

HIGH-SPEED 3.3V 16K x 18 SYNCHRONOUS PIPELINED DUAL-PORT STATIC RAM

IDT70V9369L

Features:

- ♦ True Dual-Ported memory cells which allow simultaneous access of the same memory location
- ♦ High-speed clock to data access
 - Commercial: 6/7.5/9/12ns (max.)
 - Industrial: 7.5ns (max.)
- ♦ Low-power operation
 - IDT70V9369L
 - Active: 500mW (typ.)
 - Standby: 1.5mW (typ.)
- ♦ Flow-Through or Pipelined output mode on either port via the $\overline{\text{FT}}/\text{PIPE}$ pins
- ♦ Counter enable and reset features
- ♦ Dual chip enables allow for depth expansion without additional logic
- ♦ Full synchronous operation on both ports
 - 4ns setup to clock and 0ns hold on all control, data, and address inputs
 - Data input, address, and control registers
 - Fast 6.5ns clock to data out in the Pipelined output mode
 - Self-timed write allows fast cycle time
 - 12ns cycle time, 83MHz operation in Pipelined output mode
- ♦ Separate upper-byte and lower-byte controls for multiplexed bus and bus matching compatibility
- ♦ LVTTTL-compatible, single 3.3V ($\pm 0.3\text{V}$) power supply
- ♦ Industrial temperature range (-40°C to $+85^{\circ}\text{C}$) is available for selected speeds
- ♦ Available in a 100-pin Thin Quad Flatpack (TQFP)
- ♦ Green parts available, see ordering information

JULY 2010

Description:

The IDT70V9369 is a high-speed 16K x 18 bit synchronous Dual-Port RAM. The memory array utilizes Dual-Port memory cells to allow simultaneous access of any address from both ports. Registers on control, data, and address inputs provide minimal setup and hold times. The timing latitude provided by this approach allows systems to be designed with very short cycle times.

With an input data register, the IDT70V9369 has been optimized for applications having unidirectional or bidirectional data flow in bursts. An automatic power down feature, controlled by $\overline{CE_0}$ and CE_1 , permits the on-chip circuitry of each port to enter a very low standby power mode. Fabricated using IDT's CMOS high-performance technology, these devices typically operate on only 500mW of power.

Pin Configuration^(1,2,3)

NOTES:

1. All V_{DD} pins must be connected to power supply.
2. All V_{SS} pins must be connected to ground.
3. Package body is approximately 14mm x 14mm x 1.4mm.
4. This package code is used to reference the package diagram.
5. This text does not indicate orientation of the actual part-marking.

NOTES:

- $\overline{LB}$ and $\overline{UB}$ are single buffered regardless of state of $\overline{FT}/PIPE$.
- $\overline{CE}_0$ and CE_1 are single buffered when $\overline{FT}/PIPE = V_{IL}$,
 $\overline{CE}_0$ and CE_1 are double buffered when $\overline{FT}/PIPE = V_{IH}$, i.e., the signals take two cycles to deselect.

NOTES:

5648 tbl 03

- "H" = V_{IH}, "L" = V_{IL}, "X" = Don't Care.
- $\overline{CE0}$, $\overline{LB}$, $\overline{UB}$, and $\overline{OE}$ = V_{IL}; CE₁ and $\overline{R/\overline{W}}$ = V_{IH}.
- Outputs configured in Flow-Through Output mode; if outputs are in Pipelined mode the data out will be delayed by one cycle.
- $\overline{ADS}$ and $\overline{CNRST}$ are independent of all other signals including $\overline{CE0}$, CE₁, $\overline{UB}$ and $\overline{LB}$.
- The address counter advances if $\overline{CNTEN}$ = V_{IL} on the rising edge of CLK, regardless of all other signals including $\overline{CE0}$, CE₁, $\overline{UB}$ and $\overline{LB}$.
- While an external address is being loaded ($\overline{ADS}$ = V_{IL}), $\overline{R/\overline{W}}$ = V_{IH} is recommended to ensure data is not written arbitrarily.

NOTES:

- At $f = f_{MAX}$, address and control lines (except Output Enable) are cycling at the maximum frequency clock cycle of $1/t_{cvc}$, using "AC TEST CONDITIONS" at input levels of GND to 3V.
- $f = 0$ means no address, clock, or control lines change. Applies only to input at CMOS level standby.
- Port "A" may be either left or right port. Port "B" is the opposite from port "A".
- $V_{DD} = 3.3V$, $T_A = 25^\circ C$ for Typ, and are not production tested. $I_{DD} dc(f=0) = 90mA$ (Typ).
- $\overline{CE}_X = V_{IL}$ means $\overline{CE}_{0X} = V_{IL}$ and $CE_{1X} = V_{IH}$
 $\overline{CE}_X = V_{IH}$ means $\overline{CE}_{0X} = V_{IH}$ or $CE_{1X} = V_{IL}$
 $\overline{CE}_X \leq 0.2V$ means $\overline{CE}_{0X} \leq 0.2V$ and $CE_{1X} \geq V_{DD} - 0.2V$
 $\overline{CE}_X \geq V_{DD} - 0.2V$ means $\overline{CE}_{0X} \geq V_{DD} - 0.2V$ or $CE_{1X} \leq 0.2V$

