

e. In this case,  $I_{LKG-}$  is unbounded and must be limited to  $I_{INJ-}$  using an external resistor.

- f. Current injection is internally bounded for GPIOs, and maximum current into the pin is given by  $I_{LKG+}$  for  $V_{DD} < V_{IN} < 5.5$  V.
- g. If the I/O pad is not voltage limited, it should be current limited (to  $I_{INJ+}$  and  $I_{INJ-}$ ) if there is any possibility of the pad voltage exceeding the VIO limits (including transient behavior during supply ramp up, or at any time when the part is unpowered).

**Table 21-28. Fail-Safe GPIOs that Require an External Pull-up**

| GPIO | Pin | Pull-Up Resistor Value | Unit     |
|------|-----|------------------------|----------|
| PB0  | 45  | $1k \leq R \leq 10k$   | $\Omega$ |
| PB1  | 46  | $1k \leq R \leq 10k$   | $\Omega$ |
| PE3  | 6   | $1k \leq R \leq 10k$   | $\Omega$ |

### 21.12.2.2 Non-Fail-Safe Pins

The Main Oscillator (MOSC) crystal connection pins and GPIO pins PD4 and PD5 have ESD protection as shown in Figure 21-16 on page 1151. These pins have a potential path between the I/O pad and an internal power rail if either one of the ESD diodes is accidentally forward biased. The voltage and current of these pins should follow the specifications in Table 21-29 on page 1151 to prevent potential damage to the device. In addition to the specifications outlined in Table 21-29 on page 1151, it is recommended that the ADC external reference specifications in Table 21-30 on page 1153 be adhered to in order to prevent any gain error.

Figure 21-16 on page 1151 shows a diagram of the ESD protection on non-fail-safe pins.

**Figure 21-16. ESD Protection on Non-Fail-Safe Pins****Table 21-29. Non-Fail-Safe I/O Pad Voltage/Current Characteristics<sup>abcd</sup>**

| Parameter  | Parameter Name                                               | Min  | Nom      | Max          | Unit    |
|------------|--------------------------------------------------------------|------|----------|--------------|---------|
| $V_{IO}$   | IO pad voltage limits                                        | -0.3 | $V_{DD}$ | $V_{DD}+0.3$ | V       |
| $I_{LKG+}$ | Positive IO leakage for $V_{IO} \text{ Max}^{ef}$            | -    | -        | 10           | $\mu A$ |
| $I_{LKG-}$ | Negative IO leakage for $V_{IO} \text{ Min}^{ef}$            | -    | -        | 10           | $\mu A$ |
| $I_{INJ+}$ | Max positive injection <sup>g</sup>                          | -    | -        | 2            | mA      |
| $I_{INJ-}$ | Max negative injection if not voltage protected <sup>g</sup> | -    | -        | -0.5         | mA      |

a.  $V_{IN}$  must be within the range specified in Table 21-1 on page 1124. Leakage current outside of this maximum voltage is not guaranteed and can result in permanent damage of the device.

b.  $V_{DD}$  must be within the range specified in Table 21-5 on page 1126.

- c. To avoid potential damage to the part, either the voltage or current on the ESD-protected, non-Power, non-Hibernate/XOSC input/outputs should be limited externally as shown in this table.
- d. I/O pads should be protected if at any point the IO voltage has a possibility of going outside the limits shown in the table. If the part is unpowered, the IO pad Voltage or Current must be limited (as shown in this table) to avoid powering the part through the IO pad, causing potential irreversible damage.
- e. This value applies to an I/O pin that is voltage-protected within the Min and Max  $V_{IO}$  ratings. Leakage outside the specified voltage range is unbounded and must be limited to  $I_{INJ-}$  using an external resistor.
- f. MIN and MAX leakage current for the case when the I/O is voltage-protected to VIO Min or VIO Max.
- g. If an I/O pin is not voltage-limited, it should be current-limited (to  $I_{INJ+}$  and  $I_{INJ-}$ ) if there is any possibility of the pad voltage exceeding the  $V_{IO}$  limits (including transient behavior during supply ramp up, or at any time when the part is unpowered).

