

BiCMOS Static RAM 240K (16K x 15-Bit) Cache-Tag RAM for PowerPC™ and RISC Processors

IDT71216

Features

- ♦ 16K x 15 Configuration
 - 12 TAG Bits
 - 3 Separate I/O Status Bits (Valid, Dirty, Write Through)
- ♦ Match output uses Valid bit to qualify MATCH output
- ♦ High-Speed Address-to-Match comparison times
 - 8/9/10/12ns over commercial temperature range
- ♦ $\overline{\text{TA}}$ circuitry included inside the Cache-Tag for highest speed operation
- ♦ Asynchronous Read/Match operation with Synchronous Write and Reset operation
- ♦ Separate $\overline{\text{WE}}$ for the TAG bits and the Status bits
- ♦ Separate $\overline{\text{OE}}$ for the TAG bits, the Status bits, and $\overline{\text{TA}}$
- ♦ Synchronous $\overline{\text{RESET}}$ pin for invalidation of all Tag entries
- ♦ Dual Chip selects for easy depth expansion with no performance degradation
- ♦ I/O pins both 5V TTL and 3.3V LVTTTL compatible with Vccq pins
- ♦ $\overline{\text{PWRDN}}$ pin to place device in low-power mode
- ♦ Packaged in a 80-pin plastic Thin Quad Flat Pack (TQFP).

Description

The IDT71216 is a 245,760-bit Cache Tag Static RAM, organized 16K x 15 and designed to support PowerPC and other RISC processors at bus speeds up to 66MHz. There are twelve common I/O TAG bits, with the remaining three bits used as status bits. A 12-bit comparator is on-chip to allow fast comparison of the twelve

stored TAG bits and the current Tag input data. An active HIGH MATCH output is generated when these two groups of data are the same for a given address. This high-speed MATCH signal, with TADM as fast as 8ns, provides the fastest possible enabling of secondary cache accesses.

The three separate I/O status bits (VLD, DTY, and WT) can be configured for either dedicated or generic functionality, depending on the SFUNC input pin. With SFUNC LOW, the status bits are defined and used internally by the device, allowing easier determination of the validity and use of the given Tag data. SFUNC HIGH releases the defined internal status bit usage and control, allowing the user to configure the status bit information to fit his system needs. A synchronous $\overline{\text{RESET}}$ pin, when held LOW at a rising clock edge, will reset all status bits in the array for easy invalidation of all Tag addresses.

The IDT71216 also provides the option for Transfer Acknowledge ($\overline{\text{TA}}$) generation within the cache tag itself, based upon MATCH, VLD bit, WT bit, and external inputs provided by the user. This can significantly simplify cache controller logic and minimize cache decision time. Match and Read operations are both asynchronous in order to provide the fastest access times possible, while Write operations are synchronous for ease of system timing.

The IDT71216 uses a 5V power supply on Vcc, with separate Vccq pins provided for the outputs to offer compliance with both 5V TTL and 3.3V LVTTTL Logic levels. The $\overline{\text{PWRDN}}$ pin offers a low-power standby mode to reduce power consumption by 90%, providing significant system power savings.

The IDT71216 is fabricated using IDT's high-performance, high-reliability BiCMOS technology and is offered in a space-saving 80-pin plastic Thin Quad Flat Pack (TQFP) package.

NOTES:

- "H" = V_{IH}, "L" = V_{IL}, "X" = don't care, "—" = unrelated.
- This table applies when $\overline{CS1}$ is LOW and CS2, $\overline{RESET}$, and $\overline{PWRDN}$ are HIGH. $\overline{TAOE}$, TAG, $\overline{TAIN}$ and SFUNC are "X" for this table.
- Dout in this case is the same as Din; that is, the input data is written through to the outputs during the write operation.

NOTES:

- "H" = V_{IH} , "L" = V_{IL} , "X" = don't care, "—" = unrelated.
- M = HIGH if TAGIN equals the memory contents at that address; M = LOW if TAGIN does not equal the memory contents at that address.
- PWRDN and RESET are HIGH for this table. CLK and OES are "X".
- This column represents the stored memory cell data for the given Status bit at the selected address.
- CS1 is LOW, CS2 is HIGH for this table.
- TAIN is a synchronous input; thus the inputs noted in the table must be applied during a rising CLK edge.
- TAIN will be a factor in determining the $\overline{TA}$ output in all cases except when TAH is HIGH and there is a valid MATCH. In that case, $\overline{TA}$ will be LOW(Valid).

NOTES:

1. This parameter is guaranteed with the AC Load (Figure 3) by device characterization, but is not production tested.
2. These parameters only apply when SFUNC is LOW and the internal WT bit is HIGH.
3. tADM, tDAM, tCSM and tADB, tDAB, tCSB must also be satisfied.

Timing Waveforms of Write and Read Cycles

3057 drw 07

The diagram shows the following signals and their timing characteristics:

- CLK**: Clock signal.
- A (0:13)**: Address bus. Timing parameters include t_{ADT} , t_{ADM} , t_{MHA} , t_{THA} .
- TAG (0:11)**: Tag bus. Timing parameters include t_{DAT} , t_{DAM} , t_{MHD} , t_{THD} .
- CS1**: Chip select 1. Timing parameter includes t_s .
- CS2**: Chip select 2. Timing parameter includes t_h .
- WES**: Write enable strobe. Timing parameters include t_s and t_h .
- WET**: Write enable tri-state. Timing parameter includes t_h .
- OET**: Output enable tri-state. Timing parameter includes $t_{CMLZ(1)}$.
- TAH**: Tri-state address hold. Timing parameter includes t_{OELV} .
- TAOE**: Tri-state address output enable. Timing parameter includes t_{OEMI} .
- TA**: Tri-state address. Timing parameters include t_{wmV} , t_{wmI} , t_{TAHV} , t_{TAFH} .
- MATCH**: Match signal. States include Valid, Invalid, and Match Valid.

NOTE:

1. Transition is measured $\pm 200\text{mV}$ from steady state.