NOTES:

1. Transition is measured 0mV from Low or High-impedance voltage with the Output Test Load (Figure 2). This parameter is guaranteed by device characterization, but is not production tested.
2. The Pipelined output parameters (tcyc2, tcd2) apply to either or both the Left and Right ports when $\overline{FT}/PIPE = V_{IH}$. Flow-through parameters (tcyc1, tcd1) apply when $\overline{FT}/PIPE = V_{IL}$ for that port.
3. All input signals are synchronous with respect to the clock except for the asynchronous Output Enable ($\overline{OE}$), $\overline{FT}/PIPE_R$, and $\overline{FT}/PIPE_L$.

Timing Waveform of Read Cycle for Pipelined Operation ($\overline{\text{FT}}/\text{PIPE}^{\text{X}} = \text{V}_{\text{IH}}$)^(3,7)

5648 drw 07

NOTES:

1. Transition is measured 0mV from Low or High-impedance voltage with the Output Test Load (Figure 2).
2. $\overline{\text{OE}}$ is asynchronously controlled; all other inputs are synchronous to the rising clock edge.
3. $\overline{\text{ADS}} = \text{V}_{\text{IL}}$ and $\overline{\text{CNTRST}} = \text{V}_{\text{IH}}$.
4. The output is disabled (High-Impedance state) by $\overline{\text{CE}}_0 = \text{V}_{\text{IH}}$, $\text{CE}_1 = \text{V}_{\text{IL}}$, $\overline{\text{UB}} = \text{V}_{\text{IH}}$, or $\overline{\text{LB}} = \text{V}_{\text{IH}}$ following the next rising edge of the clock. Refer to Notes under Pin Names Table.
5. Addresses do not have to be accessed sequentially since $\overline{\text{ADS}} = \text{V}_{\text{IL}}$ constantly loads the address on the rising edge of the CLK; numbers are for reference use only.
6. If $\overline{\text{UB}}$ or $\overline{\text{LB}}$ was HIGH, then the Upper Byte and/or Lower Byte of DATA_{out} for $\text{Q}_{\text{n}+2}$ would be disabled (High-Impedance state).
7. "X" here denotes Left or Right port. The diagram is with respect to that port.

Timing Waveform of Counter Reset (Pipelined Outputs)⁽²⁾

NOTES:

1. $\overline{CE_0}$, $\overline{UB}$, $\overline{LB}$, and $R/\overline{W}$ = V_{IL} ; CE_1 and $\overline{CNTRST}$ = V_{IH} .
2. $\overline{CE_0}$, $\overline{UB}$, $\overline{LB}$ = V_{IL} ; CE_1 = V_{IH} .
3. The "Internal Address" is equal to the "External Address" when $\overline{ADS}$ = V_{IL} and equals the counter output when $\overline{ADS}$ = V_{IH} .
4. Addresses do not have to be accessed sequentially since $\overline{ADS}$ = V_{IL} constantly loads the address on the rising edge of the CLK; numbers are for reference use only.
5. Output state (High, Low, or High-impedance) is determined by the previous cycle control signals.
6. No dead cycle exists during counter reset. A READ or WRITE cycle may be coincidental with the counter reset cycle. ADDR₀ will be accessed. Extra cycles are shown here simply for clarification.
7. $\overline{CNTEN}$ = V_{IL} advances Internal Address from ' A_n ' to ' $A_n + 1$ '. The transition shown indicates the time required for the counter to advance. The ' $A_n + 1$ ' Address is written to during this cycle.

Functional Description

The IDT70V9369 provides a true synchronous Dual-Port Static RAM interface. Registered inputs provide minimal set-up and hold times on address, data, and all critical control inputs. All internal registers are clocked on the rising edge of the clock signal, however, the self-timed internal write pulse is independent of the LOW to HIGH transition of the clock signal.

An asynchronous output enable is provided to ease asynchronous bus interfacing. Counter enable inputs are also provided to staff the operation of the address counters for fast interleaved memory applications.

$\overline{CE_0} = V_{IL}$ and $CE_1 = V_{IH}$ for one clock cycle will power down the internal circuitry to reduce static power consumption. Multiple chip enables allow easier banking of multiple IDT70V9369's for depth expansion configurations. When the Pipelined output mode is enabled, two cycles are required with $\overline{CE_0} = V_{IL}$ and $CE_1 = V_{IH}$ to re-activate the outputs.

Depth and Width Expansion

The IDT70V9369 features dual chip enables (refer to Truth Table I) in order to facilitate rapid and simple depth expansion with no requirements for external logic. Figure 4 illustrates how to control the various chip enables in order to expand two devices in depth.

The IDT70V9369 can also be used in applications requiring expanded width, as indicated in Figure 4. Since the banks are allocated at the discretion of the user, the external controller can be set up to drive the input signals for the various devices as required to allow for 36-bit or wider applications.