Table 21-30. ADC Electrical Characteristics (continued)

| Parameter          | Parameter Name                                                                                          | Min | Nom   | Max | Unit  |
|--------------------|---------------------------------------------------------------------------------------------------------|-----|-------|-----|-------|
| SDR <sub>S</sub>   | Signal-to-distortion ratio, Single-ended input, V <sub>ADCIN</sub> : -3dB FS, 1KHz <sup>qr</sup>        | 70  | 72    | -   | dB    |
| SNDR <sub>S</sub>  | Signal-to-Noise+Distortion ratio, Single-ended input, V <sub>ADCIN</sub> : -3dB FS, 1KHz <sup>stu</sup> | 60  | 63    | -   | dB    |
| TEMPERATURE SENSOR |                                                                                                         |     |       |     |       |
| V <sub>TSENS</sub> | Temperature sensor voltage, junction temperature 25 °C                                                  | -   | 1.633 | -   | V     |
| S <sub>TSENS</sub> | Temperature sensor slope                                                                                | -   | -13.3 | -   | mV/°C |
| E <sub>TSENS</sub> | Temperature sensor accuracy <sup>v</sup>                                                                | -   | -     | ±5  | °C    |

a. V<sub>REF+</sub> = 3.3V, F<sub>ADC</sub> = 16 MHz unless otherwise noted.

b. Best design practices suggest that static or quiet digital I/O signals be configured adjacent to sensitive analog inputs to reduce capacitive coupling and cross talk. Analog signals configured adjacent to ADC input channels should meet the same source resistance and bandwidth limitations that apply to the ADC input signals.

c. Two capacitors in parallel.

d. Internal reference is connected directly between V<sub>DDA</sub> and GNDA (VREFi = V<sub>DDA</sub> - GNDA). In this mode, E<sub>O</sub>, E<sub>G</sub>, E<sub>T</sub>, and dynamic specifications are adversely affected due to internal voltage drop and noise on V<sub>DDA</sub> and GNDA.

e. V<sub>ADCIN</sub> = V<sub>INP</sub> - V<sub>INN</sub>

f. With signal common mode as V<sub>DDA</sub>/2.

g. This parameter is defined as the average of the differential inputs.

h. As shown in Figure 21-17 on page 1155, R<sub>ADC</sub> is the total equivalent resistance in the input line all the way up to the sampling node at the input of the ADC.

i. See "System Clock Specification with ADC Operation" on page 1145 for full ADC clock frequency specification.

j. ADC conversion time (T<sub>c</sub>) includes the ADC sample time (T<sub>s</sub>).

k. 12-bit DNL

l. Gain error is measured at max code after compensating for offset. Gain error is equivalent to "Full Scale Error." It can be given in % of slope error, or in LSB, as done here.

m. Total Unadjusted Error is the maximum error at any one code versus the ideal ADC curve. It includes all other errors (offset error, gain error and INL) at any given ADC code.

n. A low-noise environment is assumed in order to obtain values close to spec. The board must have good ground isolation between analog and digital grounds and a clean reference voltage. The input signal must be band-limited to Nyquist bandwidth. No anti-aliasing filter is provided internally.

o. ADC dynamic characteristics are measured using low-noise board design, with low-noise reference voltage (< -74dB noise level in signal BW) and low-noise analog supply voltage. Board noise and ground bouncing couple into the ADC and affect dynamic characteristics. Clean external reference must be used to achieve shown specs.

p. Differential signal with correct common mode, applied between two ADC inputs.

q. SDR = -THD in dB.

r. For higher frequency inputs, degradation in SDR should be expected.

s. SNDR = S/(N+D) = SINAD (in dB)

t. Effective number of bits (ENOB) can be calculated from SNDR: ENOB = (SNDR - 1.76) / 6.02.

u. Single-ended inputs are more sensitive to board and trace noise than differential inputs; SNR and SNDR measurements on single-ended inputs are highly dependent on how clean the test set-up is. If the input signal is not well-isolated on the board, higher noise than specified could potentially be seen at the ADC output.

v. Note that this parameter does not include ADC error.

| S9            | $T_{RXDMH}$     | Master Mode: Master Rx Data In (from slave) hold<br>time                        | 0                  | -   | -                  | ns   |
| S10           | $T_{TXDSOV}$    | Slave Mode: Master Tx Data Output (to Master)<br>Valid Time from edge of SSIClk | -                  | -   | 77.74 <sup>d</sup> | ns   |
| S11           | $T_{TXDSOH}$    | Slave Mode: Slave Tx Data Output (to Master)<br>Hold Time from next SSIClk      | 55.5 <sup>e</sup>  | -   | -                  | ns   |
| S12           | $T_{RXDSSU}$    | Slave Mode: Rx Data In (from master) setup time                                 | 0                  | -   | -                  | ns   |
| S13           | $T_{RXDSH}$     | Slave Mode: Rx Data In (from master) hold time                                  | 51.55 <sup>f</sup> | -   | -                  | ns   |

a. In master mode, the system clock must be at least twice as fast as the SSIClk.

