#### Derating Curve

#### \* Derating Using Case Temperature (T<sub>C</sub>):

All power and associated overload ratings are derated based upon case temperature using the derating curve. The case temperature is measured at the center of the ceramic mounting surface, with the part properly mounted and under electrical load. Without a heat sink, when in free air at +25°C, the MP2060 is rated for 2.5 watts.

The thermal design should satisfy the following equation:

Case Temperature (T<sub>C</sub>) + [Thermal Resistance (R<sub>θJC</sub>) x power applied (Watts)] ≤ 150°C, considering the full operating temperature range of the application.

**Mounting Note:** Mount on a smooth, clean and flat heat sink surface with a thermal interface material, such as thermal grease. The entire exposed ceramic portion must be in contact with the heat sink. When using a spring clip, it is recommended that a mounting force of 8 to 30 pounds (35 to 130 N) be applied to the center of the package. The clip should be round or smooth in the contact area to avoid concentrating the load on a small point of the plastic body of the package. Another mounting option is to use a pressure bar method which can achieve a greater mounting force with a greater contact area.