b. In slave mode, the system clock must be at least 12 times faster than the SSIClk.

c. Note that the delays shown are using 8-mA drive strength.

d. This MAX value is for the minimum  $T_{SYSCLK}$  (12.5 ns). To find the MAX  $T_{TXDSOV}$  value for a larger  $T_{SYSCLK}$ , use the equation:  $4 \cdot T_{SYSCLK} + 27.74$ .

e. This MIN value is for the minimum slave mode  $T_{SYSCLK}$  (12.5 ns). To find the MIN  $T_{TXDSOH}$  value for a larger  $T_{SYSCLK}$ , use the equation:  $4 \cdot T_{SYSCLK} + 5.50$ .

f. This MIN value is for the minimum slave mode  $T_{SYSCLK}$  (12.5 ns). To find the MIN  $T_{RXDSH}$  value for a larger  $T_{SYSCLK}$ , use the equation:  $4 \cdot T_{SYSCLK} + 1.55$ .

| I6 <sup>a</sup> | T <sub>HT</sub>   | Clock High time                                                              | 24  | -                   | -            | system clocks |
| I7              | T <sub>DS</sub>   | Data setup time                                                              | 18  | -                   | -            | system clocks |
| I8 <sup>a</sup> | T <sub>SCSR</sub> | Start condition setup time (for repeated start condition only)               | 36  | -                   | -            | system clocks |
| I9 <sup>a</sup> | T <sub>SCS</sub>  | Stop condition setup time                                                    | 24  | -                   | -            | system clocks |
| I10             | T <sub>DV</sub>   | Data Valid (slave)                                                           | -   | 2                   | -            | system clocks |
|                 |                   | Data Valid (master)                                                          | -   | (6 * (1 + TPR)) + 1 | -            | system clocks |

- a. Values depend on the value programmed into the TPR bit in the **I<sup>2</sup>C Master Timer Period (I2CMTPR)** register; a TPR programmed for the maximum I2CSCL frequency (TPR=0x2) results in a minimum output timing as shown in the table above. The I<sup>2</sup>C interface is designed to scale the actual data transition time to move it to the middle of the I2CSCL Low period. The actual position is affected by the value programmed into the TPR; however, the numbers given in the above values are minimum values.
- b. Because I2CSCL and I2CSDA operate as open-drain-type signals, which the controller can only actively drive Low, the time I2CSCL or I2CSDA takes to reach a high level depends on external signal capacitance and pull-up resistor values.
- c. Specified at a nominal 50 pF load.

Figure 21-22. I<sup>2</sup>C Timing

## **21.16 Universal Serial Bus (USB) Controller**

The TM4C1232H6PM USB controller electrical specifications are compliant with the *Universal Serial Bus Specification Rev. 2.0* (full-speed and low-speed support). Some components of the USB system are integrated within the TM4C1232H6PM microcontroller and specific to the TM4C1232H6PM microcontroller design.

## 21.17 Analog Comparator

**Table 21-33. Analog Comparator Characteristics<sup>ab</sup>**

| Parameter            | Parameter Name                                | Min  | Nom      | Max        | Unit    |
|----------------------|-----------------------------------------------|------|----------|------------|---------|
| $V_{INP}, V_{INN}^c$ | Input voltage range                           | GNDA | -        | $V_{DDA}$  | V       |
| $V_{CM}$             | Input common mode voltage range               | GNDA | -        | $V_{DDA}$  | V       |
| $V_{OS}$             | Input offset voltage                          | -    | $\pm 10$ | $\pm 50^d$ | mV      |
| $I_{INP}, I_{INN}$   | Input leakage current over full voltage range | -    | -        | 2.0        | $\mu A$ |
| $C_{MRR}$            | Common mode rejection ratio                   | -    | 50       | -          | dB      |
| $T_{RT}$             | Response time                                 | -    | -        | $1.0^e$    | $\mu s$ |
| $T_{MC}$             | Comparator mode change to Output Valid        | -    | -        | 10         | $\mu s$ |

- a. Best design practices suggest that static or quiet digital I/O signals be configured adjacent to sensitive analog inputs to reduce capacitive coupling and cross talk.
- b. To achieve best analog results, the source resistance driving the analog inputs,  $V_{INP}$  and  $V_{INN}$ , should be kept low.
- c. The external voltage inputs to the Analog Comparator are designed to be highly sensitive and can be affected by external noise on the board. For this reason,  $V_{INP}$  and  $V_{INN}$  must be set to different voltage levels during idle states to ensure the analog comparator triggers are not enabled. If an internal voltage reference is used, it should be set to a mid-supply level. When operating in Sleep/Deep-Sleep modes, the Analog Comparator module external voltage inputs set to different levels (greater than the input offset voltage) to achieve minimum current draw.
- d. Measured at  $V_{REF}=100$  mV.
- e. Measured at external  $V_{REF}=100$  mV, input signal switching from 75 mV to 125 mV.

**Table 21-34. Analog Comparator Voltage Reference Characteristics**

| Parameter | Parameter Name               | Min | Nom             | Max            | Unit |
|-----------|------------------------------|-----|-----------------|----------------|------|
| $R_{HR}$  | Resolution in high range     | -   | $V_{DDA}/29.4$  | -              | V    |
| $R_{LR}$  | Resolution in low range      | -   | $V_{DDA}/22.12$ | -              | V    |
| $A_{HR}$  | Absolute accuracy high range | -   | -               | $\pm R_{HR}/2$ | V    |
| $A_{LR}$  | Absolute accuracy low range  | -   | -               | $\pm R_{LR}/2$ | V    |

a. The value for I<sub>DDA</sub> is included in the above values for I<sub>DD\_RUN</sub>, I<sub>DD\_SLEEP</sub>, and I<sub>DD\_DEEPSLEEP</sub>.

b. Note that if the MOSC is the source of the Run-mode system clock and is powered down in Sleep mode, wake time is increased by T<sub>MOSC\_SETTLE</sub>.

# A Package Information

## A.1 Orderable Devices

**Note:** See the Package Option Addendum for additional detail on orderable part numbers.

**Figure A-1. Key to Part Numbers**

**Table A-1. Orderable Part Numbers**

| Part Number     | Description                                                                                  |
|-----------------|----------------------------------------------------------------------------------------------|
| TM4C1232H6PMI7  | Tiva™ C Series TM4C1232H6PM Microcontroller Industrial Temperature 64-pin LQFP               |
| TM4C1232H6PMI7R | Tiva™ C Series TM4C1232H6PM Microcontroller Industrial Temperature 64-pin LQFP Tape-and-reel |

## A.2 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all microcontroller (MCU) devices. Each Tiva™ C Series family member has one of two prefixes: XM4C or TM4C. These prefixes represent evolutionary stages of product development from engineering prototypes (XM4C) through fully qualified production devices (TM4C).

Device development evolutionary flow:

- XM4C — Experimental device that is not necessarily representative of the final device's electrical specifications and may not use production assembly flow.
- TM4C — Production version of the silicon die that is fully qualified.

XM4C devices are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

TM4C devices have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (XM4C) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

## A.3 Device Markings

The figure below shows an example of the Tiva™ microcontroller package symbolization.

This identifying number contains the following information:

- **Lines 1 and 5:** Internal tracking numbers
- **Lines 2 and 3:** Part number

For example, TM4C123G on the second line followed by H6PGEI7 on the third line indicates orderable part number TM4C123GH6PGEI7. The silicon revision number is the last number in the part number, in this example, 7. The **DIDO** register also identifies the version of the microcontroller, as shown in the table below. Combined, the MAJOR and MINOR bit fields indicate the die revision and part revision numbers.

| MAJOR Bitfield Value | MINOR Bitfield Value | Die Revision | Part Revision |
|----------------------|----------------------|--------------|---------------|
| 0x0                  | 0x0                  | A0           | 1             |
| 0x0                  | 0x1                  | A1           | 2             |

| MAJOR Bitfield Value | MINOR Bitfield Value | Die Revision | Part Revision |
|----------------------|----------------------|--------------|---------------|
| 0x0                  | 0x2                  | A2           | 3             |
| 0x0                  | 0x3                  | A3           | 4             |
| 0x1                  | 0x0                  | B0           | 5             |
| 0x1                  | 0x1                  | B1           | 6             |
| 0x1                  | 0x2                  | B2           | 7             |

■ **Line 4:** Date code

The first two characters on the fourth line indicate the date code, followed by internal tracking numbers. The two-digit date code YM indicates the last digit of the year, then the month. For example, a 34 for the first two digits of the fourth line indicates a date code of April 2013.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PM (S-PQFP-G64)

PLASTIC QUAD FLATPACK

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.
  - D. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
